  Modify an Existing Channel or Channels Node Location .......... 79
About This Book

Audience

SAS Model Manager Administration is for the following users:
• Those who are responsible for administering SAS Model Manager.
• Those who are responsible for administering the SAS Metadata Repository for use with SAS Model Manager.

You might be assigned to a specific user group or role. That assignment determines which tasks you can perform. For more information, see “Configuring Users, Groups, and Roles” on page 40.

Prerequisites

Here are the prerequisites for administering SAS Model Manager:
• The following software must be installed on your computer:
  • Java Development Kit v1.6.0_30
    For more information about requirements for specific platforms, see SAS® 9.3 Support for Java Development Kits on support.sas.com.
  • JBoss Application Server 4.3, Oracle WebLogic Server 10.3, or IBM WebSphere Application Server 7.0.0.13
    For more information, see SAS® 9.3 Support for Web Application Servers and HTTP Servers
  • SAS Management Console 9.3
  • SAS Model Manager Client 12.1
  • You must have a user ID and password for logging in to SAS Management Console and SAS Content Server Administration Console.

Conventions Used in This Document

The following typographical conventions are used for all text in this document except for syntax:
**bold**
identifies an item in the SAS Model Manager window or a menu item.

*italics*
identifies a book title or a value that is supplied by the user.

**monospace**
identifies SAS code.

**UPPERCASE**
identifies a SAS language element, such as the SAS statements KEEP or DROP.

The following typographical conventions are used in syntax:

**bold**
identifies the name of a macro.

*italic*
identifies an argument that must be supplied by the user.

< >
identifies an optional macro argument.

| (vertical bar)
indicates that you can choose one value from a group. Values that are separated by the vertical bar are mutually exclusive.

**UPPERCASE**
indicates a keyword that can be used as a value for an argument.
What's New in SAS Model Manager 12.1

Overview

The SAS Model Manager: Administrator's Guide contains new and updated administrative tasks that are associated with SAS Model Manager.

SAS Model Manager administrative tasks have the following new features and enhancements:

- pre-installation tasks
- configurations to use SAS Workflow
- post-installation configurations
- configurations for Model Manager Java Services options

Pre-Installation Tasks

Pre-installation and configuration tasks have been added to create and configure the new Model Manager database, before the Software Deployment Wizard is run. The Model Manager database is used to store operational, historical, and auditing data for SAS Model Manager. The pre-installation tasks also include information to help you create operating system accounts for product administrators and users, remind you to install the Web application server, and how to determine the location of the SAS environment URL. For more information, see Chapter 2, “Pre-Installation Tasks,” on page 3.

Configurations to Use SAS Workflow

Configuration tasks have been added so that you can integrate SAS Workflow with some of the model management tasks that are normally performed in the SAS Model Manager client. Workflow process definitions can be configured to use model management components with the workflow activities.

You can also associate milestones with workflow activities as part of the workflow process definition. Activities that are associated with a milestone appear on the Workflow Milestones tab in the version details section of the SAS Model Manager client. The Workflow Milestone report has also been added to the available reports.
Post-Installation Configurations

Additional steps were added to the post-installation verification and configuration steps. The steps added are for configuration of Model Manager Java Services Options, and for configuring Secure Sockets Layer (SSL) and client-certificate authentication for a Web application server is configured to use HTTPS. For more information, “Post-Installation Verification and Configuration of SAS Model Manager” on page 10.

Configurations for Model Manager Java Services Options

More options have been added to the Model Manager Java Services Options setting in SAS Management Console. The configurations can be modified for reporting, scoring metadata tables usage when publishing, SAS code debugging, SAS system options, In-database connection and publishing options, and performance options for the High-Performance Analytics procedure. For more information, see “Configuring Model Manager Java Services Options” on page 16.
SAS Model Manager 12.1 has been tested with assistive technology tools. It includes accessibility and compatibility features that improve the usability of the product for users with disabilities, with exceptions noted below. These features are related to accessibility standards for electronic information technology that were adopted by the U.S. Government under Section 508 of the U.S. Rehabilitation Act of 1973 (2008 draft proposal initiative update). Applications are also tested against Web Content Accessibility Guidelines (WCAG) 2.0, part of the Web Accessibility Initiative (WAI) of the Worldwide Web Consortium (W3C). For detailed information about the accessibility of this product, send e-mail to accessibility@sas.com or call SAS Technical Support.

For more information about accessibility features and exceptions, see “Accessibility Features of SAS Model Manager” in SAS Model Manager: User's Guide.

Recommended Reading
Chapter 1
Introduction to SAS Model Manager Administrator's Guide

Overview of SAS Model Manager Administration

The *SAS Model Manager: Administrator's Guide* provides pre-installation tasks for SAS Model Manager 12.1 on SAS 9.3, and explains how to prepare SAS Model Manager for use and how to manage information that is associated with SAS Model Manager. The administrator uses SAS Management Console to access metadata repositories that store information about SAS Model Manager users, libraries, data tables, and the Publishing Framework. Frequently used administrative and configuration tasks are included in this guide to provide guidance after the SAS Model Manager installation process is completed. The high-level tasks include the following:

- Completing pre-installation and configuration tasks for SAS Model Manager
- Completing post-installation verification and configuration steps for SAS Model Manager
- Preparing a database for use with SAS Model Manager
- Setting up SAS Management Console for use with SAS Model Manager
- Creating and configuring published channels
- Managing data tables, users, groups, and roles
- Configuring directory permissions
Chapter 2
Pre-Installation Tasks

Overview of Pre-Installation Tasks

Before you install SAS Model Manager 12.1 on SAS 9.3, you must perform pre-installation tasks. The following topics explain pre-installation and configuration tasks that must be completed in addition to the SAS 9.3 pre-installation tasks that must be completed before or during the SAS Model Manager installation and configuration process.

- “Create an Operating System Account for Product Administrators and Users” on page 4
- “Install Your Web Application Server” on page 5
- “Determine the Location of the SAS Environment URL” on page 5
- “Configure the SAS Model Manager Database” on page 6
Create an Operating System Account for Product Administrators and Users

About the User Accounts for SAS Model Manager

SAS Model Manager provides two types of user accounts:

Product administrator

A SAS Model Manager administrative user is specific to SAS Model Manager. A product administrator account is not the same as a general administrator account, such as the SAS Administrator (sasadm@saspw). These users must have a valid host operating system account, and you must associate that account with a metadata user.

You must create the operating system account for the administrator as a pre-installation task. For more information, see “Create Windows Operating System Accounts and Groups for Users of SAS Model Manager” on page 4.

Users of SAS Model Manager

These users must have a valid host operating system account, and you must associate that account with a metadata user through SAS Management Console.

You can create regular user accounts for SAS Model Manager as a post-installation task. For more information, see “Configuring Users, Groups, and Roles” on page 40.

Create Windows Operating System Accounts and Groups for Users of SAS Model Manager

On the SAS Workspace Server, create an operating system account for the administrator of SAS Model Manager (for example, mdlmgadmin) and all SAS Model Manager users.

If the SAS Workspace Server is running Windows, use one of the following methods to create this operating system account:

- If you are working on a local machine, complete these steps to create this user account:

  1. If you are running in a Windows operating system environment, right-click the Computer icon on your desktop and select Manage. The Computer Management dialog box appears.
  2. In the left navigation pane, expand the Local Users and Groups node. The Users and Groups nodes appear.
  3. Right-click the Users node and select New User. The New User dialog box appears.
  4. In this dialog box, complete these tasks:

     - Specify a user name and password.

     *Note:* In Windows, you cannot enter <domain>\username (you enter the user name only), but you must enter <domain>\username in the SAS Deployment Wizard and SAS Management Console.

     - Clear the User must change password at next logon check box.
5. Click **Create**.

6. If you want to add the users that you created to a group, perform the following steps:
   a. Right-click the **Groups** node in the Computer Management dialog box, and select **New Group**.
   b. Click **Add**. Enter the user names, separated by semicolons, and click **Check Names**.
   c. Click **OK**.

7. Assign the security policy of **Log on as batch job** for each user or group.
   b. From the Local Security Policy window, expand the **Local Policies** node and select **User Rights Assignment**. Then double-click the **Log on as batch job** policy.
   c. Click **Add user or Group**. Enter the user names or group names, separated by semicolons, and click **Check Names**.
   d. Click **OK**.

- Define the user (for example, `<domain>\username`) on the Active Directory server.

---

### Create UNIX Operating System Accounts and Groups for Users of SAS Model Manager

You can create the SAS Model Manager UNIX user group as a pre-installation or post-installation task. For more information, see “Creating Operating System Accounts in UNIX Environments” on page 13.

---

### Install Your Web Application Server

Before you can install SAS Model Manager, you must have installed the Web application server. For more information about how to install and configure your Web application server so that it works with SAS, see [http://support.sas.com/resources/thirdpartysupport/v93/appservers/index.html](http://support.sas.com/resources/thirdpartysupport/v93/appservers/index.html).

---

### Determine the Location of the SAS Environment URL

During deployment, you are prompted by the SAS Deployment Wizard to specify the location of the SAS environment file, named sas-environment.xml (for example, `http://<your HTTP server>/sas-environment.xml` or `http://<server>:<port>/SASLogin/sas-environment.xml`). This file defines a set of
SAS deployments at your site for client applications to use. The sas-environment.xml file does not need to physically exist at the location that you specify in the SAS Deployment Wizard before beginning the SAS Installation. However, knowing the intended value of this URL is important because every client installation is prompted for this value. If you do not specify the URL when SAS Model Manager is installed then, as a post-installation task, you must manually edit a file on every client machine to specify this URL. Therefore, it is beneficial to decide on a value for this URL during your planning process so that it can be provided to administrators who might be performing an installation.

Configure the SAS Model Manager Database

By default, during deployment of SAS Model Manager 12.1 on SAS 9.3, the SAS Deployment Wizard creates and configures the SAS Model Manager database (MdlMgrDB) to use the SAS Framework Data Server. The database type, user ID, and password are configured to be the same as the SAS Web Infrastructure Platform Services (SharedServices or ShrdSvcs) database. The SAS Model Manager database is used to store operational, historical, and auditing data for SAS Model Manager.

If you prefer, you can choose to use a third-party database. There are six types of databases that SAS Model Manager 12.1 supports. For the SAS Framework Data Server, MySQL, and Microsoft SQL Server database types, the SAS Model Manager database is created automatically during the installation and configuration process, if you chose to automatically configure the database. For the remaining three database types, PostgreSQL, Oracle, and DB2, the SAS Model Manager database (MdlMgrDB) must be created manually by the DBA before completing the Software Deployment Wizard configuration step.

The SAS Deployment Wizard can create the tables that are needed by SAS Web Infrastructure Platform Services and SAS Model Manager. Select the Automatically create tables and load data check box to use this feature. If you prefer to create the tables yourself for the SAS Model Manager database, then clear the check box and submit the SQL statements after the wizard finishes running. The SQL statements are in the file CreateMMTables.sql, which is located in the SAS-installationdirectory\SASModelManagerMidTier\12.1\Config\Deployment\Content\dbscript\<database-type>\ directory.

