Contents

<i>Using This Book</i>	<i>xix</i>
<i>What's New in SAS Visual Analytics 7.1</i>	<i>xxi</i>
<i>Accessibility</i>	<i>xxix</i>

PART 1 Introduction to SAS Visual Analytics 1

Chapter 1 / About SAS Visual Analytics	3
What Is SAS Visual Analytics?	3
Benefits of Using SAS Visual Analytics	4
How Does SAS Visual Analytics Work?	5
SAS Visual Analytics User Community	6
Overview of SAS Visual Analytics Capabilities	7
Accessing SAS Visual Analytics	7
About the Availability of Menus and Menu Selections in SAS Visual Analytics	8
About Application Themes in SAS Visual Analytics	9
Personalize SAS Visual Analytics	9
Chapter 2 / Overview of the SAS Visual Analytics Home Page	11
Your First Look at the SAS Visual Analytics Home Page	12
Manage Content on the Home Page	16
Manage Collections on the Home Page	18
Working with the Right Pane on the Home Page	20
Discover Details Using the Object Inspector on the Home Page	23
Add Comments to Objects on the Home Page	25
Specifying Your Preferences	27
Chapter 3 / Searching from the SAS Visual Analytics Home Page	31
About Searching from the Home Page	31

Refining Your Search Results	34
------------------------------------	----

PART 2 Accessing Data 37

Chapter 4 / Overview of Data Flow in SAS Visual Analytics	39
Data Flow in SAS Visual Analytics	39
Self-Service Data Access	40
Managed Data Access	41
After a SAS LASR Analytic Server Restart	41
Requirements for Importing Data	42
Chapter 5 / Importing Local Data Files	43
Import a Local Data File	43
Limitations and Restrictions for Importing Local Data Files	46
Usage Notes	48
Chapter 6 / Importing Data from Servers	51
Import a SAS Data Set on a Server	52
Import a Database Table	53
Database Connection Tips	55
Import Tweets from Twitter	57

PART 3 Preparing Data 61

Chapter 7 / Overview of SAS Visual Data Builder	63
What Is SAS Visual Data Builder?	63
Your First Look at the Data Builder	65
Import Data	66
About Managed Access to DBMS Data	66
Work with User-Defined Formats	67

Chapter 8 / Specifying Preferences for SAS Visual Data Builder	69
Specify Global and General Preferences	69
Specify Your Preferences for the Data Builder	69
Chapter 9 / Creating Data Queries	71
What Is a Data Query?	71
About Creating Data Queries	72
Save Your Data Query	72
Save a Data Query as a New Data Query	73
Use the Design Tab	74
Adding a Data Source	75
Specify Properties for a Data Query	76
Chapter 10 / Working with Tables in Data Queries	79
Source Tables	79
Specify Properties for a Source Table	80
Output Tables	81
Staging Tables	82
Output and Staging Table Interactions	83
Create SQL Query Views	85
Chapter 11 / Working with Columns in Data Queries	87
Adding Columns to a Data Query	87
Remove Columns	88
Specify a Column Expression	89
Specify Aggregations	90
Remove All Aggregations	91
Use Group By Variables	92
Use the Auto-Aggregate Functions	92
Use the Pivot By Feature	93
Chapter 12 / Working with Filters in Data Queries	97
About Filtering Data	97
Specify a WHERE Clause	98
Specify a HAVING Clause	99
Best Practices for Filters	100

Chapter 13 / Working with Joins in Data Queries	101
About Joins	101
How Does the Automatic Join Feature Work?	102
Adding a Join	104
Example: Joins with a Junction Table	105
Remove a Join	107
Manage Joins in a Data Query	107
Best Practices for Managing Joins	108
Chapter 14 / Creating LASR Star Schemas	109
What Is a LASR Star Schema?	109
Create a LASR Star Schema	110
How Are Tables Used?	111
Chapter 15 / Working with SAS LASR Analytic Server	113
Understanding Co-Located Data	114
Predefined Libraries	115
Using SAS Data in HDFS Libraries	115
Using SAS LASR Analytic Server Libraries	117
Partition Tables	118
Load a Table (As Is) to SAS LASR Analytic Server	119
Save an In-Memory Table to HDFS	120
Appending In-Memory Tables	121
Monitor Memory Usage	123
Chapter 16 / Importing SAS Information Maps	125
About SAS Information Maps	125
Import a SAS Information Map	126
Limitations and Restrictions	126
Chapter 17 / Supporting Text Analysis	129
Features Overview	129
Load a Stop List	129
Add a Unique Numeric Key to a Table	130

Chapter 18 / Customizing Code	133
Use the Code Tab	133
Preprocess and Postprocess Code	134
Considerations for Manually Editing Code	134
Chapter 19 / Scheduling	137
About Scheduling Data Queries	137
Creating Events	141
Export Data Queries as Jobs	145
Additional Scheduling Resources	145
Chapter 20 / Using the Results Tab	147
About the Results Tab	147
Data Pages	148
Navigate within the Data	148
Find	148
Filter and Sort	149
Export Data	149
Column Headings	150

PART 4 Exploring Data 151

Chapter 21 / Overview of SAS Visual Analytics Explorer	153
What Is SAS Visual Analytics Explorer?	153
The Welcome Window	154
Your First Look at the Explorer	156
Manage Tabs in the Right Pane	157
Chapter 22 / Specifying Preferences for SAS Visual Analytics Explorer	159
Specify Global Preferences	159
Specify Your Preferences for the Explorer	159

Chapter 23 / Managing Explorations	161
What Is an Exploration?	161
Create a New Exploration	161
Save Your Exploration	162
Delete Explorations	162
Chapter 24 / Managing Data	163
Managing Data Properties	165
Add Additional Data Sources to Your Exploration	170
Replace a Data Source in Your Exploration	170
Remove a Data Source from Your Exploration	171
Refresh Your Data Sources	172
Creating Custom Categories	172
Working with Global Parameters	174
Creating Calculated Data Items	177
Creating Aggregated Measures	179
Creating Derived Items	182
Editing a Calculated, Aggregated, or Derived Data Item	187
Delete a Calculated, Aggregated, or Derived Data Item	190
Duplicate a Data Item	190
Defining a Geography Data Item	191
Define Data Items for Text Analytics	193
Chapter 25 / Working with Visualizations	195
Overview of Visualizations	199
Working with Visualizations	208
Display Detailed Data for a Visualization	211
Change the Data Source for a Visualization	211
Control Visualization Data Updates	212
Manage Visualization Comments	212
Managing Visualization Data Roles	213
Work with Filters	215
Ranking Data	215
Managing Visualization Axes	217
Working with Visualization Data Ranges and Color Gradients	218

Working with Data Brushing	221
Working with Automatic Charts	224
Working with Tables	225
Working with Crosstabs	226
Working with Bar Charts	228
Working with Line Charts	231
Working with Scatter Plots	236
Working with Bubble Plots	238
Working with Network Diagrams	242
Working with Sankey Diagrams	247
Working with Histograms	257
Working with Box Plots	259
Working with Heat Maps	262
Working with Geo Maps	264
Working with Treemaps	267
Working with Correlation Matrices	269
Working with Decision Trees	272
Working with Word Clouds	278
Chapter 26 / Working with Filters	287
About Filters in SAS Visual Analytics Explorer	288
Managing Your Filters	289
Working with Basic Filters	292
Working with Advanced Filters	298
Working with Data Source Filters	299
Editing a Filter Expression	301
Chapter 27 / Exporting Content	305
Export an Exploration as a Report	305
Export an Exploration as a PDF	307
Save a Visualization as an Image File	309
Export Data from a Visualization	310
E-mail an Exploration as a Link	310
Chapter 28 / Managing Hierarchies	313
What Is a Hierarchy?	313

Create a New Hierarchy	314
Derive a Hierarchy from a Date, Time, or Datetime Data Item	314
Create a Hierarchy from a Visualization	315
Edit a Hierarchy	315
Delete a Hierarchy	316

Chapter 29 / Performing Data Analysis **317**

Overview of Data Analysis in SAS Visual Analytics Explorer	317
Add a Fit Line to an Existing Visualization	321
Add Forecasting to an Existing Visualization	321
Forecast Measures as a New Visualization	322
Working with Scenario Analysis and Goal Seeking	323

Chapter 30 / Sharing Comments in the Explorer **327**

Sharing Comments in the Explorer	327
--	-----

PART 5 Designing Reports 331

Chapter 31 / Overview of SAS Visual Analytics Designer **333**

About the SAS Visual Analytics Designer	333
Your First Look at the Designer	334
Understanding the Tabs in the Designer	336
About the Canvas in the Designer	339
About Report Themes	340
Specifying Your Preferences for the Designer	340

Chapter 32 / Creating and Working with Reports **343**

About Reports	343
Create a New Report	344
Choose a Report View	346
Choose a Report Layout	346
View Report Properties	348
Change a Report's Name or Title	350

Import a Report or Report Objects	351
Repurpose an Existing Report	352
Open a Report	353
Refresh a Report	354
Delete a Report	355
Chapter 33 / Using Report Objects	357
About Report Objects	358
Insert a Report Object into a Report	362
Show or Hide Report Objects in the Objects Tab	363
Using Tables to Display Results	364
Use the Combine Excluded Rows (or Cells) into “All Other” Properties	369
Using Graphs to Display Results	371
Using Controls to Display Results	374
Using Container Object Types in Reports	381
Using Other Object Types in Reports	383
Using Custom Graphs to Display Results	395
Duplicate a Report Object	398
Working with Alerts for Report Objects	399
Chapter 34 / Working with Data in SAS Visual Analytics Designer	403
Overview of Data Sources and Data Items	405
Working with Data Sources in Reports	405
Working with Hierarchies in a Report	412
Working with Data Items in a Report	414
Working with Geography Data Items	435
Working with Calculated Items in Reports	437
Working with Data Role Assignments	445
Sorting Data in Reports	456
Cancel a Slow-Running Query for a Report Object	461
Chapter 35 / Working with Display Rules for Reports	465
Overview of Display Rules	465
Add Report-Level Display Rules	467
Adding Table-Level Display Rules	468

Adding Graph-Level Display Rules	479
Adding Gauge-Level Display Rules	485
Chapter 36 / Working with Report Filters	489
About Report Filters	489
Using Detail Report Filters	491
Using Post-Aggregate Report Filters	502
Chapter 37 / Working with Interactions	507
Overview of Interactions	507
Creating an Interaction	508
Delete an Interaction	523
Chapter 38 / Working with Report Links	525
Overview of Linking	525
Creating Links	526
Edit a Link	532
Delete a Link	533
Example: How Linking and Interactions Work Together	533
Chapter 39 / Ranking Values in Reports	537
Overview of Ranking in Reports	537
Add a New Rank	538
Delete a Rank	542
Chapter 40 / Working with Parameters in Reports	543
Overview of Parameters	543
Where Parameters Can Be Used in the Designer	545
Create a New Parameter for a Report	546
Edit a Parameter for a Report	547
Delete a Parameter for a Report	547
Chapter 41 / Maintaining Multi-Section Reports	549
Overview of Report Sections and Info Windows	549
Add a Section to a Report	550
Add an Info Window to a Report	551

Reorder Report Sections or Info Windows	551
Rename a Report Section or an Info Window	552
Duplicate a Report Section or an Info Window	552
Move a Report Object to Another Section or Info Window	553
Delete a Report Section or an Info Window	553

Chapter 42 / Sharing Reports with Other Users	555
Overview of Sharing Reports	555
E-mail a Report	556
Printing a Report	558
Exporting Data from Report Objects	560
Add Comments to a Report	565
Distributing Reports	566
Localize Reports	572

PART 6 Creating Custom Graph Objects 575

Chapter 43 / Creating and Using Custom Graph Objects	577
About the Graph Builder	578
About the Graph Template Gallery	579
Build a Custom Graph Object	580
Working with Roles	581
Adding a Graph Element to an Existing Graph Object	584
Incompatible Graph Elements	589
Creating a Data-Driven Lattice	591
Save a Custom Graph Object So It Appears in the Designer	594
Add a Graph Object to the Designer's Objects Tab	594
Specify Your Preferences for the Graph Builder	595
Chapter 44 / Modifying Custom Graph Objects	597
Change a Custom Graph That Has Been Saved	598
Select Components and Elements of a Graph Object	598
Change the Order of Graph Elements in a Cell	600

Remove a Graph Element	601
Working with User-Defined Lattices	601
Working with Properties	606
Sharing Data Roles	610

Chapter 45 / Graph Builder Examples **613**

Example: Data-Driven Lattice	613
Example: User-Defined Lattice (Butterfly Chart)	615
Example: Filled Overlay	619
Example: Vector Plot	621

PART 7 Viewing Reports 625

Chapter 46 / Viewing Reports on a Mobile Device **627**

Open the App for the First Time	627
Add a Server Connection for iPad	628
Add a Server Connection for Android	629

Chapter 47 / Viewing Reports in SAS Visual Analytics Viewer **631**

Overview of Viewing Reports in SAS Visual Analytics Viewer	631
Open a Report in the Viewer	632
View Report Object Information	634
Add Comments to a Report in the Viewer	634
Interacting with Reports in the Viewer	636
Subscribe and Unsubscribe to Alerts	637
About Guest Access in the Viewer	638
Specify Your Preferences for the Viewer	638

PART 8 Appendixes 641

Appendix 1 / Keyboard Shortcuts for SAS Visual Analytics	643
Appendix 2 / Gallery of Report Objects	647
Tables	648
Graphs, Charts, and Plots	650
Controls	669
Other Report Objects	670
Appendix 3 / Editing a Data Expression in Text Mode	677
Appendix 4 / Aggregations for Measures	681
Appendix 5 / Operators for Data Expressions	685
Overview of Operators for Data Expressions	686
Numeric (Simple) Operators	686
Comparison Operators	687
Boolean Operators	689
Numeric (Advanced) Operators	690
Date and Time Operators	692
Aggregated (Simple) Operators	695
Aggregated (Advanced) Operators	696
Periodic Operators	698
Text (Simple) Operators	709
Text (Advanced) Operators	710
Calculating Compound Annual Growth Rate	714
Appendix 6 / Conditions for Filters	717
Appendix 7 / Data Limits	721
Data Limits for SAS Visual Analytics Explorer	721
High-Cardinality Thresholds for Report Objects	726

Appendix 8 / Troubleshooting in SAS Visual Analytics Designer	729
Repairing Reports	729
Displaying Alert Notifications	730
Exporting Data from Report Objects to Microsoft Excel 2007	731
Appendix 9 / Using URL Parameters to View a Report	733
Appendix 10 / Twitter Data Details	737
Glossary	743
Index	751

Using This Book

Audience

The features of SAS Visual Analytics are designed for the following users:

- Persons needing to explore data in support of ad hoc business questions.
- Persons responsible for designing and creating reports for their enterprise.
- Persons responsible for analyzing report data and making decisions based on that data.

Persons responsible for managing SAS servers and managing the SAS Visual Analytics environment should refer to *SAS Visual Analytics: Administration Guide*.

The content of this document is also applicable to other SAS solutions that integrate with and use SAS Visual Analytics features.

Prerequisites

Here are the prerequisites for using SAS Visual Analytics:

- A user ID and password for logging on to SAS Visual Analytics.
- A supported web browser installed on your desktop client.
- A supported version of the Adobe Flash player installed on your desktop client.
- Access to data sources that can be used to obtain data for exploration or reports.

If you have questions about whether you are ready to use SAS Visual Analytics, contact your system administrator.

Documentation Conventions

This book uses short forms of the following phrases where the meaning is clear from context:

Long Form	Short Form	Nickname*
SAS Visual Analytics Administrator	the administrator	Administrator
SAS Visual Analytics Explorer	the explorer	Data Explorer
SAS Visual Analytics Designer	the designer	Report Designer
SAS Visual Analytics Graph Builder	the graph builder	Custom Graph Builder
SAS Visual Analytics Viewer	the viewer	Report Viewer
SAS Visual Data Builder	the data builder	Data Preparation
SAS Visual Statistics**	-	Analytical Model Builder

* Application nicknames are used on the home page, in the banner, and in the right pane.

** This solution is licensed separately. See the [SAS Visual Statistics](#) page on the SAS support site.

What's New

What's New in SAS Visual Analytics 7.1

General Enhancements to SAS Visual Analytics

The enhancements to importing data include:

- This release adds support for importing data from Pivotal HD and Cloudera Impala.
- You can specify a schema when you import data from an ODBC or PostgreSQL data source.
- You can import a Microsoft Excel macro-enabled workbook that has an XLSM filename suffix and a non-XML binary workbook that has an XLSB filename suffix.
- The list of server data sources from which you can import data is simplified. The list includes only the data sources for which SAS/ACCESS software is licensed and that your administrator has granted you the capability to use.
- When you import from Twitter, the doclatitude and doclongitude data items are set to missing values for tweets that do not include geographic coordinates. This enhancement simplifies using tweets with geo maps. (Information about the data structure of imported tweets is provided in an appendix.)

SAS Visual Analytics Home Page

The enhanced feature on the home page is that you can change the number of recent items that are shown. The **Show this number of recent items** preference has a minimum of zero items and a maximum of 25 items. The default setting is 10 items.

SAS Visual Data Builder

New and enhanced features for the data builder include:

- Information on the **Properties** tab for data queries is simplified. New tabs for input tables and output tables enable you to specify information easily.
- It is easier to add tables and subqueries to a data query. A **+** button in the toolbar enables you to navigate through libraries and tables or to use a data query as a subquery.
- Data queries have enhanced support for special characters in column names and table names.
- When you work with SAS LASR Analytic Server or SASHDAT libraries, most tasks allow you to select a **Compress data** check box to conserve memory.

SAS Visual Analytics Explorer

Enhancements for Visualizations

- A new Sankey diagram visualization enables you to perform path analytics. Path analytics displays flows of data from one event (value) to another as a series of paths.
- Forecasting in a line chart visualization enables you to perform goal seeking. With goal seeking, you can specify a target value for the forecast measure, and then determine the values of the underlying factors that would be required to achieve the target value.
- Text analytics in a word cloud visualization enables you to analyze the sentiment of documents in your document collection.
- Text analytics in a word cloud visualization supports the analysis of German language documents.
- Text analytics in a word cloud visualization enables you to explore a selection of specific documents as a new visualization.
- The geo map visualization supports dynamic Esri map providers.
- Correlation values are displayed as positive and negative values rather than as absolute values.

General Enhancements to SAS Visual Analytics Explorer

- You can add multiple data sources to a single exploration.
- On the **Filters** tab, local filters are identified as visualization filters. Global filters are labeled using the name of the data source for the current visualization.

- You can copy a filter from one visualization to another.
- You can create linked filters to subset multiple data sources at once.
- New aggregation types are available for measures.
- New aggregated operators are available for data expressions.
- You can create new types of derived data items for categories.
- Global parameters enable you to specify a variable whose value can be changed globally at any time. A new **Parameters** tab in the right pane enables you to change the values for any global parameters that affect the current visualization.
- Custom categories enable you to specify labels for groups of discrete values or for intervals of continuous numeric values. Custom categories are stored as calculated category data items.
- The Measure Details window displays additional statistics for the measures in your data.
- The tabs in the right pane can display icons instead of labels.

SAS Visual Analytics Designer

Enhanced User Interface for the Designer

- You can distribute reports to other users based on a schedule.
- Printing has been enhanced. New options for printing to PDF are available.
- Report prompts are available.
- You can re-order section prompts in a report.
- You can create post-aggregate filters for measure data items. For example, you can create a filter based on the sum of sales.

- You can add info windows to provide additional information about a report object for a user who is viewing the report on the web or on a mobile device.
- You can specify a preference for receiving alert notifications via e-mail or text message.
- The Show or Hide Objects window has been enhanced with additional graph objects.
- You can edit data source mapping for report prompts or section prompts after they have been created.
- You can localize (or translate) the labels, tooltips, and other descriptive text that are part of your reports.

Enhanced Report Objects

- You can associate parameters with report controls so that report consumers can set the values of the parameters.
- A word cloud report object is available.
- A prompt container report object is available.
- All report objects have **Border and Fill** options on the **Styles** tab.
- Geo map report objects support dynamic Esri map providers.
- The gauge report object is displayed under the **Other** heading on the **Objects** tab. All gauges are represented by one object type. You can use the new **Type** property to specify that you want a bullet, dial, slider, speedometer, or thermometer gauge.
- The bar chart has a new **Grouping scale** property, which enables you to create a 100% stacked bar chart.
- You can use the new **Rotate value label** property to rotate the X axis category labels on graphs by 45 degrees. This property is available for the bar chart, targeted bar chart, waterfall chart, line chart, dual axis bar chart, dual axis line chart, and the dual axis bar-line chart.

- Animation is available for the targeted bar chart, line chart, pie chart, dual axis bar chart, dual axis line chart, and dual axis bar-line chart.
- For list tables, you can turn off or turn on the aggregation labels for totals.
- For crosstabs, you can specify that you want to show missing labels as blanks.
- For tables and graphs, you can define a filter for a measure data item where the filter is applied after the measure data is aggregated to limit the resulting data that report consumers see in the summarized report object.
- For slider controls, you can select the **Set fixed range** property to specify the **Minimum** and **Maximum** values for the slider end points.
- The **Enable selection in the viewers** check box on the **Properties** tab for a stored process is selected by default.
- There is a new **Combine excluded rows into “All Other”** property for list tables and crosstabs. And, there is a new **Combine excluded cells into “All Other”** property for graphs. This property applies to both filters and ranks.
- You can create a slider control with a single value, which can be used with parameters and interactions.
- Schedule charts can have display rules.

Enhanced Data Items

- Parameters are available for calculations, filters, display rules, and ranks.
- New aggregation types are available for measure data items.
- You can specify a custom sort so that category data items in a table or graph can sort to the top or to the bottom.
- In the New Custom Category window, the new **Based on** label identifies the type and the name of the data item that the new custom category is based on.

SAS Visual Analytics Graph Builder

New and enhanced features in SAS Visual Analytics Graph Builder include:

- There are two new plot types:
 - A series plot displays a series of line segments that connect observations of input data. A series plot can use numeric or character data on the X axis.
 - A vector plot shows the change in value of a measure using directed line segments, or vectors, to represent both direction and magnitude at each point.
- The graph builder includes a gallery of predefined graph objects. Using these predefined graph objects as templates, you can build custom graph objects.
- The Target role has been added to bar charts.
- New properties have been added to various graph elements.

SAS Visual Analytics Viewer

New and enhanced features in SAS Visual Analytics Viewer include:

- You can print to PDF.
- You can specify a preference for receiving alert notifications via e-mail or text message.

SAS Visual Analytics Administration

For information about changes and enhancements in administration of SAS Visual Analytics, see the *SAS Visual Analytics: Administration Guide*.

Note: Administrative and deployment documentation for SAS Visual Analytics is available to only licensed customers. To request access, see the instructions on the [SAS Visual Analytics](#) page on the SAS support site.

Accessibility

For information about the accessibility of this product, see [Accessibility Features of SAS Visual Analytics 7.1](#) at support.sas.com.

What Is SAS Visual Analytics?

SAS Visual Analytics is an easy-to-use, web-based product that leverages SAS high-performance analytic technologies. SAS Visual Analytics empowers organizations to explore huge volumes of data very quickly to identify patterns and trends and to identify opportunities for further analysis. SAS Visual Data Builder (the data builder) enables

users to summarize data, join data, and enhance the predictive power of their data. Users can prepare data for exploration and mining quickly and easily. The highly visual, drag-and-drop data interface of SAS Visual Analytics Explorer (the explorer), combined with the speed of the SAS LASR Analytic Server, accelerate analytic computations and enable organizations to derive value from massive amounts of data. This creates an unprecedented ability to solve difficult problems, improve business performance, and mitigate risk rapidly and confidently. SAS Visual Analytics Designer (the designer) enables users to quickly create reports or dashboards, which can be viewed on a mobile device or on the web.

SAS Visual Analytics empowers business users, business analysts, and IT administrators to accomplish tasks from an integrated suite of applications that are accessed from a home page. The central entry point for SAS Visual Analytics enables users to perform a wide variety of tasks such as preparing data sources, exploring data, designing reports, as well as analyzing and interpreting data. Most important, reports can be displayed on a mobile device or in the SAS Visual Analytics Viewer (the viewer).

Benefits of Using SAS Visual Analytics

Using SAS Visual Analytics, users can enhance the analytic power of their data, explore new data sources, investigate them, and create visualizations to uncover relevant patterns. Users can then easily share those visualizations in reports. In traditional reporting, the resulting output is well-defined up-front. That is, you know what you are looking at and what you need to convey. However, data discovery invites you to plumb the data, its characteristics, and its relationships. Then, when useful visualizations are created, you can incorporate those visualizations into reports that are available on a mobile device or in the viewer.

SAS Visual Analytics provides users with the following benefits:

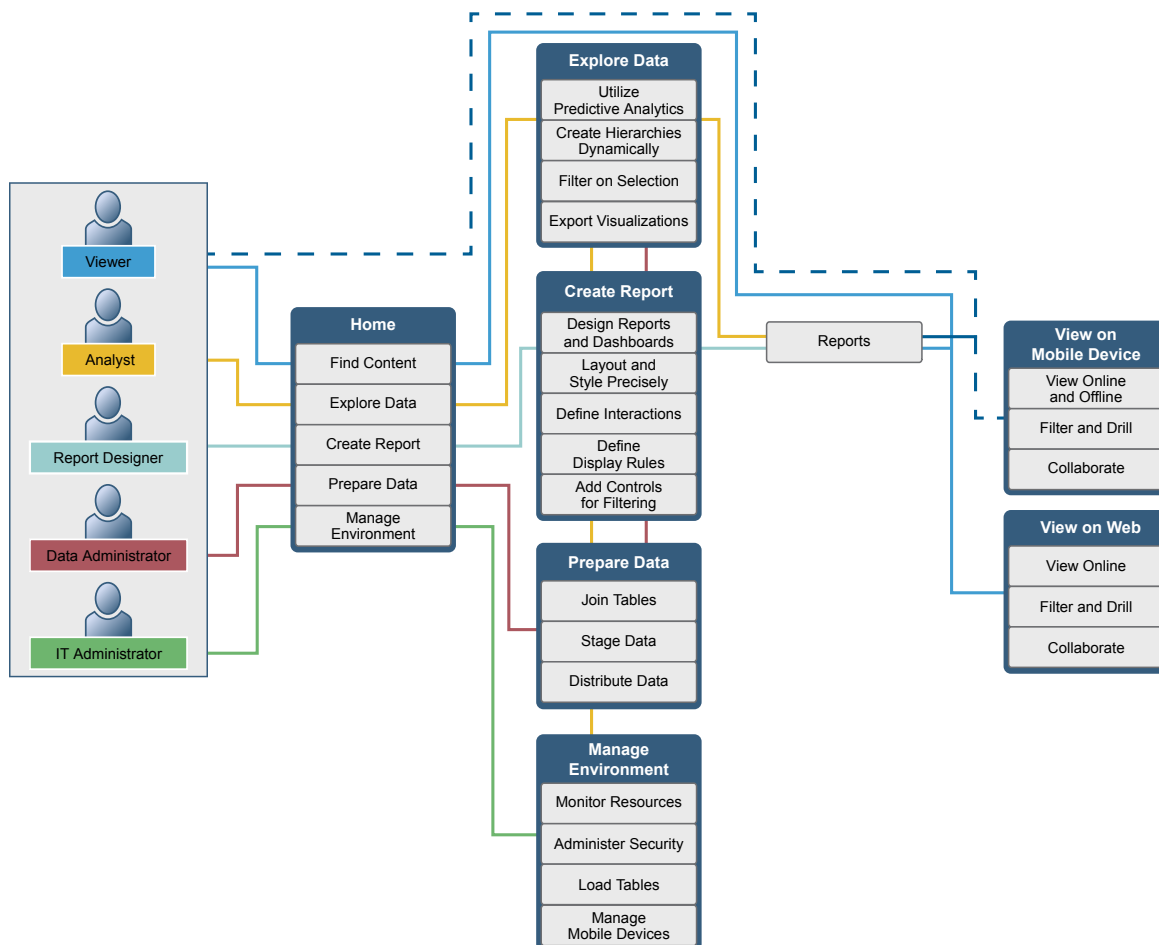

- enables users to apply the power of SAS analytics to massive amounts of data
- empowers users to visually explore data, based on any variety of measures, at amazingly fast speeds

- enables users to share insights with anyone, anywhere, via the web or a mobile device

How Does SAS Visual Analytics Work?

You can use SAS Visual Analytics to explore and view data, interact with and create reports, and display reports on a mobile device or on the web. You can explore your data by using interactive visualizations such as charts, histograms, and tables. Report designers can easily point and click to query central sources of data. You can add filters and design the layout using tables, graphs, and gauges. You can use drag and drop to create a well-formatted report.

The following figure illustrates how the different pieces of SAS Visual Analytics work together. It shows how users interact with the different interfaces.

Figure 1.1 Overview of SAS Visual Analytics

SAS Visual Analytics User Community

The SAS Visual Analytics user community is dedicated to users who are focused on exploratory visualization and analytical techniques, data preparation, dashboard reporting, and mobile BI. You can share your experiences, discuss topics and ideas, seek help from your peers, and share information about upcoming events. You can access the user community at support.sas.com/VAUserCommunity.

For questions requiring immediate technical assistance, contact SAS Technical Support at support.sas.com.

Overview of SAS Visual Analytics Capabilities

Users might have access to different functionality, depending on their assigned roles. Roles are mapped to capabilities. A *capability*, also known as an *application action*, defines the operations a user can perform.

Note: Access to functionality depends on how SAS Visual Analytics is installed at your site. For example, a site might not have the explorer.

SAS Visual Analytics provides five predefined roles—Basic, Report Viewing, Analysis, Data Building, and Administration. A predefined set of capabilities is available for each role. A system administrator can modify these roles and specify the capabilities for each role that meet the guidelines for your company. They can also define new roles. If you have questions about your assigned role, contact your system administrator. For more information about the roles and the capabilities that are available, see the *SAS Visual Analytics: Administration Guide*.

Note: This user's guide discusses tasks that you might be able to perform, depending on your role.

Accessing SAS Visual Analytics

Authenticated Users

SAS Visual Analytics uses the standard sign-in window for SAS applications. To display the sign-in window, use the URL that is supplied by your system administrator. For example, you might enter: `http://host/SASVisualAnalyticsHub`

Click **Sign Out** in the upper right corner of the user interface to sign out of SAS Visual Analytics. When you click **Sign Out**, you are signed out of all SAS web applications. For example, suppose that you have the home page, the explorer, and the designer open, and then you click **Sign Out** when you finish working on a report in the designer. In this case, you have also signed out of the home page and the explorer.

Guest Access

SAS Visual Analytics system administrators can configure support for guest access. Users with guest access can access only the SAS Visual Analytics home page and the viewer. Guest access uses a shared account, so it does not provide individualized features, such as history or alerts. If provided by the system administrator, favorites and preferences are read-only features. If guest access is configured, it is available at a special URL such as `http://host/SASVisualAnalyticsHub/guest.jsp`

Accessing SAS Visual Analytics as a guest is useful if you do not have a metadata identity. This enables you to view reports that are widely available under a generic, shared account. You can also view reports that are available to the public on the Internet.

About the Availability of Menus and Menu Selections in SAS Visual Analytics

All of the following conditions influence whether a SAS Visual Analytics menu or menu selection is available to use:

- your role and the associated capabilities. For example, you must have a Data Building role to prepare data.
- your location in SAS Visual Analytics. For example, some application features are available only if you are designing a report.
- the currently selected report object. For example, ranges are not available for list tables.

- whether the data for a report has been defined. For example, if the data has not been selected, then you cannot create a filter.

For more information about roles and capabilities, see the *SAS Visual Analytics: Administration Guide*.

About Application Themes in SAS Visual Analytics

An application theme is the collection of colors, graphics, and fonts that appear in the application. SAS Visual Analytics provides the following themes: SAS Corporate (default theme), SAS Blue Steel, SAS Dark, SAS High Contrast, and SAS Light. To change the application theme, see [“Specify Global Preferences” on page 27](#).