SAS Framework Data Server cannot be configured manually. But you can choose to configure MySQL and Microsoft SQL Server manually. Here are the versions of the alternative databases for SAS Model Manager 12.1 that were used for testing in SAS 9.3:

- Oracle 11g FP2
- PostgreSQL 8.7, 9.0 and 9.1
- MySQL 5.0 and 5.5.11
- IBM DB2 Version 9.7 FP2
- Microsoft SQL Server 2008 and 2008 R2
If you prefer to use a third-party vendor database instead of SAS Framework Table Server, then the SAS Model Manager database must be configured with the tables and data that are needed by SAS Model Manager. The JDBC connection information for the database must be provided to the SAS Deployment Wizard. The following information must be provided for the SAS Model Manager database:

- Host name of the database server
- Port number of the database server or listener
- Database name or Oracle System Identifier (SID)
  
  *Note:* Some databases, such as PostgreSQL are case sensitive. The database name must be `MdlMgrDB`.

- User ID, password, and schema (if applicable)
  
  *Note:* The database user ID, password, and schema must be the same as they are for the database for SAS Web Infrastructure Platform Services.

- Directory location of JDBC drivers for the database
  
  *Note:* The SAS Model Manager configuration uses the same values as the SAS Web Infrastructure Platform Services database prompts for the SAS Model Manager database, except for the database name.

For database-specific information about configuring a database, see the *Configuring an Alternative Database for SAS® Web Infrastructure Platform Services Configuration Guide*, available at

[http://support.sas.com/resources/thirdpartysupport/v93/appservers/SharedServicesAlternativeDatabase.pdf](http://support.sas.com/resources/thirdpartysupport/v93/appservers/SharedServicesAlternativeDatabase.pdf)

Overview of Preparing SAS Model Manager for Use

After installing and configuring SAS Model Manager, you must perform additional tasks to prepare SAS Model Manager for use.

- Verify that all installation and configuration steps have been completed. Perform any required additional configuration steps for the installed SAS solutions.
- If necessary, prepare a database to use with SAS Model Manager.

Note: This task needs is required only if you have SAS Scoring Accelerator installed.

For more information about installation and configuration, see the SAS Knowledge Base/Install Center at http://support.sas.com/documentation/installcenter/.

Post-Installation Verification and Configuration of SAS Model Manager

After you install SAS 9.3 and SAS Model Manager 12.1 using SAS Software Depot, you must perform additional configuration steps before you can use SAS Model Manager.

1. Verify that all installation and configuration steps in the instructions.html file have been completed. The instructions.html file is located in \sasconfigdir\Lev#\Documents\.

2. The SAS Deployment Wizard does not create SAS Model Manager users by default. The SAS Administrator must create users in SAS Management Console with the appropriate group and role permissions. Verify that all users who were created during the installation process to use SAS Model Manager are granted the appropriate permissions to the SAS Workspace Server. In a Windows environment, each user or group must be granted permission to the Log on as a batch job local security policy. For more information, see “Create Windows Operating System Accounts and Groups for Users of SAS Model Manager” on page 4.

In a UNIX environment all SAS Model Manager users must be part of a group that has the appropriate group permissions. For more information, see “Creating Operating System Accounts in UNIX Environments” on page 13 and “Configuring Users, Groups, and Roles” on page 40.

3. If the SAS Workspace Server is located in a UNIX environment, you must enable the SAS Workspace Server XCMD option in order to support R model functionality. For more information, see “Enabling the SAS Workspace Server XCMD Option” on page 14.

4. During installation, if you chose to perform a manual configuration of the SAS Model Manager database, or you chose a third-party database vendor that does not support automated creation of tables and loading of data, additional configuration steps are required. For more information, see “Configure the SAS Model Manager Database” on page 6.
5. If the SAS Scoring Accelerator or SAS Model Manager In-Database Scoring Scripts products are a part of your SAS 9.3 deployment, additional configuration steps are required to prepare the database for publishing and scoring in SAS Model Manager. For more information, see “Preparing a Database for Use with SAS Model Manager” in Chapter 8 of SAS In-Database Products: Administrator's Guide.

6. If the Web application server is configured to use HTTPS, you must configure Secure Sockets Layer (SSL) and client-certificate authentication on the Client machine and on the SAS Workspace Server.

For more information, see the application server documentation page for your Web application server. The documentation for your server that is specific to SAS is available at http://support.sas.com/resources/thirdpartysupport/v93/appservers/.

The following are the security-related configuration documents for the currently supported Web application servers:

Note: A document about configuring the IBM WebSphere Application Server 7 for Secure Sockets Layer and client-certification authentication on SAS 9.3 Enterprise BI Server Web Applications will be placed at the same location. Contact SAS Technical Support for questions until the document is available.

7. Configure SAS Workflow. For more information, see “Configuring SAS Workflow for Use with SAS Model Manager” on page 24.

8. Verify the configuration of the dashboard reports directory on the SAS Workspace Server. For more information, see “Configuring the Dashboard Reports Directory” on page 15.

9. Configure the Model Manager Java Services Options. For more information, see “Configuring Model Manager Java Services Options” on page 16.

10. If the machine where SAS Workspace Server is located for SAS Model Manager supports IPV4 and IPV6 network addresses, in order for a user to perform tasks such as performance monitoring and model retrain, you must modify the contents of the -JREOPTIONS parameter by using the sasv9_usermods.cfg file. There are multiple versions of this file. Modify the file that is located in the \sasconfigdir\Lev#\SASApp\WorkspaceServer\ directory.

The following lines of code and user-supplied values must be added to the file:

```java
-JREOPTIONS={
-Djava.net.preferIPv4Stack=true
-Djava.net.preferIPv6Addresses=false
}
```

If you use IPv4 network addresses, the true and false values above are valid. If you use the IPv6 network address, you must reverse the true and false values. That is preferIPv4Stack=false and preferIPv6addresses=true.

SAS Model Manager uses JGroups to perform multicast communication between the SAS Application Server and the SAS middle-tier. The JGroups software bind to the IP address of the first non-loopback network interface that it can detect on the machine. In certain circumstances, such as machines with multiple network adapters or protocols, the SAS Application Server could bind to an address that is not able to
use multicasting to communicate to the SAS middle-tier. In these cases, you must also add the following line of code to the JREOPTIONS parameter:

-Djgroups.bind_addr=[IP Address]

If you do not know the correct value for the JGroups bind address, you can consult your network administrator to select the appropriate IP address. The address selected should be able to support multicasting to communicate to the SAS middle-tier. For more information, see “Configuring the JGroups Bind Address” in Chapter 13 of SAS Intelligence Platform: Middle-Tier Administration Guide.

11. If you have installed SAS Model Manager to use with SAS Enterprise Miner, you must access the SAS Content Server and create a public directory for SAS Enterprise Miner to register a model SAS package (SPK) file. To create a SAS Content Server public directory, follow these steps:

a. Access the SAS Content Server Administration Console by entering http://hostname:port/SASContentServer/dircontents.jsp. An example of hostname:port is localhost:8080. Log in using the SAS Administrator account (for example, sasadm@saspw) that you defined during the SAS installation process.

b. In the Add folder field, enter a folder name such as Models.

c. Click Add folder.

d. The Models folder is displayed in the Item name column.

e. Click the Permissions icon that is associated with the Models folder.

f. In the Add principal field, enter the value jcr:all. Change all of the permissions to Yes.

g. Click Save Changes.

h. Log off from the SAS Content Server Administration Console and restart any open SAS Enterprise Miner sessions to pick up the changes.

12. If you have installed SAS Model Manager to use with SAS Enterprise Miner, you must configure the SAS Metadata Repository to use the SAS Content Server public directory that you created previously. Follow these steps:

a. In SAS Management Console, expand Application Management on the Plugins tab. SAS Enterprise Miner should be listed and should contain subfolders.

b. Expand the Projects folder.

c. Right-click the SAS Workspace Server that is associated with your SAS Enterprise Miner installation, and select Properties. An example is SASApp - Logical Workspace Server.

d. Click the Options tab.

e. In the WebDAV URL field, enter http://hostname:port/SASContentServer/repository/default/Models/.

   Note: WebDAV is used to register a model SPK file from SAS Enterprise Miner.

f. Click OK and then restart any open SAS Enterprise Miner sessions to pick up the changes.

For more information about post-installation tasks, see the SAS 9.3 installation documentation.
Creating Operating System Accounts in UNIX Environments

Using Operating System Groups to Assign Permissions

Users have different operating system privileges on the SAS Workspace Server. By defining a user group for SAS Model Manager, you can assign all SAS Model Manager users to the same group and grant the same permissions to all SAS Model Manager users at one time. All SAS Model Manager users must have Read, Write, and Execute permissions for each environment directory that a user is permitted to use. Users also need permissions to all of the files and directories in an environment directory. The operating system must be configured to grant these permissions as new files and directories are created. The steps that you follow to do this depend on which operating system groups are defined and your site’s security policies.

Conditions for the User Group for SAS Model Manager

If you are working in a UNIX operating environment, the following conditions must be met:

• A group of users is created for the UNIX operating environment. The logon IDs for each SAS Model Manager user must be in this group. The group must also include any user who might run code that is created from a SAS Model Manager project in a SAS session.
• Users can be members of multiple groups, but the SAS Model Manager group is the primary group for each user.
• The SAS scripts are updated to grant permissions to the SAS Model Manager users on the SAS Workspace Server. For more information, see “Update the SAS Scripts to Grant Permissions to the User Group” on page 13.
• Each environment directory has the correct ownership, and the user group for the SAS Model Manager has Read, Write, and Execute permissions.

Update the SAS Scripts to Grant Permissions to the User Group

Using the umask option, you can grant permissions to the SAS Model Manager users on a conditional basis if the user is part of the SAS Model Manager user group.

Note: This example might require changes to fit your server configuration. In particular, this example could result in changed permissions on other SAS files, such as OLAP cubes. For example, if you are working with multiple UNIX groups and have a SAS OLAP Server, you must ensure that the account under which the SAS OLAP Server runs keeps the Read and Execute permissions to OLAP files.

To set these permissions:

2. Enter the configuration information for your operating environment. Here is the general format of this code:
Note: The following code uses grave accents and not quotation marks.

```
CMD=<your-operating-system-path>
CURR_GID=`eval $CMD -g`
GID=<solution-group-id>
if [ $CURR_GID -eq $GID ]; then umask 002 fi
```

a. In the `CMD=<your-operating-system-path>`, specify the full path on your server where the ID command is stored. You can get this information by typing a `which id` or `whence id` command on your console.

b. In the `GID=<solution-group-id>`, specify the group ID. Type `id` on your console to get the GID and UID information.

c. A value of 002 is recommended for the `umask` option.

Here are code examples for each UNIX environment where SAS Model Manager is supported:

<table>
<thead>
<tr>
<th>Operating Environment</th>
<th>Sample Code</th>
</tr>
</thead>
</table>
| AIX                   | CMD=/usr/bin/id  
CURR_GID='eval $CMD -g'
GID=201
if [ $CURR_GID -eq $GID ]; then umask 002 fi |
| H64I (HP-Itanium)     | CMD=/usr/bin/id  
CURR_GID='eval $CMD -g'
GID=201 if [ $CURR_GID -eq $GID ]; then umask 002 fi |
| S64 (Solaris)        | CMD=/usr/xpg4/bin/id  
CURR_GID='eval $CMD -g'
GID=201 if [ $CURR_GID -eq $GID ]; then umask 002 fi |
| SAX (Solaris for X64) | CMD=/usr/xpg4/bin/id  
CURR_GID='eval $CMD -g'
GID=201  
if [ $CURR_GID -eq $GID ]; then umask 002 fi |
| LNX (Linux)           | #!/bin/bash  
CMD=/usr/bin/id  
CURR_GID='eval $CMD -g'
GID=500
if [ "$CURR_GID" -eq "$GID" ]; then umask 002 fi |

### Enabling the SAS Workspace Server XCMD Option

When you are running the SAS Workspace Server in a UNIX environment for a SAS Model Manager 12.1 on SAS 9.3 deployment, the XCMD option is turned off by default.
So you cannot use the SYSTEM function, the X command, or the PIPE option in a
FILENAME statement. You must enable the SAS Workspace Server XCMD option in
order to support R model functionality.

To enable the XCMD option, follow these steps:
1. From SAS Management Console, expand the Server Manager node on the Plug-ins
tab.
4. Select Options ⇒ Advanced Options ⇒ Launch Properties and then select the
   Allow XCMD check box.
5. Click OK to save the setting.
6. Stop and restart your SAS Object Spawner.

---

### Configuring the Dashboard Reports Directory

In SAS Model Manager 12.1, the dashboard report directory is configured during
installation. The default directory is ```\SASConfigDir\Lev#\AppData\SASModelManager12.1\Dashboard```

*Note:* When the Application Server and the SAS Workspace Server are located on
different physical machines, the Software Deployment Wizard creates a directory on
the Application Server machine and uses that value for the `App.DashboardDir`
property value. You must create a directory that is accessible by the SAS Workspace
server, and the SAS Model Manager users must have permissions to the directory.

To configure a different directory to store the SAS Model Manager dashboard reports,
follow these steps:

1. Connect to the SAS Workspace Server.
2. Create a new directory (for example, `C:\Dashboard`).
   *Note:* The directory must be located on a SAS Workspace Server or a network drive
   that is accessible by the SAS Workspace Server. Do not include special
   characters or spaces in the name of the directory.
3. Grant user permissions for the new directory. For example, perform the following
tasks:
   - Grant Full Control permission to users who need to create subdirectories, write
     content, or delete content. This type of user includes a user who you will be
     adding (using SAS Management Console) to the Model Manager Administrator
     Users group or a user who is a SAS Administrator.
   - Grant Read, Write, and Execute permissions to users who need to create
     performance indicators and execute dashboard reports. This type of user includes
     a user who you will be adding (using SAS Management Console) to the Model
     Manager Advanced Users group.
   - Grant Read and Execute permissions to users who need only to view the
     dashboard reports. This type of user includes a user who you will add (using SAS
     Management Console) to the Model Manager Users group.
Note: In a UNIX environment all SAS Model Manager users must be part of a group that has the appropriate group permissions. For more information, see “Creating Operating System Accounts in UNIX Environments” on page 13 and “Configuring Users, Groups, and Roles” on page 40.

4. From SAS Management Console, expand the Application Management node on the Plug-ins tab.

5. Select and expand Configuration Manager ⇒ SAS Application Infrastructure.

6. Right-click Model Manager JavaSvcs 12.1 and select Properties.

7. (optional) Click the Settings tab and then select Report Options. Use this setting to specify the styles that are available when a user generates dashboard reports, and to enable the indicator override option for defining dashboard report indicators. When you use the indicator override configuration, indicators with conditions are available when you add dashboard report indicators using the SAS Model Manager Client. For more information, see “Report Options” on page 17.

8. Click the Advanced tab to modify the application dashboard directory. Change the property value for App.DashboardDir to the directory path that was configured.

9. Click OK.

---

Configuring Model Manager Java Services Options

Overview of Configuring Model Manager Java Services Options

The Model Manager Java Services Options in SAS Management Console enables you to modify SAS Model Manager configurations. The configurations can be modified for reporting, metadata tables usage when publishing a scoring function, SAS code debugging, SAS system options, In-database connection and publishing options, and performance options for the High-Performance Analytics procedure.

To modify the settings for the report options, follow these steps:

1. Log on to SAS Management Console as a SAS administrator.

2. On the Plug-ins tab, navigate to Application Management ⇒ Configuration Manager ⇒ SAS Application Infrastructure.

3. Right-click Model Manager JavaSvcs 12.1 and select Properties.

4. Click the Settings tab and then select Model Manager Java Services.
5. Select one of the following options to view and configure the available settings.

- **Report Options**
- **Publish Scoring Options**
- **Debug Options**
- **Valid Variable Name Options**
- **In–Database Options**
- **Performance Options**

6. Click **OK**.

7. For the changes to take effect you must restart the Web application server.

---

**Report Options**

The **Report Options** setting in SAS Management Console enables you to modify the SAS Model Manager configurations for the dashboard reports, model retrain reports and performance monitoring. These reports are available when you use the SAS Model Manager client.

To modify the report options setting, follow these steps:

1. Specify the formats that are available when a user creates model retrain reports. The default values are RTF, PDF, HTML, and EXCEL. You can remove any of the default values so that they are not available in the SAS Model Manager client.
2. Specify the report styles that are available when a user creates the model retrain reports and dashboard reports. You can add or remove SAS styles. The default values are SAS default, Seaside, Meadow, and Harvest. For more information about SAS styles, see “Understanding Styles, Style Elements, and Style Attributes” in Chapter 3 of SAS Output Delivery System: User's Guide.

3. Select Yes for the dashboard indicator override. When you do that, indicators with conditions are available when a user adds dashboard report indicators.

4. Specify a value for random seed to be used by performance tasks for models that have an interval target. The default value is 12345. The random seed is the initial seed for the random number generator used for sampling the input data set.

5. Specify a value for the sample size that is used by performance tasks for models that have an interval target. The default value is 1000. The sample size for models with an interval target is the number of observations from the input data set.

6. Specify a value for the sample size that is used by performance tasks for characteristic and stability analysis. The default value is 10000. The sample size for characteristic and stability analysis is the number of observations from the input data set.

7. Select Yes or No to specify whether to use the temporary tables on the High-Performance Analytics appliance for performance monitoring. The default is Yes.

**Publish Scoring Options**

The Publish Scoring Options setting enables you to indicate that the metadata tables be populated in the target database when publishing a scoring function. The default is Yes. During the installation and configuration process of the database, the metadata tables must be created in the database if this setting is set to Yes. If you plan on only using the SAS Embedded Process publish method to publish scoring model files, this setting can be ignored, and you do not need to create the metadata tables during the database configuration process.

For information about the database configurations, see “Configure the SAS Model Manager Database ” on page 6. For more information about publishing models to a database, see “Publishing Models to a Database” in Chapter 12 of SAS Model Manager: User's Guide.

**Debug Options**

The Debug Options setting to enables you to use the debug options when executing SAS code within the SAS Model Manager client. The default value is No.

The Debug Options setting does not work for scoring tasks. To enable debug options with scoring tasks, you must add the following line of code to the sasv9_usermod.sas file in the \sasconfigdir\Lev#\SASApp \WorkspaceServer\ directory:

```sas
options mprint symbolgen notes;
```

**Valid Variable Name Options**

The Valid Variable Name Options setting enables you to set the VALIDVARNAME system option to ANY when executing SAS code. The default value is No.
The Valid Variable Name Options setting does not work for scoring tasks. To use the VALIDVARNAME system option with scoring tasks, you must add the following line of code to the \sasv9_usermods.sas file in the directory:

```sas
options validvarname='any';
```

**In-Database Options**

The In-Database Options settings enables you to specify the publish type, database connection settings, and publish settings that are used when publishing models to a database using SAS Model Manager.

To modify the settings for the in–database options, follow these steps:

1. Select a method to publish models to the database for scoring. The default publish type is the SAS Embedded Process publish method.
2. Select a database type.
3. Specify values for database settings that are required to publish to the selected database type.

Here are the available database settings according to the publish method and database type:

<table>
<thead>
<tr>
<th>Database Settings</th>
<th>SAS Embedded Process</th>
<th>Scoring Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server name</td>
<td>Teradata</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Oracle</td>
<td>Teradata</td>
</tr>
<tr>
<td></td>
<td>Netezza</td>
<td>Netezza</td>
</tr>
<tr>
<td></td>
<td>Greenplum</td>
<td>Greenplum</td>
</tr>
<tr>
<td></td>
<td>DB2</td>
<td>DB2</td>
</tr>
<tr>
<td>Database name</td>
<td>Teradata</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Oracle</td>
<td>Teradata</td>
</tr>
<tr>
<td></td>
<td>Netezza</td>
<td>Netezza</td>
</tr>
<tr>
<td></td>
<td>Greenplum</td>
<td>Greenplum</td>
</tr>
<tr>
<td></td>
<td>DB2</td>
<td>DB2</td>
</tr>
<tr>
<td>User ID</td>
<td>Teradata</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Oracle</td>
<td>Teradata</td>
</tr>
<tr>
<td></td>
<td>Netezza</td>
<td>Netezza</td>
</tr>
<tr>
<td></td>
<td>Greenplum</td>
<td>Greenplum</td>
</tr>
<tr>
<td></td>
<td>DB2</td>
<td>DB2</td>
</tr>
<tr>
<td>Server user ID</td>
<td>Not applicable</td>
<td>DB2</td>
</tr>
<tr>
<td>Schema</td>
<td>Oracle</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Greenplum</td>
<td></td>
</tr>
<tr>
<td></td>
<td>DB2</td>
<td></td>
</tr>
</tbody>
</table>
4. Specify to use the model manager table when publishing. The default value is **No**. When you are publishing the scoring model files to a database using the SAS Embedded Process publish method, the files are by default stored in the table sas_model_table. If the **use model manager table** value is set to **Yes**, the scoring model files are stored in the table sas_mdlmgr_ep. These tables are located in the target database. This setting provides the ability for users to segregate the SAS Model Manager scoring model files from the SAS model scoring files when using the SAS Embedded Process publish method.

5. Specify to force the republish of model scoring files by default when using the SAS Embedded Process publish type. The default value is **No**. If you set this setting to **Yes**, then the **Replace scoring files that have the same publish name** option in the Publish Models to a Database window in SAS Model Manager is selected by default.

6. Select the default format of the model publish name when using the SAS Embedded Process publish method. The format selected determines the value that appears for the publish name in the Publish Models to a Database window in SAS Model Manager. The scoring function publish method publish name defaults to the model name.

7. Specify a directory path to store the temporary scoring files. If a value is not specified, the SAS work directory is used by default. However, if you select the **Display detailed log messages** option when publishing to a database, the SASUSER directory is used.

**Note:** The **Support Netezza SAS Embedded Process** setting is set to **No** by default since with the release of SAS Model Manager 12.1 on SAS 9.3. Therefore, the SAS Scoring Accelerator does not support the SAS Embedded Process publish method for Netezza. When the support is made available for SAS 9.3 this setting enables you to turn on the support for SAS Model Manager, so that Netezza appears in the database type drop-down list in SAS Model Manager.