Note: If you have special requirements for your themes, then contact your system administrator about using SAS Theme Designer for Flex to build custom themes. SAS Theme Designer for Flex is installed with SAS themes. For more information, see *SAS Theme Designer for Flex: User's Guide*.

Report themes are available in the designer. The designer provides the following report themes: SAS Light, SAS Dark, or SAS High Contrast. Your site might also have custom report themes. For more information, see [“About Report Themes” on page 340](#).

Personalize SAS Visual Analytics

SAS Visual Analytics provides accessibility features that you can use to personalize the user interface to make it easier to use.

- **Themes:** You can change the colors, graphics, and fonts that appear in the application. Several themes are available, including the SAS High Contrast theme. For more information, see [“Specify Global Preferences” on page 27](#).

You can also change the themes that are used in reports. For more information, see [“About Report Themes” on page 340](#).

- **Configurable focus indicator:** The interface provides an indicator of the current location of the focus. You can configure the focus indicator to make it easier to see. For more information, see [“Specify Global Preferences” on page 27](#).
- **Color inversion:** You can invert the colors in the interface to improve readability. For more information, see [“Specify Global Preferences” on page 27](#).
- **Zoom support:** You can make your screen content larger and smaller by using the zoom in (Ctrl+plus sign) and zoom out (Ctrl+minus sign). You can reset the zoom state (Ctrl+0) keyboard shortcuts.
- **Landmarks in the user interface:** Landmarks are references to the primary areas of an application’s interface. They provide a quick and easy way for keyboard users to navigate to these areas. Press Ctrl+F6 to open the Landmarks window.
- **Keyboard shortcuts:** You can use keyboard shortcuts as a quick and easy way to perform tasks or navigate the user interface. For more information, see [“Keyboard Shortcuts for SAS Visual Analytics” on page 643](#).

For more information, see [Accessibility Features of SAS Visual Analytics 7.1 at support.sas.com](#).

Your First Look at the SAS Visual Analytics Home Page

After you sign in to SAS Visual Analytics using the standard sign-in window for SAS applications, you will see the home page. The home page enables you to create new content in SAS Visual Analytics. In addition, it enables you to access content that you and others have created.

Here are the features of the home page:

Figure 2.1 The Home Page

- 1 The application bar enables you to return to the home page and to access other parts of SAS Visual Analytics and other SAS applications that integrate with the home page. You can access your recently created or viewed reports, explorations, stored processes, stored process reports, data queries, or other objects in your recent history. Buttons are displayed for each open application.
- 2 The menu bar enables you to access task options, such as creating reports, exploring data, managing your environment or favorites, setting your view, and getting help on using SAS Visual Analytics. You can search all SAS content from the menu bar, and you can sign out of SAS Visual Analytics.

- 3 The **Create Content** area provides icons to let you quickly explore data, create a new report, or prepare data, depending on your role, the associated capabilities, and your SAS software licenses. Other installed SAS applications might add actions to the **Create Content** area.
- 4 The **My Content** area lists any metadata objects that are created by a supported SAS application. For example, explorations, reports, queries, tables, stored processes, or stored process reports that you have opened or created recently are listed. It also lists any content that you have marked as a favorite or as part of a collection. Click **Browse** to explore folders to find a report, exploration, stored process, stored process report, table, or query.

Note: All tables are displayed because the home page does not distinguish between LASR tables and other tables.

- 5 The **Other Content** area displays lists of explorations, reports, stored processes, stored process reports, queries, or tables that someone with the **Visual Analytics: Administration** role has added for you. If someone with the **Visual Analytics: Administration** role has not created any lists, then you will not see the **Other Content** area. If you have the **Visual Analytics: Administration** role, then you will also see a **Manage** link that enables you to manage lists.
- 6 The **Common Actions** section provides an alternate way for you to access features and other installed SAS applications. For more information, see [“Working with the Right Pane on the Home Page” on page 20](#).
- 7 The **Links** section provides links to pages that you have bookmarked. For more information, see [“Working with the Right Pane on the Home Page” on page 20](#).
- 8 The **SAS Resources** section provides links to the introductory video for SAS Visual Analytics, to resources on the SAS website, and to social media. For more information, see [“Working with the Right Pane on the Home Page” on page 20](#).

Note: Guest access does not provide individualized features on the home page, such as history or alerts. By default, a user with guest access has a Basic role and can access only the home page and the viewer. For more information, see [“Guest Access” on page 8](#).

If you have the **Theme Designer for Flex: Administration** role in SAS Management Console, you can access the SAS Theme Designer for Flex from the **More Actions** item on the menu bar or in the **Common Actions** section.

Here is an example of the menu bar with the **More Actions** item.

Display 2.1 Home Page Menu Bar with the More Actions Item

Once you start using the home page, thumbnails enable you to open explorations, reports, stored processes, stored process reports, tables, queries, and folders that you have created or opened. The default view is secure, generic thumbnails that represent the content. An administrator can set a property that specifies the use of thumbnails that are shared and unique to each object. Shared thumbnails are unique for each individual report object, so each report looks different from other reports, and each exploration looks different from other explorations.

Generic thumbnails are distinguished by content type only. All reports look the same, but they appear different from explorations. Here are examples of the generic thumbnails that you might see on the home page:

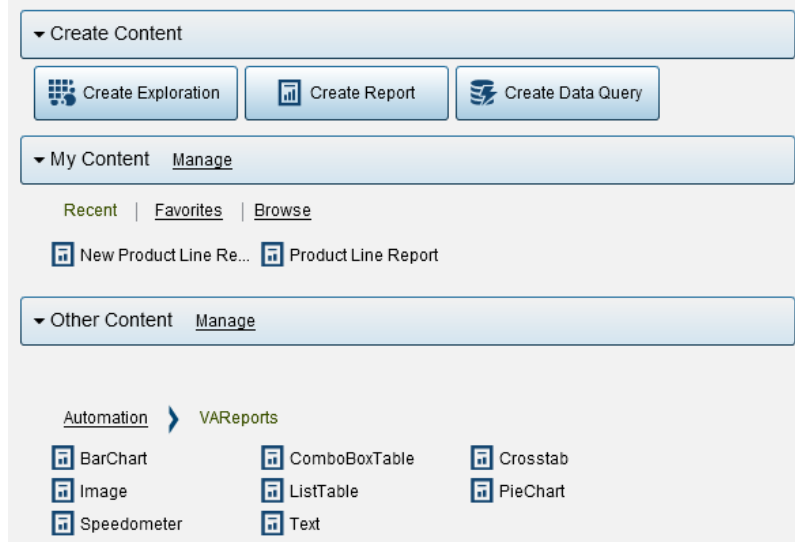

Display 2.2 Generic Thumbnails for an Exploration, a Report, and a Stored Process

You can choose to view the content on the home page as a list. To change your view, click  on the menu bar, and then select **Thumbnail** or **List**. The default is **Thumbnail**.

Here is an example of the list view for the home page:

Display 2.3 List View

For more information about other parts of the SAS Visual Analytics interface, see the following topics:

- [“Your First Look at the Data Builder” on page 65](#)
- [“Your First Look at the Explorer” on page 156](#)
- [“Your First Look at the Designer” on page 334](#)

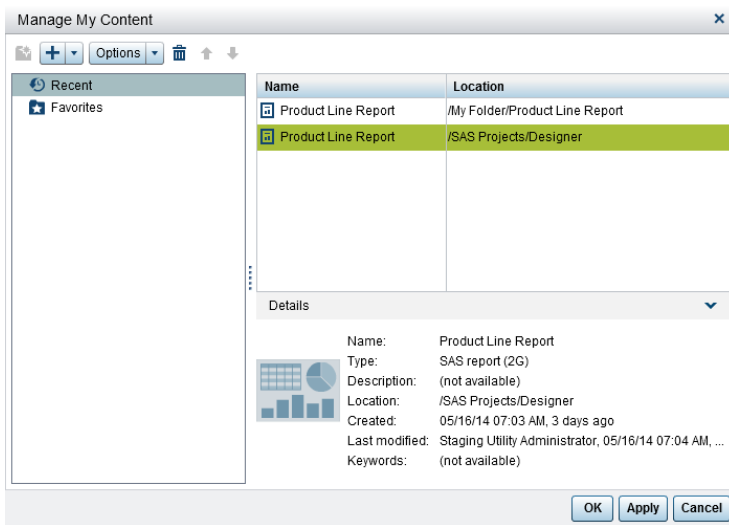

Manage Content on the Home Page

The home page displays recent reports, explorations, stored processes, stored process reports, tables, and queries, as well as favorites and collections under the **My Content** heading on the home page. A *favorite* is a report, an exploration, a stored process, a stored process report, a table, or a query that you can quickly access. A *collection* is a group of favorites. For more information about collections, see [“Manage Collections on the Home Page” on page 18](#).

Note: A user with guest access cannot manage content.

To manage your content, click **Manage** to the right of the **My Content** heading. The Manage My Content window is displayed.

Display 2.4 Manage My Content Window

The following icons are available in the Manage My Content window:

Icon	Description
	Enables you to create a new favorites group for your reports, explorations, stored processes, stored process reports, tables, and queries. Folder names cannot be longer than 60 characters. This icon is available only when Favorites is selected.
	Enables you to add a report, exploration, stored process, stored process report, table, or query to your list of favorites. You can also create or add a collection of favorites.
Options	Enables you to select either Clear Recent History or Clear Favorites .
	Enables you to delete favorite or recent content, one at a time. You can delete multiple items by pressing the Ctrl key. For a collection, you have a choice of permanently deleting the collection or simply removing it from under the My Content heading on the home page.

Icon	Description
↑	Enables you to move favorites content up in the list to change what is displayed under the My Content heading on the home page.
↓	Enables you to move favorite content down in the list to change what is displayed under the My Content heading on the home page.

When you select a report, exploration, stored process, stored process report, table, or query in the Manage My Content window, the details such as the name and location of that item are displayed. Favorite groups are displayed only in the tree on the left side of the Manage My Content window.

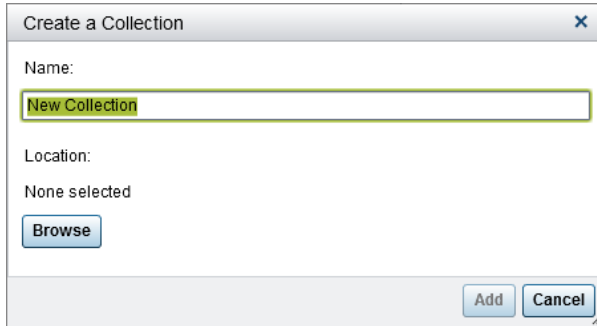

Manage Collections on the Home Page

A collection is a group of favorites. If you have the Create Collections capability, then you can create collections. You can create a collection that points to your favorite reports, explorations, stored processes, stored process reports, tables, queries, folders, and favorite groups.

To create a new collection:

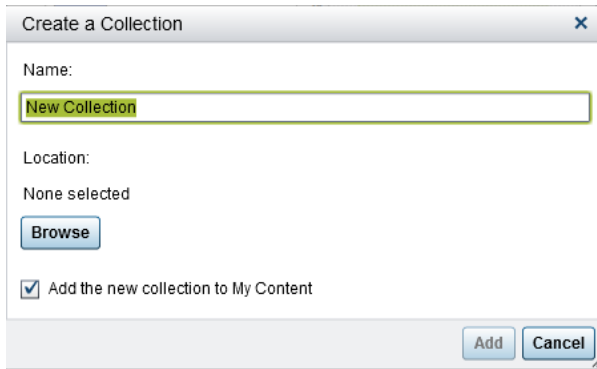

1 Do one of the following:

- On the home page, click **Manage** to the right of the **My Content** heading. The Manage My Content window is displayed.
Click **+** to open the menu, and then select **Create a Collection**. The Create a Collection window is displayed.

The 'Create a Collection' dialog box is shown. It has a title bar with a close button (X). Inside, there is a 'Name:' label followed by a text input field containing 'New Collection'. Below that is a 'Location:' label followed by the text 'None selected' and a 'Browse' button. At the bottom right are 'Add' and 'Cancel' buttons.

- In the object inspector, click **Collections**. Then, select **Create a Collection**. The Create a Collection window is displayed.

The 'Create a Collection' dialog box is shown again, but with an additional checkbox at the bottom left labeled 'Add the new collection to My Content', which is checked. The 'Add' and 'Cancel' buttons are at the bottom right.

- 2 Enter a **Name** for the collection.
- 3 Click **Browse** to select a **Location** for the collection. The Choose a Location window is displayed.

Select an existing folder or create a new one. Click **OK** to return to the Create a Collection window.

Note: When you create a new collection, you can add items to it from within the Manage My Content window only if the collection is a root collection in **My Collections**.

- 4 (Optional) If you opened the Create a Collection window from the object inspector, then you can clear the **Add the new collection to My Content** check box. This means that the new collection is not displayed on the home page next to the **Favorites** link.

- 5 Click **Add**. If you are in the Manage My Content window, then the new collection is displayed on the left.

In the Manage My Content window, you can rename, remove, or permanently delete a collection by right-clicking on the name of the collection and selecting the applicable option.

Working with the Right Pane on the Home Page

About the Right Pane

The **Common Actions**, **Links**, and **SAS Resources** sections are displayed in the right pane on the home page. Someone who has the **Visual Analytics: Administration** role can control which sections are displayed in the right pane. For example, someone with the **Visual Analytics: Administration** role might hide all of the sections, two of the sections, or only one section. For any of the sections that are displayed, you can control which sections are visible in your SAS Visual Analytics session. You can also control the order in which the items in the sections are displayed.

The following sections can be displayed in the right pane:

Common Actions

Provides an alternate way for you to access features, such as designing reports, exploring data, managing your environment or content. For example, you can click **Build Custom Graph** to access the graph builder. If you have a Data Building role, then a **Prepare Data** link is displayed. You might also see links to other SAS products, such as SAS Theme Designer for Flex, depending on your role and the SAS licenses that your site has.

Links

Provides links to pages that you have bookmarked. Someone with the **Visual Analytics: Administration** role can also provide shared links for all users. For information about links, see [“Manage Links in the Right Pane” on page 22](#).

SAS Resources

Provides links to resources on the SAS website, including the introductory video for SAS Visual Analytics, the SAS Visual Analytics User Community, and to social media.

Hide Content in the Right Pane

To hide content in the right pane, position your mouse pointer over the section title (**Common Actions**, **Links**, or **SAS Resources**), and click .

To hide or reorder content in a specific section, position your mouse pointer over the section name, and click .

Note: You cannot hide or reorder the first three **Common Actions** (which are **Open**, **Manage My Content**, and **Edit Preferences**).

To hide content in the right pane using the menu bar:

- 1 Click  beside  on the menu bar.
- 2 Clear the selection for one or more of the following sections:
 - **Common Actions**
 - **Links**
 - **SAS Resources**

The selected section is hidden in the right pane.

Note: If someone with the **Visual Analytics: Administration** role has hidden any of the sections in the right pane, then the sections are not displayed in the menu.

Show Content in the Right Pane

To show content in the right pane:

- 1 Click  beside  on the menu bar.

2 Select one or more of the following sections:

- **Common Actions**
- **Links**
- **SAS Resources**

The selected section is displayed in the right pane.

To show or reorder content in a specific section, position your mouse pointer over the section name, and click .

Note: You cannot hide or reorder the first three **Common Actions** (which are **Open**, **Manage My Content**, and **Edit Preferences**).

If you have the Administer Hub capability, then you will also see a **Manage Shared View of Right Pane** menu item when you click ▼ beside  on the menu bar. When you select this menu item, the Manage Shared View of the Right Pane window is displayed. Administrators can use this window to hide sections, restore sections, and add links in the right pane. Links that are added using the Manage Shared View of the Right Pane window are shared links that anyone can see.

Manage Links in the Right Pane

Note: All URLs must start with `http://` or `https://`.

You can add, edit, and delete links in the **Links** section that is displayed in the right pane.

To add new links, position your mouse pointer over the **Links** section heading in the right pane to activate the , which opens the Add Link window. Links that are added using the Add Link window are private and visible only to the user who created them. Click  to open the Manage Links window, where you can add, delete, re-order, and hide links. You cannot delete shared links that were added using the Manage Shared View of the Right Pane window.

If you have an Administration role, then you can click ▼ beside  on the menu bar, and select **Manage Shared View of Right Pane**. The Manage Shared View of the Right

Pane window is displayed. You can use this window to add links to the right pane that are shared with other users.

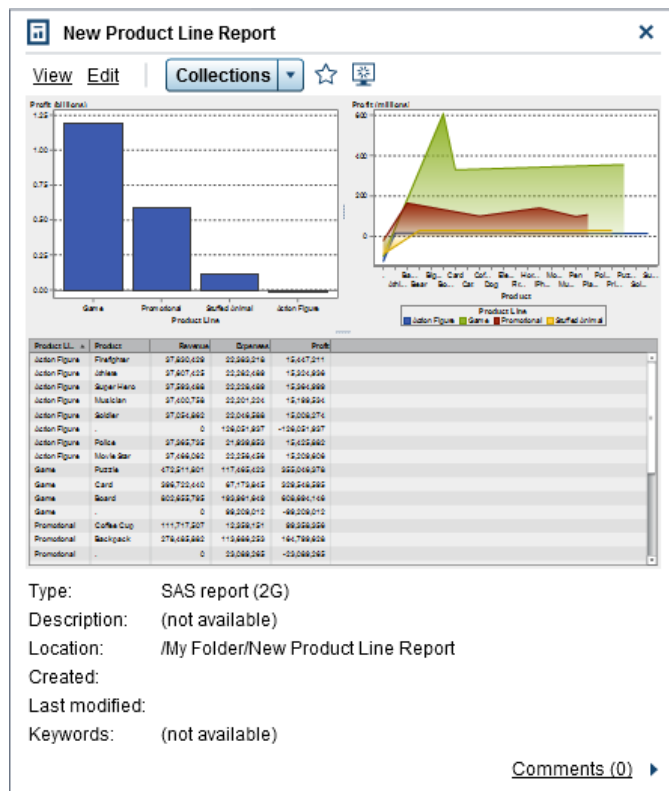

Discover Details Using the Object Inspector on the Home Page

The home page provides an object inspector that enables you to quickly find more information about an object when you click it. You can see a description of the report, exploration, stored process, stored process report, table, query, folder, or collection; the location of the selected object; the author; when the object was created and modified; and a list of keywords.

Your role and capabilities determine the availability of actions on the toolbar (such as viewing, editing, or opening) in the object inspector. For more information about roles and capabilities, see the *SAS Visual Analytics: Administration Guide*.

Here is an example of what you might see in the object inspector for a report that has been viewed:

Display 2.5 The Object Inspector on the Home Page

You can use the toolbar in the object inspector to do one or more of the following tasks (which are available depending on your role and capabilities):

- **View** a report, which opens the report in SAS Visual Analytics Viewer (the viewer).
- **Edit** a report, which opens the report in SAS Visual Analytics Designer (the designer) so that you can edit or change the objects in the report.
- **Open** an exploration, which displays SAS Visual Analytics Explorer (the explorer). The **Open** link is also available for stored processes, stored process reports, queries, and folders.
- **Create Report** for a table, which displays the designer.

- **Explore Data** for a table, which displays the explorer.
- Click **Collections** to select an existing collection or to create a new collection. For more information, see [“Manage Collections on the Home Page” on page 18](#).
- Click ☆ to add the object to your list of favorites. When the star icon is yellow, it indicates that the object is in your list of favorites. Click ★ to remove the object from your list of favorites.
- Click  to set the object as the initial screen when you start SAS Visual Analytics. When the icon is blue, it indicates that the object is set as your initial screen. Click  to remove this initial screen setting.

In the object inspector, you can also do the following:

- Click the user name beside the **Created** or **Last modified** labels to search for all of the SAS reports, queries, tables, stored processes, and stored process reports that have been created or modified by that user.
- Click **Comments** to add or view comments. Any user who has the Add or View Comments capability can add comments to any report, exploration, stored process, stored process report, table, or query. They can view existing comments about any report, exploration, stored process, stored process report, table, or query using the **Comments** link in the lower right of the object inspector. You cannot comment on folders, favorite groups, or collections. For more information, see [“Add Comments to Objects on the Home Page” on page 25](#).

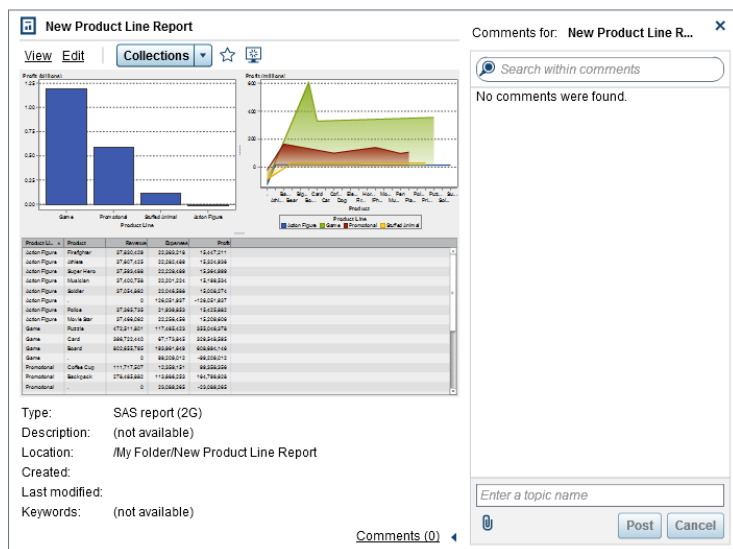

Add Comments to Objects on the Home Page

If you have the Add or View Comments capability, then you can use the object inspector on the home page to add (or view) comments to objects on the home page. You can add comments to reports, explorations, stored processes, stored process reports, tables, and queries. You can also respond to existing comments or edit your own comments. You cannot comment on folders, favorite groups, or collections. You cannot see comments that were added to visualizations using the explorer.

To add a comment:

- 1 Click on a report, exploration, stored process, stored process report, table, or query to open the object inspector.
- 2 Click **Comments** in the lower right corner to expand the object inspector.

Display 2.6 Comments in the Object Inspector

- 3 Enter a topic name and a comment.
- 4 Click **Post** to add your comment. The **Comments** link in the object inspector updates to show that there is a comment.
- 5 (Optional) Click to attach a file or an image to your comment.

To respond to an existing comment:

- 1 Click on a report, exploration, stored process, stored process report, table, or query to open the object inspector.
- 2 Click **Comments** in the lower right corner to expand the object inspector.
- 3 Select an existing comment. Then, enter a reply.

- 4 (Optional) Click  to attach a file or image to your reply.
- 5 Click **Post** to add your comment. The **Comments** link in the object inspector updates to show that there is a comment.

Note: To edit another user's comments or to delete comments, you must belong to the predefined role **Comments:Administrator**. This role includes the capabilities of editing or deleting comments.

To search for a comment:

- 1 Enter the word or phrase that you want to search for in the search field. Press Enter.
- 2 (Optional) To clear your search, click . Then, you can enter another word or phrase in the search field.

Specifying Your Preferences

All of your preferences persist between sessions. Preferences are not available for a user with guest access.

Specify Global Preferences

You can specify global preferences that are applied to all SAS web applications that are displayed with the Adobe Flash player. These preferences are set by each user.

To specify global preferences:

- 1 Click either  or **Edit Preferences** on the home page. The Preferences window is displayed.

Note: If you are in the data builder, the explorer, the designer, or the viewer, then select **File ► Preferences** to open the Preferences window.

- 2 Click **Global Preferences** in the left pane.
- 3 Specify your preferences.

- Select a **User locale** to specify your language and geographic region.

Note: If you change the **User locale** preference, then you must sign out and sign in to SAS Visual Analytics for the change to take effect.

TIP If you receive distributed reports, it is recommended that you set the **User locale** preference. The report distribution feature does not have access to the browser locale, so it depends on the locale specified for the **User locale**. For more information, see [“Distributing Reports” on page 566](#).

- Select a **Theme** to change the color scheme and other visual settings for all of your SAS web applications.
- Select **Invert application colors** to invert all of the colors in your SAS web applications.
- Select **Override settings for focus indicator** to change the color, thickness, and opacity of the focus in your SAS web applications.
- Click **Reset** to show all warning and confirmation messages.

- 4 Click **OK** to apply your changes.

Specify the SAS Visual Analytics General Preferences

Using the SAS Visual Analytics home page, you can specify your general preferences for SAS Visual Analytics. Preferences are saved on a per-user basis.

To specify your general preferences:

- 1 Click either  or **Edit Preferences** to open the Preferences window.
- 2 Click **General** in the left pane.
- 3 Specify a value for **Show this number of recent items**. There is a minimum of zero and a maximum of 25. The default setting is 10 items.

Click **Clear History** to reset your history.

- 4 Click **OK** to apply your changes.

Specify Your Preferences for the Home Page

To specify preferences that are specific to the home page:

- 1 Click either  or **Edit Preferences** to open the Preferences window.
- 2 Click **Home** in the left pane.
- 3 Select an option from the **Initial screen** drop-down list. The available options depend on your role and capabilities.

TIP If you select **A specific object**, then you can use the Choose an Item window to choose one content type (for example, SAS reports (2G), visual explorations, or a SAS Visual Statistics project) for your initial screen. (SAS Visual Statistics is licensed separately.) If you select a report in the Choose an Item window, then you might be able to click ▼ beside the **OK** button to select either **View (Visual Analytics Viewer)** or **Edit (Visual Analytics Designer)**. The available content types and the options for opening reports depend on the SAS products that your site has licensed and how they are configured.

- 4 Specify **Order the actions associated with a content type** preferences. Select a **Content type**, and then use the arrow keys to specify the **Order of actions**. This preference also affects the order of actions in the object inspector's toolbar.

This preference also determines which application opens when you click on a link to a report in an e-mail message. For example, suppose that you specify **Edit - SAS Visual Analytics Designer** as the first item in the list of actions for the **SAS report (2G)** content type. Then, you receive an e-mail message with a link to a report. When you click the link to the report, it is displayed in the designer.

- 5 Click **OK** to apply your changes.

Specify Other Preferences

You can specify other preferences in SAS Visual Analytics:

- [“Specify Your Preferences for the Data Builder” on page 69](#)
- [“Specify Your Preferences for the Explorer” on page 159](#)
- [Specify Your Preferences for the Designer on page 340](#)
- [“Specify Your Preferences for the Graph Builder” on page 595](#)
- [“Specify Your Preferences for the Viewer” on page 638](#)

3

Searching from the SAS Visual Analytics Home Page

<i>About Searching from the Home Page</i>	31
<i>Refining Your Search Results</i>	34

About Searching from the Home Page

You can search all reports, explorations, stored processes, stored process reports, tables, and queries that are on the metadata server from the menu bar on the home page. The list of items that you can search for depends on the SAS products that your site has licensed.

Note: There can be a delay between the time that an object (for example, a report or an exploration) is created or changed and when the search is updated.

The following fields in metadata are searched:

- Comment Title
- Comment Description
- Created
- Description
- Keywords
- Last Modified

- Title

The search field on the menu bar supports the following types of searches:

- single word
- multiple word
- in-word wildcards

Note: A wildcard search has a limit of 200 words.

Use the asterisk (*) to represent possible characters in a particular position in a word to generalize the word or to make it easier to find in a search. For example, if you specify *"cat*"*, then the search matches any word with the prefix *cat*, such as *cats*, *category*, *catfish*, and so on.

- spaces in strings that use quotation marks indicate that the words are considered together as a phrase for the search. For example, suppose that you search for *"Sample Report"*. The search matches *Sample Report 1* and *A Sample Report*, but not *Sample Values Report* or *Sample-Report*.

- the **AND** operator

For example, if you specify *"A AND B"*, then only documents that contain both A and B are returned.

- plus (+) and minus (-) syntax

The plus (+) sign and minus (-) sign are prefix operators. This means that the operator precedes the search term that is required or excluded, rather than following it. For example:

- Specifying *2012 2013 2014* matches documents that contain any of the three terms.
- Specifying *+2012 +2013 +2014* matches only documents that contain all three terms.
- Specifying *2012 2013 -2014* matches documents that contain 2012 or 2013, but only if they do not contain 2014.

Note: Single- and multiple-word searches that are plain text have a wildcard appended to them. For example, if you search for the word *sample*, then it is converted to *sample**. This means that you get different results than if you entered “*sample*”, *+sample*, or **sample**.

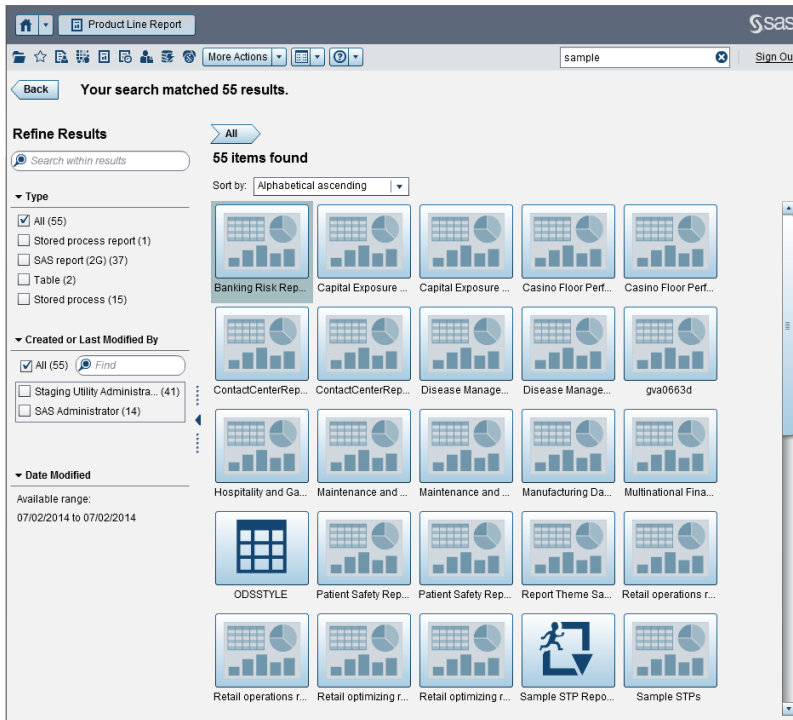

The search is not case sensitive.

Up to 5000 items can be returned in a single search. If your search results exceed 5000 items, then the first 5000 items appear, and a message is displayed at the top of the Search Results window. The message tells you how many results matched your search and how many have been displayed. Narrowing your search using the search field enables the relevant search results to be displayed. When you submit a new search that returns fewer than 5000 items, you can see all the search results.

Search results on the home page are not ranked. In the workspace, you can use the **Sort by** drop-down list to specify that you want the list of items to sort by **Alphabetical ascending**, **Alphabetical descending**, **Date ascending**, or **Date descending**. The default is **Alphabetical ascending**.

Suppose that you search for the word *sample*. All words that contain *sample* at the beginning are displayed in the workspace. (For example, a word that starts with *samples* is displayed.) Here is an example of the search results:

Display 3.1 Search Results on the Home Page

Refining Your Search Results

You can refine your search results using your original search on the metadata server. After you enter your original search using the menu bar on the home page, the search results are displayed in the workspace. Note that when you refine your search results, the initial 5000 item subset is not affected.

The refine search feature is dependent on your locale. The search is not case sensitive.

You can refine the search results displayed in the workspace using the **Search within results** field in the left pane. When you enter a term or terms, you can use quotation

marks and spaces when you are searching within your results. Only the items that match your refined search appear in your workspace. Each search term that you enter must appear at least once in the object name, the description, the author's name, or keywords in the metadata.

You can also refine your search results by selecting (or clearing) check boxes in the left pane. Note that the totals in the parentheses in any pane are dependent on what has been selected in the other two panes.

The following panes are available:

- The **Type** pane shows the available object types. In SAS Visual Analytics, you can search for **Stored process report**, **SAS report (2G)**, **Table**, **Stored process**, **Visual data query**, or **Visual exploration**. Depending on the SAS products that you have licensed at your site, other SAS object types might appear in the **Type** pane. The default is **All** object types.

The available types are determined by the capabilities that your system administrator has assigned. For example, you might see only the **All**, **SAS report (2G)**, **Table**, and **Stored process** check boxes in the **Type** pane.

If you select all of the check boxes for the individual types, then the check boxes clear, and the **All** check box is selected automatically. If you clear the check boxes for all of the types, then the **All** check box is selected automatically.

Note: If your role permits you to see only one type, then you will not see the **Type** pane.

- The **Created or Last Modified By** pane enables you to search for a specific user or to select one or more users by name.

The number in parentheses beside the user's name identifies the number of objects that the user has created or modified, taking into account the filters that have been selected in the other panes.

If you select all of the check boxes for the users in the list, then the check boxes clear, and the **All** check box is selected automatically. If you clear the check boxes for all of the users, then the **All** check box is selected automatically.

- The **Date Modified** pane lists the dates that the objects were last modified. You can refine the search to a specific date range by specifying a **From** date, a **To** date, or

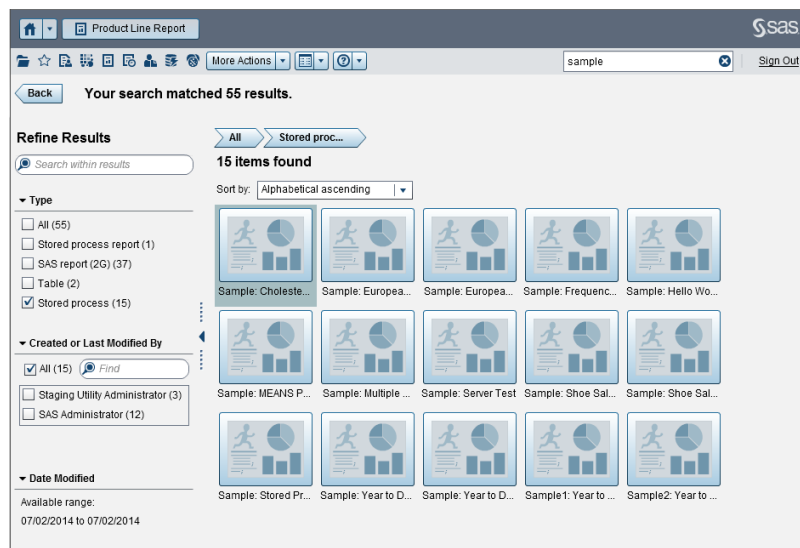

both. If the initial results set represents only a single day, then the **From** and **To** fields are hidden to conserve visual space.

The dates are time zone dependent. If your company has offices in multiple time zones, then the date modified time stamp on the object reflects the time at which it was saved using the current user's time zone. For example, if a report was modified by a user on January 3 at 2:00 a.m. in New York, another user in California sees that it was modified on January 2 at 11:00 p.m.

At the top of the workspace, you can see the breadcrumbs for the selections that you have made to refine your search. Breadcrumbs change as you modify the selections in the **Type**, **Created or Last Modified By**, and **Date Modified** panes. The breadcrumbs also show any search strings that you entered in the **Search within results** field.

Suppose that you search for the word *sample*. Then, you refine the search results by selecting **Stored process** for **Type**. All stored processes that contain the word *sample* are displayed in the workspace. Here is an example of the refined search results:

Display 3.2 Refined Search Results on the Home Page

Overview of Data Flow in SAS Visual Analytics

<i>Data Flow in SAS Visual Analytics</i>	39
<i>Self-Service Data Access</i>	40
<i>Managed Data Access</i>	41
<i>After a SAS LASR Analytic Server Restart</i>	41
<i>Requirements for Importing Data</i>	42

Data Flow in SAS Visual Analytics

All reporting and exploration of data in SAS Visual Analytics is performed against data that is in memory on a SAS LASR Analytic Server. In addition to the in-memory tables, you can use your own data with self-service data access if you have been granted the Import and Load Data capability.

If your site has data that must be prepared before it is ready for analysis, then the data builder can perform basic data preparation and load data to memory on a SAS LASR Analytic Server. The following list summarizes the data builder features that enable the flow of data from source systems into SAS Visual Analytics:

- Joining tables, such as fact and dimension tables.
- Working with SAS/ACCESS engines to read and write data with operational systems.

- Scheduling data queries for basic data flow automation.

SAS Visual Analytics Administrator provides features that are most commonly associated with [managed data access](#). The administrator enables control of whether tables are loaded to memory and secures access to in-memory tables.

Self-Service Data Access

SAS Visual Analytics offers a variety of ways to bring your data into the SAS Visual Analytics environment, which enables you to work with your data quickly. The following list summarizes the different ways:

Import data from a file

When you are creating data queries, explorations, or reports, you can import data from a Microsoft Excel spreadsheet, a delimited text file (CSV), or a SAS data set. After you import the data, it is ready to use.

Autoload

Instead of using your browser to import a file, you can transfer the file to a directory that acts as a drop box. A scheduled job imports the file from the directory. The process requires some setup before autoload can be used.

Import SAS data set on a server

You can direct the SAS Application Server to import a SAS data set that is already on the server. The import process is optimized and you can import large files when a SAS data set is already on the server.

Import a database table

After providing connection information, you can transfer a table from a database to a SAS LASR Analytic Server. Afterward, you can use the in-memory table as is for reports and explorations, or you can prepare it for analysis with the data builder.

Note: Your site must license and configure the related SAS/ACCESS engine to use this feature.

Import tweets from Twitter

After authenticating with Twitter and providing search criteria, you can import tweets into memory on a SAS LASR Analytic Server. You can then use the unstructured data with the explorer. A typical exploration of Twitter data can perform text analysis to look for patterns and trends in the tweets.

TIP The self-service import feature keeps track of your most recently used values for each import type to simplify repeated import actions. If you clear your browser's cache, then your most recently used values are forgotten.

Managed Data Access

Many sites prepare data sources to be used by business analysts. This information can come from data sources such as data warehouses and transactional systems. A data administrator enables access by registering the tables and libraries in SAS metadata. A data administrator might use additional SAS products to provide advanced data governance, data quality, and data management support.

SAS/ACCESS engines can be used to access data in operational systems, transactional systems, or data warehouses. SAS offers a variety of SAS/ACCESS engines for accessing data from operational systems. These engines must be licensed and configured at your site to connect to the data. After a connection is set up, you can use SAS Management Console and SAS Visual Analytics Administrator for registering the libraries and tables from these data sources.

After a SAS LASR Analytic Server Restart

When an administrator restarts a SAS LASR Analytic Server, all the tables on the server are removed from memory as the server stops. Tables that you import with the self-service features remain in memory so long as the server is running. However,

administrators cannot interactively reload imported tables for you. If you want to use a table that you imported after a server restart, then you must repeat the import action.

TIP Your administrator can configure a server to automatically reload tables that were imported from local files after a restart.

Requirements for Importing Data

Importing data requires starting a SAS session on the SAS Application Server. Typically, this requirement is met by each user who has a host account.

For deployments on Microsoft Windows, the host account must have the **Log on as a batch job** Windows privilege. For deployments on Linux that use a distributed SAS LASR Analytic Server, the host account must be configured for passwordless SSH. For more information about working with the server, see *SAS LASR Analytic Server: Reference Guide*.

5

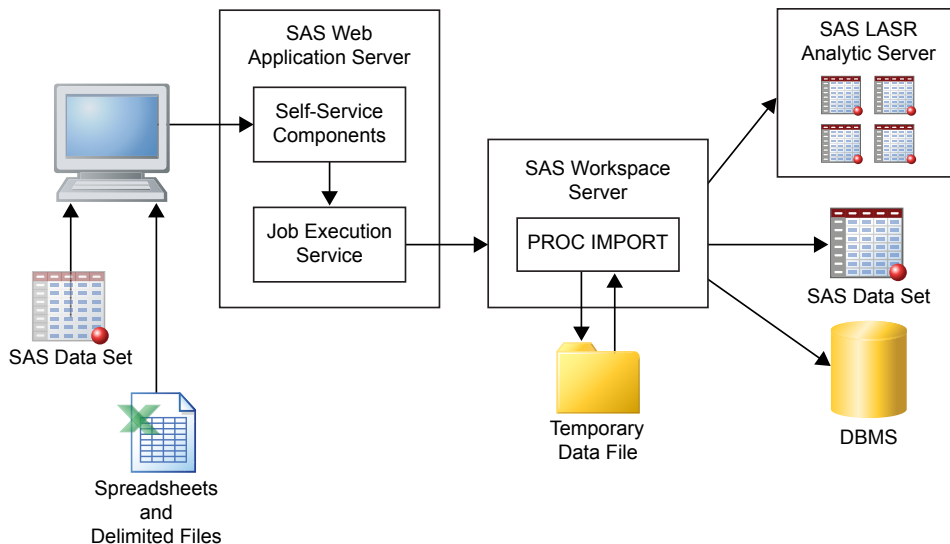

Importing Local Data Files

<i>Import a Local Data File</i>	43
<i>Limitations and Restrictions for Importing Local Data Files</i>	46
Large Data Files	46
Importing Data from Spreadsheets	47
Table Names, Column Names, and Special Characters	47
<i>Usage Notes</i>	48

Import a Local Data File

When you import a local data file, you take a file such as a spreadsheet, delimited text file, or SAS data set from your desktop, and then the file is transferred as data to SAS LASR Analytic Server. This enables you to access data without needing assistance from an administrator or information technology group.

The following figure shows how a file is accessed from your PC, transferred to the SAS Workspace Server, and then stored in an output table.

Note: When you import a SAS data set, it is not processed with PROC IMPORT. SAS data sets are transferred to output with a DATA step.

Note: Only the data builder can output a SAS data set or a DBMS table. The explorer and designer can import data to SAS LASR Analytic Server only.

You can import data files that are available from the file systems on your PC. This includes local file systems such as `C:\` on Windows machines and paths such as `/home/$USER` on UNIX machines. Network file systems and shared folders are also included, such as UNC paths like `\\nas\spreadsheets`.

To import data from a Microsoft Excel spreadsheet, delimited text file, or SAS data set:

- 1 Click the link for the type of data file that you want to import, and then select the file.
- 2 Specify the following input file parameters:

Note: For SAS data sets, there are no parameters to specify.

Spreadsheet options

The following options are available when you import a Microsoft Excel spreadsheet:

Select worksheet

Select **All** or the check boxes for the worksheets to import.

Begin import on row

The default is to import data from the first row of the spreadsheet. If the data begins on a different row, make changes.

Includes column names

Select this check box when the row on which to begin the import has the column names.

Text file options

The following options are available when you import a delimited text file:

Delimiter

Select the delimiter that is used in the text file to import. You can specify a single character to use as a user-defined delimiter.

First row contains column names

Select this check box when the text file includes the column names on the first row of the file.

Data records begin on row

The default is to import data records from the first row. If you select **First row contains column names**, then this value increments to 2.

Number of rows to scan

The default is to read up to the first 500 rows from the file to determine the data type and length for each column. Smaller values cause the import to complete quickly, but you risk the chance of determining too short a value for character columns. Larger values reduce the chance of truncating character columns, but they increase processing time.

Encoding

Select the encoding of the text file. If you are importing UTF-8 or UTF-16 data, then make sure that the SAS Application Server is a Unicode server or that all of the file contents can be successfully transcoded to the encoding of the SAS Application Server.

- 3 (Optional) Click **Preview** to view the data. Preview displays up to 500 rows from the file.

TIP Previewing the data can help you determine whether you specified the correct encoding.

- 4 (Optional) In the **Output Table** section, enter the name for the table and a description. The description is limited to 256 characters. Review the library and location settings by clicking **Advanced** and make changes if necessary.

You do not have access to the **Advanced** section if you are using the explorer or designer and do not have the Build Data capability. Instead, you can import the data to a general-purpose area or select **Store the table in a private location** to prevent other users from accessing the data.

- 5 Click **OK**.

Limitations and Restrictions for Importing Local Data Files

Large Data Files

When you import data files (spreadsheets, SAS data sets, or delimited text files) from your machine, you are limited to files that are 4 GB or less. This constraint is set by the web browser. Because importing large files through the web browser impacts overall performance and because you can experience long wait times, alternate approaches are recommended for importing large files.

Note: Administrators can specify a limit that is less than 4 GB.

As an alternative to importing data files through your web browser, you can transfer files to the machine for the SAS server and use autoloader. You can import data from files that are larger than 4 GB. In general, FTP and network file systems transfer data files faster than web browsers.

Importing Data from Spreadsheets

The following list identifies considerations for importing data from spreadsheets:

- You can import Excel Workbook (XLSX, XLSM, and XLSB) files and Excel 97-2003 Workbook (XLS) files. You cannot import XLST or other Excel file types.

Note: To import XLSB files, the machine for the workspace server must have Microsoft Data Access Components (MDAC) and Microsoft JET (Joint Engine Technology) or Microsoft ACE (for 2007 and later) provider software installed.

TIP If your spreadsheet is from an unsupported Excel file type, then try saving it as an XLSX file and then importing it.

- When you import a spreadsheet (from your PC) that has multiple worksheets, by default, all of the worksheets are imported. A table is created for each worksheet. You can clear the check boxes for the worksheets that you do not want to import.
- Importing pivot tables is not supported.

Table Names, Column Names, and Special Characters

In general, you can import files that use blanks and special characters in the filenames and column names. The following list identifies how table names are handled:

- For text files (such as CSV files), the table name is initially set from the filename.
- When you import a spreadsheet, the table names are handled as follows:
 - If the spreadsheet contains a single worksheet, then the table name is initially set from the filename.
 - If the spreadsheet contains multiple worksheets, then each table name is initially set as a combination of the filename, an underscore, and the name of the worksheet.

- After the initial table name is determined, any unsupported special character in the name is replaced with an underscore. Unsupported special characters include / \ * ? " < > | : - and period (.).
- Table names are shortened to 32 characters because that is the table name length that is supported by SAS.

For column names, most special characters can be used, including spaces. Any unsupported special character in the name is replaced with an underscore. Unsupported special characters include / \ * ? " < > | : - and period (.).

By default, column names are read from the first row of the text file. If you clear the **Includes column names** check box, then the column names are generated for you as follows:

- **Spreadsheets**Column names are assigned A, B, C, and so on.
- **Text files**Column names are assigned VAR1, VAR2, and so on.

The following table identifies how column names that begin with a number, such as 2014sales, or use numbers only, such as 2014, interact with the **Includes column names** check box:

Source File Column Name	Imported Column Name
2014sales	_2014sales for Microsoft Excel files and text files.
2014	_2014 for XLSX, XLSM, XLSB, and text files. For Excel 97-2003 Workbook (XLS) files, a letter such as A, B, C, and so on, is substituted for the column name, depending on the column position in the file.

Usage Notes

Review the following notes if you have trouble importing data:

- Before you click **OK** to import the data, click **Preview**. Preview shows an accurate representation of the column names and data values that will be available after the import.
- If SAS is configured as a Unicode server at your site, then you have the most flexibility for importing data. Specifically, SAS as a Unicode server helps with using column names or filenames (that are used as table names) that have double-byte characters.
- When you import a delimited text file (CSV file), you must specify the encoding of the text file. In some cases, the import reports success, even though the data might be corrupted. It is important to verify the imported data.
- If you import a SAS data set that uses user-defined formats, then you must ensure that the custom format catalog is available to the SAS Application Server. For more information, see [“Work with User-Defined Formats” on page 67](#).
- If importing large data files at the same time is common for your deployment, then you should be aware that the large data files are written to temporary disk space on the server. In extreme cases, this can cause temporary disk space to become full. Systems that run out of disk space can become unresponsive and difficult to troubleshoot.
- If you import data from text files and plan to append the data, then you must verify that the column data types and lengths match the table that you want to append to.

Importing Data from Servers

<i>Import a SAS Data Set on a Server</i>	52
<i>Import a Database Table</i>	53
<i>Database Connection Tips</i>	55
Common Fields	55
Additional Options for Importing Hadoop Tables	56
Additional Options for Importing PostgreSQL Tables	56
Additional Options for Importing Oracle Tables	56
Additional Options for Importing Teradata Tables	57
<i>Import Tweets from Twitter</i>	57

Import a SAS Data Set on a Server

The following figure depicts how your PC can be used to specify a SAS data set on the SAS Application Server machine (represented as the SAS Workspace Server), and then load the data set into memory on a SAS LASR Analytic Server.

You can direct the SAS Workspace Server to access the file systems on the server. For example, if you have a large data set, you can use FTP or another method to copy it to a directory on the server, and then use the server to import it.

To import a SAS data set that is accessible from your SAS Application Server:

- 1 Select **SAS Data Set** from the list of **Server** data types, navigate to the SAS data set, and click **OK**.

Note: Remember that the data files and directories are on the remote machine, not on your PC.

- 2 (Optional) In the **LASR Table** section, enter the name for the table and a description. The description is limited to 256 characters. Review the library and location settings by clicking **Advanced** and make changes if necessary.

You do not have access to the **Advanced** section if you are using the explorer or designer and do not have the Build Data capability. Instead, you can import the data to a general-purpose area or select **Store the table in a private location** to prevent other users from accessing the data.

- 3 Click **OK**.

Import a Database Table

You can import data from the following databases:

- Aster
- BigInsights
- Cloudera
- Cloudera Impala
- DB2
- Greenplum
- Hortonworks
- MySQL
- Netezza
- ODBC
- Oracle
- Pivotal HD
- PostgreSQL

- Salesforce
- SAP HANA
- SQLServer
- Teradata
- Vertica

Note: BigInsights, Cloudera, Hortonworks, and Pivotal HD all use the SAS/ACCESS Interface to Hadoop even though they are different menu selections.

To import data from a database:

- 1 Select the database name from the list of **Server** data types. The list includes only the data sources for which SAS/ACCESS software is licensed and that your administrator has granted you the capability to use.
- 2 Specify your connection information, and then click **Browse** to select the table to import.
- 3 (Optional) Review the library and location settings by clicking **Advanced** and make changes if necessary.

You do not have access to the **Advanced** section if you are importing data from the explorer or designer and do not have the Build Data capability. Instead, you can import the data to a general-purpose area or select **Store the table in a private location** to prevent other users from accessing the data.

- 4 Click **OK**.

The SAS/ACCESS product for the database must be licensed and configured for the SAS Workspace Server to import database tables.

Database Connection Tips

Common Fields

The following fields are used for connecting to most databases:

- User ID
- Password
- Server
- Port
- Database

The **Server** field corresponds to the host name for the server. Some databases use connection information that is similar to ODBC. These databases often request a data source name instead of the combination of server and port. See the following sections for connection details for databases that have unique fields.

Note: After you have successfully imported a table, the connection information is saved, except for the password. This enables you to import additional tables quickly or to re-import the table as needed.

Most fields are case sensitive. For example, specifying a value of `products` in the **Database** field might not be the same as specifying `PRODUCTS`. Case sensitivity depends on the database vendor. Furthermore, some databases use schemas. Some databases automatically use the user ID as the schema if a schema is not explicitly specified. Be aware that the **User ID** and **Schema** fields can be case sensitive. Check with your database administrator if you are unsure.

Additional Options for Importing Hadoop Tables

SAS Visual Analytics offers self-service options for importing data from Cloudera Hadoop, Hortonworks Data Platform, and InfoSphere BigInsights. Each of these platforms requires separate setup by your administrator.

A common connection type for all of these platforms is to connect to Hive or HiveServer2 and then import tables. The **SAS system options** field can be used to specify environment variables such as the following:

```
set=SAS_HADOOP_JAR_PATH="/path/to/files"
```

The **options** keyword is submitted with any options that you specify in the field.

If the Hadoop cluster is configured with the SAS Embedded Process, then you can perform parallel loading from HDFS to SAS LASR Analytic Server. In this case, the **Configuration** field must specify the path to a Hadoop configuration file. You must also specify at least the HDFS_METADIR= and HDFS_DATADIR= options in the **Hadoop options** field. More options might be necessary for your site. For information about setting up parallel loading from Hadoop, see *SAS Visual Analytics: Administration Guide*.

Additional Options for Importing PostgreSQL Tables

The **Schema** field is not case sensitive when you browse for tables, but it is case sensitive when the import is performed. As a result, if you specify a schema in the wrong case, you can successfully browse for a table, and then select it in the **Choose a Table** window. However, the import fails. In this case, contact your database administrator for assistance with the schema name.

Additional Options for Importing Oracle Tables

The value for the **Path** field is related to the net service name in the tnsnames.ora file. The tnsnames.ora file is generated during the Oracle client installation on the machine

for the SAS Application Server. The file is typically stored in an Oracle installation directory such as `/opt/oracle/app/oracle/product/10.2.0/db_1/network/admin/tnsnames.ora`. The net service name for the connection information is contained in this file. See the following figure:

```
# tnsnames.ora Network Configuration File:
C:\oracle\product\10.2.0\client_1\network\admin\tnsnames.ora
# Generated by oracle configuration tools.

NEWSERVER10G =
  (DESCRIPTION =
    (ADDRESS_LIST =
      (ADDRESS = (PROTOCOL = TCP)(HOST = server.na.sas.com)(PORT = 1521))
    )
    (CONNECT_DATA =
      (SERVICE_NAME = server10g)
    )
  )
```

Additional Options for Importing Teradata Tables

The **Teradata Management Server** field is used to determine whether the SAS LASR Analytic Server is co-located on the data appliance. If the SAS LASR Analytic Server and the Teradata database are on the same data appliance, then make sure that the **Teradata Management Server** field includes the host name that the SAS LASR Analytic Server uses.

SAS Visual Analytics and the Teradata database can be configured to transfer data in parallel when they are not co-located on the same data appliance. For information about setting up parallel loading, see *SAS Visual Analytics: Administration Guide*.

Import Tweets from Twitter

To search for tweets and import them:

- 1 Select **Twitter** in the Import Data window.

The first time you import tweets, you are directed to the Twitter website to log on to your account and authorize SAS Visual Analytics. After the initial logon, SAS Visual

Analytics uses authorization tokens for accessing Twitter instead of requiring you to log on each time.

- 2 Enter a search term and the maximum number of tweets to return.

The search operators that you can use are described at <https://dev.twitter.com/rest/public/search>.

Note: SAS does not support the following:

- searches for languages other than English. Requests for other languages (such as using `lang=fr`) return no tweets.
- search terms cannot include double-byte characters.

- 3 (Optional) In the **LASR Table** section, enter the name for the table and a description. Review the library and location settings by clicking **Advanced** and make changes if necessary.

You do not have access to the **Advanced** section if you are using the explorer or designer and do not have the Build Data capability. Instead, you can import the data to a general-purpose area or select **Store the table in a private location** to prevent other users from accessing the data.

- 4 (Optional) Review the **Proxy Server** section and make changes if necessary.

- 5 Click **OK**.

The first time that you successfully log on to Twitter, SAS stores authorization tokens that enable you to import tweets again without logging on to Twitter. If you click **Clear Authorization Tokens**, then the tokens for accessing Twitter are removed from SAS Visual Analytics.

The search results from a Twitter import in SAS Visual Analytics and the search results from Twitter's own search interface do not match exactly. Each uses a different mechanism to download tweets. A Twitter import in SAS Visual Analytics uses Twitter's public search API. There are limits on what data and how much data that SAS can download using Twitter's public search API. These limits might not apply to Twitter's own search interface. For more information, see <https://dev.twitter.com/rest/reference/get/search/tweets>.

For information about the data structure of imported tweets, see [Appendix 10, “Twitter Data Details,”](#) on page 737.

Note: Rate limits apply to the Twitter service. Such limits are beyond the control of SAS Visual Analytics. You are required to follow all applicable terms of use that Twitter and others might promulgate as to the Twitter data.

Note: Certain functionality in the software enables the user to invoke external third-party resources. Be aware that use of these resources might result in disclosure and transmission of information that the user submits to these resources.

Overview of SAS Visual Data Builder

<i>What Is SAS Visual Data Builder?</i>	63
<i>Your First Look at the Data Builder</i>	65
<i>Import Data</i>	66
<i>About Managed Access to DBMS Data</i>	66
<i>Work with User-Defined Formats</i>	67

What Is SAS Visual Data Builder?

The data builder enables analysts and data administrators to perform basic data preparation. You can create data queries to perform joins, add calculated columns, and subset and sort data. Several productivity features accelerate the creation of columns based on common aggregation functions.

Once you create your data queries, you can reuse them as subqueries for more sophisticated data queries, export them as jobs for scheduling, or schedule them directly from the user interface.

The data builder has self-service data import features that enable you to access data from the following data sources:

- Microsoft Excel spreadsheets
- delimited text files

- SAS data sets
- database tables
- Twitter

After you import the data, you can prepare it for analysis or join it with existing data.

The data builder provides a series of features that take advantage of the in-memory tables in SAS LASR Analytic Server.

You can perform the following operations to add data to memory in the server:

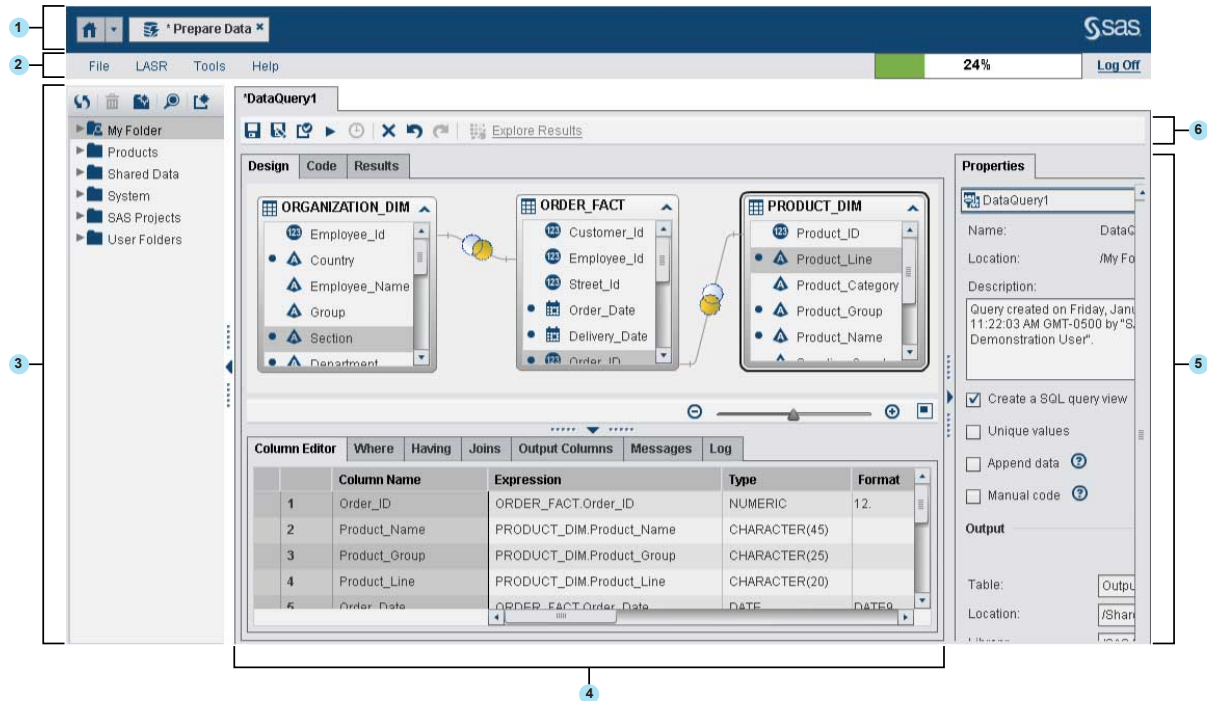

- load an existing table directly into memory
- load the results of a data query into memory (or stage the data and then load it into memory)
- append rows to an in-memory table

After the data is in memory, you can perform the following operations with in-memory tables:

- join in-memory tables to form a LASR star schema
- append entire in-memory tables to another in-memory table
- save in-memory tables to HDFS for persistence and fast reloads

Your First Look at the Data Builder

Here are the features of the data builder:

- 1 The application bar enables you to return to the home page and to access other parts of SAS Visual Analytics and other SAS applications that integrate with the home page. You can access your recently created or viewed reports, explorations, stored processes, data queries, or other objects in your recent history. Buttons are displayed for each open application.
- 2 The menu bar contains menus that enable you to perform tasks such as creating new data queries and LASR star schemas. The right side of the menu bar has a memory gauge that displays the memory utilization for a distributed SAS LASR Analytic Server. You can also sign out of SAS Visual Analytics.
- 3 The navigation pane displays a tree (the SAS Folders tree) of tables and data queries.

- 4 The center of the screen contains the workspace. When you create a new object, such as a data query, it is represented as a tab on the top of the workspace.

The bottom of the workspace contains a series of tabs that enable you to create column expressions, joins, and filter data.

- 5 The properties pane enables you to manage the properties of the item that is selected in the workspace.
- 6 The toolbar contains icons that enable you to manage, run, and schedule data queries.

Import Data

The data builder has self-service data import features. After you select **File ► Import Data**, you can click the link for the type of data that you want to import.

For more information, see [Chapter 5, “Importing Local Data Files,” on page 43](#) and [Chapter 6, “Importing Data from Servers,” on page 52](#).

About Managed Access to DBMS Data

The data builder can be used to read source tables from third-party vendor databases and to write tables to them as well. The SAS/ACCESS Interface products provide this feature. The user ID and password that you use to log on to the data builder might not be valid for a third-party vendor database. If this is the case, then you are prompted for credentials to the DBMS when you access a registered table from a library with a Read operation or a Write operation. As an alternative to being prompted, you can store a login in metadata that has valid DBMS credentials. For more information, see "How to Store Passwords for a Third-Party Server" in *SAS Intelligence Platform: Security Administration Guide*.

If you are prompted for credentials and supply an invalid user ID or password, then you are denied access to the data. In this case, you can select **File ► Clear Credentials**

Cache to remove the invalid credentials from your session. The next time you access the data source, you are prompted again.

Work with User-Defined Formats

A format is a set of instructions that SAS uses to write data values. Formats are used in the data builder to control the written appearance of data values. User-defined formats are specialized formats that are not supplied by SAS. These formats are stored in a custom format catalog.

The preferred method for making user-defined formats available to a SAS Application Server is to name the custom format catalog `formats.sas7bcat`, and to place it in `SAS-config-dir/Lev1/SASApp/SASEnvironment/SASFormats`. For more information about using user-defined formats, see *SAS Intelligence Platform: Data Administration Guide*.

When a user-defined format is permanently associated with a variable, the data builder uses the format and shows it in the **Format** column. However, if you select the **Format** menu and choose a different format, you cannot use the **Format** menu to go back to the original user-defined format. You can click  to undo the change to the format if you have not saved your work yet, or you can remove and add the column back again.

Even if the custom format catalog is made available to the SAS Application Server correctly, you cannot associate a user-defined format to a variable with the data builder. The menu in the **Format** column does not enable you to specify a user-defined format.

8

Specifying Preferences for SAS Visual Data Builder

<i>Specify Global and General Preferences</i>	69
<i>Specify Your Preferences for the Data Builder</i>	69

Specify Global and General Preferences

To specify global SAS preferences, see [“Specify Global Preferences” on page 27](#). To specify general preferences, see [“Specify the SAS Visual Analytics General Preferences” on page 28](#).

Specify Your Preferences for the Data Builder

To specify preferences that are specific to SAS Visual Data Builder, perform the following steps after you log on to the data builder:

- 1 Select **File** ► **Preferences** to open the Preferences dialog box.
- 2 Select **SAS Visual Data Builder** ► **General**.

Select a default SAS Application Server to use from **Application server**. If you have added SAS Application Server instances to your deployment, then make sure that

the Job Execution Service has been configured for the SAS Application Server that you select. For more information, see *SAS Intelligence Platform: Middle-Tier Administration Guide*.

3 Select **SAS Visual Data Builder ► Scheduling**.

Specify a default scheduling server, batch server, and deployment directory. For more information, see [“Scheduling Preferences” on page 139](#).