For information about the database configurations, see “Configure the SAS Model Manager Database” on page 6. For more information about publishing models to a database, see “Publishing Models to a Database” in Chapter 12 of *SAS Model Manager: User’s Guide*.

**Performance Options**

The performance options contain the performance parameters for the PERFORMANCE statement to use the High-Performance Analytics procedure. Currently only the Teradata and Greenplum database types support High-Performance Analytics.

The PERFORMANCE statement defines performance parameters for multithreaded and distributed computing, passes variables about the distributed computing environment, and requests detailed results about the performance characteristics of a High-Performance Analytics procedure.

The following performance options can be specified for the PERFORMANCE statement.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Commit</td>
<td>Specifies an integer to request that the High-Performance Analytics procedure writes periodic updates to the SAS log.</td>
<td>10000</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
<td>Default Value</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------</td>
</tr>
<tr>
<td>CPU count</td>
<td>Specifies how many processors that the procedure should assume are available on each host in the computing environment. You can enter the value of ACTUAL, or enter an integer between 1 and 256.</td>
<td>ACTUAL</td>
</tr>
<tr>
<td>Database server</td>
<td>Specifies the name of the server for the database as defined through the hosts file and as used in the LIBNAME statement.</td>
<td></td>
</tr>
<tr>
<td>Details</td>
<td>Requests a table that shows a timing breakdown of the procedure steps.</td>
<td>No</td>
</tr>
<tr>
<td>Timeout</td>
<td>Specifies the timeout in seconds for a High-Performance Analytics procedure to wait for a connection to the appliance and establish a connection back to the client.</td>
<td>120</td>
</tr>
<tr>
<td>Host name</td>
<td>Specifies the name of the appliance. If a value for the Host option is specified, it overrides the value of the grid host environment variable.</td>
<td></td>
</tr>
<tr>
<td>Installation directory</td>
<td>Specify the name of the directory in which the High-Performance Analytics shared libraries are installed on the appliance.</td>
<td></td>
</tr>
<tr>
<td>Installation location</td>
<td>Specify the name of the directory in which the High-Performance Analytics shared libraries are installed on the appliance. If a value is specified for the Installation directory option, it overrides this option.</td>
<td></td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
<td>Default Value</td>
</tr>
<tr>
<td>--------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------------</td>
</tr>
<tr>
<td>Number of nodes</td>
<td>Specifies the number of nodes in the distributed computing environment, provided that the data is not processed alongside the database. You can enter an integer or you can specify a value of ALL if you want to use all available nodes on the appliance without oversubscribing the system.</td>
<td></td>
</tr>
<tr>
<td>Number of threads</td>
<td>Specify the number of threads for analytic computations. This option overrides the SAS system option THREADS</td>
<td></td>
</tr>
<tr>
<td>Grid host</td>
<td>Specifies the host name for the grid. If a value for the Host option is specified, it overrides the value of the grid host environment variable.</td>
<td></td>
</tr>
<tr>
<td>Grid RSH command</td>
<td>Specifies the command to run a remote shell.</td>
<td></td>
</tr>
<tr>
<td>Grid reply host</td>
<td>The host name of the client node to which the grid connects.</td>
<td></td>
</tr>
<tr>
<td>Grid port range</td>
<td>Specifies the range of parts that are permitted by the firewall.</td>
<td></td>
</tr>
<tr>
<td>Grid path</td>
<td>Specifies the local directory path for the grid node.</td>
<td></td>
</tr>
</tbody>
</table>

For more information about High-Performance Analytics, see the *SAS High-Performance Analytics Server 12.1: User's Guide*.

### Configuring and Using Java Web Start

For a SAS Model Manager 12.1 on SAS 9.3 deployment, the Java Web Start client can be used to access the SAS Model Manager 12.1 application by entering the URL

```
http://hostname:port/SASModelManagerJWS/Status
```

in your Web browser. The default value for the *SAS Environments URL* on the Status page is...
When you click Launch, the default value for the SAS environment field is (host deployment), unless you configure the Java Web Start Client to use the SAS environment URL in SAS Management Console.

Note: Only a SAS administrator (for example, sasadm@saspw) can configure the Java Web Start client for SAS Model Manager.

To specify the link to the Java Web Start client as the SAS environment URL, follow these steps:

1. From SAS Management Console, expand the Application Management node on the Plug-ins tab.

2. Select and expand Configuration Manager ⇒ SAS Application Infrastructure.

3. Right-click Model Manager JWS 12.1 and select Properties.

4. Click the Settings tab, and then select Model Manager Java Web Start Options.
   - Enter a value is for the SAS environment URL setting, and in the format of http://hostname:port/SASLogon/sas-environment.xml. For more information about SAS environments, see Appendix 1, “Configuring the SAS Environment File,” in SAS Intelligence Platform: Middle-Tier Administration Guide.
   - Verify that the value that is specified for the Preferred SAS environment setting is the SAS environment that should be selected by default in the client’s logon dialog box. If a valid SAS environment with the specified name is not found, the value is ignored.

5. Make any necessary changes to the settings, and click OK.

6. To verify that Java Web Start has been configured correctly, enter the URL http://hostname:port/SASModelManagerJWS/Status in your Web browser, verify that there is a value for the SAS Environments URL property, and then click Launch.

---

Configuring the Limitation on the Number of Observations for a Scoring Result Set

When the Scoring Task Type property is set to Production in SAS Model Manager, you can use SAS Management Console to limit the number of observations that a scoring result set can contain.

To configure a limitation for the number of observations, follow these steps:

1. From SAS Management Console, expand the Application Management node on the Plug-ins tab.

2. Select and expand Configuration Manager ⇒ SAS Application Infrastructure.

3. Right-click Model Manager JavaSvcs 12.1 and select Properties.

4. Click the Advanced tab. Change the property value for App.TableObsLimitation to limit the number of observations in the scoring result set. The default value of 0 indicates that there is no limit to the number of observations that a scoring result set can contain.

5. Click OK. The value that you specified now appears in the Number of Observations result set property when you create a scoring task using SAS Model Manager.
Configuring SAS Workflow for Use with SAS Model Manager

Overview

SAS Workflow provides services that work together to model, automate, integrate, and streamline business processes. It provides a platform for more efficient and productive business solutions.

SAS Workflow is used by SAS solutions that benefit from business process management. SAS Workflow Studio is a desktop client application that is used to design and deploy workflow process definitions. The SAS middle tier hosts the workflow engine and the workflow services as part of the SAS Web Infrastructure Platform. The Workflow Console for SAS Model Manager is used to manage the workflow processes that are associated with versions in a modeling project. For more information about SAS Workflow, see “SAS Workflow” in Chapter 1 of SAS Intelligence Platform: Middle-Tier Administration Guide.

To use SAS Workflow with SAS Model Manager, be sure the following prerequisites are met:

1. SAS Workflow Engine, SAS Workflow Services, and SAS Workflow Studio must be installed and configured. For more information, see SAS Intelligence Platform: Installation and Configuration Guide
2. If you want to receive notifications for a workflow process, you can configure alert notifications using SAS Management Console. For more information, see “Configuring Alert Notifications for SAS Workflow” on page 51.
3. Workflow process definitions must be created using SAS Workflow Studio. For more information about creating process definitions, see the SAS Workflow Studio: User's Guide.

Guidelines for Creating Process Definitions

When you create process definitions in SAS Workflow Studio to use with SAS Model Manager, follow these guidelines:

- Participants, and policies must be added to the activity level. Statuses added at the activity level and the default statuses at the process definition level can be used for an activity status. Data objects can be added at the process definition level or activity level.
- Only the Potential Owner and Business Administrator workflow roles are used by SAS Model Manager and they can be used in either a participant or swimlane definition.
- In order to assign additional participants to activities using the Workflow Console, the user must have or be in a group that is assigned the workflow role of business administrator. Also, in order to create new workflows and assign participants, the user must be in the Model Manager Administrator Users group or in a group that is associated with the Model Manager Administrator Users group in SAS Management Console.
The **Create a workflow instance** capability must be enabled for the usage role that is associated with a user or group in order for them to be able to create workflows. By default this capability is enabled for the Model Manager: Administration Usage role that is associated with the Model Manager Administrator Users group. You can access the capability from the **Capabilities** tab in the Role Properties window. In the assigned capabilities tree, expand **Model Manager JavaSvcs 12.1 ⇨ Workflow Service**.

The following SAS Model Manager groups are created at installation time:
- Model Manager Administrator Users Group (mdlmgradminusers)
- Model Manager Advanced Users Group (mdlmgradvusers)

For more information, see “Configuring Users, Groups, and Roles” on page 40.

- Only process definitions that are in the Workflow repository, with the `mmapi` tag attribute specified in the file properties, are available to SAS Model Manager in the Workflow Console.

**How to Associate a Model Management Component with a Workflow Activity**

With the release of SAS Model Manager 12.1 you can associate a model management component with an activity as part of creating a workflow process definition.

First you must create a workflow process definition using SAS Workflow Studio. Add the activities, statuses, and data objects that you want to include in your workflow. For more information about creating a workflow process definition, see the *SAS Workflow Studio: User's Guide*.

To associate a model management component with an activity, follow these steps:

1. Start SAS Workflow Studio, and then open a workflow process definition.
2. Expand the **Activities** node in the process tree.
3. Expand an activity node, right-click the **Data Objects** folder, and select the **New Data Object** menu option.
4. Enter **MM_TaskToDo** for the data object label.

5. Select **Short Text** from for the type of data object.

6. Enter the model management component directory path and XML filename in the **Text** property. The directory path is `ConfigTemplates/nodeTemplates/<XML-filename>`. See Table 3.1 on page 27 to get the appropriate XML filename.
7. Click OK.

8. Repeat steps 3 through 7 for each activity that you want to associate a model management component.

<table>
<thead>
<tr>
<th>Model Management Component Name</th>
<th>Description</th>
<th>XML Filename</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Documents</td>
<td>This component enables you to attach documents to the Documents folder at the project, or version level.</td>
<td>AddDocument.xml</td>
</tr>
<tr>
<td>Import Models</td>
<td>This component enables you to import models from the SAS Metadata Repository, a SAS package file (.spk), or a PMML file (.xml) into the version that is associated with the workflow.</td>
<td>ModelRegistration.xml</td>
</tr>
<tr>
<td>Publish Models</td>
<td>This component enables you to publish champion and challenger models from the model repository to the SAS Metadata Repository or to a database.</td>
<td>ModelPublish.xml</td>
</tr>
<tr>
<td>Model Management Component Name</td>
<td>Description</td>
<td>XML Filename</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-------------</td>
<td>--------------</td>
</tr>
<tr>
<td>Set Champion and Challenger</td>
<td>This component enables you to set a project champion model and challenger models.</td>
<td>SetChampionOrChallenger.xml</td>
</tr>
<tr>
<td>View Models</td>
<td>This component enables you to view a list of the models. You can also view model information such as properties, model variables, score code, model files, notes, and history. By default, the Model Viewer component is available from both the Import Models and also the Set Champion and Challenger components.</td>
<td>GenericModelViewer.xml</td>
</tr>
<tr>
<td>View Model Performance</td>
<td>This component enables you to view the performance of the project champion model through a series of charts. The performance charts are generated using performance tasks in the SAS Model Manager client application.</td>
<td>PerformanceView.xml</td>
</tr>
<tr>
<td>View Reports</td>
<td>This component enables you to view reports that were created using the New Report wizard under the associated version in the SAS Model Manager client application.</td>
<td>ReportsView.xml</td>
</tr>
<tr>
<td>Utility</td>
<td>This component consists of all of the available model management components.</td>
<td>Utility.xml</td>
</tr>
</tbody>
</table>

**Note:** The list of the model management components that can be configured to be used with the SAS Model Manager Workflow Console can also be found at [http://server-name:port/SASContentServer/repository/default/ModelManager/ConfigTemplates/nodeTemplates/](http://server-name:port/SASContentServer/repository/default/ModelManager/ConfigTemplates/nodeTemplates/)

**How to Associate a Milestone with a Workflow Activity**

With the release of SAS Model Manager 12.1 you can specify the process type of milestone for process definition and associate a milestone ID with an activity as part of creating a workflow process definition. This enables the workflow and activities that are associated with a version to appear on the Workflow Milestones tab in the version details view, and in the Workflow Milestones Report in SAS Model Manager.