4 Click **OK** to apply your changes.

9

Creating Data Queries

What Is a Data Query?

A data query is your primary method for selecting and formatting data that is used with data exploration and creating reports.

A data query is a metadata object that manages the references to input tables, output tables, staging tables, joins, and summarizations from a SAS Visual Data Builder session. You can save data queries and open them later to edit the data preparation

operations that are performed in the data query. You can use saved data queries as subqueries when you create a new data query.

About Creating Data Queries

You can use the data builder to create data queries to prepare data for analytics. You can use a data query to subset, sort, join, and add calculated columns to tables.

As you create your data query, click  to validate your data query. Use the  button to preview or run the data query.

The preview option uses a temporary table for the output table. Clicking the **Results** tab shows only the first 100 rows. When you run the data query, it uses the specified output table instead of a temporary table.

Save Your Data Query

When you click , you clear the undo and redo history.

The default location for saving data queries is initially set to **/My Folder**. If you save the data query in a different folder, then the complete length of the path and name is limited to 128 characters.

Note: If the data query uses a SAS LASR Analytic Server library for the output table (this is the default), then the server does not need to be running when you save the data query. However, the server must have been started at least once in the past. When you save it, the data builder checks the metadata authorization for the library and table before it performs the save. If the server has never been started, then there is no security key to use for checking authorization. For more information, see "Security Keys" in *SAS Visual Analytics: Administration Guide*.

Save a Data Query as a New Data Query

Open an existing data query from the SAS Folders tree that closely matches the data query that you want to create. Click , and then enter a new name and select a location. Perform any customizations.

In many cases, you want to use the same input tables, joins, and so on, but you want a different output table. In this case, click **Clear** on the **Outputs** tab, and then specify new output table information. This step ensures that you use a different output table for the copied data query.

Note: If you change only the name of the output table in the copied data query, then the name of the original output table in the original data query is also changed.

For example, an analyst creates a data query that summarizes sales data and includes several geographic regions. The data query is saved with an output table that is named `sales`. A regional sales manager wants to perform a similar summarization, but he wants to filter the data for a single geographic region. In this case, the regional sales manager performs the following steps:

- 1 Opens the analyst's data query, and clicks  to save a copy of the data query with a new name.
- 2 Filters the data on the **Where** or **Having** tab for the geographic region.
- 3 Clicks **Clear** on the **Outputs** tab, and then specifies new output table information. This ensures that the original output table, `sales`, for the original data query is not overwritten.
- 4 Saves and runs the copied data query.

[“Output Tables” on page 81](#)

Use the Design Tab

The **Design** tab is the default view for working with data queries. This tab provides an easy-to-use interface for creating a data query. You can perform the following tasks with the **Design** tab:

- Drag and drop tables or data queries from the SAS Folders tree onto the workspace.
- Join tables by using your pointer to select the source column, and then drag the pointer to the corresponding column in the joined table.
- Add columns to the **Column Editor** tab by clicking the column name from the table in the workspace or by right-clicking on the table and selecting **Add All Columns**.
- Use the **Column Editor** tab to specify column expressions, aggregations, and sort. You can set the attributes for a column, such as the type, format, and label.
- View the **Output Columns** tab to see the number of output columns and attributes. When you specify aggregations and pivot by columns, the number of output columns can increase dramatically.
- Click  to check that the data query is valid.
- Check the **Messages** tab for information about warnings and errors such as invalid column expressions.
- Check the **Log** tab to view the SAS log. A SAS log is generated when you preview, run, or validate a data query.
- Use the **Outputs** tab in the right pane to specify output table information.

Adding a Data Source

Add a Table

To add a table to a data query, use the SAS Folders tree to locate the table () and then drag and drop the table onto the workspace.

TIP You can also click  and search for the table by name and location.

Add a Subquery

After you have created a data query and saved it, it can be used as an input data source to another data query. To add a subquery, use the SAS Folders tree to locate the data query () and then drag and drop the data query onto the workspace.

The subquery is represented in the workspace by the columns that are selected for output in the subquery.

Support for Special Characters

In most cases, you can use table names and column names that contain special characters, including blank characters. When you use a column in your data query, the data builder applies the n-literal syntax, such as `'table name'n.'``column name'n`, so that SAS can use the column.

Rules for SAS names apply. For more information, see “Names in the SAS Language” in *SAS Language Reference: Concepts*.

The data builder does not apply the n-literal syntax to code that you enter manually on the **Where** tab or **Having** tab or in column expressions. For example, if your table has a

column that is named `quantity ordered`, then you must add the n-literal syntax (similar to the following example):

```
AVG(table.'quantity ordered'n)
```

Best Practices for Adding Data Sources

When you plan to join data sources (tables or subqueries), the order in which you add the data sources to the workspace matters. The first data source that is added to the workspace is automatically assigned as the left table for any joins that you add to the data query.

If you are creating a data query that uses a fact table and dimension tables, then the simplest approach is to drag and drop the fact table onto the workspace first. You can perform left, right, or full joins with the dimension tables faster because you must specify only the join type. However, if you drag and drop a dimension table first, then you can easily use the  button on the **Joins** tab to switch the left and right tables in the join.

If you are not using a fact table or dimension tables, then the sequence for adding tables to the workspace might not be very important. Just remember that the first table dropped onto the workspace is assigned as the left table, and you can switch the left table and right table on the **Joins** tab. The data builder takes advantage of vendor-specific features in SQL processing whenever possible. If the source tables are from a third-party vendor database, then the SAS/ACCESS Interface engine can optimize the performance of the data query by passing the SQL statements through to the database.

Specify Properties for a Data Query

On the **Properties** tab, you can view or specify the following properties:

Name

displays the name for the data query. The initial value is `DataQuery1`. You can specify a different name when you save the data query.

Location

displays the metadata folder location for the data query object. The initial value is `/My Folder`. You can specify a different location when you save the data query.

Description

specifies a description of the data query.

Create an SQL query view

specifies to create a view for either the work table or the output table. For more information, see [“Create SQL Query Views” on page 85](#).

Unique values

specifies whether the SQL keyword `DISTINCT` is applied to the `SELECT` statement that is used to generate the result set for the data query.

Append data

specifies whether the result set for the data query is appended to the output table. If a staging table is used, then the staging table is replaced with the result set before appending to the output table.

On the **Outputs** tab, you can view or specify the following properties:

Table

specifies the table name for either the staging output or the final output. For more information, see [“Specify an Output Table” on page 81](#).

Compress data

specifies to compress the output table. For more information, see [“Output and Staging Table Interactions” on page 83](#).

Location

specifies the metadata folder location to use for registering the staging table metadata or output table metadata. Click  to select a different location.

Library

specifies the library to use for the staging table or output table. Click  to select a different library.

Partition by

specifies the column to use for partitioning the output table. This property applies when the output table is in a SAS LASR Analytic Server library or SAS Data in HDFS library only. For more information, see [“Partition Tables” on page 118](#).

<i>Output and Staging Table Interactions</i>	83
<i>Create SQL Query Views</i>	85

Source Tables

When you drop a table onto the workspace, the data builder connects to the SAS Metadata Server to determine the column names and data types for the table. When you drop a subquery onto the workspace, the data builder makes the same request, but determines the column names and data types for the output table of the subquery.

Because the data builder uses metadata for source tables, you (or an administrator) must register the table in metadata before you can access the data. Source tables can be registered with SAS Visual Analytics Administrator or SAS Management Console.

When you import data from a file, database table, or Twitter, the data builder registers the data in metadata as a table. This enables you to work with it as a source table for data preparation.

See Also

- [“Adding a Data Source” on page 75](#)
- *SAS Visual Analytics: Administration Guide*
- *SAS Intelligence Platform: Data Administration Guide*

Specify Properties for a Source Table

When you create a data query and select a table in the workspace or when you select it from the menu on the **Inputs** tab, you can specify the following:

Alias

displays the SAS table name that is stored in metadata. You can specify a new value to use as a table alias. The alias name is stored with the data query, and it does not affect the metadata information for the table.

Name

displays the metadata object name. You can change the metadata object name in the SAS Folders tree by selecting it, right-clicking, and selecting **Rename**.

Location

displays the table's metadata folder.

Library

displays the table's library.

Auto-aggregate

specifies whether to apply aggregations to the columns for this table when the columns are added to the query.

Aggregations

specifies the aggregations to apply to the columns for this table when the columns are added to the data query.

See Also

[“Use the Auto-Aggregate Functions” on page 92](#)

Output Tables

About Output Tables

When you create a data query, you specify an output table on the **Outputs** tab. When you save the data query, the output table is registered (or updated) in the metadata. When you run the data query, the physical output table is created, and then the metadata is updated. The metadata that is created when you save or run the data query enables you to use the table as a source table for another data query or another SAS application.

Subqueries do not require an output table. If you do not need to view the results of a data query that you intend to use as a subquery, then you can click **Clear** on the **Outputs** tab and still save the subquery. You can then drag and drop the subquery into a data query.

When you create a data query, the default output table name is OutputTable.

Specify an Output Table

Every data query must have an output table in order to save the results in a table. How you specify the output table affects whether metadata is updated or created.

You can specify an output table name, location, and library on the **Outputs** tab.

The following table shows alternative ways to specify an output table.

Action	How To
Change the name of the output table. *	Enter the new name in the Table field, and save the data query. All data queries, reports, explorations, and so on, still reference the same table object.
Create a new output table. *	Click Clear , and then specify a table name, location, and library. This action disassociates the previously used output table.
Reuse an existing table.	Click  , and then browse for the table to use. This action disassociates the previously used output table.

* If you replace the default table name, OutputTable, with another name before you save the data query, the data builder registers a new output table and uses it with the data query.

You can enter a name that is up to 32 characters as the output table name. If a third-party vendor database product is used for the output table, then the number of characters might be less.

If you select a SAS LASR Analytic Server or SAS Data in HDFS library, the **Partition by** menu becomes available.

Staging Tables

About Staging Tables

Staging data is a best practice because you can use the data builder to access and transfer data from operational systems once, rather than frequently interfere with the operational systems and reduce their performance. Using the data builder to stage data can provide the advantage of adding calculated columns when you stage the data.

Like the output table, the staging table is registered in metadata when you save the data query. The physical table for the staging table is created when you run the data query.

You cannot specify the name for a staging table. The name of the output table is used, and an `_STG` suffix is applied to the name. The suffix is used for the table name in metadata. The physical name of the staging table does not include the suffix.

Specify a Staging Table

To use a staging table, perform the following steps on the **Outputs** tab:

- 1 Select the **Use a staging table** check box.
- 2 Specify a library.

Note: The data builder is initially configured to use the Visual Analytics Public LASR library and the Visual Analytics Public HDFS pair of libraries. If you specify different libraries, then make sure that you understand how the path in HDFS is related to the server tag for the SAS LASR Analytic Server library. For more information, see *SAS Visual Analytics: Administration Guide*.

Output and Staging Table Interactions

The physical table is always replaced with the results of the data query. When you use a data query to append data and stage the data too, the staging table holds the data to append. As a result, the output table that the data query appends to is typically much larger than the staging table.

If you select the **Compress data** check box on the **Outputs** tab, then the tables are compressed as follows:

- If the output table is in the SAS LASR Analytic Server library or SAS Data in HDFS library, then the output table is compressed.
- If the output table is in the SAS LASR Analytic Server library and the staging table is in the SAS Data in HDFS library, then the staging table is compressed. It will automatically be compressed when it is loaded to memory on the SAS LASR Analytic Server.

The following table identifies the supported combinations for output tables and staging tables. In addition, whether you can append data to tables is indicated.

Table 10.1 Output Table and Staging Table Interactions

Output Table	Staging Table	Append Data
SAS or DBMS *	None	Supported
SAS Data in HDFS	None	Not supported
Teradata or Greenplum **	None	Supported
SAS LASR Analytic Server	None	Supported
SAS or DBMS *	SAS or DBMS *	Supported
SAS LASR Analytic Server	SAS or DBMS *	Supported ***
SAS LASR Analytic Server	SAS Data in HDFS Note: When the staging table is in HDFS, SAS LASR Analytic Server is the only choice for the output table.	Not supported
SAS LASR Analytic Server	Teradata or Greenplum **	Supported ***

* The SAS or DBMS value represents data stored in SAS data sets or a third-party vendor database, respectively.

** The Teradata or Greenplum value represents deployments that use a third-party vendor appliance as a co-located data provider for SAS LASR Analytic Server.

*** Appending data is performed by the SAS LASR Analytic Server engine. Appends are not performed by having the server read data in parallel.

The information about appending data in the previous table applies to data queries. See [“Appending In-Memory Tables” on page 121](#) if you are working with in-memory tables on SAS LASR Analytic Server exclusively.

See Also

[Chapter 15, “Working with SAS LASR Analytic Server,” on page 113](#)

Create SQL Query Views

You can influence whether the work table or output table is a view or a table. To specify view, select the **Create a SQL query view** check box on the **Properties** tab. The option is enabled by default. In most cases, this option improves performance by reducing data movement and storage requirements.

When working with tables in a database, if the source tables and output tables are in the same library, the **Create a SQL query view** option can enable you to pass a CREATE VIEW statement directly to the database. When this happens, the data query runs almost instantaneously because there is no data movement to create a view.

The following table summarizes the interactions between library types and views:

Library Type	Interactions
Base SAS	Base SAS libraries always support views for output tables or staging tables. Source tables can be from different libraries because the connection information is stored in the view.
DBMS	<p>If the source tables and the output tables or staging tables are in the same library, then the view is created in the database.</p> <p>If they are in different libraries, then the check box is not enabled and the output table or staging table is created as a physical table.</p>
SAS LASR Analytic Server or SAS Data in HDFS	<p>These libraries types do not support views. Selecting the check box applies to the work table, rather than the output table or staging table.</p> <p>If the source tables and the output tables are in the same SAS LASR Analytic Server library, then the check box is not enabled, and the work table must be a physical table.</p>

Note: In some cases, the check box is enabled, but using this option can result in an error when running the data query. For example, if you use a DBMS library for the output table, you must have permission to create a view. You can clear the check box to create the output table as a physical table in these cases.

11

Working with Columns in Data Queries

<i>Adding Columns to a Data Query</i>	87
<i>Remove Columns</i>	88
<i>Specify a Column Expression</i>	89
<i>Specify Aggregations</i>	90
<i>Remove All Aggregations</i>	91
<i>Use Group By Variables</i>	92
<i>Use the Auto-Aggregate Functions</i>	92
<i>Use the Pivot By Feature</i>	93

Adding Columns to a Data Query

When you add a data source (a table or subquery) to the workspace, the columns from the data source are not automatically added as output columns. You must add the columns to the data query that you want to use.

After the columns are added, you can specify column expressions and aggregations and use the sort and pivot by features.

Note: As an exception, the auto-aggregate feature requires that you set the default aggregations for the table before they are added to the data query.

When a data source is dropped onto the workspace, the column types are represented by the following icons:

Table 11.1 Icons for Data Types

Icon	Description
	This icon represents numeric data.
	<p>This icon represents character data.</p> <p>Note: Date, time, and datetime data use this icon. After the column is added, the Type and Format columns are updated with information about the new column.</p>

You can add columns to the data query in the following ways:

- Select the table in the workspace, right-click, and select **Add All Columns**
- To add one column from a table, select the column name with your pointer.

TIP If you select the column name an additional time, then the column is added to the data query again. This can be helpful if you want to use a column for both numeric and character data. When you add a column more than once, a number is added to the column name. If you change the column name, then you must make sure that you do not have more than one column with the same name.

- Click the **Column Editor** tab and enter a column name, expression, and type in the bottom row of the table. The remaining fields are optional.

Remove Columns

To remove a column from a data query:

- 1 Click the **Column Editor** tab.
- 2 Select the column to remove, right-click, and select **Remove Column**.

Specify a Column Expression

To specify a column expression:

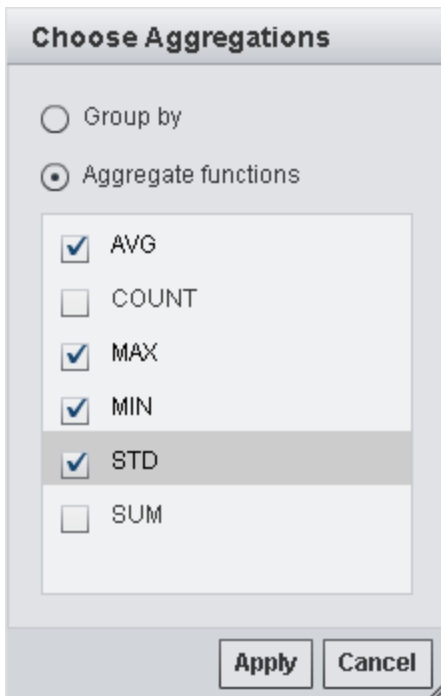

- 1 On the **Column Editor** tab, specify a name for the column.
- 2 Select `table-name.column-name` from the **Expression** column. If you added a new column manually, then you must make sure that you specified a table name and a column name.
- 3 Click  to open the expression builder. The table name and column name are added automatically as the default SQL expression.
The expression is limited to 1024 characters.
- 4 On the **Fields** tab, select columns from the source tables that you have added to the data query.
- 5 On the **Functions** tab, select the functions to apply to the source column.
- 6 Enter arithmetic operators and expressions such as CASE statements directly in the **SQL expression** area.
- 7 Click **Apply** to save the column expression.

Note: If you click  after you click **Apply**, then your last change to the expression is undone. However, because the expression window is closed, you might not notice the undo.

Specify Aggregations

To specify an aggregation for a column:

- 1 On the **Column Editor** tab, place your pointer in the **Aggregations** cell for the column and click. Click the ellipsis button to select the aggregations to use.
- 2 In the Choose Aggregations dialog box, select the **Aggregate functions** radio button.

- 3 Select the check boxes for the aggregate functions to use. Click **Apply**.

Note: After you click **Apply**, all of the other columns are automatically specified as **GROUP BY** columns. You can change a column from **GROUP BY** to an aggregate function by repeating this step for the column.

The following display shows how adding aggregations results in additional output columns. The aggregate function is appended to the column name.

Column Editor	Where	Having	Joins	Output Columns	Messages	Log
#	Column Name	Type	Format			
7	State	CHARACTER(25)	\$25.			
8	Quantity_STD	NUMERIC				
9	Quantity_MIN	NUMERIC				
10	Quantity_MAX	NUMERIC				
11	Quantity_AVG	NUMERIC				
12	Total_Retail_Price_STD	NUMERIC				
13	Total_Retail_Price_MIN	NUMERIC				
14	Total_Retail_Price_MAX	NUMERIC				
15	Total_Retail_Price_AVG	NUMERIC				
16	CostPrice_Per_Unit_STD	NUMERIC				
17	CostPrice_Per_Unit_MIN	NUMERIC				
18	CostPrice_Per_Unit_MAX	NUMERIC				

Remove All Aggregations

To remove all the aggregate functions and group by settings:

- 1 On the **Column Editor** tab, select all the columns.
- 2 Right-click, and select **Remove Aggregations**.

TIP This menu option is available only when all of the columns are selected and at least one aggregation is defined.

Use Group By Variables

When you add an aggregation to a column, the remaining columns are automatically used as group by variables. The **Aggregations** column displays **GROUP BY** for these variables.

You can use a column as a group by variable by following the steps in [“Specify Aggregations”](#) and selecting the **Group by** radio button.

Use the Auto-Aggregate Functions

The auto-aggregate feature is a productivity feature that enables you to specify a set of aggregations to apply as default aggregations to numeric columns for a specific table. A typical use is to automatically aggregate some of the columns in a fact table.

To use the auto-aggregate feature:

- 1 Select a table on the **Design** tab.
- 2 On the **Inputs** tab, select **Enable** for **Auto-aggregate**.
- 3 Click the ellipsis button next to **Aggregations** to open the Choose Aggregations window.
- 4 Select the check boxes for the aggregate functions that you want to apply, and then click **Apply**.

Whenever you add a column to the data query, the selected aggregate functions are automatically applied.

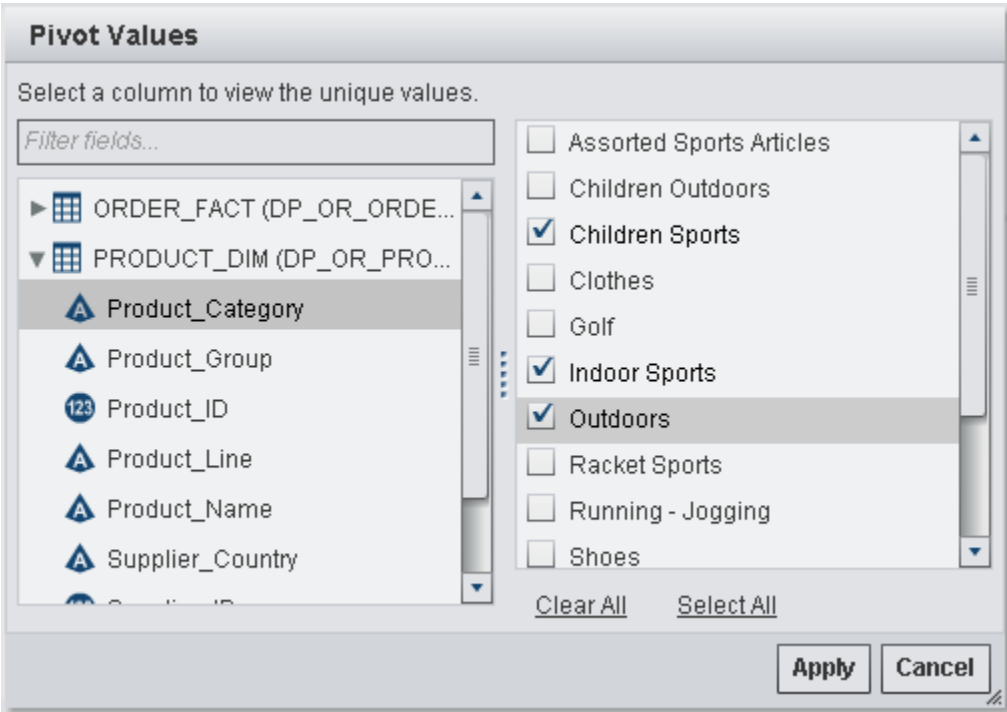

Use the Pivot By Feature

The pivot by feature provides an easy and powerful way to summarize data for analytics. You can specify a column to use as a categorical variable and the unique values to use. When the data query is run, the output table is summarized with the aggregations that you apply.

To use the pivot by feature:

- 1 On the **Column Editor** tab, place your pointer in the **Pivot By** cell for the column to use as the pivot column. Click the ellipsis button to select the pivot column and values.
- 2 In the Pivot Values dialog box, select the pivot by column. You can enter search criteria in **Filter fields** to filter the column names.

The following display shows an example of pivoting by three values in the Product_Category column.

- 3 After the unique values for the column are loaded, select the check boxes for the values to use in the summarization. Click **Apply**.

The following display shows an example of the **Column Editor** tab when a pivot by column is used. The minimum and maximum Total_Retail_Price are calculated for each Customer_ID and are then pivoted by (transposed by) three values of the Product_Category column.

Display 11.1 Column Editor Tab with a Pivot By Column

Column Editor								
		Where	Having	Joins	Output Columns	Messages	Log	
		Column Name	Expression		Type	Format	Label	Aggregations
1		Customer_ID	ORDER_FACT.Customer_ID		NUMERIC	13.		GROUP BY
2		Total_Retail_Pr...	ORDER_FACT.Total_Retail_Price		NUMERIC		TRP	MIN,MAX
+								Pivot By
								PRODUCT_DIM.Product_Category

TIP TRP is specified as the label for the Total_Retail_Price column. Look at the next display to see how the label is used to create labels for the new columns.

The following display shows how pivoting the Customer_ID column by three values of the Product_Category column results in additional output columns. A substring of the pivot by values is used as a prefix to each column name and the aggregate function is used as a suffix. The pivot by column label and aggregate function are used in the output column label.

Display 11.2 Output Columns Tab with Pivot By Values

Column Editor	Where	Having	Joins	Output Columns	Messages	Log	
#	Column Name	Type	Format	Label			
1	Customer_ID	NUMERIC	13.				
2	OUTD_Total_Retail_Price_MIN	NUMERIC		OUTDOORS_TRP_MIN			
3	INDO_Total_Retail_Price_MIN	NUMERIC		INDOOR_SPORTS_TRP_MIN			
4	CHI1_Total_Retail_Price_MIN	NUMERIC		CHILDREN_SPORTS_TRP_MIN			
5	OUTD_Total_Retail_Price_MAX	NUMERIC		OUTDOORS_TRP_MAX			
6	INDO_Total_Retail_Price_MAX	NUMERIC		INDOOR_SPORTS_TRP_MAX			
7	CHI1_Total_Retail_Price_MAX	NUMERIC		CHILDREN_SPORTS_TRP_MAX			

12

Working with Filters in Data Queries

<i>About Filtering Data</i>	97
<i>Specify a WHERE Clause</i>	98
<i>Specify a HAVING Clause</i>	99
<i>Best Practices for Filters</i>	100

About Filtering Data

You can use the **Where** and **Having** tabs to filter data in SAS Visual Data Builder.

The SQL expression on the **Where** tab is applied to the input data. This SQL expression is often used to subset data on the columns in the source tables.

The SQL expression on the **Having** tab can be applied to either the input data or the calculated columns. This SQL expression is typically used to subset data on calculated columns in the output table.

The maximum length for a WHERE or HAVING clause is 4096 characters.

Specify a WHERE Clause

To add a WHERE clause to a data query:

- 1 Click the **Where** tab.
- 2 On the **Fields** tab, expand the table node, and select the column to use for filtering data.

TIP You can type in **Filter fields** to locate the column.

- 3 Double-click the column or drag and drop it in the **SQL expression** area.
- 4 (Optional) You can click the **Functions** tab and select the functions to use with filtering.
- 5 For character variables, you can click **Unique Values** to load the unique values of the column. Select the check boxes to specify the unique values to include in the filter.

Click **Apply** to add the unique values to the **SQL expression** area.

- 6 Edit the WHERE clause in the **SQL expression** area as follows:

Number of Values	Edit	Example
A single character value	Add an equal sign between the column name and the unique value.	CARS.Make = 'Acura'
More than one character value	Specify an IN operator and enclose the unique values in parentheses.	CARS.Make IN ('Acura', 'Audi')

Number of Values	Edit	Example
Numeric comparison	Specify a numeric operator and a constant, or specify a numeric operator and another column name.	CARS.Cylinders >= 6 PRDSALE.Actual > PRDSALE.Estimate

- Click  to save the filter.

Specify a HAVING Clause

To add a HAVING clause to a data query:

- Click the **Having** tab.
- On the **Fields** tab, expand the table node, and select the column to use for filtering data. The **Output Columns** node includes the calculated columns.

TIP You can type in **Filter fields** to locate the column.

- Double-click the column or drag and drop it in the **SQL expression** area.
- (Optional) You can click the **Functions** tab and select the functions to use with filtering.
- For character variables, you can click **Unique Values** to load the unique values of the column. Select the check boxes to specify the unique values to include in the filter.
Click **Apply** to add the unique values to the **SQL expression** area.
- Edit the HAVING clause in the **SQL expression**. The syntax is identical to that shown in step 6 of “Specify a WHERE Clause”.

- Click  to save the filter.

Best Practices for Filters

SAS Visual Data Builder provides the **Where** and **Having** tabs for filtering data. Follow these best practices:

- Filter on the **Where** tab first because the WHERE clause reduces the rows to consider for further subsetting.
- When you specify a filter on a column that is an index or primary key, avoid using a function whenever it is possible. Using a function, such as `CAST(order_id as DOUBLE)`, risks performing a full-table scan rather than using the index.
- Filter on the table that has the smallest number of rows first.
- If you must remove a table that is used on the **Where** or **Having** tabs, then remove the reference to the table from the filters before you remove the table. Otherwise, if you remove a table that is referenced in a filter, then all of the filtering conditions are cleared.

13

Working with Joins in Data Queries

<i>About Joins</i>	101
<i>How Does the Automatic Join Feature Work?</i>	102
Feature Overview	102
Using Foreign and Primary Keys	103
Matching by Name	103
Selecting the Join Type	103
<i>Adding a Join</i>	104
Drag and Drop Join Lines	104
Use the Joins Tab	105
<i>Example: Joins with a Junction Table</i>	105
<i>Remove a Join</i>	107
<i>Manage Joins in a Data Query</i>	107
<i>Best Practices for Managing Joins</i>	108

About Joins

SAS Visual Data Builder supports joins for tables and subqueries. You can join tables to each other, including self joins. You can join subqueries to tables and join subqueries to subqueries. When you use a subquery in a join, the join condition is made against the output table for the subquery. The data builder supports joining up to 256 tables.

When you drop a table or subquery onto the workspace, the data builder attempts to determine a join condition automatically. When the data builder creates a join automatically using foreign keys or by matching columns, the join is added as an inner join. The data builder also supports left, right, and full joins. You must specify the join type manually if you do not want an inner join.

In addition to easily adding joins to a data query, the data builder generates an SQL statement with all of the joins declared explicitly. For example, you can specify an inner join in a WHERE clause, such as `WHERE t1.order_id=t2.order_id`. However, mixing inner joins in a WHERE clause and outer join types in a single data query can be complex to read and understand.

SAS Visual Data Builder always generates an SQL statement with inner joins declared explicitly. For example, see the following code sample:

```
LEFT JOIN
    LIB1.TRANSACTION_TYPE_DIM TRANSACTION_TYPE_DIM
    ON CASH_FLOW_FACT.TRANSACTION_TYPE_KEY =
        TRANSACTION_TYPE_DIM.TRANSACTION_TYPE_KEY
INNER JOIN
    LIB1.TRANSACTION_DIM TRANSACTION_DIM
    ON PARTY_DIM.SEGMENT_ID = TRANSACTION_DIM.SEGMENT_ID
    AND PARTY_DIM.TRANSACTION_KEY = TRANSACTION_DIM.TRANSACTION_KEY
```

How Does the Automatic Join Feature Work?

Feature Overview

SAS Visual Data Builder attempts to join tables and data queries automatically as you add them to the workspace. When you drag and drop a table or data query onto the workspace, information about the table or data query is retrieved from the SAS Metadata Server. For subqueries, the metadata for the subqueries' output table is retrieved.

Using Foreign and Primary Keys

If primary key or foreign key information is registered in the metadata for the table that you drag and drop onto the workspace, then the data builder retrieves the foreign key and primary key information.

The data builder then iterates over each of the tables that are already in the workspace in the same sequence in which they were added to the workspace. The data builder retrieves the foreign key and primary key information for the table, and compares the length, type, and name with the key columns for the newly added table. If a match is found, then the tables are used in the join, and the columns are added as a join condition. The data builder continues to search for matches between the two tables, and it adds join conditions when possible. After a set of join tables is identified, the data builder does not continue iterating over the tables that are already in the workspace.

Matching by Name

If there is no foreign key or primary key information for the table that is dragged and dropped onto the workspace, then the data builder does not use foreign key or primary key information for the tables already in the workspace.

The data builder retrieves the column information for all of the columns in the newly added table. The data builder then iterates over each of the tables that are already in the workspace in the same sequence in which they were added to the workspace. The data builder compares the length, type, and name for each column with each column in the newly added table. If a match is found, then the tables are used in the join, and the columns are added as a join condition. The data builder does not continue to search for matches between the two tables, and it does not continue iterating over the tables that are already in the workspace.

Selecting the Join Type

When the data builder finds the first set of matching columns by comparing keys or matching names, it sets the join type for the two tables. The data builder checks the metadata for the columns to determine whether the columns are nullable. (Many third-

party vendor databases support **NOT NULL** as a constraint for a column when the table is created in the database with SQL. The constraint ensures that there are no missing values for the column.) The data builder performs the following steps to set the join type:

- 1 If the column for the existing table is not nullable but the column for the newly added table is nullable, then the tables use a left join.
- 2 If the column for the existing table is nullable but the column for the newly added table is not nullable, then the tables use a right join.
- 3 If both columns for the existing table and newly added table are nullable, then the tables use a full join.
- 4 If none of the previous conditions are met, then the tables use an inner join.

You can specify the join type by right-clicking on the join icon () and selecting the join type from the menu.

Adding a Join

Drag and Drop Join Lines

To add a join by selecting a column name and dragging your pointer to another column:

- 1 Place your pointer on one of the columns in a table to use, and then click and drag your pointer to a column in the other table to use in the join.
- 2 If you want a join type other than an inner join, then select the join, right-click, and select the join type.

TIP The first table that is added to the workspace is always set as the left table. You can switch the right table and left table by using the [Joins tab](#).

Use the Joins Tab

To add a join manually:

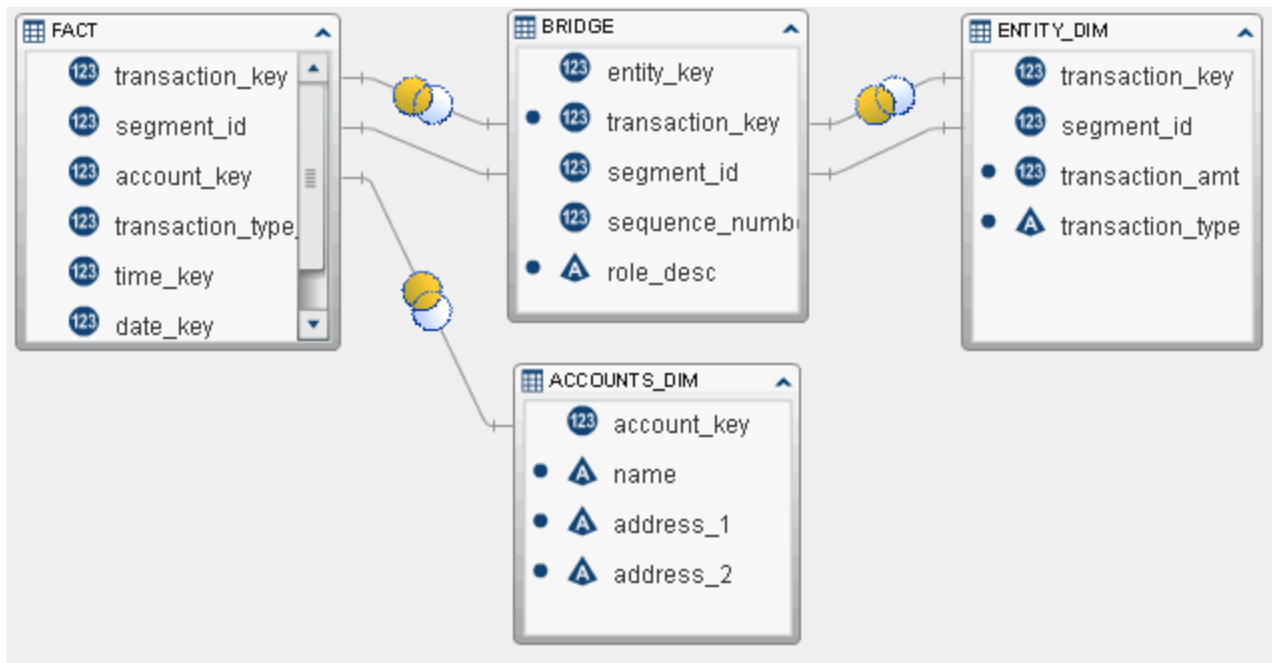

- 1 Click the **Joins** tab.
- 2 Click **+**.
- 3 Use the menus to replace **Not Selected** with the table names to use in the join. Click **Save**.
- 4 The default join type is an inner join. Use the menu in the **Join Type** column to select a different join type.
- 5 Click **+** in the **Join conditions** area.
- 6 Use the menus to replace **Not Selected** with the column names to use in the join condition. Click **Save**.
- 7 Click  to save the join condition with the data query.

Example: Joins with a Junction Table

By default, the data builder considers the first table that you drop in the workspace as the fact table. As you add tables to the data query, the data builder attempts to join the tables with the first table, the fact table. This strategy works well for straightforward fact table and dimension table arrangements. However, in many cases, you need to join additional tables to a junction table. Junction tables are also known as bridge tables or link tables.

In the following figure, the Bridge and Accounts_Dim tables are joined to the Fact table. The Accounts_Dim table has a join on the Account_Key column. The Bridge table is

joined on the compound key (represented as two lines), which consists of the Transaction_Key and Segment_ID columns.

To retrieve the transaction amount and transaction type from the Entity_Dim table, it must have a join that uses the Bridge table instead of the first table (fact table) that was added to the workspace.

To create a join to a junction (or bridge) table:

- 1 Add the fact table to the data query first.
- 2 Add the dimension tables, such as the Accounts_Dim table and junction tables. The data builder attempts to join the tables automatically.

Review the join as follows:

- a Check that the correct columns are used.
- b Change the join type, such as from inner to left, as needed.
- 3 Add the tables that use the junction table, such as the Entity_Dim table. Initially, the data builder attempts to join the tables to the fact table.

Correct the join as follows:

- a Select the automatic join to the fact table, right-click, and select **Remove Join Condition**.
- b Use your pointer to connect the keys from the junction table to the dimension table.
- c Change the join type as needed.

Remove a Join

You can remove a join by using either of the following methods:

- Select the join in the workspace, right-click, and select **Remove Join Condition**.
- Click the **Joins** tab, select the row in the table, and click **X**.

Manage Joins in a Data Query

Once a join is added to a data query, you can change the join by selecting it in the workspace, right-clicking, and changing the join type or removing the join condition.

You can also change a join by clicking the **Joins** tab, and then selecting the row in the table. You can make the following changes:

- add and remove tables from the join list
- reorder the sequence of joins by moving them up or down
- switch the left table and right table assignments for a join
- add, remove, and change the columns that are used in the join condition

The **Joins** tab shows the join condition for the entire data query. Make sure that you select a row in the upper table to set the columns in the **Join conditions** area.

The workspace shows a link between the tables that are used in a join. If you specify a left join or right join, then the  icon reflects which table provides the bulk of the data. If you rearrange the tables in the workspace (switching the left table and right table), then the  icon continues to reflect which table provides the bulk of the data. In order to change the data relationship, use either of the following methods:

- Switch the left table and right table by selecting a row from the table, and clicking .
- Change the join type from left to right or from right to left.

Best Practices for Managing Joins

In most cases, the sequence in which joins are specified on the **Joins** tab does not matter. However, it is possible that the query optimizer for the data source might perform the joins in a sequence that reduces performance. In these rare cases, you can change the sequence in which joins are specified on the **Joins** tab by selecting the join in the list, and clicking  or . This join sequence is still determined by the query optimizer, but you can control how the SQL for the join is presented to the query optimizer.

Creating LASR Star Schemas

<i>What Is a LASR Star Schema?</i>	109
<i>Create a LASR Star Schema</i>	110
<i>How Are Tables Used?</i>	111
Input Tables	111
Column Prefixes	111
Output Table and Conserving Memory	112
Performance Considerations	112

What Is a LASR Star Schema?

A LASR star schema is very similar to a typical star schema in a relational database. Imagine a single fact table that is surrounded by dimension tables. Each dimension table is joined to the fact table with a dimension key. Typically, the dimension key and the corresponding column in the fact table are the same data type and length. If your tables do not use the same data type and length, then there are two ways to correct the data:

- Change the data definition in the system with the original data.
- Create a data query that modifies the columns and outputs the table to an in-memory table.

Single-level star schemas are supported. Snowflake schemas are not.

Create a LASR Star Schema

To create a LASR star schema:

- 1 Select **LASR** ► **Create a Star Schema**.
- 2 Drag and drop tables or data queries from the SAS Folders tree onto the workspace. Keep the following suggestions in mind:
 - Drag and drop the fact table first and then the dimension tables.
 - Any input tables that are not already in a SAS LASR Analytic Server library are loaded to memory when the star schema is run.
 - If a dimension table shows the  icon, then it usually indicates that the data builder could not determine the join condition for the dimension table. Position your pointer over the icon for information about how to correct the incomplete table status.
 - If a dimension table shows the  icon, then it usually indicates that the table is from a different SAS LASR Analytic Server library than the output table. You must use one SAS LASR Analytic Server library only.
- 3 (Optional) If you do not want a column from the dimension table in the output table, then select the column in the table in the workspace, right-click, and select **Remove Column**.

Note: All of the columns from the fact table are automatically selected and required to be included in the output table.
- 4 (Optional) Click the **Joins** tab to review the columns that are used to generate the output table.
- 5 (Optional) Specify a different column prefix. For more information, see [“Column Prefixes”](#).
- 6 Click the **Output** tab, and specify a name for the output table.

- 7 Click , and specify a name and location for the LASR star schema.
- 8 Click ► to generate the output table.

How Are Tables Used?

Input Tables

The fact table and dimension tables are used in the star schema after you drag and drop them onto the workspace. By default, the data builder considers the first table that you drop in the workspace as the fact table. Click  from the toolbar to select a different fact table.

Because the star schema is formed in memory by the server, the first step is to make sure that the tables are loaded to memory. Be aware that the tables are transferred each time the star schema runs and this can reduce performance. Conversely, if the tables are already loaded to memory on the server, the star schema runs and generates the output faster.

Column Prefixes

The first 15 characters of a dimension table's name and the underscore character are initially set as a prefix for the column names from the dimension table. Column names for the output table are a combination of the prefix and the original column name.

However, you can specify a different value for the prefix after you select the table name from the menu at the top of the **Inputs** tab.

Column names from the fact table are not modified with a prefix.

TIP A column name is limited to 32 characters. If you have a long column name, then reducing the prefix can help you keep more of the original column name.

Output Table and Conserving Memory

To use memory efficiently, the default output for the schema is a view. The **Create output as a view** check box on the **Output** tab is selected by default to create a view. If you clear the check box, then the output is a table.

When the output is a view, the rows are created from the original tables when the view is accessed. This is the main advantage of a view because it does not create the entire output table and hold it all in memory.

If you clear the **Create output as a view** check box to create a table from the star schema, then the system must have enough available memory to store the table. If the system runs out of memory while running the star schema, then the memory that was used for the output table is freed and you receive an error message.

If you use SAS LASR Analytic Server tables for input to the schema, then the output table for the star schema must use the same library.

Performance Considerations

Creating a LASR star schema as a view can be more convenient than creating a table, but accessing data through the view can impact performance negatively. The scale of the impact depends on the size of the dimension tables. However, the number of passes through the data is even more important. For example, requesting percentiles or box plots or fitting statistical models requires passing through the data multiple times. These requests are impacted more than a request for summary statistics.

Keep the following considerations in mind:

- The initial creation of a view is faster than forming a table. However, accessing the data in a view is slower than accessing the data from a table.
- Creating a table requires more physical memory than creating a view. If your system has sufficient memory capacity, then creating a table provides the best performance for accessing the data.

Understanding Co-Located Data

One of the most powerful benefits of SAS LASR Analytic Server is the ability to read data in parallel from a co-located data provider. In this configuration, the SAS LASR Analytic Server software is installed on the same hardware as the data provider. The currently supported data providers are the following:

- SAS High-Performance Deployment of Hadoop (or a customer-supplied Hadoop cluster that has been configured to use the SAS services from SAS High-Performance Deployment of Hadoop)
- Teradata Data Warehouse Appliance
- Greenplum Data Computing Appliance

The data builder excels at accessing data from a variety of data sources, performing basic data preparation, and then staging the prepared data with a co-located data provider. After the data is staged, the server can load the data to memory for exploration, reporting, and further in-memory data preparation.

The SAS Deployment Wizard registers two predefined libraries for the SAS LASR Analytic Server and two libraries for the co-located data provider. For the third-party vendor products, the default library name and location are as follows:

Teradata Data Warehouse Appliance

```
/Shared Data/SAS Visual Analytics/Public/Visual Analytics  
Public Teradata
```

Greenplum Data Computing Appliance

```
/Shared Data/SAS Visual Analytics/Public/Visual Analytics  
Public Greenplum
```

Predefined Libraries

The names and purposes of the libraries are as follows:

Visual Analytics Public LASR

This library is initially configured as the default library for the data builder. It is automatically selected as the output library for importing self-service data, creating data queries, and preparing in-memory data.

This library is intentionally configured as a general-purpose library with extremely limited restrictions for securing data access.

Visual Analytics LASR

This library is initially configured to provide Write permission to data builder users and administrators only. The initial security settings might align with organizational goals for securing and managing data access.

For deployments that use a distributed SAS LASR Analytic Server, a pair of libraries for the co-located data provider are predefined with permissions that match the same initial security settings.

Using SAS Data in HDFS Libraries

Default Library

When your deployment uses Hadoop as a co-located data provider, the SAS Deployment Wizard registers a predefined library for it. This library is available for use in the SAS Folders tree, and it is located in `/Shared Data/SAS Visual Analytics/Public/Visual Analytics Public HDFS`.

Staging Library

You can specify a SAS Data in HDFS library as a staging library. This is a common use because the rows for the output table are distributed among the machines in the cluster. The server can then read the data in parallel when it loads the table to memory.

You must specify a SAS LASR Analytic Server library for the output library when you use a SAS Data in HDFS library for staging.

Output Library

You can specify a SAS Data in HDFS library as an output library. The engine distributes the rows for the table to the machines in the cluster. Afterward, you can select the table from the SAS Folders tree, right-click, and select **Load a Table**. This menu option loads the table from HDFS to memory on a SAS LASR Analytic Server.

You can partition SAS Data in HDFS tables when they are used in an output library. You can select a column to use from the **Partition by** menu. Partitioning the table ensures that all of the rows with the same formatted value as the selected column are distributed to one machine in the cluster. The rows are also placed in the same HDFS block. When you load a partitioned table to memory, the partitioning information is retained, and the result is a partitioned in-memory table.

See Also

[“Partition Tables” on page 118](#)

Restrictions

The following restrictions apply to using SAS Data in HDFS libraries with SAS Visual Data Builder:

- You cannot specify a SAS Data in HDFS library as an input library because the SAS Data in HDFS engine is a Write-only engine.
- The **Append data** check box on the **Properties** tab is disabled. The SAS Data in HDFS engine does not support appending data.

- If you specify a SAS Data in HDFS library as an output library, you cannot view the results on the **Results** tab because the SAS Data in HDFS engine is a Write-only engine.

Using SAS LASR Analytic Server Libraries

Default Library

During installation, the SAS Deployment Wizard registers a predefined library for SAS LASR Analytic Server. This library is available for use in the SAS Folders tree, and it is located in `/Shared Data/SAS Visual Analytics/Public/Visual Analytics Public LASR`.

Input Libraries

When you select a SAS LASR Analytic Server table as an input table for a data query, be aware of the following best practices if the table is large. If the table is not large, then using it for input requires no special considerations.

Here are the considerations for using a large SAS LASR Analytic Server table as an input table:

- A WHERE clause is processed in memory by the server if no aggregations or joins are used. Specify a filter on the **Where** tab so that you use only the rows that you want.
- Instead of using a data query (which transfers the data from the server to the SAS Workspace Server and then performs the join), you can create a LASR star schema. The LASR star schema performs the join in memory with other in-memory tables.

Output Libraries

A SAS LASR Analytic Server library is initially configured as the default output library. When you run a data query, click  **Explore Results** to explore the table immediately.

You can select the **Append data** check box on the **Properties** tab to add rows to an in-memory table. However, this option is not available if you use a SAS Data in HDFS library as a staging library. Instead, for deployments that use HDFS, you can use the data query to append rows, and then save the in-memory table to HDFS.

Partition Tables

When you specify a SAS LASR Analytic Server or SAS Data in HDFS library as an output library, you can specify a partition key for the table. You can select a column to use from the **Partition by** menu.

Partitioning uses the formatted values of the partition key to group rows that have the same value for the key. All of the rows that have the same value for the key are loaded to a single machine in the cluster. For SAS LASR Analytic Server libraries, this means that the rows that have the same value for the key are in memory on one machine. For SAS Data in HDFS libraries, all of the rows that have the same value for the key are written to a single file block on one machine. (The block is replicated to other machines for redundancy.) When the partitioned table is loaded onto a server, the partitioning remains when it is in memory.

If you select a partition key and also specify sort options for columns on the **Column Editor** tab, the sort options are passed to the current engine in an **ORDERBY=** option. This enhancement applies to SAS LASR Analytic Server and SAS Data in HDFS libraries and can improve performance once the data is in memory.

When you specify a partition key, avoid using a variable that has few unique values. For example, partitioning by a flag column that is Boolean results in all rows on two machines because only two values are available. At the other end of the spectrum, partitioning large tables by a nearly unique key results in many partitions that have few rows.

Determining the optimal partition key can be a challenging task. However, as an example, if you tend to access data based on a customer ID, then you might improve performance by partitioning the data by customer.

SAS LASR Analytic Server: Reference Guide

Load a Table (As Is) to SAS LASR Analytic Server

The data builder is typically used to perform basic data preparation. However, there are cases when a table is already prepared for analysis. In these cases, you can load a table to memory on SAS LASR Analytic Server without any modification.

To load a table into memory on a SAS LASR Analytic Server:

- 1 Use the SAS Folders tree to locate the table.

TIP You can also click , and search for the table by name and location.

- 2 Select the table, right-click, and select **Load a Table**.
- 3 The fields in the **Source Table** section are filled automatically.

Specify the following settings in the dialog box:

Table 15.1 *Load a Table Dialog Box Properties*

Field	Description
Name	Enter the name to use for the table. This field is initially set to the same name as the source table. This name is registered in metadata with the SAS LASR Analytic Server library.

Field	Description
Description	Enter a description of the data. This description is displayed by SAS clients such as SAS Visual Analytics Explorer.
Location	This field is initially set to a default folder. Click Browse , and select a folder to use for the table metadata.
Library	This field is initially set to a default library. Click Browse , and select the SAS LASR Analytic Server library to use with the table.

- 4 Click **OK**.

Save an In-Memory Table to HDFS

This feature is available for deployments that use Hadoop as a co-located data provider only.

To save an in-memory table to HDFS:

- 1 Select **LASR ► Save a Table to HDFS**.
- 2 Click  to select the SAS LASR Analytic Server table that you want to save.
- 3 Make any necessary changes to the **Location** and **Library** fields in the **HDFS Table** section.

Note: The data builder is initially configured to use the Visual Analytics Public LASR library and Visual Analytics Public HDFS library. If you specify different libraries, then make sure that you understand how the path in HDFS is related to the server tag for the SAS LASR Analytic Server library. For more information, see *SAS Visual Analytics: Administration Guide*.

- 4 (Optional) Specify options. By default, the data builder replaces the table in HDFS if it already exists. You can specify the number of redundant copies for the table.
- 5 Click , and specify a name and location.
- 6 Click ► to save the table to HDFS.

Note: The table is saved with the user ID of the user that started the SAS LASR Analytic Server.

Appending In-Memory Tables

How Does Appending In-Memory Tables Work?

The data builder provides a very convenient way to add incremental data into a single table. For example, if sales data is loaded into memory on a daily schedule, you can append the numerous daily tables into a separate table that contains the cumulative sales data.

For the purpose of comparison, you can create a data query to append to an in-memory table with a data query. One reason to append entire tables is that you can also access the tables individually.

Append In-Memory Tables

To append in-memory tables:

- 1 Select **LASR ► Append Tables**.
- 2 Select the table that you want to append data to from the **Available tables** list, and move it to the **Base table** field.

If the table that you want to use is not listed, then click . If a table is added to the library after you click , then the list does not automatically refresh to show the new table. Select the same library again to refresh its contents.

- 3 Add tables to the **Source tables** list. These are the tables that have the rows to append to the base table.
- 4 (Optional) If you select the **Unload source tables after appending them to the base table** check box, then the source tables are dropped from memory after the append completes.

Select this option only if you do not want to access the source tables individually.

- 5 Click , and specify a name and location.
- 6 Click  to append the source tables.

How Are Tables Used?

Source Tables

The following list identifies the considerations for source tables:

- The source tables and base table must be in-memory.
- The source tables can be LASR star schema views. However, the base table cannot be a view.
- If you append tables with character columns of different lengths, then the length of the column in the base table takes precedence. For example, if you have a column in the base table that is 15 characters and a column in the source table is 20 characters, the data from the source table's column is truncated to 15 characters.
- If the base table is partitioned, then the source tables must be partitioned on the same variables.
- If the base table has a column that is not present in a source table, then the rows in the source table receive a missing value for the column that is not present in the source table.
- If a source table has columns that are not present in the base table, then the columns are dropped and are not appended to the base table. The base table always maintains the same number of columns.

- The order of the columns in a source table does not need to match the order of the columns in the base table.
- The data builder does not prevent you from appending the same source table more than once. Review the source table list to ensure you did not accidentally use a source table more than once.

Conserving Memory

After you append the source tables, the base table grows to accommodate the additional rows. This consumes memory on the SAS LASR Analytic Server.

If you do not need to access the source tables after appending them, then you can select the **Unload source tables after appending them to the base table** check box. This option conserves memory, but you must ensure that the source tables are loaded to memory again (often with newer data) before you can run the append again.

Monitor Memory Usage

A memory gauge is visible in the menu bar that shows the amount of physical memory that is used on the server.

The server rejects requests to add tables or append rows when 80% or more of the memory is used. (The default value for the server is 75%. SAS Visual Analytics deployments set the value at 80%.) System administrators can specify a different value for the server with SAS Management Console.

For non-distributed deployments, the 80% threshold applies to the single machine. For distributed deployments, the 80% threshold is evaluated for each machine in the cluster.

If the threshold is crossed, the operation fails, and the **Messages** tab includes an error that is similar to the following example:

```
ERROR: A server-side limit on the consumption of memory resources has
been reached. These limits can be adjusted by the owner or by the
administrator of the LASR Analytic Server.
```

In some deployments with limited network bandwidth, the data builder cannot communicate with the SAS LASR Analytic Server monitor, and the memory gauge fails to appear.

Importing SAS Information Maps

<i>About SAS Information Maps</i>	125
<i>Import a SAS Information Map</i>	126
<i>Limitations and Restrictions</i>	126

About SAS Information Maps

A SAS Information Map is descriptive information that is used by many SAS solutions and Business Intelligence products. An information map is applied to the data sources in your data warehouse to describe the structure and content of data. An information map does not contain any physical data. Information maps provide business users with a user-friendly way to understand data so that they can perform data queries and get results for themselves.

SAS Information Maps are created with either SAS Information Map Studio or the INFOMAPS procedure. SAS Visual Data Builder cannot create, edit, or save an information map. However, the data builder can import the business logic from a relational information map and represent it as an SQL query.

See Also

Base SAS Guide to Information Maps

Import a SAS Information Map

To import a SAS Information Map:

- 1 Use the SAS Folders tree to locate the map .
- 2 Select the map, right-click, and select **Import Query**.

A new data query is created with the same name as the map. The output table is automatically set with the same name as the map.

The business logic is imported from the map and represented as an SQL query on the **Code** tab.

TIP If you want to join a table, then save the data query, create a new data query, and add it as a subquery.

See Also

[Chapter 18, “Customizing Code,” on page 133](#)

Limitations and Restrictions

SAS Visual Data Builder has the following limitations and restrictions for working with information maps:

- The data builder can use information maps that are based on relational tables. Information maps that are based on OLAP cubes cannot be used.
- The information map cannot use more than 50 physical tables. A table that is used more than once in a self join counts as one physical table.

- The information map cannot use more than 5000 physical columns. A column that is used in more than one data item counts as one physical column.
- Prompts are not supported. Even if a prompt has a default value, the default value is not included.
- Data items that are based on business data are not supported. For example, the equation `Dataitem1 = Year + 2` (where `Year` is a data item) is not included in the data query.
- Data items that are based on physical columns are not supported. For example, the equation `Dataitem2 = FirstName || LastName` (where `FirstName` and `LastName` are columns) is not included in the data query.
- The output table is automatically named with the same name as the map. The name field is limited to 32 characters.

17

Supporting Text Analysis

<i>Features Overview</i>	129
<i>Load a Stop List</i>	129
<i>Add a Unique Numeric Key to a Table</i>	130

Features Overview

SAS Visual Analytics can perform text analysis with the explorer. To enable text analysis, perform the following data administration tasks with the data builder:

- Load a stop list to filter out commonly used words.
- Add a numeric key to existing tables that have unstructured text.
- Acquire Twitter data to analyze tweet trends. For information about acquiring Twitter data, see [“Import Tweets from Twitter” on page 57](#).

Load a Stop List

A stop list is a table of words that you want to ignore in your text analysis. By eliminating some commonly used words, such as the various forms of the verb “to be,” you can filter out noise from your analysis. SAS Visual Analytics supports English language text analysis and includes a stop list for English.

To load a stop list:

- 1 Select **Tools ► Load Text Analytics Stop List**.
- 2 Make changes to the location and library if necessary. Each stop list must be stored in its own metadata folder.

A table that is named ENGSTOPL is registered in the specified location and library.
- 3 Click **OK**.

SAS Visual Analytics supports one stop list for each SAS LASR Analytic Server. You load the stop list (which is a table) to memory by performing the previous steps. If more than one library is registered for SAS LASR Analytic Server, then you can use any one of them. If you load a stop list more than once or use more than one library, then the server uses the last stop list that was loaded to memory.

Add a Unique Numeric Key to a Table

In the case where your data already includes unstructured text that you want to analyze, the data builder can add a unique numeric key as a column in the table. For example, many data tables include a text column for comments. Using text analysis, you can look for trends or themes within these comments. The text analysis in SAS Visual Analytics requires a unique numeric key to reference the data sources.

To add a unique numeric key to a table:

- 1 Create a new data query.
- 2 Add the columns to include in the text analysis by clicking the column name in the table in the workspace.
- 3 In the **Column Editor**, right-click on the first row in the table, and select **Add Generated Key Column**.

A column that is named **GENERATED_ID** is added to the table.

- 4** Specify an output table, library, and location.
- 5** Save and run the data query.

When you run the data query, the **GENERATED_ID** column begins at zero and increments for each row in the source table. If you select the **Append data** check box on the **Properties** tab, then the data query increments from the current maximum value.

If the data that you want to use is already in memory on SAS LASR Analytic Server, then performing the previous steps results in the following sequence of data movements:

- The data is read from memory on SAS LASR Analytic Server and transferred to the SAS Application Server.
- The data query runs and adds the generated key column.
- The data is transferred back to SAS LASR Analytic Server in a new table.

You can avoid these data movements by adding the generated key column before loading the table to memory on SAS LASR Analytic Server.

18

Customizing Code

<i>Use the Code Tab</i>	133
<i>Preprocess and Postprocess Code</i>	134
<i>Considerations for Manually Editing Code</i>	134
Before You Manually Edit Code	134
Table and Column Metadata	135
Input and Output Libraries	135
Output and Staging Tables	136
Validate Custom Code	136

Use the Code Tab

You can click the **Code** tab to view the SQL statements that are generated by the data preparation expressions on the **Design** tab.

You can also use the **Code** tab to enter custom code.

- The **Preprocess** and **Postprocess** views enable you to enter SAS statements that are run before and after the data query runs.
- The **All Code** view shows the generated SQL statements. Click  to unlock the view so that you can manually edit all of the SAS statements for the data query. After you have unlocked the view, the button icon changes to .

After you have unlocked the view, you cannot continue using the **Design** tab to edit the data query, and the **Preprocess** and **Postprocess** views are disabled. However, if you

have not saved your changes to the code, you can click  to be able to use the **Design** tab.

Preprocess and Postprocess Code

In some cases, you might want to assign SAS options, load format catalogs, use LIBNAME statements, or run macros before running a data query. You can unlock the code to enter the statements, but that prevents you from using the **Design** tab. However, the **Preprocess** view or **Postprocess** view might enable you to supplement the data query while using the code generation features of the **Design** tab.

Any SAS statements that you enter in the **Preprocess** view or **Postprocess** view are included in the **All Code** view.

Considerations for Manually Editing Code

Before You Manually Edit Code

The code generation features in SAS Visual Data Builder can generate a lot of SAS statements with a few simple clicks. Depending on your needs, you might benefit by using the **Design** tab for adding input tables, performing joins, and filtering data before you customize the generated code.

The following features and settings must be specified before you unlock the code:

Unique values

Selecting this check box determines whether the DISTINCT keyword is included in the generated PROC SQL statement. After you unlock the code, the check box cannot be used to include the keyword.

Append data

Selecting this check box enables you to use the generated SAS statements for appending data to the output table before you unlock the code.

Output table

You must specify the table name, location, and library, and you must save the data query before you unlock the code. When you save the data query, the metadata for the table is registered.

Use a staging table

Selecting this check box registers the metadata for the table when you save the data query. Select the check box, specify the library, and save before you unlock the code.

Table and Column Metadata

After unlocking the code and saving it, the columns in the output table are removed from metadata. This is because the data builder uses the columns selected on the **Design** tab to create column metadata, and those column selections are no longer available after you unlock the view on the **Code** tab.

When you run the unlocked data query, the column metadata is registered as part of running the code. However, the columns might not be visible in the data builder immediately because the table metadata (without any columns) is cached in the application.

Input and Output Libraries

When you unlock the code for manual editing, you must specify the libraries to use for your tables. You can do this with LIBNAME statements. If you dragged and dropped the tables onto the workspace before you unlocked the code for manual editing, then the LIBNAME statements for the tables are automatically included.

See Also

- *SAS Statements: Reference*
- *SAS/ACCESS for Relational Databases: Reference*

Output and Staging Tables

Specify the table names, locations, and libraries on the **Outputs** tab just as you do on the **Design** tab.

Note: Specify the tables and save the data query before you unlock the code. If you do not specify the table name or the table name is already in use, then you are not able to save the data query.

See Also

SAS Language Interfaces to Metadata

Validate Custom Code

If you entered SAS statements in the **Preprocess** or **Postprocess** view, then those statements are not validated when you click .

If you unlock the code in the **All Code** view, then the  button is disabled. You cannot validate customized code.

Scheduling

- About Scheduling Data Queries* 137
 - How Does the Scheduling Feature Work? 137
 - Edit Data Queries That Are Already Scheduled 138
 - Caution about Scheduling Data Queries to Run Now 138
 - Scheduling Preferences 139
 - When Are the Scheduling Preferences Used? 141
- Creating Events* 141
 - Why Use Events? 141
 - Create a Time Event 142
 - Create a File Event 144
- Export Data Queries as Jobs* 145
- Additional Scheduling Resources* 145

About Scheduling Data Queries

How Does the Scheduling Feature Work?

When you have a data query open in the workspace, you can click  to schedule the data query. When you schedule a data query, the data builder performs the following operations:

- 1 Creates a *job* that performs the data query operations.

- 2 Creates a *deployed job* from the job.
- 3 Places the job into a new *deployed flow*.
- 4 Schedules the flow on a *scheduling server*.

You can reschedule the data query based on specified conditions (for example, run immediately or run whenever a trigger condition is met).

The job, deployed job, and deployed flow are metadata objects. The data builder stores them in the same metadata folder with the data query. The metadata objects are named based on the following pattern:

`vdb_name_timestamp`

Note: Up to 42 characters from the data query name are used as the name.

When the specified conditions are met, the data query is run with the user ID that scheduled it. This is the behavior for the Operating System Services Scheduler.

Edit Data Queries That Are Already Scheduled

If you edit a data query that is already scheduled, you must click  again so that the SAS statements for the data query are regenerated and saved.

Caution about Scheduling Data Queries to Run Now

When you schedule a data query, one of the options is to run it immediately. Select **Run now** in the Schedule window.

Performing the following steps results in an error condition:

- 1 Use a SAS data set for the output table of the data query.
- 2 Run the data query.
- 3 Click the **Results** tab to look at the output.
- 4 Schedule the data query by selecting **Run now**.