First you must create a workflow process definition using SAS Workflow Studio. Add the activities, statuses, and data objects that you want to include in your workflow. For more information about creating a workflow process definition, see the *SAS Workflow Studio: User's Guide*. 
To specify the process type of milestone for a process definition, you must add a data object for the process type at the process definition level. To add the Process Type data object at the process definition level, follow these steps:

1. Start SAS Workflow Studio, and then open a workflow process definition.
2. Right-click the **Data Objects** folder, and select the **New Data Object** menu option.
3. Enter **Process Type** for the data object label.
4. Select **Short Text** from for the type of data object.
5. Enter **Milestone** in the **Text** property.
6. Click OK.

To associate a milestone ID with an activity, follow these steps:

1. Start SAS Workflow Studio, and then open a workflow process definition.
2. Expand the Activities node in the process tree.
3. Expand an activity node, right-click the Data Objects folder, and select the New Data Object menu option.
4. Enter `MM_MilestoneID` for the data object label.

5. Select `Short Text` from for the type of data object.

6. Enter a name for the milestone ID in the `Text` property. The name can be the same as the activity name.
7. Click OK.

8. Repeat steps 3 through 7 for each activity that you want to associate a milestone ID so that it appears on the Workflow Milestones report.

How to Make Process Definitions Available to SAS Model Manager

After you have created a workflow process definition in the SAS Workflow Studio, you must make the process definition available to SAS Model Manager.

To save the process definition to the Workflow repository, follow these steps:

1. Save the process definition to your local drive.
2. Log on to the server.
3. Add the tag attribute of `mmapi` to the process definition file properties.
4. Upload the process definition.
5. Verify that the process definition appears in the Workflow Definitions category view of SAS Model Manager Workflow Console.

For more information, see “Deploying and Maintaining Processes” in Chapter 5 of *SAS Workflow Studio: User's Guide*.

Log On to the Server

With SAS Workflow Studio, you are limited to managing locally stored workflow process definitions on your system until you have logged on to the SAS Content Server.
After you are connected, you can access additional process definitions that are stored in the SAS Content Server.

To log on to the server, follow these steps:

1. From the Server menu, select Logon.
2. In the Log On window, select the host-name from the SAS environment drop-down list.
   
   Note: For more information, see Appendix 1, “Configuring the SAS Environment File,” in SAS Intelligence Platform: Middle-Tier Administration Guide.

3. Enter a user ID and password, and click Log On.
4. Click OK for success message that might appear.

### Add Tag Attributes to a Process Definition

Only those process definitions in the Workflow repository that have the mmapi tag attribute specified in the file properties are available to SAS Model Manager in the Workflow Console.

To add a tag attribute to the file properties of a process definition template in SAS Workflow Studio, follow these steps:

1. Select File ⇒ Properties and click Add.
2. Enter the tag value of mmapi.
   
   Note: The file properties are case sensitive. This value must be lowercase.
3. Click OK twice.

### Upload a Process Definition

To upload a process, follow these steps:

1. From the Server menu, select the Save to Repository menu option. The Save to Workflow Repository window appears.
2. (Optional) Enter relevant comments to associate with the process definition.
3. Select the Activate option if you want to activate the current version in the Workflow repository.
4. Click OK.
5. Click OK for the success messages that might appear.

### Verify That the Process Definitions Are Available in the Workflow Console

To verify that the workflow process definitions are available in the Workflow Console, follow these steps:

1. Enter the URL http://hostname:port/SASModelManagerWorkflow in your Web browser.
2. Enter the user ID and password for a SAS Model Manager administrator.
3. Verify that the uploaded process definition appears in the Workflow Definitions category view.

See Also

Overview of Setting Up SAS Management Console for Use with SAS Model Manager

SAS Management Console acts as the user interface to the SAS Metadata Repository. In order for SAS Model Manager to read data tables, the metadata for those tables must also exist within the SAS Metadata Repository. The metadata for the data tables is stored in libraries within the SAS Metadata Repository. SAS Management Console also enables administrators to configure users, groups, roles and to create publication channels.

You can determine how you want to organize your SAS libraries. For example, you can put all of the tables that are needed by a given project, version, model, scoring task, and report in one library. Or, you can create seven libraries that correspond to the structure of the Data Sources folders that SAS Model Manager uses. In most cases, users already
have model tables grouped in project-related SAS libraries. Most of the time, your SAS Model Manager Data Sources folders contain tables from different SAS libraries.

## Configuring a SAS Model Manager Connection Profile for the SAS Metadata Repository

### Overview of Configuring a Connection Profile

A connection profile enables you to communicate with the SAS Metadata Repository from SAS Management Console. Before you can define SAS Model Manager libraries, users, groups, roles, and publication channels in SAS Management Console, you must create a connection profile.

The Connection Profile wizard guides you through the process of creating the profile for your server. For more information, see the Help.

### Create a New Metadata Profile

To create a new metadata profile, follow these steps:

1. Start SAS Management Console. The **Connection Profile** dialog box appears.

   ![Connection Profile Dialog Box](image)

2. Select **Create a new connection profile**, and click **OK**. The Connection Profile wizard window appears.
3. Click **Next**.

4. Enter the name of your connection profile. Select the check box if you want to open this connection profile by default. Click **Next**.
5. Complete the following connection information:

a. Enter the fully qualified name (or IP address) of the machine on which your metadata server operates. Enter the TCP/IP port number that was defined at installation. By default the port is 8561.

b. Enter a valid user ID and a password.

c. (Optional) Select the check box to save the user ID and password for this profile.

   *Note:* When you select this option, the user ID and password are saved and automatically displayed when this profile is chosen during login.

d. Click **Next**. A summary of the connection profile options that you defined is displayed.
6. Click **Finish** to save your connection profile.

   SAS Management Console is then connected to your active connection profile server as shown on the window title bar.

   **Note:** You need to verify that Publishing Framework plug-ins are available on your SAS Management Console navigation tree. Otherwise, you need to install SAS Foundation Services 1.3 or higher so that you can configure your channels and subscribers for SAS Model Manager.

### Connect to an Existing Metadata Profile

To connect to or change your SAS Metadata Server connection profile, follow these steps:

1. Select **File** \(\Rightarrow\) **Connection Profile**. The Disconnect from Server dialog box appears.

2. Click **Yes**. The Connection Profile dialog box appears.
3. Select **Open an existing connection profile**.

4. Select the name of your SAS Metadata Server connection profile from the list.

5. Click **OK**.

Now you should see your SAS Metadata Server name in the SAS Management Console status bar (server-name:port number).

---

### Configuring Users, Groups, and Roles

#### Overview of Configuring Users, Groups, and Roles

When you use SAS Management Console to configure users, groups, and roles, users from different departments or divisions can collaborate to create, update, and deploy models. They use the SAS Publishing Framework to inform subscribers about model updates.

As an administrator, you need to create users, user groups, and then assign roles in order for users to access the SAS Model Manager repository. The **User Manager** plug-in for SAS Management Console allows a user to define a user or a group. A wizard helps you create the user and groups of users and also to assign roles.

*Note:* If you are using an automated approach to add and maintain user identities, see [SAS Note 40628](https://support.sas.com) or the Appendix 1, “User Import Macros,” in *SAS Intelligence Platform: Security Administration Guide*.

#### SAS Model Manager Users, Groups, and Roles

The following users, groups, and roles are created as part of the SAS Model Manager installation process:

*Note:* The SAS Model Manager Administrator user is no longer created by default during installation. You must create a user and assign the user to the **Model Manager Administrator Users** group.
### Table 4.1  SAS Model Manager Users

<table>
<thead>
<tr>
<th>User</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS Administrator</td>
<td>This user has access to all SAS Management Console capabilities and metadata administrative tasks. SAS 9.3 creates this user during installation.</td>
</tr>
<tr>
<td>SAS Demo User</td>
<td>This user is optional. You can choose to create this user during installation. However, this user is not assigned to a group during installation.</td>
</tr>
</tbody>
</table>

### Table 4.2  SAS Model Manager Groups

<table>
<thead>
<tr>
<th>Group</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS Administrators</td>
<td>This group performs metadata administrative tasks. SAS 9.3 creates this group during installation.</td>
</tr>
<tr>
<td>Model Manager Administrator Users</td>
<td>This group has administrative permissions for the SAS Model Manager Client and to the Workflow Console.</td>
</tr>
<tr>
<td>Model Manager Advanced Users</td>
<td>This group has permissions to read, write, and delete content.</td>
</tr>
<tr>
<td>Model Manager Users</td>
<td>This group has permission to read content.</td>
</tr>
<tr>
<td>Model Manager Example Life Cycle Assignee Users</td>
<td>This group is used by the example life cycle templates that are shipped with SAS Model Manager. The group contains those users who can change the status of life cycle tasks, but who cannot approve them.</td>
</tr>
<tr>
<td>Model Manager Example Life Cycle Approver User</td>
<td>This group is used by the example life cycles templates that are shipped with SAS Model Manager. The group contains those users who can approve completed life cycle tasks.</td>
</tr>
</tbody>
</table>

### Table 4.3  SAS Model Manager Roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comment Administrator</td>
<td>A user who can manage comments in the SAS Model Manager Workflow Console. This role is assigned to the group Model Manager Administrators.</td>
</tr>
<tr>
<td>Management Console: Advanced</td>
<td>Provides access to all plug-ins in SAS Management Console. This role is assigned to the group SAS Administrators.</td>
</tr>
<tr>
<td>Role</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Metadata Server: Operation</td>
<td>Supports adding metadata repositories and operating the metadata server. This role is assigned to the group SAS Administrators.</td>
</tr>
<tr>
<td>Metadata Server: User Administration</td>
<td>Supports management of users, groups, and roles other than the unrestricted users role. This role is assigned to the group SAS Administrators.</td>
</tr>
<tr>
<td>Metadata Server: Unrestricted</td>
<td>Provides all capabilities in SAS Management Console and provides access to all metadata. This role is assigned to the group SAS Administrator Users.</td>
</tr>
<tr>
<td>Model Manager: Administration Usage</td>
<td>A user who can perform all SAS Model Manager tasks. This role is assigned to the group Model Manager Administrator Users.</td>
</tr>
<tr>
<td>Model Manager: Advanced Usage</td>
<td>A user who can perform all SAS Model Manager tasks except for tasks that can be performed only by a SAS Model Manager administrator. This role is assigned to the group Model Manager Advanced Users.</td>
</tr>
<tr>
<td>Model Manager: Usage</td>
<td>A SAS Model Manager general user. The general user can perform all tasks except for advanced user tasks and administrator tasks. This role is assigned to the group Model Manager Users.</td>
</tr>
<tr>
<td>Model Manager: Life Cycle Assignee Usage</td>
<td>A user or group who can be assigned to complete a life cycle task.</td>
</tr>
<tr>
<td>Model Manager: Life Cycle Approval Usage</td>
<td>A user or group who can approve the completion of a life cycle task.</td>
</tr>
<tr>
<td>Model Manager: Life Cycle Participant Usage</td>
<td>A user or group that is displayed in the Participant selection list of the Life Cycle Template Editor.</td>
</tr>
</tbody>
</table>

**Table 4.4** SAS Model Manager Java Services Capabilities

<table>
<thead>
<tr>
<th>Capability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workflow Service: Create a workflow instance</td>
<td>Users or groups associated with a usage role that has this capability can create a workflow instance. This role is assigned to the Model Manager: Administration Usage role by default.</td>
</tr>
<tr>
<td>Capability</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Job Execution Service: Refresh job logs</td>
<td>Provides access to all plug-ins in SAS Management Console. This role is assigned to the group SAS Administrators.</td>
</tr>
</tbody>
</table>

For more information about SAS Model Manager tasks that are associated with each role, see the *SAS Model Manager: User's Guide*.

**Create a New User**

Before creating users for SAS Model Manager, you need to define these users on your network domains with valid user IDs and passwords. SAS Management Console helps you create users by using the New User wizard. You can click Help any time to get information about the current window properties.

To create a new user, follow these steps:

2. Enter the name of the user on the **General** tab.

   The **Display Name**, **Job Title**, and **Description** are optional.
CAUTION:
Do not use spaces or special characters in the name of a user, group or role.

3. Provide an e-mail address for the user to receive e-mail notifications from the SAS Publishing Framework. Click the Email tab on the lower panel and then click New. The Email Properties dialog box appears.

![Email Properties dialog box]

4. Enter SMTP in the Type field and the user's e-mail address in the Address field. Click OK.

5. Click the Group and Roles tab if you want this user to be included in a specified group. Use the arrow to add the new user to a group.

![New User Properties dialog box]
6. Click the **Accounts** tab and select **New**. The New Login Properties dialog box appears.

```
6. Click the Accounts tab and select New. The New Login Properties dialog box appears.
```

```
New Login Properties

Enter Login Information: Enter User IDs for Microsoft Windows in the format of domain\userid. See help for details.

User ID: ____________________________
Password: ____________________________
Confirm Password: _____________________
Authentication Domain: DefaultAuth

OK Cancel Help
```

7. Enter the **User ID**, **Password**, and the **Authentication Domain**. Click **New** to create a new valid domain. Enter a name and description for the new domain, and then click **OK** twice to add the new account.

8. (Optional) Click the **Authorization** tab if you want to add users or groups that can view and modify the metadata of this group. It is recommended that you specify authorizations for group level and not user level.

9. Click **OK**.

   The newly created user is displayed with all the other users when the User Manager object is selected from the SAS Management Console navigation tree.

10. In a Windows environment grant the new user permissions for the user rights assignment of **Log on as a batch job** for local security policies on the machine that hosts the SAS Workspace Server.

### Create a New User Group

To create a user group, follow these steps:

1. Right-click **User Manager** from the SAS Management Console **Plug-ins** tab, and select **New ⇒ Group**. The New Group Properties window appears.
2. Enter the name of the group on the General tab. The other fields are optional.

3. Click the Members tab. From the Available Identities list, select the users to be included in this group. Select the user name from the Available Identities list and click ▸ to add it to the Current Members list.
4. (Optional) Select the **Groups and Roles** tab if you want this user group to be included in a specified group.

5. (Optional) Select the **Accounts** tab. You might need this to create the New Login Properties for users who were not defined previously.

6. (Optional) Click the **Authorization** tab if you want to add users or groups that can view and modify the metadata of this group.

7. Click **OK**.

   The newly created group name is displayed with all the other groups when the User Manager object is selected from the SAS Management Console navigation tree.

---

**Create a New Role**

To create a new role, follow these steps:

1. Right-click **User Manager** from the SAS Management Console **Plug-ins** tab, and select **New = Role**. The New Role Properties window appears.
2. Enter the name of the role on the General tab. The other fields are optional.

3. Click the Members tab. From the Available Identities list, select the users and groups to assign to this role. Select the user or group name from the Available Identities list and click to add it to the Current Members list.
4. Click the **Capabilities** tab. Expand the tree nodes, and then select the check boxes to assign capabilities to the role.
5. Click the **Contributing Roles** tab to give this role all of the capabilities of one or more other roles. Use the arrows to add the new user to a group.

*Note:* Changes that you make to a role's capabilities affect any roles with which that role is associated.
6. (Optional) Click the **Authorization** tab if you want to add users or groups that can view and modify the metadata of this role.

7. Click **OK**.

   The newly created role name is displayed with all the other roles when the **User Manager** object is selected from the SAS Management Console navigation tree.

---

**Configuring Alert Notifications for SAS Workflow**

To enable workflow participants to receive alert notifications from SAS Workflow you must configure the **E-mail** notification type in SAS Management Console. After you have configured the alert notifications, you can then use the Notify Participant policy and other workflow notification policies for workflow process activities in SAS Workflow Studio. The notifications setting in SAS Management Console is a global setting. Preferences and notifications can also be configured for individual users.

The **Send Notification By Data Object** policy in SAS Workflow Studio integrates with the SAS Web Infrastructure Platform’s Notification Service. Recipients are notified according to their preferences (e-mail or portlets).

1. Log on to SAS Management Console as an administrator.

2. On the **Plug-ins** tab, navigate to **Application Management**: **Configuration Manager**: **SAS Application Infrastructure**.

3. Right-click **SAS Application Infrastructure** and select **Properties**.
Create Model Manager Libraries in SAS Management Console

To create a new SAS library in SAS Management Console, follow these steps:

1. Start SAS Management Console and connect to your preferred SAS Metadata Repository.

2. In the SAS Management Console tree, expand the following folders:
   Environment Management ➔ Data Library Manager ➔ Libraries.

4. In the folder display, ensure that the folders are expanded for Resource Templates ➔ Libraries ➔ SAS Data. Select SAS BASE Library and then click Next.

5. Enter a name, description, and location for your new SAS library, and then click Next. Add an optional description.

6. (Optional) Select the SAS server where the new library is to be assigned, and then click Next.
7. Enter a unique SAS library reference name of eight characters or fewer. You will use the SAS libref to access the table.

8. Use the arrow controls to choose a path from the Path Specification Available items box, or click New to specify a new path for your library. Afterwards your library path specification appears in the Path Specification Selected Items list. Click Next.
9. Review the summary of the information that you entered, and if it is correct, click Finish.

Your SAS Library appears in the SAS Management Console SAS Libraries list. It has been added to the SAS Metadata Repository. Now you can view your new SAS library in SAS Model Manager. For more information, see “Verify Accessibility of Data Tables in SAS Model Manager” on page 59.

Creating a New Table Using SAS

Here are two examples of how to create a new table by submitting SAS code. The first example creates a table based on another existing table. The second example shows how to create a new empty table.

If you submit the example code below to SAS, make sure that the directory path that is specified in the LIBNAME statement exists. Before you submit the code in Example 1, you need to verify that the appdata.sas7bdat file exists in the specified LIBNAME directory. After the code from the examples is submitted to SAS, two new .sas7bdat files will be created on disk at the location c:\smmwork.

Example Code 4.1  Create a New Table from an Existing Table

LIBNAME smmwork 'c:\smmwork';
data smmwork.PROJECTIN;
set smmwork.appdata;
keep age numCards everDefault;
if _N_>1 then stop;
run;
Example Code 4.2  Create a New Empty Table

LIBNAME smmwork 'c:\smmwork';
data smmwork.PROJECTOUT;
length posterior $ prediction $1;
posterior=.; prediction='';
run;

Registering a Table Using SAS Management Console

Overview of Registering a Table

After you create your data tables, you must register them in a SAS Metadata Repository so that the SAS Model Manager can locate them. SAS Model Manager can add data tables from the SAS Metadata Repository that are registered in SAS Management Console. You register tables in SAS Management Console in the Data Library Manager, Libraries folder.

How to Register a Table

The Register Tables wizard guides you through the process of importing and registering a SAS table in the SAS Metadata Repository. Each library type has a different Register Tables wizard that is called from the Data Library Manager.

Note: The Register Tables wizard is not available on UNIX platforms.

To import and register a table into a SAS Management Console Data Library, follow these steps:

1. Copy the .sas7bdat file for your table into the directory path on the Workspace server that you provided in the Path Specification data field of the New Library Wizard. For more information, see “Create Model Manager Libraries in SAS Management Console” on page 52.

2. Start SAS Management Console, and connect to the SAS Metadata Repository that contains your new SAS Library.

3. In the SAS Management Console tree, expand the following folders:

   Environment Management ⇒ Data Library Manager ⇒ Libraries

4. Right-click the SAS Library name that you want to import your table into, and then select Register Tables from the pop-up menu. The Register Tables wizard window appears.
5. Verify that the information that is displayed in the **Select a SAS Library** page is correct, and then click **Next**.

6. The Default Application Server dialog box might appear if the selected folder location is **User Folders** or if a default application server has not been previously selected. Select your SAS server, click **Test Connection** to verify that the connection to the server is successful, and then click **OK**.

7. If prompted, enter your SAS user ID and password to log on to your SAS server.

8. The Define Tables and Select Folder Location page is displayed. Select the table or tables that you want to register, and then click **Next**.
9. Click Finish.

The metadata for the imported table is written into the SAS Metadata Repository and is associated with the selected SAS Library.
Note: You must create folders with appropriate access permissions so that users can manage their models, create reports, and publish model updates. If a SAS Model Manager user does not have the appropriate permissions to access a folder, then the tables and libraries are not listed in the Data Sources perspective of SAS Model Manager. For more information about creating a folder and setting permissions, see the SAS Management Console Help.

See Also

“Create Model Manager Libraries in SAS Management Console” on page 52

Verify Accessibility of Data Tables in SAS Model Manager

To verify that your new library and associated tables are accessible in SAS Model Manager, follow these steps:

1. Start SAS Model Manager and select the Data Sources category view.
2. Expand the SAS Folders node and navigate to the location of the folder that you selected to store your registered tables, when creating your new library.
3. Expand the folder and verify that the metadata tables that are associated with your new SAS library are displayed.
4. Select a metadata table to view the associated columns and data in the Details pane.
For more information about data sources in SAS Model Manager, see the *SAS Model Manager: User's Guide*. 
Overview of Creating and Configuring Publication Channels

SAS Model Manager uses the SAS Publishing Framework to publish model updates to an operational environment for testing and production. The SAS Administrator creates and configures definitions for channels, content subscribers, and group subscribers. Then the user can use the SAS Model Manager model extraction macros or user-written SAS code to retrieve and deploy the updated models to the operational environment.