These steps result in an error condition because SAS unlocks a SAS data set when it is opened for reading. When step 3 is performed, the output table is locked, and no other process can overwrite the output table. The following message is included in the SAS log:

Locked Error Message

```
ERROR: A lock is not available for OUTPUTTABLE.
```

```
ERROR: Lock held by process xxxx.
```

You can avoid this error condition. If you want to schedule the data query to run now, then close it, open it again, and schedule it to run now. Alternatively, you can schedule the data query to run in the future and then close the data query.

Scheduling Preferences

Default Scheduling Server

By default, your deployment includes a server that is named **Operating System Services** – *hostname.example.com*. This server is used as the default scheduling server.

Use the Server Manager plug-in to SAS Management Console to identify the scheduling servers that are included in your deployment. You can specify a different scheduling server in your application preferences. Any data queries that you schedule after you specify a different scheduling server will use the new scheduling server.

Some deployments include the Platform Suite for SAS server. To use this server, change the scheduling server. The default name is **Platform Process Manager**.

In all cases, when you schedule a new data query, the data builder retrieves your default scheduling server, and uses that value to look up the scheduling server in SAS metadata. The data builder uses the first server that matches the value in SAS metadata. Including the host name, such as **Operating System Services** – *hostname.example.com* ensures that the data builder uses the server that you specify.

Default Batch Server

By default, your deployment includes a server that is named **SASApp – SAS DATA Step Batch Server**. This server is used as the default batch server.

You can specify a different batch server in your application preferences. Consider the following before you change the default batch server:

- The batch server must be registered in metadata as a component of a SAS Application Server that you can access.
- You must specify the same SAS Application Server as your default application server in your preferences.

As with the default scheduling server, the data builder retrieves your default batch server, and uses that value to look up the batch server in SAS metadata the first time you schedule the data query. The data builder uses the first server that matches the value in SAS metadata.

If you have multiple server contexts and each context has its own batch servers, then you should specify in preferences the servers that you want to use.

Default Deployment Directory

A deployment directory is a SAS metadata object that represents the following items:

- the name of the SAS Application Server with which the deployment directory is associated. The default value is **SASApp**.
- a name for the deployment directory. The default value is **Batch Jobs**.
- the path to the deployment directory. The default value is **SAS-config-dir/Lev1/SASApp/SASEnvironment/SASCode/Jobs**.

When you schedule a data query, the SAS statements for the data query are saved in a file. The file is saved in the path that is associated with the deployment directory. The file is named based on the same pattern that is described in [“How Does the Scheduling Feature Work?” on page 137](#).

The data builder looks up the SAS Application Server in the SAS Metadata Server using your scheduling server preference setting. The initial value is **SASApp**. If a matching server name is not found, then the data builder uses the first application server that is

returned. After the server is determined, the data builder looks up the deployment directory in that server context that matches your scheduling server preference setting. If a matching deployment directory is not found, then the data builder uses the first deployment directory that is returned.

You can specify a different name for the default deployment directory. For more information about deployment directories and using the Server Manager plug-in to SAS Management Console, see *Scheduling in SAS*.

When Are the Scheduling Preferences Used?

Any of the preferences that you change are used the next time you create a data query and schedule it. If you edit an existing data query that is already scheduled, then the existing settings for the scheduling server, batch server, and deployment directory are not updated with the changes. To change the settings for existing data queries that are already scheduled, use SAS Management Console to redeploy the deployed job for the data query.

Creating Events

Why Use Events?

Events specify conditions that must be met before a step in the flow can take place. You can use SAS Visual Data Builder to create two types of events.

- *Time events* are evaluated based on a specified time being reached.

Note: You can specify multiple time events. However, the Operating System Services Scheduler (the default scheduler) can use only one of the time events.

- *File events* are evaluated based on the state of a specified file.

You can create file events if your deployment includes a scheduling server that supports them, and the flow is deployed to that scheduling server. Time and file events can be used as triggers (conditions that must be met in order to run a flow on the scheduling server).

Create a Time Event

You can create a time event and use it as a trigger.

To create a time event:

- 1 In the Schedule window, select **Select one or more triggers for this data query**, and then click **New Time Event**.
- 2 In the New Time Event window, specify whether the time event should happen one time only or more than once. If the time event should happen one time only, then specify the date and time for the time event.
- 3 If the time event should happen more than once, then select **More than once** and then select a radio button for how often the time event should repeat (such as hourly, weekly, or yearly).
- 4 Specify the details of when the time event should repeat. The specific fields that are available depend on the recurrence interval that you select.

If you select **Hourly**, then the time is calculated from hour zero on a 24-hour clock. For example, if you leave **Interval hour** set to 1, then the data query runs at hour zero (midnight), and runs each hour. If you set **Interval hour** to 2, then the data query runs every other hour, and the **Offset hour** specifies whether to run on the even hours (when set to 0) or on the odd hours (when set to 1). In this case, the **Offset hour** specifies the offset from hour zero (midnight).

If the recurrence interval requires you to select start times, then use the **Hours** and **Minutes** check boxes to select the times. The **Minutes** area contains groupings of 10-minute intervals. Selecting a check box for a minute grouping selects all of the minutes in that grouping.

TIP The following display is available after selecting **More than once** and then **Daily** on the New Time Event window.

Hours:	Minutes:	Selected start times:
<input checked="" type="checkbox"/> 19:00 <input type="checkbox"/> 20:00 <input type="checkbox"/> 21:00 <input type="checkbox"/> 22:00 <input type="checkbox"/> 23:00	<input checked="" type="checkbox"/> 0-9 <input type="checkbox"/> 10-19 <input type="checkbox"/> 20-29 <input type="checkbox"/> 30-39 <input type="checkbox"/> 40-49 <input type="checkbox"/> 50-59	19:00, 19:01, 19:02, 19:03, 19:04, 19:05, 19:06, 19:07, 19:08, 19:09
Duration in minutes: <input type="text" value="1"/>		

To select individual minutes, expand the grouping.

Hours:	Minutes:	Selected start times:
<input checked="" type="checkbox"/> 19:00 <input type="checkbox"/> 20:00 <input type="checkbox"/> 21:00 <input type="checkbox"/> 22:00 <input type="checkbox"/> 23:00	<input checked="" type="checkbox"/> 0-9 <input type="checkbox"/> 0 <input type="checkbox"/> 1 <input checked="" type="checkbox"/> 2 <input type="checkbox"/> 3 <input type="checkbox"/> 4 <input type="checkbox"/> 5	19:02
Duration in minutes: <input type="text" value="1"/>		

If you select multiple values for **Hours**, then all of the selections for **Minutes** apply to all of the selected values. For example, if you select 19:00 (07:00 PM) and 22:00 (10:00 PM) for **Hours**, and 43 for **Minutes**, then the time event is scheduled for 19:43 and 22:43.

Hours:	Minutes:	Selected start times:
<input checked="" type="checkbox"/> 19:00 <input type="checkbox"/> 20:00 <input type="checkbox"/> 21:00 <input checked="" type="checkbox"/> 22:00 <input type="checkbox"/> 23:00	<input checked="" type="checkbox"/> 40-49 <input type="checkbox"/> 40 <input type="checkbox"/> 41 <input type="checkbox"/> 42 <input checked="" type="checkbox"/> 43 <input type="checkbox"/> 44 <input type="checkbox"/> 45	22:43 19:43
Duration in minutes: <input type="text" value="1"/>		

- 5 The **Duration in minutes** field is used to specify the maximum number of minutes after the specified time has been reached that the dependency is kept in an open state. This value is used when a job has multiple dependencies. It specifies a window of time in which the time event remains open so that other events can also be met.

For example, a query is specified to run only if a file event and a time event are both met. The time event has a value for **Duration in minutes** of 10. When the time specified for the time event is reached, the query runs if the file event is met at any time up to 10 minutes later.

- 6 If needed, specify the start date and end date for the time event. The default is to start at the current date and time and not to have an end date.

Create a File Event

You can create a file event and use it as a trigger. The file event can check for various file conditions, such as its existence, size, or age.

Note: Not all scheduling servers support file events. Platform Suite for SAS servers do support file events. The **New File Event** button that is used to create a file event is available only when the scheduling server supports file events.

To create a file event:

- 1 In the Schedule window, select **Select one or more triggers for this data query**, and then click **New File Event**.
- 2 In the New File Event window, specify or select the file to use for the file event.
- 3 Select the condition to evaluate the file to make the file event true. For example, if you selected **not exist** for the condition, the file event would be true only if the selected file was not in the specified location.
- 4 If needed, specify the details (such as size or age) about the condition.

Export Data Queries as Jobs

For deployments that include SAS Data Integration Studio and prefer to deploy jobs, create flows, and schedule flows manually, you can export a data query as a job, and then perform the deployment steps.

This feature enables you to work with a data query interactively while you create it, and then you can export the data query as a job for automating the operations. After the job is exported, you can deploy the job for scheduling with SAS Data Integration Studio. For more information about deploying jobs, see *Scheduling in SAS*.

After a job is stored in metadata, you can open the job with SAS Data Integration Studio and edit it. This might be necessary if you need to add or remove columns or change the column expression in a calculated column.

If the deployment does not include SAS Data Integration Studio, then you can modify the data query and export it as a job again. However, you cannot overwrite job objects in metadata with the data builder. If you need to delete objects from metadata (such as jobs, libraries, or tables), use SAS Management Console.

To export a data query as a job:

- 1 Use the SAS Folders tree to locate the data query.
- 2 Select the data query, right-click, and select **Export as a job**.
- 3 In the Export as a Job window, enter a name and specify a location. Click **Export**.

Additional Scheduling Resources

SAS Visual Data Builder provides an easy-to-use method for taking a data query and making it available for scheduling as a flow. In addition, the Schedule Manager plug-in

to SAS Management Console provides additional resources for managing deployed flows, job dependencies, and scheduling servers.

For users that are familiar with the Schedule Manager plug-in, be aware that the data builder does not support scheduling a data query without a trigger. In the Schedule Manager plug-in, this option is specified as the **Manually to the scheduling server** condition. If this is your preferred method for scheduling, you can use the Schedule Manager plug-in to modify the flow for the scheduled data query. If you use the data builder to schedule the data query afterward, the setting is lost and you must repeat your steps with the Schedule Manager plug-in.

Using the Results Tab

<i>About the Results Tab</i>	147
<i>Data Pages</i>	148
<i>Navigate within the Data</i>	148
<i>Find</i>	148
<i>Filter and Sort</i>	149
<i>Export Data</i>	149
<i>Column Headings</i>	150

About the Results Tab

After you have created your data query and clicked ►, it runs, and you are prompted to determine whether you want to view the results.

If you click **Yes**, then the data builder retrieves the data and shows you the results on the **Results** tab.

Note: For large data sets, retrieving and displaying the data can require a long time.

Data Pages

When you view data, a SAS server retrieves the data from the data set. Instead of returning all of the data, the data viewer requests a page of data. You can set the page size to between 20 and 2000 rows.

A slider is provided at the bottom of the **Results** tab so that you can navigate through the pages and browse the entire data set.

Navigate within the Data

Navigate to a row in the table by entering the row number in the **Go to row** field. The **Go to first row** and **Go to last row** buttons provide navigation to the first and last rows of the table.

Find

Search for text or numbers in the data set by clicking , typing in the **Find** field, and pressing Enter. The find feature searches through the rows in the data set for the value, and it highlights the first row with the value. You can navigate through the results by clicking **Find next** and **Find previous**.

Click  to set options. The following list identifies the options:

- **Options tab**

- ☐ **Exactly matches the specified string**
- ☐ **Contains the specified string** (default setting)
- ☐ **Starts with the specified string**

- ☐ **Case sensitive**
- ☐ **Trim leading and trailing spaces** (default setting)
- **Columns** tab
 - Enable and clear check boxes to specify the columns to search.

Filter and Sort

Sort the data by clicking , and then choosing the columns and sort order. The **Generated SQL statement** field shows the sort criteria.

Filter the data by clicking , and setting the following options:

- The **Sample** tab is used to limit the number of rows to return or to select distinct values.
- The **Row Filter** table is used to subset data with a WHERE clause. You can filter on the values in multiple columns, set ranges for numeric values, and use IN and NOT IN criteria for character values. If the number of distinct values is less than 50, then you can select check boxes for the values. If there are more than 50 distinct values, then you must enter the values to use for filtering.
- The **Column Filter** tab is used to select the columns to display.

Export Data

You can save the data that you view as a comma-separated values file. After you click , you can choose to export the rows on the current data page, all of the rows, or a range of rows. The export feature has a limit of exporting 200,000 rows.

If you choose to export all of the data or a range of rows, then you must click **Retrieve Data** before you can click **Export as CSV**.

Column Headings

Use the **Headings** menu to control the appearance of the column headings. You can view the column name from the data set, the column label from the data set, or a combination of the two. If a column does not have a label in the data set, then the column name is used.

Overview of SAS Visual Analytics Explorer

<i>What Is SAS Visual Analytics Explorer?</i>	153
<i>The Welcome Window</i>	154
Overview of the Welcome Window	154
Create a New Exploration	154
Open an Existing Exploration	155
<i>Your First Look at the Explorer</i>	156
<i>Manage Tabs in the Right Pane</i>	157

What Is SAS Visual Analytics Explorer?

SAS Visual Analytics Explorer (the explorer) is a component of SAS Visual Analytics that enables you to explore your data sources. You can explore your data by using interactive visualizations such as charts, histograms, and tables. You can also apply data analysis such as forecasting, correlation, and fit lines.

Your work in the explorer is saved as a metadata object called an *exploration*. An exploration (sometimes called a visual exploration) contains all of the visualizations, data settings, and filters from your explorer session.

You can use the explorer to explore in-memory tables from the SAS LASR Analytic Server. You can either open a table directly or you can open a saved exploration.

You can export your exploration results as reports, which can be refined in SAS Visual Analytics Designer (the designer) or viewed directly. Reports can be viewed on a mobile device or in the SAS Visual Analytics Viewer (the viewer).

You can save your explorations as PDF documents, share your saved explorations via e-mail, and export your visualizations as image files. You can export the data from your visualizations to a data file that you can use in other tools.

Note: Stored processes are not supported in the explorer.

The Welcome Window

Overview of the Welcome Window

If you enter the explorer without a reference to a specific exploration, then the Welcome window appears.

The Welcome window enables you to perform the following tasks:

- [“Create a New Exploration” on page 154](#)
- [“Open an Existing Exploration” on page 155](#)

Create a New Exploration

To create a new exploration, click **Select a Data Source**. The Open Data Source window appears.

To open a data source that is already loaded, select the data source from the **Data Sources** pane and then click **Open**. In the **Search** field, you can enter a short string to find all of the data sources whose names, descriptions, or locations begin with that string.

Note: You can also perform a search that matches a string anywhere in the data source name, description, or location. Select the **Search** field, and then press Ctrl + Down to switch the search to **Search (contains)**.

To load a new data source, click one of the links in the **Import Data** pane. This task is available only if you have the Import and Load Data capability.

For information about importing data, see [Chapter 5, “Importing Local Data Files,”](#) on page 43 and [Chapter 6, “Importing Data from Servers,”](#) on page 51.

Open an Existing Exploration

To open an existing exploration, you can either select from your recent explorations, or select any exploration by clicking **Browse** to locate the exploration.

Your First Look at the Explorer

Here are the main parts of the explorer user interface:

Figure 21.1 The Explorer User Interface

- 1 The application bar enables you to return to the home page and to access other parts of SAS Visual Analytics and other SAS applications that integrate with the home page. You can access your recently created or viewed reports, explorations,

stored processes, data queries, or other objects in your recent history. Buttons are displayed for each open application.

- 2 The menu bar offers common tasks, such as creating a new exploration.
- 3 The toolbar enables you to manage your explorations and visualizations.
- 4 The **Data** pane enables you to manage the data that is used in your visualizations.
- 5 The data properties table enables you to set data item properties.
- 6 The workspace displays one or more visualizations.
- 7 The right pane's tabs enable you to set properties and data roles, create filters and ranks, set global parameter values, and use comments.
- 8 The dock contains any minimized visualizations.

Manage Tabs in the Right Pane

In the right pane, the following tabs can be displayed:

-  **Roles**
-  **Filters**
-  **Ranks**
-  **Properties**
-  **Comments**
-  **Parameters**

To hide a tab, click  beside the tab label.

To show a tab, select **View** ► **tab-name** from the main menu.

To display the full label name for each tab, select the  drop-down list, and then deselect **Show icons only**.

You can reorder the tabs in the right pane by dragging and dropping them.

22

Specifying Preferences for SAS Visual Analytics Explorer

<i>Specify Global Preferences</i>	159
<i>Specify Your Preferences for the Explorer</i>	159

Specify Global Preferences

See “[Specify Global Preferences](#)” on [page 27](#) for details about global preferences for SAS Visual Analytics.

Specify Your Preferences for the Explorer

Here are the steps to specify preferences that are specific to SAS Visual Analytics Explorer (the explorer):

- 1 Select **File** ► **Preferences** to open the Preferences window.
- 2 Select **SAS Visual Analytics Explorer** ► **Geographic Mapping**.

- 3 Select the default **Map provider mode** for geographic maps. The map provider creates the background map for geo maps and for network diagrams that display a map.

Note: You can change the map provider for an individual visualization by editing the **Map service** value on the **Properties** tab.

- 4 If your **Map provider mode** is **Esri**, then you must select the specific Esri map service that you want to use.
 - 5 Select **SAS Visual Analytics Explorer ► Visualizations**.
 - 6 Select a **Graph skin** to change the visual effects that are applied to your graphs. For example, many of the **Graph skin** settings apply lighting effects to the features of your graph to create a 3-D appearance.
 - 7 Select **Visualization data threshold** to specify the amount of data values that your visualizations can process. The precise amount of data that is supported varies depending on the visualization type. See [Appendix 7, “Data Limits,” on page 721](#).
- Note:** A high value for **Visualization data threshold** might degrade your application performance or lead to time-out errors.
- 8 Select **Update automatically** to specify whether new visualizations apply your changes automatically.
 - 9 To return to the default settings, select **Reset to Defaults**.
 - 10 Click **OK** to apply your changes. Your preferences persist between sessions.

23

Managing Explorations

<i>What Is an Exploration?</i>	161
<i>Create a New Exploration</i>	161
<i>Save Your Exploration</i>	162
<i>Delete Explorations</i>	162

What Is an Exploration?

An exploration (sometimes called a visual exploration) is a metadata object that contains all of the visualizations and data settings from a SAS Visual Analytics Explorer (the explorer) session. You can use explorations to save your session for later and to share it with others.

Create a New Exploration

To create a new exploration, select **File ► New Exploration** from the menu bar. The Open Data Source window appears. Select your data source, and then click **Open**.

Save Your Exploration

To save your current exploration, select **File** ► **Save As**, and then select a location and a name.

Delete Explorations

To delete an exploration, use the SAS Visual Analytics home page. See [“Manage Content on the Home Page”](#) on page 16.

24

Managing Data Properties

Overview of Managing Data Properties

At any time after you have loaded a data source for your exploration, you can modify the properties of the data items. The changes that you make are saved as part of the exploration, but do not affect the original data source.

You can manage the properties for individual data items by using the **Data** pane or manage the properties for all of your data items by using the Data Properties window.

Manage Data Properties for Data Items

You can manage data properties by using the Data Properties window or by using the properties table in the **Data** pane.

To access the Data Properties window, select **Data ► Data Properties** from the menu bar.

For each data item, you can specify the following properties:

Name

specifies the name of the data item.

Classification

specifies whether the data item is a category, a measure, a document collection, or a geography.

Note: Changing the classification from a category to a measure or vice versa does not change the data type of the data. You can change the data type by using the **Format** and **Parse** operators in a calculated data item.

Model Type

specifies the type of data model for a measure or for a category with datetime data. Select whether the data model is continuous or discrete.

The model type that you specify determines the type of data filters that you can create for the data item.

Note: If you change the model type for a data item that is used in a filter, then the filter is removed.

Format

specifies the data format for the data item.

See [“Select a Numeric Format” on page 166](#) and [“Select a Date or Time Format” on page 167](#) for information about specifying formats.

Aggregation (for measures only)

specifies the method that is used to aggregate values for the measure. For a list of the aggregations that you can choose, see [“Aggregations for Measures” on page 681](#).

Select a Numeric Format

Here are the steps to select a numeric format:

- 1 In the Data Properties window or in the property table in the **Data** pane, click the format for the data item. A window appears.
- 2 Select the basic format type from the **Format** list.
- 3 Specify the **Width** parameter for the format. The width of the format specifies the maximum number of characters that a value can contain, including decimal points.

A preview of your format appears in the **Sample** field.

- 4 Specify the number of **Decimals** for the format. The **Decimals** value specifies the number of digits that appear to the right of the decimal place.

A preview of your format appears in the **Sample** field.

- 5 Click **OK** to apply your format.

Note: You can restore the default format by clicking **Reset to Default**.

Select a Date or Time Format

Here are the steps to select a date or time format:

- 1 In the Data Properties window or in the property table in the **Data** pane, click the format for the data item. A window appears.
- 2 Select the basic format type from the **Format** list.
- 3 If necessary, select a more specific format from the **Sample** list. The format names also represent sample values for the format.
- 4 Click **OK** to apply your format.

Note: You can restore the default format by clicking **Reset to Default**.

Note: Time and datetime values in the explorer ignore daylight-saving time.

Show and Hide Data Items

If your exploration contains a large number of data items, you might want to hide the items that you are not interested in.

Here are the steps to select which data items that are shown in the **Data** pane:

- 1 Select **Data ► Show or Hide Items** from the menu bar. The Show or Hide Items window appears.

- 2 Click **Select All** to select or deselect all of the data items, or click the check box beside each data item to select whether that data item is shown.
- 3 Click **OK** to apply your changes.

Sort Data Items

To sort your data items in the **Data** pane, select  and then select **Sort Items**. Select **Ascending by Name** or **Descending by Name**.

Group Data Items

To group your data items in the **Data** pane, select , and then select **Group Items**. Select one of the following grouping types:

By First Letter

groups by the first letter of the data item name.

By Data Type

groups by data type (date, numeric, or character).

By Model Type

groups by model type (continuous or discrete).

By Classification

groups by data classification (category, geography, hierarchy, measure, or aggregated measure).

By Format

groups by data format (for example, \$CHAR, Numeric, Percent, or MMMYYY).

By Aggregation

groups measures by the default aggregation.

Note: The default grouping is **By Classification**.

Assigning Colors for Category Values

About Colors

By default, the explorer assigns colors dynamically to category values for grouped visualizations. You can assign specific colors to your category values to ensure that the category values are always represented by a specific color. Because the same assigned colors are used in every visualization, you can easily compare values between visualizations.

Assign Colors for a Category

Here are the steps to set the colors for a category:

- 1 Right-click on a category from the **Data** pane, and then select **Colors**. A color selection window appears.
- 2 For each category value to which you want to assign a color, select the value from the **Choose** drop-down list, and then click the color box to select a color. Click **Apply** to save your selection.
- 3 (Optional) To automatically assign persistent colors for all of the unassigned category values, click **Assign remaining**. Colors are assigned to all of the remaining category values. These colors are used consistently in all of your visualizations.
- 4 Click **OK** to apply your changes.

Reset Colors for a Category

Here are the steps to reset the colors for a category:

- 1 Right-click on a category from the **Data** pane, and then select **Colors**. A color selection window appears.
- 2 Click **Reset all** to clear all of the color assignments for the category.
- 3 Click **OK** to apply your changes.

Assign a Color for a Specific Category Value

Here are the steps to assign the color for a specific category value:

- 1 Within a grouped visualization, right-click on a data value, and then select **Change Color**.
- 2 Click the color box to select the color.
- 3 Click **OK** to apply the new color. This color value is used consistently for the selected category value in all of your visualizations.

Add Additional Data Sources to Your Exploration

At any time, you can add additional data sources to your exploration. To add a data source to your exploration, select **Data ► Add Data Source**. In the Open Data Source window, select or import the data source that you want to use, and then click **Open**.

The new data source is selected automatically in the **Data** pane. You can use the drop-down list in the **Data** pane to select which data source you want to use.

Note: Each visualization in your exploration is associated with a specific data source. By default, a new visualization uses the data source that is selected in the **Data** pane when the visualization is created. For an empty visualization with no ranks or filters, you can add data items from any data source to change the data source.

Replace a Data Source in Your Exploration

At any time, you can replace a data source in your exploration with a different data source. All of the visualizations, filters, and settings that used the previous data source are applied to the new data source.

Here are the steps to replace a data source in your exploration:

- 1 In the **Data** pane, select the data source that you want to replace from the drop-down list.
- 2 Select , and then select **Change Data Source**.
- 3 In the Change Data Source window, select or import the data source that you want to use.

Note: If any data items in the previous data source do not exist in the new data source, then a message appears. Any data items that do not exist in the new data source are removed from your exploration. Any filters, ranks, or calculated items that are based on the removed data items are also removed.

- 4 Click **Change** to add the new data source.

Remove a Data Source from Your Exploration

Here are the steps to remove a data source from your exploration:

- 1 On the **Data** pane, select the data source that you want to delete from the drop-down list.
- 2 Select , and then select **Delete Data Source**.

Note: You cannot delete the last remaining data source from an exploration.

- 3 Confirm that you want to delete the selected data source.

Note: Any visualizations, filters, ranks, or calculated items that are based on the deleted data source are removed from your exploration.

Refresh Your Data Sources

At any time, you can refresh your data sources to include the latest changes.

To refresh your data sources, select **Data ► Refresh All Data Sources**.

Your visualizations are automatically updated with the refreshed data.

Creating Custom Categories

About Custom Categories

A custom category is a category data item that enables you to assign labels for groups of values in an existing category or measure.

For example, if your data source contains a category with country names, you might create a custom category to group the country names by continent. For a measure, you might label three value ranges as “Low,” “Optimal,” and “High.”

Create a Custom Category for a Measure

Here are the steps to create a custom category for a measure:

- 1 Select **Data ► New Custom Category**.
- 2 Select the measure that you want to use for the custom category.
- 3 Specify the **Name** for the custom category.
- 4 Select whether the custom category uses **Intervals** or **Distinct Values**.
- 5 Specify the label groups for the custom category:
 - a As needed, click **New label** to add a new label group to the custom category.

- b** For each label group, click the label group heading (for example, **Label1**) to specify the label text.

Note: The label text must use characters that are compatible with the locale of the data source. If the data source uses Unicode, then your labels can contain characters from any locale.

- c** For each label group, specify the values that are associated with the label:
 - For intervals, select **+** and specify the minimum and maximum values for the interval.
 - For distinct values, drag and drop values from the **Values** list onto the label group.

- 6** Select one of the following options:

Group remaining values as

assigns a label to all values that are not included in your label groups. The default label text is “Other.”

Show as missing

assigns all values that are not included in your label groups as missing values.

- 7** Click **OK**. The new custom category is displayed in the **Data** pane.

Create a Custom Category for a Category or a Date

Here are the steps to create a custom category for a category or a date:

- 1** Select **Data ► New Custom Category**.
- 2** Select the category or date that you want to use for the custom category.
- 3** Specify the **Name** for the custom category.
- 4** Specify the label groups for the custom category:

- a As needed, click **New label** to add a new label group to the custom category.
- b For each label group, click the label group heading (for example, **Label1**) to specify the label text.

Note: The label text must use characters that are compatible with the locale of the data source. If the data source uses Unicode, then your labels can contain characters from any locale.

- c For each label group, specify the values that are associated with the label.
Drag and drop values from the **Values** list onto the label group.

5 Specify the Options for remaining values.

Select one of the following options:

Group remaining values as

assigns a label to all values that are not included in your label groups. The default label text is “Other.”

Show as missing

assigns all values that are not included in your label groups as missing values.

Show as is

retains the existing category value for all values that are not included in your label groups.

- 6 Click OK.** The new custom category is displayed in the **Data** pane.

Working with Global Parameters

About Global Parameters

Global parameters enable you to specify a variable whose value can be changed globally at any time. You can use global parameters in filters, calculated items, and aggregated measures.

If your selected visualization contains a data item or filter that uses a global parameter, then the parameter appears on the **Parameters** tab. The same value for the parameter is used globally in your exploration for all filters, calculated items, and aggregations that include the parameter.

Note: Global parameters are shown on the **Parameters** tab only if a data item or filter that uses the global parameter is used in the selected visualization.

Create a Global Parameter

You can create a global parameter during the process of editing a filter, calculated item, or aggregated measure.

- 1 In the expression editor, right-click the **Parameter** heading in the **Data Items** list, and then select **Create Parameter**.
- 2 Specify the **Name** of the parameter.
- 3 Specify the **Type** for the parameter. You can select either **Numeric** or **Character**.
- 4 For character parameters, specify the **Current value** for the parameter.

For numeric parameters, specify the following:

Minimum value

specifies the minimum possible value for the parameter.

Maximum value

specifies the maximum possible value for the parameter.

Current value

specifies the current value for the parameter.

Format

specifies the data format for the parameter.

- 5 Click **OK** to save the parameter.

- 6 Finish editing your item. If you close the expression editor window without saving, then your new parameter is not saved.

Set the Value for a Global Parameter

If your selected visualization contains a global parameter, then the parameter appears on the **Parameters** tab.

For a numeric parameter, either drag the slider to adjust the value or click the value below the slider to edit the value.

For a character parameter, enter the value in the text field.

Edit a Global Parameter

To edit the settings for a parameter, follow these steps:

- 1 On the **Parameters** tab, select the ▼ drop-down list for the parameter, and then select **Edit**.
- 2 For character parameters, specify the **Current value** for the parameter.

For numeric parameters, specify the following:

Minimum value

specifies the minimum possible value for the parameter.

Maximum value

specifies the maximum possible value for the parameter.

Current value

specifies the current value for the parameter.

Format

specifies the data format for the parameter.

- 3 Click **OK** to apply your changes.

Delete a Global Parameter

To delete a global parameter, follow these steps:

- 1 Edit a filter, calculated item, or aggregated measure.
- 2 In the **Data Items** list, right-click the parameter that you want to delete, and then select **Delete Parameter**.

Note: You can delete a global parameter only if it is not used by any filters, calculated items, or aggregated measures.

- 3 Finish editing your item, and then click **OK**.

Note: If you close the expression editor window without saving, then the parameter is not deleted.

Creating Calculated Data Items

About Calculated Data Items

The explorer enables you to calculate new data items from your existing data items by using an expression.

Note: All calculations are performed on unaggregated data. The calculation expression is evaluated for each row in the data source before aggregations are performed. To perform calculations on aggregated data, see [“Creating Aggregated Measures” on page 179](#).

In addition to performing mathematical calculations on numeric values, you can use calculated data items to create character values and date and time values. For example, if your data contains separate categories for month, day, and year, then you can calculate a date value from each category.

Create a Calculated Data Item

Here are the steps to create a calculated data item:

- 1 Select **Data ► New Calculated Item**. The New Calculated Item window appears.
- 2 Enter a **Name** for the calculated data item.
- 3 Select the data type for the calculated data item from the **Result type** drop-down list.

Note: The data type is updated automatically based on the outermost operator of your expression.

- 4 Build the expression for your calculated data item by dragging and dropping data items, global parameters, and operators onto the expression in the right pane. For each field in the expression, you can insert a data item, a global parameter, an operator, or a specific value.

Note: Aggregated data items and derived data items are not supported for calculation expressions.

When you drag and drop data items, global parameters, and operators onto the expression, the precise location of the cursor determines where and how the new element is added to the expression. As you drag the new element over the expression, a preview appears, which displays how the expression would change if you drop the element at the current location.

For example, if your current expression is `(Profit / Revenue)`, and you drag the **x - y (subtract)** operator over the open parenthesis symbol, then the expression changes to `([number] - (Profit / Revenue))`. If you drag the operator over the division symbol, then the expression changes to `(Profit - Revenue)`.

There are a large number of operator types available to perform mathematical functions, process datetime values, and evaluate logical processing such as IF clauses. See [Appendix 5, “Operators for Data Expressions,” on page 685](#).

Note: You can also edit your expression as text. See [“Editing a Data Expression in Text Mode” on page 677](#).

- 5 When you are finished creating your expression, select the **Default aggregation** for the calculated data item, and then click **Select** to choose the data format.
- 6 Click **Preview** to see a preview of the calculated data item as a table. The table displays the values of the calculated item and any data items that are part of the calculation expression.
- 7 Click **OK** to create the new calculated data item. The new data item appears in the **Data Items** pane.

Creating Aggregated Measures

About Aggregated Measures

Aggregated measures enable you to calculate new data items by using aggregated values. For example, you might want to calculate a company's profits by subtracting expenses from revenues.

Note: To calculate data items by using unaggregated values, see [“Creating Calculated Data Items” on page 177](#).

Aggregations are evaluated as part of the calculation expression. For each data item in your expression, you can select the aggregation type and the context for the aggregation.

Create an Aggregated Measure

Here are the steps to create an aggregated measure:

- 1 Select **Data ► New Aggregated Measure**. The New Aggregated Measure window appears.

- 2 Enter a **Name** for the aggregated measure.
- 3 Build the expression for your aggregated measure by dragging and dropping data items, global parameters, and operators onto the expression in the right pane. For each field in the expression, you can insert a data item, a global parameter, an operator, or a specific value.

Note: You can create a new calculated item to use in the aggregated measure expression. Click **New Calculated Item** to create the new calculate item.

When you drag and drop items, global parameters, and operators onto the expression, the precise location of the cursor determines where and how the new element is added to the expression. As you drag the new element over the expression, a preview appears, which displays how the expression would change if you drop the element at the current location.

There are a large number of operator types available to perform mathematical functions and evaluate logical processing such as IF clauses. See [Appendix 5, “Operators for Data Expressions,” on page 685](#).

Note: You can also edit your expression as text. See [“Editing a Data Expression in Text Mode” on page 677](#).

- 4 For each data item in your expression, select an aggregation type. By default, **Sum** is used for measures and **Distinct** is used for categories. To select a new aggregation type, drag and drop an aggregated operator from the **Operators** list onto the aggregation type in the expression. See [Appendix 5, “Operators for Data Expressions,” on page 685](#) for a list of the aggregated operators that are available.
- 5 For each aggregated operator in your expression, select the aggregation context. A drop-down list beside each aggregation enables you to select one of the following context values:

ByGroup

calculates the aggregation for each subset of the data item that is used in a visualization. For example, in a bar chart, an aggregated measure with the **ByGroup** context calculates a separate aggregated value for each bar in the chart.

ForAll

calculates the aggregation for the entire data item (after filtering). For example, in a bar chart, an aggregated measure with the **ForAll** context uses the same aggregated value (calculated for the entire data item) for each bar in the chart.

By using the **ForAll** and **ByGroup** contexts together, you can create measures that compare the local value to the global value. For example, you might calculate the difference from mean by using an expression like the following:

```
Avg ByGroup(X) - Avg ForAll(X)
```

- 6 When you are finished creating your expression, click **Select** to choose the data format.
- 7 Click **OK** to create the new aggregated measure. The new data item appears in the **Data Items** pane.

Support for Aggregated Measures

Aggregated measures can be used in the following visualization types:

- Automatic Chart
- Crosstab
- Bar Chart
- Bubble Plot (grouped bubble plots only)
- Line Chart
- Treemap
- Geo Map

Creating Derived Items

About Derived Items

For the categories and measures in your exploration, you can create derived data items. Derived data items are aggregated measures that perform calculations for your data.

Derived Item Types for Categories

For categories, you can create the following types of derived items:

Distinct Count

displays the number of distinct values for the category that it is based on.

Count

displays the number of nonmissing values for the category that it is based on.

NMiss

displays the number of missing values for the category that it is based on.

Derived Item Types for Measures

For measures, you can create the following types of derived items:

Difference from Previous Parallel Period

Displays the difference between the value for the current time period and the value for the previous parallel time period within a larger time interval. For example, you might derive the difference between sales for the current month and sales for the same month of the previous year.

Note: This derived item is not available if your data source does not contain a date data item that includes the year.

Difference from Previous Period

Displays the difference between the value for the current time period and the value for the previous time period. For example, you might derive the difference between sales for the current month and sales for the previous month.

Note: This derived item is not available if your data source does not contain a date data item that includes the year.

Percent Difference from Previous Parallel Period

Displays the percentage difference between the value for the current time period and the value for the previous parallel time period within a larger time interval. For example, you might derive the percentage difference between sales for the current month and sales for the same month of the previous year.

Note: This derived item is not available if your data source does not contain a date data item that includes the year.

Percent Difference from Previous Period

Displays the percentage difference between the value for the current time period and the value for the previous time period. For example, you might derive the percentage difference between sales for the current month and sales for the previous month.

Note: This derived item is not available if your data source does not contain a date data item that includes the year.

Percent of Subtotals

For crosstabs only, displays the percentage of the subtotal value for the measure on which it is based.

You can select whether to calculate the percentage of the subtotal value for the rows in the crosstab or for the columns in the crosstab.

For example, you might calculate the percentage of the row subtotal value for a measure that contains revenue values. The derived item displays the percentage of the subtotal of revenues for each row in the crosstab.

Note: **Percent of Subtotals** can be created only from within a crosstab visualization.

Percent of Total

Displays the percentage of the total value for the measure on which it is based. For example, you might derive the percentage of the total value for a measure that contains revenue values. If you create a bar chart by using the derived item and a category that contains products, then the bar chart shows the percentage of total revenue for each product.

Note: The percentage of the total value is relative to the subset of data that is selected by your filters and ranks.

Period to Date

Displays the aggregated value for the current time period and all of the previous time periods within a larger time interval. For example, you might derive the year-to-date total for each month.

Note: This derived item is not available if your data source does not contain a date data item that includes the year.

Year over Year Growth

Displays the percentage difference between the current time period and an equivalent time period from the previous year. For example, you might derive the difference in sales between the current month and the same month of the previous year.

Note: This derived item is not available if your data source does not contain a date data item that includes the year.

Year to Date

Displays the aggregated value for the current time period and all of the previous time periods within the year. For example, you might derive the year-to-date total for each month.

The year-to-date calculation subsets the data for each year using today's date (where today is evaluated each time you view the exploration). To use all data for every period, use a **Period to Date** item or edit the expression for the derived item.

Note: This derived item is not available if your data source does not contain a date data item that includes the year.

Year to Date Growth

Displays the percentage difference between the year-to-date value for the current time period and the year-to-date value for the same time period of the previous year. For example, you might derive the difference in year-to-date sales between the current month and the same month of the previous year.

The year-to-date calculation subsets the data for each year using today's date (where today is evaluated each time you view the exploration). To use all data for every period, use a **Period to Date** item or edit the expression for the derived item.

Note: This derived item is not available if your data source does not contain a date data item that includes the year.

Note: The derived item types that aggregate values over time use periodic operators. For information about using periodic operators, see [“Periodic Operators” on page 698](#).

Create a Derived Item for a Measure

You can create a derived item for a measure by using the **Data** pane or by selecting a measure in a visualization.

To create a derived item from the **Data** pane, right-click the data item that the derived item is based on, and then select **Create** ► *item-type*. If you select a type that uses a date, select the date data item that is used for date calculations.

To create a derived item in a visualization, right-click a measure heading in the visualization, and then select **Create and Add** ► *item-type*. If you select a type that uses a date, select the date data item that is used for date calculations. The derived item is added to the visualization automatically.

For a list of item types, see [“Derived Item Types for Measures” on page 182](#).

The new derived item appears in the **Data** pane.

Create a Derived Item for a Category

To create a derived item for a category from the **Data** pane, right-click the category, and then select **Create** ► *item-type*.

The new derived item appears in the **Data** pane.

Support for Derived Items

Derived items can be used in the following visualization types:

- Automatic Chart
- Crosstab
- Bar Chart
- Line Chart
- Bubble Plot (grouped bubble plots only)
- Network Diagram
- Geo Map
- Treemap

Explore Distinct Values in a Visualization

For a bar chart, line chart, treemap, or geo map that contains a distinct count derived item, you can explore the distinct values that are associated with a data point in the visualization. To explore the distinct values, right-click on a data point in the visualization, and then select **Explore Distinct Values**. When you explore the distinct values, a new bar chart is created. The new bar chart displays the values and the frequency of each value.

For example, you might use a distinct count derived item to create a bar chart that displays the number of cities where each product line is produced.

Then, you might want to explore the distinct values for City where Promotional items are produced. By right-clicking on the bar for Promotional, and then selecting **Explore Distinct Values**, you get a new bar chart that contains the cities where promotional items are produced and the frequency of data for each city.

Editing a Calculated, Aggregated, or Derived Data Item

Open the Editor Window

To edit a duplicate data item, an aggregated measure, a calculated data item, or a derived data item, right-click the item in the **Data** pane, and then select **Edit**.

Note: You cannot edit a Percent of Total or Percent of Subtotals derived item.

Specify the Item Name

To specify the name for the item, enter a name in the **Name** field.

Edit a Parameter Value

To edit a parameter value for an operator, select the parameter, and enter a new value. Or, right-click the parameter field, and select **Replace with** to select a data item or a global parameter.

To specify a missing value, enter a period (.) character.

Add an Operator

To add an operator to the expression:

- 1 From the **Operators** list, select the operator that you want to add. For a list of the operators that are available, see [Appendix 5, “Operators for Data Expressions,” on page 685](#).
- 2 Drag and drop the operator onto the expression.

- 3 For any required parameters, select the parameter, and enter a value. Or, right-click the parameter field, and select **Replace with** to select a data item or a global parameter.

Replace an Operator

To replace an operator, drag and drop a new operator onto the existing operator in the expression. You can also right-click an operator in your expression, and select **Replace Operator with** ► *operator*.

Add a Global Parameter

To add an existing global parameter to your expression, drag and drop the parameter from the **Data Items** list onto your expression.

To create a new global parameter, in the expression editor, right-click the **Parameter** heading in the **Data Items** list, and then select **Create Parameter**. For more information about creating global parameters, see [“Working with Global Parameters” on page 174](#).

Delete Part of an Expression

To delete a part of an expression, highlight the part of the expression that you want to delete, right-click, and then select **Delete** or **Clear**.

Subset an Expression

To subset an expression and delete the remainder:

- 1 Highlight the part of the expression that you want to keep.
- 2 Right-click, and select **Keep Operand**. The parts of the expression that were not selected are removed.

Edit an Expression as Text

On the **Text** tab of the expression editor, you can edit an expression as text code. See [“Editing a Data Expression in Text Mode” on page 677](#).

Display the Current Expression as Text

To display the current expression as text on the **Display Text** tab, click the  drop-down, and then select **Show display text**.

Manage the Scratch Area

The scratch area of the expression editor enables you to store elements of an expression, and then add them back into the expression as needed.

You can see the contents of the scratch area on the **Scratch** tab.

To move items to the scratch area, right-click part of the expression, and select **Move to Scratch Area**. You can also drag and drop items from your expression onto the **Scratch** tab.

To move an item from the scratch area to your expression, drag and drop the item from the **Scratch** tab onto your expression.

To delete an item in the scratch area, click the  button next to the item.

Preview an Expression (Calculated Data Items Only)

For calculated data items, you can preview the results of your expression by clicking **Preview Results**.

You can preview the results of a subset of your expression by right-clicking a part of your expression, and then selecting **Preview Subexpression Results**.

Previewing the results of subsets of your expression is useful for troubleshooting if a complex expression does not return the expected result.

Delete a Calculated, Aggregated, or Derived Data Item

To delete a duplicate data item, an aggregated measure, a calculated data item, or a derived data item, right-click on the data item in the **Data** pane, and then select **Delete**.

Note: If the deleted data item is used by a visualization, then a confirmation message appears. The deleted item is removed from the visualization.

Note: You cannot delete a data item that is included in a hierarchy. You must remove the data item from any hierarchies before you can delete it.

Duplicate a Data Item

Duplicate data items enable you to use multiple copies of a measure that have different data formats or default aggregations. For example, you might want to use the Minimum and Maximum aggregations for a data item in the same visualization.

Here are the steps to duplicate a data item:

- 1 Right-click on a measure in the **Data** pane, and then select **Duplicate Data Item**. The New Duplicate Item window appears.

Note: You can also invoke the New Duplicate Item window by dragging and dropping the same data item onto a visualization more than once.

- 2 Enter a **Name**, a **Format**, and a **Default aggregation** for the duplicate data item.
- 3 Click **OK** to create the duplicate data item.

Defining a Geography Data Item

About Geography Data Items

A geography data item is a category whose values are mapped to geographical locations or regions. Geography data items can be used with [geo maps](#) to visualize your data on a geographic map.

For example, if your data source contains a CountryName column that identifies countries, then you might create a geography data item for CountryName by using the predefined geographic role, **Country or Region Names**. See [“Define a Geography Data Item By Using a Predefined Geographic Role” on page 191](#).

You might create a customized geography data item to identify geographic information that is specific to your organization (for example, sales regions, warehouse locations, oil platforms, and so on). For each unique combination of category values, latitude values, and longitude values, a point is plotted on the geographic map. See [“Define a Geography Data Item By Using a Custom Geographic Role” on page 193](#).

Note: For predefined geographic roles, the values of your geography data items must match the lookup values that are used by SAS Visual Analytics. To view the lookup values, see <http://support.sas.com/va71geo>.

Define a Geography Data Item By Using a Predefined Geographic Role

Here are the steps to define a geography data item by using a predefined geographic role:

- 1 In the **Data** pane, locate a category that contains geographic information.
- 2 Right-click the category, and then select **Geography** ► **role-type**, where *role-type* can be any of the following:

Country or Region Names

specifies countries or regions by name.

Country or Region ISO 2-Letter Codes

specifies countries or regions by using two-letter country codes from the ISO 3166-1 standard.

Country or Region ISO Numeric Codes

specifies countries or regions by using three-digit numeric country codes from the ISO 3166-1 standard.

Country or Region SAS Map ID Values

specifies countries or regions by using the two-letter codes that are used with the MAPSGFK library that is included with SAS/GRAPH.

Note: The two-letter SAS Map ID country values are identical to the ISO 3166–1 two-letter country codes.

Subdivision (State, Province) Names

specifies country subdivisions (for example, states and provinces) by using the subdivision names.

Subdivision (State, Province) SAS Map ID Values

specifies country subdivisions (for example, states and provinces) by using the two-letter codes that are used with the MAPSGFK library that is included with SAS/GRAPH.

US State Names

specifies states and territories in the United States by using the state and territory names.

US State Abbreviations

specifies states and territories in the United States by using two-letter postal codes.

US ZIP Codes

specifies five-digit ZIP codes for the United States.

- 3 Click **OK** to apply your changes.

Define a Geography Data Item By Using a Custom Geographic Role

Here are the steps to define a geography data item by using a custom geographic role:

- 1 In the **Data** pane, locate a category that contains geographic information.
- 2 Right-click the category, and then select **Geography ► Custom**. The Custom Geography window appears.
- 3 Specify the following:

Latitude

specifies a measure from your current data source that contains the latitude (Y) coordinate values for the geographic role that you want to define.

Longitude

specifies a measure from your current data source that contains the longitude (X) coordinate values for the geographic role that you want to define.

Coordinate Space

specifies the coordinate space (coordinate system) that is used to project the longitude and latitude coordinate values.

- 4 Click **OK** to apply your changes.

Define Data Items for Text Analytics

To enable text analytics for the word cloud visualization:

- 1 Specify a data item as the unique row identifier for the exploration. You can choose a category, a measure, or a calculated item. The unique row identifier must have a unique value for each row of the data source.

TIP To determine whether the values of a category are unique, assign the category to a bar chart with no measures. If the frequency of any value is greater than one, then the category values are not unique. To determine whether the values of a measure are unique, open the **Measure Details** window, and then compare the **Total Rows** and **Distinct Count** statistics. If the statistics are identical, then the measure values are unique.

Right-click the data item in the **Data** pane, and then select **Set as Unique Row Identifier**.

Note: A nonunique row identifier can produce unreliable results.

- 2 Assign one or more categories to the **Document Collection** data role. Right-click a category, and then select **Document Collection**.

Note: A document collection can be used in your visualizations the same way a category is used.

Overview of Visualizations

About Visualizations

SAS Visual Analytics Explorer (the explorer) displays data by using visualizations. A visualization is an interactive visual representation of your data.

Visualization Types

You can assign any of the following types to your visualizations:

Automatic Chart

Automatically selects the chart type based on the data that is assigned to the visualization. When you are first exploring a new data set, automatic charts give you a quick view of the data.

For more information, see [“Working with Automatic Charts” on page 224](#).

Table

A table visualization titled "Visualization 1" displaying car data. The table has four columns: "Origin", "Type", "Horsepower", and "MPG (Highway)". The data is as follows:

Origin	Type	Horsepower	MPG (Highway)
Asia	SUV	265	23
Asia	Sedan	117	44
Asia	Wagon	315	19
Asia	Sports	238	24
Asia	Sedan	240	25
Asia	Wagon	155	29
Asia	Sedan	200	31
Asia	Sedan	115	38
Asia	SUV	275	20
Asia	SUV	235	19
Asia	Truck	143	29
Asia	Sports	287	26
Asia	Hybrid	110	51
Asia	Sedan	200	29

Displays the data as a table. Tables enable you to examine the raw data for each observation in the data source. You can rearrange the data columns and apply sorting.

For more information, see [“Working with Tables” on page 225](#).

Crosstab

Visualization 1

Origin		Asia		Europe
Type	DriveTrain	Horsepower	MPG_(Highway)	
Hybrid	Front	276	168	
Truck	Rear	475	74	
	All	1047	102	
Wagon	Front	502	135	
	Rear	740	71	
	All	800	104	
Sports	All	527	51	
	Front	1043	141	
SUV	Rear	2261	261	
	Front	1873	196	
Sedan	All	3481	346	
	All	1344	189	
	Rear	2460	226	

Displays the data as a crosstab. Crosstabs enable you to examine the data for intersections of hierarchy nodes or category values. You can rearrange the rows and columns and apply sorting. Unlike tables, crosstabs display aggregated data.

For more information, see [“Working with Crosstabs” on page 226](#).

Bar Chart

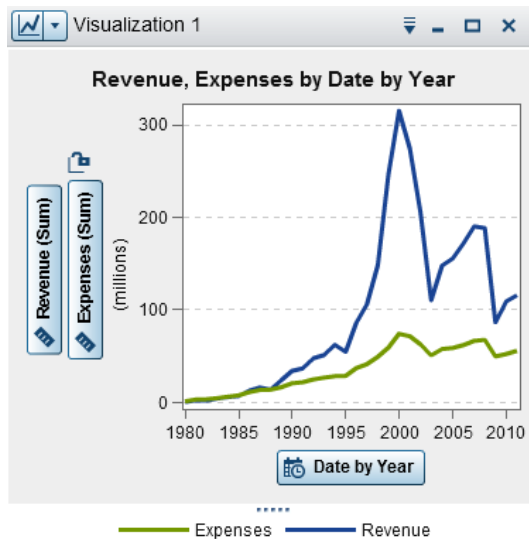

Displays the data as a bar chart. Bar charts are useful for comparing data that is aggregated by the distinct values of a category.

A bar chart consists of vertical bars or horizontal bars. You can apply grouping and create lattices.

For more information, see [“Working with Bar Charts” on page 228](#).

Line Chart

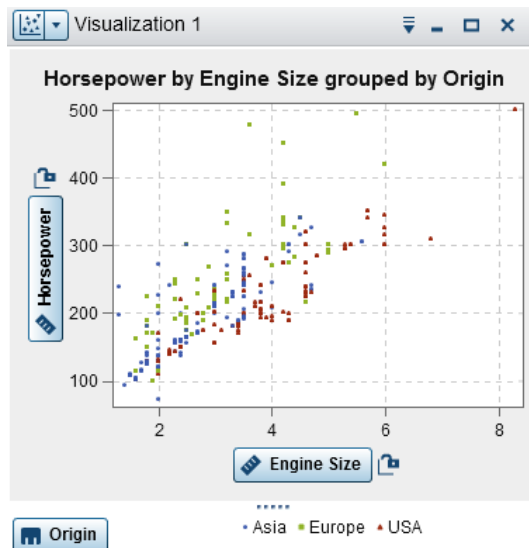

Displays the data as a line chart. A line chart is useful for data trends over time. Line charts support forecasting for predicting future values.

You can apply grouping and create lattices.

For more information, see [“Working with Line Charts”](#) on page 231.

Scatter Plot

Displays the data as a scatter plot. Scatter plots are useful to examine the relationship between numeric data items.

In a scatter plot, you can apply statistical analysis with correlation and regression. Scatter plots support grouping.

When you apply more than two measures to a scatter plot, a scatter plot matrix compares each pair of measures.

For more information, see [“Working with Scatter Plots”](#) on page 236.

Bubble Plot

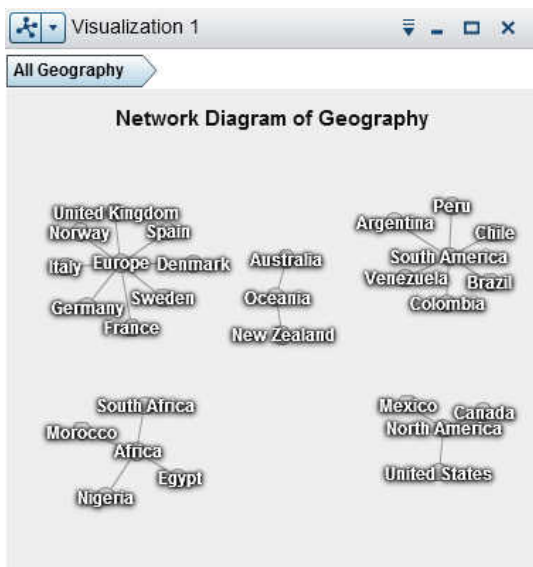

Displays the data as a bubble plot. A bubble plot displays the relationships among at least three measures. Two measures are represented by the plot axes, and the third measure is represented by the size of the plot markers.

You can apply grouping and create lattices. By assigning a datetime data item to the plot, you can animate the bubbles to display changes in the data over time.

For more information, see [“Working with Bubble Plots”](#) on page 238.

Network Diagram

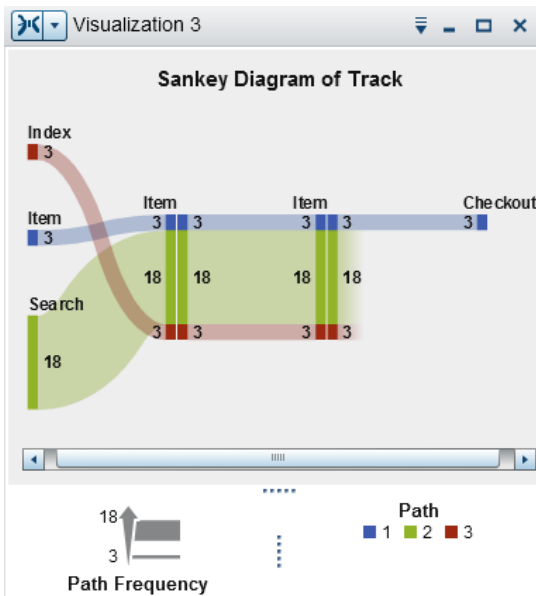

Displays a series of linked nodes. A network diagram displays the relationships between the values of categories or hierarchy levels.

You can indicate the values of measures through the sizes and colors of the nodes and the node links.

For more information, see [“Working with Network Diagrams”](#) on page 242.

Sankey Diagram

Displays a series of linked nodes, where the width of each link indicates the frequency of the link or the value of a measure. A Sankey diagram enables you to perform path analytics. Path analytics displays flows of data from one event (value) to another, as a series of paths.

For more information, see [“Working with Sankey Diagrams” on page 247](#).

Histogram

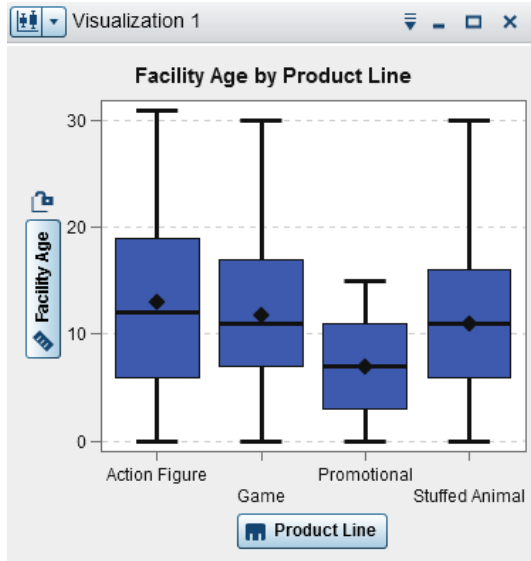

Displays the data as a histogram. A histogram displays the distribution of values for a single measure.

You can select the bar orientation, and you can select whether the values are displayed as a percentage or as a count.

For more information, see [“Working with Histograms” on page 257](#).

Box Plot

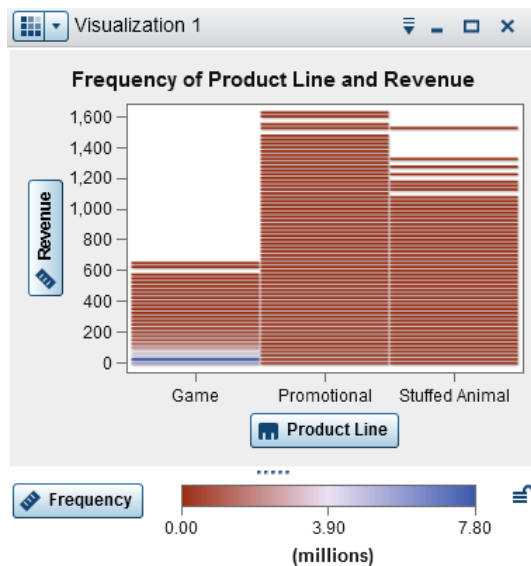

Displays the data as a box plot. A box plot displays the distribution of values for a single measure using a box and whiskers. The size and location of the box indicate the range of values that are between the 25th and 75th percentile. Additional statistical information is represented by other visual features.

You can create lattices, and you can select whether the average (mean) value and outliers are displayed for each box.

For more information, see [“Working with Box Plots” on page 259](#).

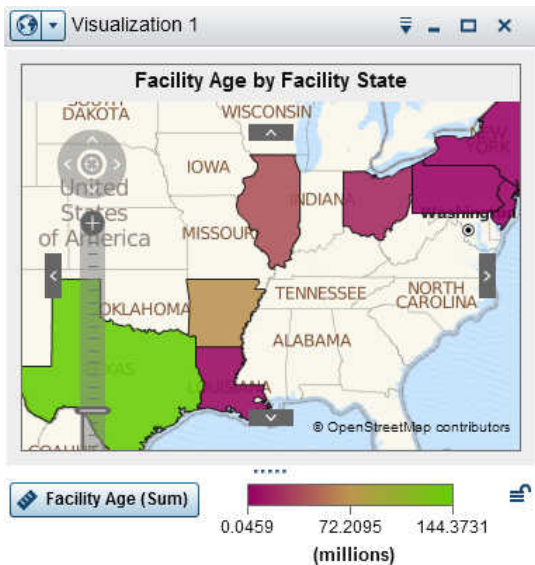

Heat Map

Displays the data as a heat map. A heat map displays the distribution of values for two data items using a table with colored cells. If you do not assign a measure to the **Color** data role, then a cell's color represents the frequency of each intersection of values. If you assign a measure to the **Color** data role, then a cell's color represents the measure value of each intersection of values.

For more information, see [“Working with Heat Maps” on page 262](#).

Geo Map

Displays the data as a geo map. A geo map displays your data as an overlay on a geographic map. You can display your data either as bubbles, as a scatter plot, or as colored regions.

For more information, see [“Working with Geo Maps” on page 264](#).

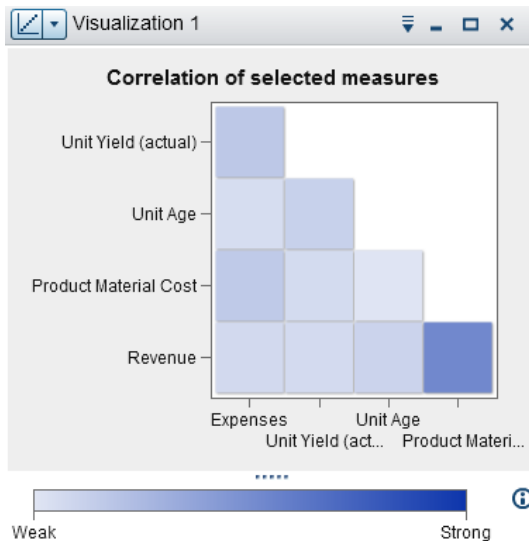

Treemap

Displays the data as a treemap. A treemap displays your data as a set of rectangles (called tiles). Each tile represents a category value or a hierarchy node. The size of each tile represents either the frequency of the category or the value of a measure. The color of each tile can indicate the value of an additional measure.

For more information, see [“Working with Treemaps” on page 267](#).

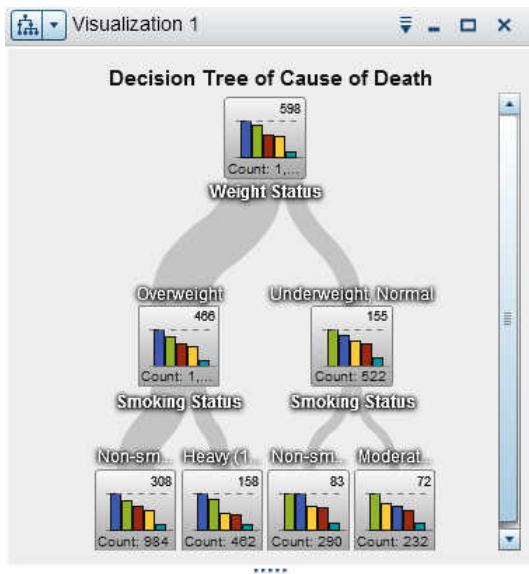

Correlation Matrix

Displays the data as a correlation matrix. A correlation matrix displays the degree of correlation between measures as a series of colored rectangles. The color of each rectangle indicates the strength of the correlation.

For more information, see [“Working with Correlation Matrices”](#) on page 269.

Decision Tree

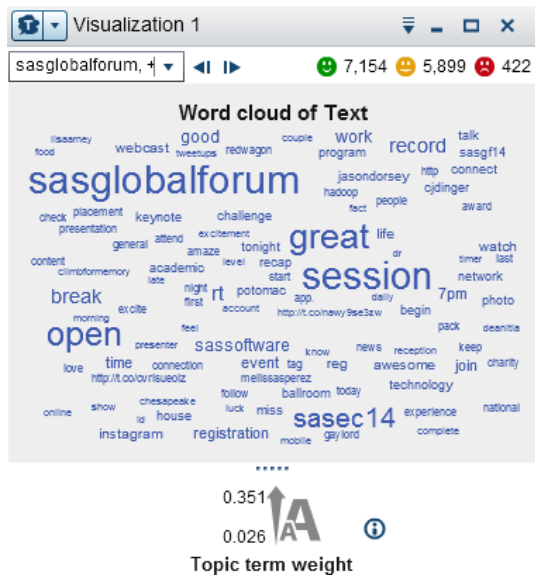

Displays the data as a decision tree. A decision tree displays a series of nodes as a tree, where the top node is the target data item, and each branch of the tree represents a split in the values of a predictor data item.

The splits enable you to see which values of the predictor data item correspond to different distributions of values in the target data item.

For more information, see [“Working with Decision Trees”](#) on page 272.

Word Cloud

Displays a set of words from a character data item. Depending on the type of word cloud and your data roles, the size of each word in the cloud can indicate the relevance of the word to a topic, the frequency of the word in a category, or the value of a measure.

You can use text analytics in a word cloud to identify topics and terms that appear together in your data and to analyze the sentiment of the documents in a topic.