As shown in the following figure, several tasks are necessary to configure and use the SAS Model Manager publishing functionality.
Figure 5.1 Configuring SAS Model Manager to Enable Publishing Models

Here are the tasks.

1. The SAS Model Manager administrator creates either an archive or a WebDAV persistent storage location for channels that is accessible from the SAS Workspace Server.

2. The SAS Model Manager administrator creates SAS Model Manager users, HTTP servers, content subscribers, and channels using SAS Management Console.

3. The SAS Model Manager administrator or an advanced user publishes models using the SAS Model Manager Client.

4. The content subscriber (for example, Scoring personnel) receives an e-mail notification from the SAS Model Manager Server that contains a channel content update.

5. The content subscriber extracts models from a channel (for example, on a SAS Content Server) to prepare them for scoring.

Note: SAS Management Console Help provides details for your SAS Model Manager publishing configuration options.

It is recommended that at first you use channels that have the Archive File type for the persistent storage option. This is the simplest channel definition and configuration to use.
to publish directly to your operational testing or production scoring servers. A channel called **MMChannel** is created that has a persistent store Archive File type during the installation of SAS Model Manager. For more information, see “Create a New Channel” on page 72.

---

**Define an HTTP or HTTPS Server**

The SAS Model Manager installation process defines a default SAS Content Server. Use this process to add HTTP or HTTPS servers. A WebDAV-enabled HTTP or HTTPS content server must be defined in SAS Management Console before you can publish to channels from SAS Model Manager. The server is usually a third-party server such as Microsoft Internet Information server or an Apache server.

*Note:* You must have WriteMetadata permission for a repository in order to define an HTTP or HTTPS content server for that repository.

To define your HTTP or HTTPS content server, follow these steps:

1. Start SAS Management Console. Open your existing connection profile for your server. If your connection profile is not available in the list, see “Configuring a SAS Model Manager Connection Profile for the SAS Metadata Repository” on page 36.

2. From the **Plug-ins** tab, right-click **Server Manager**, and then select **New Server**. The New Server Wizard window appears.

3. Select **Resource Templates** ⇒ **Servers** ⇒ **Content Servers** ⇒ **Http Server**, and then click **Next**.
Note: If the HTTP server template is not available, then you must add the resource template. For more information, see the SAS Management Console Help.

4. Enter the name and the description of your HTTP server. Click Next.
5. (Optional) On the server properties page, enter the software version and vendor information for the third-party HTTP or HTTPS server that you are defining.

6. Click **New** to create base path or paths on your server. The New Base Path dialog box appears.

   *Note:* If you have not defined the base path for your HTTP server, see “Define Publish Locations for the SAS Content Server” on page 67.

   ![New Base Path dialog box](image)

   7. In the **Base Path** field specify the location of the top-level directory where report content items such as report definitions or image files are stored. (This path must be set up as an alias on the Web server.) The **Description** field is optional.

   8. Select the **Supports WebDAV** option and then click **OK** to save your settings. The new base path appears in the **Base Path(s)** field of the server properties page.

   ![New Server Wizard](image)

9. Click **Next**. The connection properties page opens.
10. Enter the connection properties for your HTTP server:
   a. Select **Default Auth** from the list. When you click **New** to create a new domain, a dialog box appears. Enter the name and description of your domain.
   b. Enter the fully qualified name or the IP address of your server.
   c. Enter a port number (for example, 8080 for a Web application server).

11. Click **Next**. The New Server Wizard window displays a summary of the settings for the new server and indicates that you have successfully completed the definition of a new server.
12. Click **Finish**. Your new server is displayed under the Server Manager node in the SAS Management Console Navigation Tree.

For more information, see the following resources:

1. The SAS Management Console Help.

2. The SAS online documentation about administering HTTP Servers and WebDAV, available at [http://support.sas.com](http://support.sas.com). Search for Administering HTTP Servers and WebDAV.

---

**Define Publish Locations for the SAS Content Server**

During the SAS Model Manager installation process the **ModelManager**, **sasfolders**, and **sasdav** WebDAV folders are automatically created on the SAS Content Server. You can use the SAS Content Server Administration Console (SCS Admin Console) to create a new publishing location for the WebDAV folder or to control access to an existing WebDAV folder. If you need to define a new WebDAV-enabled HTTP content server after the initial installation of SAS Model Manager, then you must define a publishing location. For more information, see “Define an HTTP or HTTPS Server” on page 63.

**Note:** Although you can add a folder to the **sasfolders** location, the folder that you add is not added to the SAS Metadata Server.

**TIP**  The best practice is to add folders to metadata using SAS Management Console.

To define a new publishing location, follow these steps:
1. Access the SAS Content Server Administration console by entering the following URL in your Web browser and substituting the server name and port number of your SAS Content Server: `http://server-name:port/SASContentServer/direcontents.jsp`.

   **Note:** The default port number depends on the application server that is being used. For example, the default port for JBOSS is 8080.

2. Log on to the console as an unrestricted user (for example, SAS Administrator). The SCS Admin Console window appears.

3. Enter a name for the folder in the text box and then click **Add folder** to create a new location for publishing channels.

4. (Optional) To create a subfolder, select the folder that you created in the previous step, enter a name for the subfolder in the text box, and click **Add folder**.

   **Note:** Use the breadcrumb trail above the list to return to a parent folder.

5. To set permissions for a folder, follow these steps:
   a. Click the permission icon next to the item that you want to modify. The Permissions page appears.

   b. For each principal that is listed, modify the permissions by changing each permission to **Yes** or **No**.

   c. To add more principals to the page, do one of the following:
      - If you know the principal's name, enter it in the field and click **Save changes**.
      - Click **Search for Principals** to search for a name. When you find the principal that you want to add, select the check box that is next to the principal's name and then click **Return**.
After the principal's name appears on the permission page, you can set permissions for the principal.

*Note:* For more information about administering the SAS Content Server, see the *SAS 9.3 Intelligence Platform: Web Application Administration Guide.*

---

### Configuring Channels and Subscribers for SAS Model Manager

#### Overview of Configuring Channels and Subscribers

The Publishing Framework plug-in to SAS Management Console enables you to administer the Publishing Framework.

*Note:* You need to verify that Publishing Framework plug-ins are available in your SAS Management Console navigation tree. If the plug-in is not available, you need to install SAS Foundation Services 1.3 or later so that you can configure your channels and subscribers for SAS Model Manager.

With the Publishing Framework plug-in, you can manage subscribers and channels. For more information, see the Help.

When the Publishing Framework plug-in is available, the SAS Management Console Project Tree should look as follows:

![SAS Management Console Project Tree](image)

The SAS Metadata Server (for example, **Foundation**) that is shown under the Publishing Framework plug-in contains the **Subscribers** folder and the **Channels** folder.
The Publishing Framework plug-in to SAS Management Console provides wizards that enable you to create subscribers. When you create a subscriber with a wizard, the subscriber object that has the specified attributes is stored on the SAS Metadata Server.

**Channel to Subscriber Configuration**

There are several ways to configure channels to publish your models to the SAS Model Manager channel subscribers.

Choose one of these options to define the method to use for publishing channels:

1. **None** - specifies to publish all content that is published to the channel directly to the subscribers (through e-mail). The content is not persisted.
2. **Archive** - specifies a path and an optional logical server for the location of the persistent storage. The Archive File option is recommended for publishing model packages. Publishing Framework publishes the content as an archive (binary) SPK (SAS package) file to the persistent storage location.
3. **WebDAV** - specifies the WebDAV server location.

**Tip** The best practice is to use the Archive File type for channel persistent storage and e-mail for subscriber notification.

Before publishing models using SAS Model Manager, you must create channels and subscribers to publish your model updates.

**Creating Channels and Subscribers**

The channel sends the information from the publishers to the subscribers who want it. A subscriber is a person or a program that has a need for information that is published. To receive information from a channel, the user must be defined as a subscriber.

The Publishing Framework plug-in provides wizards that enable you to create subscribers. Information about the subscriber is stored on the SAS Metadata Server.

*Note:* Channel subscribers must be users of the SAS Metadata Server and their e-mail addresses must be specified.

**Create a Channel Folder**

If you expect to create a large number of channels, then consider grouping related channels into channel folders. You can create subfolders within folders, thereby creating a folder hierarchy to which access controls can be applied. For more information, see the SAS Management Console Help.

*Note:* Currently it is not possible to move an existing channel into a folder or from one folder to another. Plan ahead to avoid having to delete and recreate channels.

To create channel folders, follow these steps:

1. From the SAS Management Console navigation tree, expand the Publishing Framework node.
2. Select and expand the desired metadata repository node.

3. If you are creating a top-level folder, then select **Channels**. If you are creating a subfolder, then navigate to and select the desired parent folder.

4. Right-click **Channels** and then select **New Folder**.

   The New Channel Folder wizard window appears.

   ![New Channel Folder Wizard](image)

5. Enter a name for the new channel folder and then click **Next**. The new folder is created and the metadata definition information is displayed.
Create a New Channel

To create a new channel, follow these steps:

1. From the SAS Management Console navigation tree, expand the Publishing Framework node.

2. Select and expand the desired metadata repository node.

3. If you are creating a channel within a folder, select the Channels node and navigate to the desired folder.

4. Right-click Channels or the desired channel folder and select New Channel. The New Channel wizard opens.

6. Click Finish.
5. Specify the name of your channel and click **Next**.

6. Use the arrow to associate content subscribers with this channel to be notified at publish time. Click **Next**.
7. Select Archive. The archive page opens.

8. Select File for Archive Type and enter the path of your publish location. Click Next.

The information window appears, providing a summary of the input and status of successful completion of the channel creation.

Note: The Archive storage has two other types, HTTP and FTP, that you can select from the list.

9. Click Finish. The new channel name is displayed under the Channels node of SAS Management Console.

For more information, see the SAS Management Console Help or the SAS 9.3 Publishing Framework: Developer's Guide.
Create a New Subscriber

SAS Model Manager supports only the content subscriber and the Name/Value pair filter for filtering. You can publish to a channel even when the channel does not have any associated subscribers. SAS Model Manager users can extract contents from a channel if they are not subscribers of the channel. However, only subscribers of a channel can receive notifications. You can also create a subscriber group that contains individual subscribers or other subscriber groups. For more information, see the SAS Management Console Help.

To create a new content subscriber:

1. Expand the Publishing Framework node in the SAS Management Console navigation tree.
2. Select the desired metadata repository node.
3. Select **Subscribers** ➔ **Content Subscribers**.
4. Right-click **Content Subscribers** and select **New Content Subscriber**. The New Content Subscriber wizard window appears.
5. Specify a name and a description for this subscriber. The name must be unique within its parent folder. The description is optional. Click Next.