For more information, see [“Working with Word Clouds” on page 278](#).

Working with Visualizations

Create a New Visualization

To create a new visualization, click  on the toolbar, or select **Visualization** ► **New** from the menu bar.

Manage Visualizations

Delete a Visualization

To delete a visualization, click the  button on the visualization, or select **Visualization** ► **Delete** from the menu bar to delete the selected visualization.

You can delete all of your visualizations by selecting **View** ► **Delete All Visualizations**.

Duplicate a Visualization

To duplicate a visualization, select **Visualization ► Duplicate** from the main menu, or select the  drop-down list from the visualization toolbar, and then select **Duplicate**.

The new visualization is named “Copy of *visualization-name*”. You can enter a new name on the **Properties** tab.

Show and Minimize Visualizations

To minimize a visualization, click  in the visualization that you want to minimize. The visualization appears in the dock pane at the bottom of the workspace.

To restore a visualization, click the name of the visualization in the dock pane.

You can select which visualizations are visible by using the [Manage Visualizations](#) window.

To minimize all visualizations, select **View ► Minimize All Visualizations** from the menu bar.

To show all visualizations, select **View ► Show All Visualizations** from the menu bar.

Maximize a Visualization

To maximize a visualization to fill the entire workspace, click  in the visualization that you want to maximize. To return the visualization to its normal size, click .

Arrange the Visualizations in the Workspace

Move the Position of a Visualization

To move a visualization, drag and drop the title bar of the visualization on the location where you want to place the visualization.

When you drag and drop a visualization onto another visualization, the placement of the visualization is determined by the edge that is closest to the drop point.

When your workspace contains visualizations in multiple rows, if you drag and drop a visualization onto the bottom edge or top edge of a visualization, then the target

visualization and the moved visualization split the space that was previously occupied by the target visualization.

Resize a Visualization

To resize a visualization in your workspace, drag the resizing tab  at the bottom edge or the right edge of the visualization that you want to resize.

Use the Manage Visualizations Window

The **Manage Visualizations** window enables you to manage all of your visualizations together. Each visualization is represented by a thumbnail image or by an icon of the visualization type if the visualization has not been displayed in the current session.

To open the Manage Visualizations window, select **View ► Manage Visualizations** from the main menu bar.

The Manage Visualizations window enables you to perform the following tasks:

Task	Action
Add visualizations to the selection list. (Restore visualizations.)	Select a visualization from the Available list, and then click  , or click  to add all of the available visualizations.
Remove visualizations from the selection list. (Minimize visualizations.)	Select a visualization from the Selected list, and then click  , or click  to remove all of the visualizations.
Change the order of the selected visualizations.	In the Selected list, drag and drop the visualizations in the order that you want, or select a visualization and click the up and down arrows to move it.
Search the available visualizations.	<p>In the Search field, enter a string to search for. A visualization matches the search if the string appears anywhere in the visualization name.</p> <p>Only the matching visualizations appear in the Available list.</p>

Task	Action
Filter the available visualizations.	Click  , and then select your filter parameters. You can filter either on the visualization type or on the data items that are used in each visualization. Only the matching visualizations appear in the Available list.
Rename a visualization.	Right-click on any visualization, and then select Rename . Enter a new name, and then click OK .
Delete a visualization.	Right-click on any visualization, and then select Delete .

Display Detailed Data for a Visualization

For all visualization types besides tables and crosstabs, you can display the detailed data for the visualization in the details table. To display the details table for a visualization, click the  drop-down list from the visualization toolbar, and then select **Show Details**.

Change the Data Source for a Visualization

Each visualization in your exploration is associated with a specific data source.

For an empty visualization with no data items, ranks, or visualization filters, you can add a data item from any data source. The new data source is assigned to the visualization automatically.

To change the data source for a visualization that is not empty, follow these steps:

- 1 If the data source that you want to use is not part of the exploration, then add the new data source. See [“Add Additional Data Sources to Your Exploration” on page 170](#).
- 2 Select the visualization for which you want to change the data source.
- 3 Remove any ranks from the **Ranks** tab and any visualization filters from the **Filters** tab.
- 4 On the **Roles** tab, remove all data items from the data roles.
- 5 From the **Data source** drop-down list, select the data source for the visualization.

Control Visualization Data Updates

By default, the explorer applies changes to your visualizations automatically when you change data roles, filters, or ranks.

To disable automatic updates, deselect the **Auto-update** check box at the bottom of the right pane. When you are ready to apply your updates, click **Update** at the bottom of the right pane.

Note: You can change the default behavior for new visualizations by deselecting **Update automatically** in the Preferences window.

Manage Visualization Comments

You can use the **Comments** tab to view and create comments for the current visualization. See [“Sharing Comments in the Explorer” on page 327](#).

Managing Visualization Data Roles

Add a Data Item

For a visualization to display data, you must assign data items to it. You can assign data items to a visualization by performing any of the following actions:

- Drag and drop the data item onto the center of the visualization. The data item is assigned to a role automatically. If the visualization already has data items assigned to the required roles, then you can choose how to assign the new data item.
- Drag and drop the data item onto a **Measure** or **Category** button in the visualization to assign the data item to a specific data role.
- From the visualization toolbar, select the  drop-down list, and then select **Add Category** or **Add Measure**.
- Use the **Roles** tab in the right pane. Either drag and drop a data item onto a role, or expand the drop-down list beside the role and then select a data item.

Each visualization requires a minimum number of each type of data item. The following table lists the requirements for each visualization:

Table 25.1 Required Data Items for Visualizations

Visualization Type	Requirements
Automatic Chart	one data item of any type
Table	one data item of any type (except aggregated measure)
Crosstab	one data item of any type
Bar Chart	one category or hierarchy
Line Chart	one category or hierarchy

Visualization Type	Requirements
Scatter Plot	one measure
Bubble Plot	three measures
Network Diagram	one category or hierarchy
Sankey Diagram	one category, one data item of any type, and one datetime or measure
Histogram	one measure
Box Plot	one measure
Heat Map	two data items of any type (except aggregated measure)
Geo Map	one geography
Treemap	one category or hierarchy
Correlation matrix	two measures
Decision tree	two data items of any type (except aggregated measure)
Word Cloud	one category or document collection

Replace a Data Item

You can replace a data item by using any of the following methods:

- Drag and drop the new data item from the **Data** pane onto the data item in the visualization that you want to replace.
- Right-click on the data item that you want to replace in either the visualization or on the **Roles** tab, and then select **Replace *item-name* ► *new-item-name***.

Remove a Data Item

You can remove a data item by using any of the following methods:

- Drag and drop the data item from the visualization onto the **Data** pane.
- Select the ▼ drop-down list from the visualization toolbar, and then select **Remove** ► *item-name* .
- Right-click on the data item that you want to delete in either the visualization or on the **Roles** tab, and then select **Remove** *item-name*.

Switch Data Roles

To switch the data items that are assigned to two roles, drag and drop one data item onto another data item either by using the buttons in the visualization or by using the fields on the **Roles** tab.

For example, you can switch the axes of a scatter plot by dragging the measure on the X axis to the measure on the Y axis.

Work with Filters

You can use the **Filters** tab to subset the data in your visualizations. See [Chapter 26](#), “Working with Filters,” on page 287.

Ranking Data

Overview of Ranking

You can use the **Ranks** tab to create ranks to subset the data in your visualizations. A rank selects either the top (greatest) or the bottom (least) aggregated value for a category.

A rank selects values for a category based on either the frequency of the category values or the aggregated value of a measure.

For example, you might create a rank of the top 10 countries by frequency to select the 10 countries that are most represented in your data source. As another example, you might create a rank of the top 10 countries by population to select the 10 countries with the greatest population.

Note: If the category for the rank is part of a hierarchy that is used in the current visualization, then the rank is applied only when the hierarchy is drilled to the level of the rank category.

Create a New Rank

To create a rank:

- 1 From the **Data** pane, select the data item that you want to use as the base of the rank. You can select any category or geography data item, regardless of whether it is assigned to the current visualization.
- 2 Either right-click on the data item, and select **Add as Rank on Visualization**, or drag and drop the data item onto the **Ranks** tab.
- 3 Set the parameters for the rank:
 - a Select the type of rank from the drop-down list. **Top** specifies that the rank selects the greatest value. **Bottom** specifies that the rank selects the least value.
 - b Specify the number of values for the rank. For example, if you specify 5, and you select **Top** as the rank type, then the rank selects the five greatest values.
 - c From the **By** drop-down list, select the measure that is used to create the rank. You can either select any measure, or select **Frequency** to use the frequency of the rank category.

Note: If you select a measure that is used in the current visualization, then the rank uses the same aggregation for the measure that is used by the current visualization.

Note: Only the Sum, Average, Count, Minimum, and Maximum aggregation types can be used in a rank.

- d (Optional) Select **Ties** to include ties in the rank.

If you select **Ties**, then the rank selects as many values as necessary to include all of the ties. If you do not select **Ties**, then the rank selects only the number of values that are specified by the rank parameters.

For example, if your rank selects the top three values, but there are five values tied for the greatest value, then the number of values that are selected by the rank depends on the **Ties** option. If you select **Ties**, then the rank includes all five of the tied values. If you do not select **Ties**, then the rank includes only three of the tied values.

Note: If the ranking does not select all of the tied values, or if the number of tied values exceeds the maximum that is set by your administrator, then a message appears.

Note: By default, your rank changes are applied automatically to the current visualization. To apply multiple changes together, deselect **Auto-Update**, and then click **Update** when you are ready to apply your rank changes.

Delete a Rank

To delete a rank, click  on the rank on the **Ranks** tab.

Managing Visualization Axes

Lock an Axis

By default, the axes of your visualizations adjust automatically to your data. If you change the data that is displayed by applying filters or ranks or by drilling down, then the data ranges and scaling of your axes will change to fit the data.

For comparison purposes, you might want to lock the axes and retain the same data ranges and scaling. To lock an axis, click the  icon beside the axis heading.

To re-enable automatic adjustments for an axis, click the  icon beside the axis heading.

Adjust an Axis

For a locked axis, you can adjust the visible data range. You can adjust the range by dragging the scroll bar that appears over the axis tick marks or by right-clicking a measure heading, and then selecting **Set Visible Axis Range**.

Transfer Axis Settings

For a locked axis, you can transfer the axis settings to a compatible visualization. A compatible visualization must have a measure (or frequency) assigned to an axis.

To transfer an axis, right-click the measure heading, and then select **Transfer Axis Settings**. From the Select Compatible Visualizations window, select the visualization to which you want to transfer the axis settings.

Working with Visualization Data Ranges and Color Gradients

Support for Customized Data Ranges and Color Gradients

The following visualization types enable you to customize the data range and color gradient:

- Heat map
- Geo map (with the **Color** role assigned)
- Bubble plot (with continuous data assigned to the **Color** role)

- Network diagram (with the **Node Color** or **Link Color** role assigned)
- Word cloud (with the **Color** role assigned)
- Treemap (with the **Color** role assigned)

Specify a Custom Color Gradient

To specify a custom color gradient:

- 1** Right-click on the color gradient in the legend, and then select **Edit Color Gradient**.
- 2** From the Edit Color Gradient window, select a color gradient from the **Color gradient** drop-down list.
- 3** Click **OK** to apply the new color gradient.

Specify a Custom Data Range

To specify a custom data range:

- 1** Right-click on the color gradient in the legend, and then select **Configure Color Gradient**.
- 2** From the Select Color Gradient window, deselect **Automatically adjust color range to data**.
- 3** In the **Lower** field, specify the lower bound for the data range.
- 4** If the selected color gradient uses three colors, specify the inflection point of the gradient in the **Inflection** field, or select **Use midpoint** to use the midpoint between the lower and upper values as the inflection point. The inflection point is the point for the middle color in a three-color gradient.
- 5** In the **Upper** field, specify the upper bound for the data range.
- 6** Click **OK** to apply the new color gradient.

Share a Color Gradient and Data Range between Visualizations

To share data ranges and color gradients between visualizations, all of the visualizations must support customized data ranges. See [“Support for Customized Data Ranges and Color Gradients” on page 218](#).

To share a data range and color gradient between visualizations:

- 1 If the data range has not been customized, then right-click on the legend for the color gradient and data range that you want to share, and then select **Lock Data Range**.
- 2 Right-click on the legend for the color gradient and data range that you want to share, and then select **Transfer Configuration**. The Select compatible visualizations window appears.
- 3 Select the visualizations that you want to share the color gradient and data range with. The visualizations are sorted based on their similarity to the source visualization. Visualizations that use the same data items and visualizations that are the same type are shown at the top of the list.
- 4 When you are finished, click **OK** to apply the color gradient and data range to all of the selected visualizations.

Remove Customized or Shared Color Data Ranges

To remove a customized or shared data range from a visualization, right-click on the legend, and select **Remove Custom Data Range**.

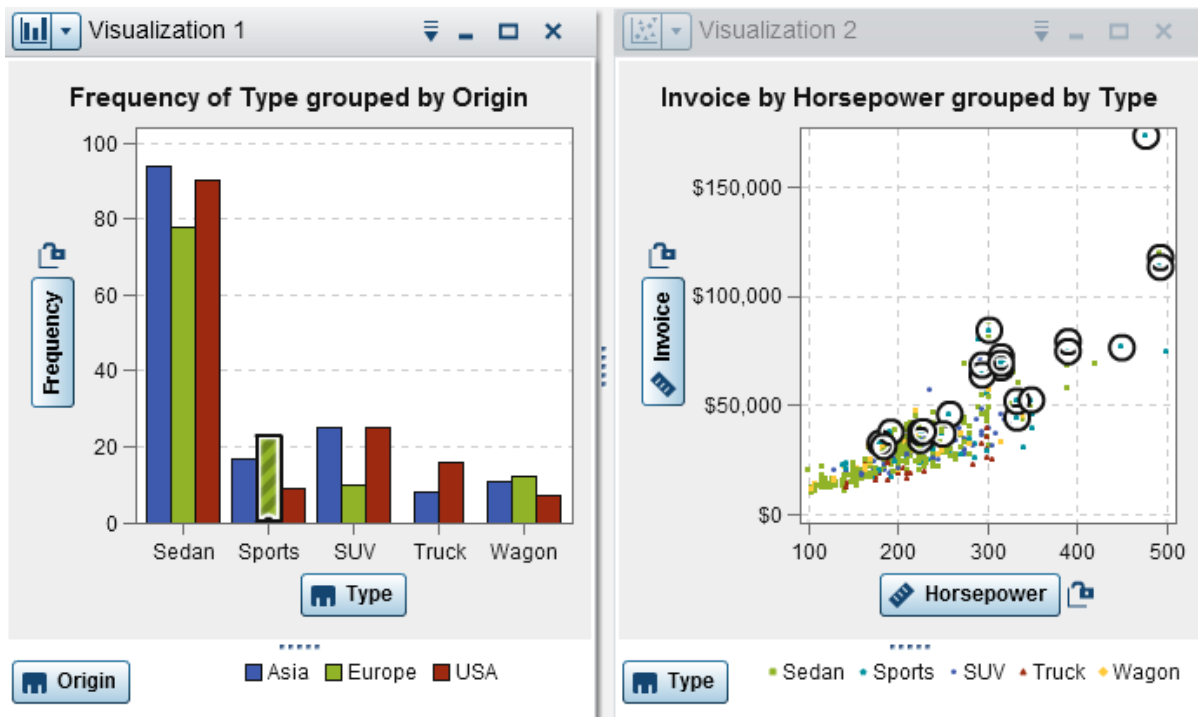

Working with Data Brushing

Overview of Data Brushing

Data brushing is a feature of some visualizations that enables you to select data values in one visualization and highlight the corresponding data values in all of your other visualizations.

For example, you might have a bar chart and a scatter plot in your exploration. If you enable data brushing, and you select a bar in the bar chart, then the markers in the scatter plot that correspond to the selected value in the bar are highlighted.

Figure 25.1 Data Brushing Example

The following visualization types support data brushing:

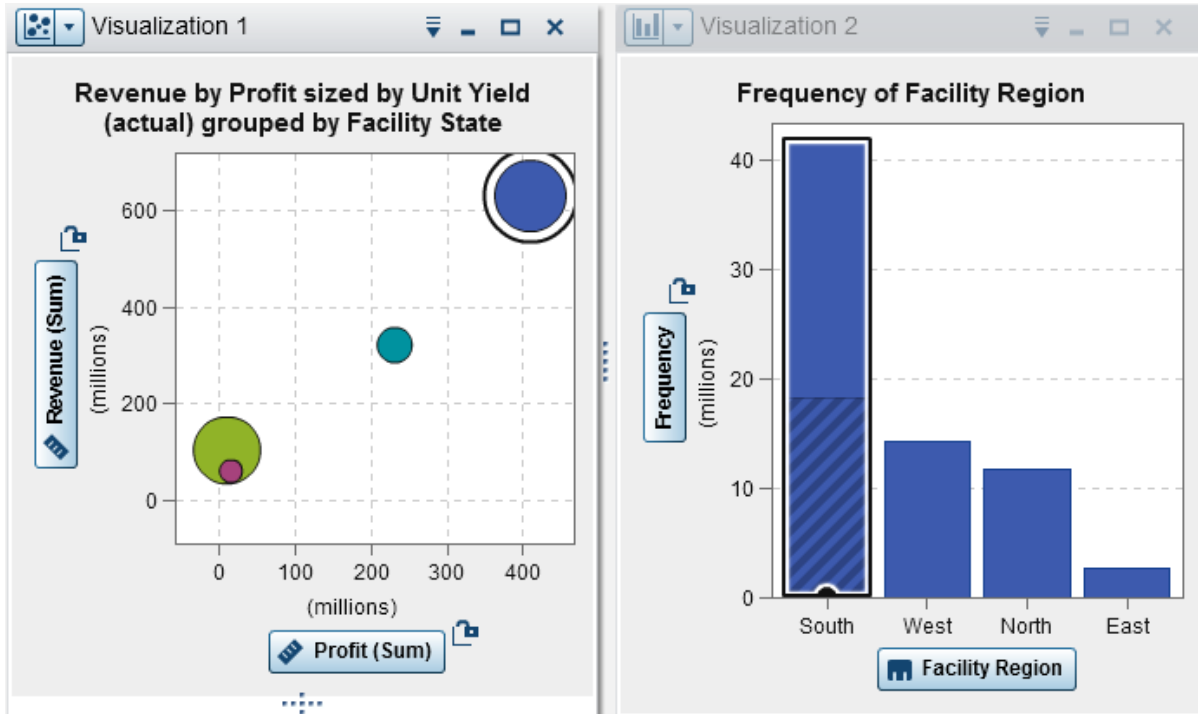

- Bar chart

- Line chart
- Scatter plot
- Bubble plot (if the **Group** role is assigned)
- Network diagram
- Histogram
- Heat map (if categories are assigned to both axes)
- Geo map
- Treemap
- Word cloud

For histograms and for bar charts of frequency that are not grouped or latticed, data brushing can indicate the portion of a bar that corresponds to the brushed data. The bar is highlighted and then partially shaded to indicate the corresponding portion. The value for the shaded portion of the bar is included in the data tip for the bar.

In [Figure 25.2](#), a selection in a bubble plot highlights a portion of the corresponding bar in a bar chart.

Figure 25.2 Data Brushing with Partial Shading

For bar charts that have a measure assigned or that are grouped or latticed, the entire bar is highlighted.

Enable Data Brushing

To enable data brushing, select **View ► Data Brushing**.

Select Values in a Visualization

You can select values in your visualization by using any of the following methods:

- Click the data values. This is most useful for bar charts, histograms, and treemaps. To select multiple data values, hold down the Ctrl key while clicking each data value.

- Click and drag to select data values in a rectangular region. This is most useful for scatter plots and heat maps.
- Select data values in the details table for the visualization. Press Shift+click to select multiple adjacent values, or press Ctrl+click to select or deselect individual values.

Working with Automatic Charts

Automatic charts display different types of charts automatically based on the data items that are assigned to the chart.

The type of chart can be any of the following:

Table 25.2 Automatic Chart Types

Data Items	Chart Type
One measure	Histogram
One category	Bar chart
One aggregated measure	Crosstab
One datetime category and any number of other categories or measures	Line chart
One geography and up to two measures	Geo map
One geography and three or more measures	Bar chart
One document collection	Word cloud
Two measures	Scatter plot or heat map
Three or more measures	Scatter plot matrix or correlation matrix
One or more categories and any number of measures and geographies	Bar chart

Note: The **Roles** tab for an automatic chart always contains **Categories** and **Measures**. To set advanced data roles such as grouping and lattices, click the **Use chart-type** link on the **Roles** tab to change the visualization from an automatic chart to the chart type that is currently shown. For example, if your automatic chart shows a bar chart, then click **Use Bar Chart** to change the type to a bar chart and enable advanced data role settings.

Working with Tables

About Tables

A table displays data as text. The data value for each measure or category that is assigned to the table is displayed as a column. The data values in the table are not aggregated.

Note: For very large data sources, the table visualization displays only the first two billion (2,147,483,647) rows.

Data Roles for a Table

The basic data role for a table is a column. A column can be any type of data item. You can add any number of columns to a table.

Specify Properties for a Table

On the **Properties** tab, you can specify the following option:

Name

specifies the name of the visualization.

Managing Columns

Sort Columns

By default, the table is sorted by the values of the first column. To change the sorting, click on the heading for the column that you want to sort by. An arrow appears in the column heading to indicate the sorting. If the arrow points upward, then the sort is ascending. If the arrow points downward, then the sort is descending.

Rearrange Columns

To rearrange your columns, drag and drop the column headings.

Resize Columns

To resize a column, click, and then drag and drop the left or right edge of a column heading.

Working with Crosstabs

About Crosstabs

A crosstab displays the intersections of category values and measure values as text. If the crosstab contains measures, then each cell of the crosstab contains the aggregated measure values for a specific intersection of category values. If the crosstab does not contain measures, then each cell of the crosstab contains the frequency of an intersection of category values.

Data Roles for a Crosstab

The basic data roles for a crosstab are columns, rows, and measures. You can assign either a single hierarchy or any number of categories to each column and row role. If you assign measures to the crosstab, then the measure values are displayed in the cells of the crosstab. If you do not assign measures, then the frequency of each intersection of values is displayed in the cells of the crosstab.

Specify Properties for a Crosstab

On the **Properties** tab, you can specify the following options:

Name

specifies the name of the visualization.

Show missing values as blanks

displays missing values as empty cells in the crosstab. By default, missing values are represented by a period (.) character.

Indented

selects the indented layout for the crosstab.

Show column subtotals

adds subtotals to each column for each node on the row axis after the first.

Note: For the indented layout, subtotals are always enabled.

Show column totals

adds totals to each column.

Note: Total values are aggregated based on the aggregations for each measure.

Show row subtotals

adds subtotals to each row for each node on the column axis after the first.

Note: For the indented layout, subtotals are always enabled.

Show row totals

adds totals to each row.

Note: Total values are aggregated based on the aggregations for each measure.

Totals Placement

specifies the location of totals and subtotals. Select **Before** to place the totals and subtotals before the axis headings. Select **After** to place the totals and subtotals after the axis headings.

Note: For the indented layout, totals are always placed before the axis headings.

Managing Rows and Columns

Sort a Row or Column

By default, the crosstab is sorted alphabetically by the values of the first category that you assign to the **Rows** role. To change the sorting, right-click on the heading for the row or column that you want to sort by, and then select **Sort** ► **sort-method**.

If you apply sorting to a measure, then the sorting for the rows is applied as a secondary sort. The outer row values are sorted by their subtotals for the measure. To remove measure sorting, select a sort for any category.

Rearrange Rows and Columns

To rearrange your rows and columns, drag and drop the row headings and column headings.

Resize Columns

To resize a column, click, and then drag and drop the left or right edge of the column heading.

Create a Hierarchy from a Crosstab

Crosstabs enable you to create hierarchies from the categories on a crosstab axis. To create a hierarchy, right-click on a category heading, and then select **Create Hierarchy**. The categories are replaced with a new hierarchy.

The name of the new hierarchy is generated from the name of the outermost category, with the suffix “Hierarchy.”

Working with Bar Charts

About Bar Charts

A bar chart displays data by using bars. The height of each bar represents the value.

Data Roles for a Bar Chart

The basic data roles for a bar chart are categories and measures. You can assign one category only, and the category values are plotted on the category axis. You can assign many measures, and the measure values are plotted on the response axis. If a bar chart contains no measures, then the frequency of the category values is plotted on the response axis.

In addition to the basic data roles, you can assign these roles:

Group

groups the data based on the values of the category data item that you assign. Depending on the value that you selected for the **Grouping style** property, the group values are shown as either individual bars or as segments of each bar.

Note: Grouping is not available if you assign multiple measures to the visualization.

Lattice columns

creates a lattice of charts with a column for each value of the category data item that you assign.

Lattice rows

creates a lattice of charts with a row for each value of the category data item that you assign.

Specify Properties for a Bar Chart

On the **Properties** tab, you can specify the following options:

Name

specifies the name of the visualization.

Title

specifies the title that appears above the graph.

Note: The **Title** option is disabled if you select **Generate graph title**.

Generate graph title

specifies that the graph title is generated automatically based on the data items in the visualization.

Show grid lines

displays grid lines for each tick on the response axis.

Bar direction

specifies whether the bars are vertical or horizontal.

Frequency

specifies whether the frequency is displayed as a count (**Count**) or as a percentage (**Percent**).

Note: The frequency values are based on the data that is shown in the visualization (after filters and other data selections have been applied).

Note: This option has no effect if a measure is assigned to the visualization.

Grouping style

specifies how grouped data is displayed. If you select **Stack**, then the values of the grouping variable are displayed as segments of each bar. If you select **Cluster**, then each value of the grouping variable is displayed as a separate bar.

Note: This option is disabled if no data item is assigned to the **Group** role.

Measure layout

specifies whether the measures share a single response axis (**Shared axis**) or have separate response axes for each measure (**Separate axes**).

Note: The **Measure layout** option is disabled if your visualization contains exactly one measure.

Overview

specifies whether the chart overview is enabled.

Show data labels

shows the data values as text in the visualization.

Note: You can always view a data value as a data tip when you position the cursor over a data value.

Rotate axis labels

displays the category labels at an angle.

Note: The **Rotate axis labels** option has no effect when you select a horizontal bar orientation.

Reference Lines

adds reference lines to the visualization. To create a reference line, click , and then specify the parameters for the line in the New Reference Line window.

The name of each reference line appears below the **Reference Lines** option. You can edit or delete your reference lines by using the icons next to each name.

Sort Data Values

By default, a bar chart is sorted in descending order by the value of the first measure. To change the sorting, right-click on the data item that you want to sort on, and then select **Sort** ► **sort-method**. For a grouped bar chart, the data is sorted by the category values in alphabetical order.

Note: If the visualization contains a rank, then, by default, the data is sorted based on the values of the rank.

Working with Line Charts

About Line Charts

A line chart displays data by using a line that connects the data values. If you assign multiple measures to a line chart, then you can create separate Y axes for each measure.

Data Roles for a Line Chart

The basic data roles for a line chart are categories and measures. You can assign one category only, and the category values are plotted on the category axis. You can assign

many measures, and the measure values are plotted on the response axis. If the line chart contains no measures, then the frequency of the category values is plotted on the response axis.

In addition to the basic data roles, you can assign these roles:

Group

groups the data based on the values of the category data item that you assign. A separate line is created for each data value.

Note: Grouping is not available if you assign multiple measures to the visualization.

Lattice columns

creates a lattice of charts with a column for each value of the category data item that you assign.

Lattice rows

creates a lattice of charts with a row for each value of the category data item that you assign.

Forecasting

enables forecasting for the line chart. Forecasting estimates future values for your data based on statistical trends.

Note: Forecasting is available only if a date or datetime data item is assigned to the visualization.

Underlying factors

if forecasting is enabled, adds additional measures to the forecast as underlying factors. The forecasting model evaluates the additional measures to determine whether they contribute to the accuracy of the forecast. If the additional measures do not increase the accuracy of the forecast, then they are not used. If the additional measures do increase the accuracy of the forecast, then the forecast line is adjusted, and the confidence bands are narrowed.

The measures that you add as underlying factors can also be used in a scenario analysis.

Note: Underlying factors are available only if your line chart contains a single measure in the **Measures** role.

Specify Properties for a Line Chart

On the **Properties** tab, you can specify the following options:

Name

specifies the name of the visualization.

Title

specifies the title that appears above the graph.

Note: The **Title** option is disabled if you select **Generate graph title**.

Generate graph title

specifies that the graph title is generated automatically based on the data items in the visualization.

Show grid lines

displays grid lines for each tick on the response axis.

Frequency

specifies whether the frequency is displayed as a count (**Count**) or as a percentage (**Percent**).

Note: The frequency values are based on the data that is shown in the visualization (after filters and other data selections have been applied).

Note: This option has no effect if a measure is assigned to the visualization.

Measure layout

specifies whether the measures share a single response axis (**Shared axis**) or have separate response axes for each measure (**Separate axes**).

Note: The **Measure layout** option is disabled if your visualization contains exactly one measure.

Overview

specifies whether the chart overview is enabled.

Show markers

shows markers for the data points in the visualization.

Show data labels

shows the data values as text in the visualization.

Note: You can always view a data value as a data tip when you position the cursor over a data value.

Thin data labels

removes data labels as necessary to avoid overlap. The thinning algorithm retains the labels for local high points and low points on the line chart.

Rotate axis labels

displays the category labels at an angle.

Reference Lines

adds reference lines to the visualization. To create a reference line, click , and then specify the parameters for the line in the New Reference Line window.

The name of each reference line appears below the **Reference Lines** option. You can edit or delete your reference lines by using the icons next to each name.

Duration (if forecasting is enabled)

specifies the number of data intervals to forecast.

Note: This option is available only if forecasting is enabled for the visualization.

Confidence (if forecasting is enabled)

specifies the degree of confidence for the confidence band. The default value is 95%.

Sort Data Values

By default, for category data, a line chart is sorted in descending order by the value of the first measure. To change the sorting, right-click on the data item that you want to sort on, and then select **Sort ► sort-method**.

Note: If the visualization contains a rank, then, by default, the data is sorted based on the values of the rank.

Note: Sorting is not available if a datetime data item is assigned to the **Category** role.

Forecasting

About Forecasting

Forecasting uses the statistical trends in your data source to predict future data values. Forecasting is available only if a date or datetime data item is assigned to the visualization.

In addition to the predicted future data values, the forecast displays a confidence band. For more information, see [“Forecasting” on page 320](#).

Enable Forecasting

To add forecasting to a line chart, select **Forecasting** on the **Roles** tab.

Note: The line chart must contain a date or datetime data item to apply forecasting.

On the **Properties** tab for the line chart, you can adjust the number of data values to predict by using the **Duration** option. You can specify the degree of confidence for the confidence band by using the **Confidence** option.

On the **Roles** tab, you can add additional measures to the forecast as **Underlying factors**. The forecasting model evaluates the additional measures to determine whether they contribute to the accuracy of the forecast. If the additional measures do not increase the accuracy of the forecast, then they are not used. If the additional measures do increase the accuracy of the forecast, then the forecast line is adjusted, and the confidence bands are narrowed.

Note: Underlying factors are available only if your line chart contains a single measure in the **Measures** role.

The measures that you use as underlying factors can also be used in scenario analysis and goal seeking. For more information, see [“Working with Scenario Analysis and Goal Seeking” on page 323](#).

Working with Scatter Plots

About Scatter Plots

A scatter plot displays the values of measures by using markers. When you apply more than two measures, the visualization displays a scatter plot matrix. A scatter plot matrix is a series of scatter plots that display every possible pairing of the measures that are applied to the visualization.

If you create a scatter plot that has a very large number of data values, then the scatter plot is rendered either as a [heat map](#) (for two measures) or as a correlation matrix for three or more measures.

Data Roles for a Scatter Plot

The basic data role for a scatter plot is a measure. You can assign any number of measures. If you assign a single measure to a scatter plot, then the values are plotted along a line.

In addition to measures, you can assign a **