6. Click Select to associate a person with this subscriber.

7. The search filter enables you to search the repository for users whose names either contain or are equal to a string that you specify. Enter the string in the text field, select either contains or equals from the list, and click Search. A list of users whose names meet your search criteria appears in the Available People list.
8. If the desired user does not exist in the repository, then click **New User** to define that user. Then, select the desired user from the **Available People** list and click **OK**.

9. Click **Next**.

10. Select the subscriber's delivery transport and then specify the attributes. Click **Next**.
11. Specify one or more filters to eliminate content that the subscriber does not want to receive. To add a filter, click the tab that corresponds to the type of filter (Name/Value, Entry, or MIME Type). Select **Inclusion** or **Exclusion** and then click **Add** to specify the filter criteria.

12. Click **Next**.

13. Review the subscriber specifications. Click **Back** to make any corrections. Click **Finish** when you are satisfied with your selections.
Modify an Existing Channel or Channels Node Location

Modify the Directory Location for the Channels Node

To change the location of the application channels directory, follow these steps:

1. From SAS Management Console, expand the Application Management node on the Plug-ins tab.
2. Select and expand Configuration Manager \rightarrow SAS Application Infrastructure \rightarrow Model Manager JavaSvcs 12.1.
3. Right-click Model Manager JavaSvcs 12.1 and select Properties.
4. Click the Advanced tab to modify the application channels directory. Change the property value for App.ChannelDir to a directory that is accessible by the SAS Workspace Server.
5. Click OK.

Modify the Persistent Store Directory Location for a Channel

To modify the location of the persistent store directory path for a channel, follow these steps:

1. From the SAS Management Console navigation tree, expand the Publishing Framework node.
2. Select and expand the desired metadata repository node.
3. If you are modifying a channel within a folder, select the Channels node and navigate to the desired folder.
4. Right-click the name of the channel that you want to modify, and then select Properties.
5. Click the Persistent Store tab, and modify the archive file path and server location.
6. Click OK.

Chapter 6
Managing Data Tables, Users, Groups, and Roles in SAS Management Console

Overview of Managing Data Tables, Users, Groups, and Roles in SAS Management Console

SAS Management Console is the primary tool that is available to administer the SAS Metadata Repository. SAS Management Console is a framework that provides a variety of plug-ins that expand the capability of SAS Management Console. Only certain users can view and use plug-ins. A user’s access to plug-ins depends on which roles the user is assigned to and which capabilities are assigned to those roles. SAS Model Manager makes extensive use of the SAS Metadata Repository. Therefore, SAS Management Console is used to perform a number of administrative tasks. Some of those tasks include managing users, groups, roles, and data tables. For information about other administrative tasks such as creating users, groups, roles, and channels, see Chapter 4, “Setting Up SAS Management Console for Use,” on page 35.

For information about SAS Management Console and plug-ins, see “Understanding the State of Your System” in the SAS Intelligence Platform: System Administration Guide. Also, see the SAS Management Console Help.

Modifying a Data Table

SAS Model Manager does not provide a way to modify the structure of a data source table. If a data source table is modified externally (using SAS Management Console, for example), then the existing SAS Model Manager scoring tasks might stop functioning.

For more information, see SAS Management Console Help or the SAS Intelligence Platform: System Administration Guide.
Deleting a Data Table

Overview of Deleting a Data Table

Data tables can be deleted only from the SAS Metadata Repository using SAS Management Console. Data tables cannot be deleted from SAS Model Manager using the Data Sources view. If the data table's metadata is deleted from the SAS Metadata Repository using SAS Management Console or the operating system, SAS Model Manager cannot access the data table to view data or to perform any reporting or scoring tasks. In this case, an error message appears.

*Note:* Only a SAS Administrator or a user with Delete permission can delete data tables using SAS Management Console.

Delete a Data Table in SAS Management Console

To delete a data table in SAS Management Console, follow these steps:

2. On the **Plug-ins** tab, expand the following folders:
   
   **Environment Management** ⇒ **Data Library Manager** ⇒ **Libraries**.

3. Select the library that contains the data table that you want to delete.

4. Right-click the data table name in the right pane, and then select **Delete** from the pop-up menu. The **Delete Table** dialog box is displayed.

5. Click **OK** to delete the data table. The data table is removed from the SAS Metadata Repository library, but it is not physically removed from the operating system.

For more information, see SAS Management Console Help or the *SAS Intelligence Platform: System Administration Guide*. 
Managing Users, Groups, and Roles

You use SAS Management Console to set up users, groups, and roles to define which actions a user can perform when using SAS Model Manager. For information about setting up a user, group, or role, see “Configuring Users, Groups, and Roles” on page 40.

In order to make access distinctions and track user activity, security systems must know who is making each request. The primary purpose of user administration is to provide information that helps systems make this determination. The SAS environment requires one external account ID for each user. The SAS environment then uses its copy of these IDs to establish a unique SAS metadata identity for each connecting user. All of a user's group memberships, role memberships, and permission assignments are ultimately tied to their SAS metadata identity.

To access user administration features in SAS Management Console, select the User Manager node on the Plug-ins tab. Your roles and permissions determine which user administration tasks you can perform.

Note: The User Manager node is the only location from which you can manage identities.

For more information, see the SAS Management Console Help or the SAS Intelligence Platform: System Administration Guide.
activity
a process element that associates executable logic with an event such as a status change or timer event.

activity status
the outcome of an activity in a process. The status of an activity (for example, Started, Canceled, Accepted) is typically used to trigger the next activity.

candidate model
a predictive model that evaluates a model's predictive power as compared with the champion model's predictive power.

challenger model
a model that is compared and assessed against a champion model for the purpose of replacing the champion model in a production scoring environment.

champion model
the best predictive model that is chosen from a pool of candidate models in a data mining environment.

channel
a virtual communication path for distributing information. In SAS, a channel is identified with a particular topic. Using the features of the Publishing Framework, authorized users or applications can publish digital content to the channel, and authorized users and applications can subscribe to the channel in order to receive the content.

classification model
a predictive model that has a categorical, ordinal, or binary target.

data object
an object that holds the business data that is required to execute workflow process activities.

data set
See SAS data set
**data source**
- a table, view, or file from which you will extract information. Sources can be in any format that SAS can access, on any supported hardware platform. The metadata for a source is typically an input to a job.

**DATA step**
- in a SAS program, a group of statements that begins with a DATA statement and that ends with either a RUN statement, another DATA statement, a PROC statement, or the end of the job. The DATA step enables you to read raw data or other SAS data sets and to create SAS data sets.

**DATA step fragment**
- a block of SAS code that does not begin with a DATA statement. In SAS Model Manager, all SAS Enterprise Miner models use DATA step fragments in their score code.

**identity**
- See metadata identity

**input variable**
- a variable that is used in a data mining process to predict the value of one or more target variables.

**instance**
- See process instance

**library reference**
- See libref

**libref**
- a SAS name that is associated with the location of a SAS library. For example, in the name MYLIB.MYFILE, MYLIB is the libref, and MYFILE is a file in the SAS library.

**metadata**
- descriptive data about data that is stored and managed in a database, in order to facilitate access to captured and archived data for further use.

**metadata identity**
- a metadata object that represents an individual user or a group of users in a SAS metadata environment. Each individual and group that accesses secured resources on a SAS Metadata Server should have a unique metadata identity within that server.

**milestone**
- a collection of tasks that complete a significant event. The significant event can occur either in the process of selecting a champion model, or in the process of monitoring a champion model that is in a production environment.

**model function**
- the type of statistical model, such as classification, prediction, or segmentation.

**model scoring**
- the process of applying a model to new data in order to compute outputs.
output variable
in a data mining process, a variable that is computed from the input variables as a prediction of the value of a target variable.

package
See SAS package file

package file
See SAS package file

participant
a user, group, or role that is assigned to an activity. These users, groups, and roles are defined in SAS metadata and are mapped to standard roles for the process.

policy
a process element that associates executable logic with an event such as a status change or timer event.

prediction model
a model that predicts the outcome of an interval target.

process
a series of activities, together with the participants and the logic that is required to execute the activities. A workflow process includes policies, status values, and data objects.

process definition
a process template that has been uploaded to the server and activated. Process definitions are used by the SAS Workflow Engine to create new workflow process instances.

process instance
a process that is running in the SAS Workflow Engine. After a process template is uploaded to the server and activated, client applications can use the template to create and run a new copy of the process definition. Each new copy is a process instance.

process template
a model of a process that has been saved to an XML file.

project
a collection of models, SAS programs, data tables, scoring tasks, life cycle data, and reporting documents.

project tree
a hierarchical structure made up of folders and nodes that are related to a single folder or node one level above it and to zero, one, or more folders or nodes one level below it.

publication channel
an information repository that has been established using the SAS Publishing Framework and that can be used to publish information to users and applications.

publish
to deliver electronic information, such as files and system-generated events, to one or more destinations. These destinations can include e-mail addresses, message queues,
publication channels and subscribers, WebDAV-compliant servers, and archive locations.

Publishing Framework
a component of SAS Integration Technologies that enables both users and applications to publish SAS files (including data sets, catalogs, and database views), other digital content, and system-generated events to a variety of destinations. The Publishing Framework also provides tools that enable both users and applications to receive and process published information.

SAS Content Server
a server that stores digital content (such as documents, reports, and images) that is created and used by SAS client applications. To interact with the server, clients use WebDAV-based protocols for access, versioning, collaboration, security, and searching.

SAS data set
a file whose contents are in one of the native SAS file formats. There are two types of SAS data sets: SAS data files and SAS data views.

SAS Metadata Repository
a container for metadata that is managed by the SAS Metadata Server.

SAS Metadata Server
a multi-user server that enables users to read metadata from or write metadata to one or more SAS Metadata Repositories.

SAS package file
a container for data that has been generated or collected for delivery to consumers by the SAS Publishing Framework. Packages can contain SAS files, binary files, HTML files, URLs, text files, viewer files, and metadata.

SAS publication channel
See publication channel

SAS variable
a column in a SAS data set or in a SAS data view. The data values for each variable describe a single characteristic for all observations (rows).

scoring
See model scoring

scoring function
a user-defined function that is created by the SAS Scoring Accelerator from a scoring model and that is deployed inside the database.

scoring task
a process that executes a model's score code.

segmentation model
a model that identifies and forms segments, or clusters, of individual observations that are associated with an attribute of interest.

source
See data source
SPK
See SAS package file

subscriber
a recipient of information that is published to a SAS publication channel.

variable
See SAS variable

version folder
a folder in the Project Tree that typically represents a time phase and that contains models, scoring tasks, life cycle data, reports, documents, resources, and model performance output.

WebDAV server
an HTTP server that supports the collaborative authoring of documents that are located on the server. The server supports the locking of documents, so that multiple authors cannot make changes to a document at the same time. It also associates metadata with documents in order to facilitate searching. The SAS business intelligence applications use this type of server primarily as a report repository. Common WebDAV servers include the Apache HTTP Server (with its WebDAV modules enabled), Xythos Software's WebFile Server, and Microsoft Corporation's Internet Information Server (IIS).

workflow
a sequence of processes together with the people, information and tools that are necessary to accomplish a specific business objective or goal.
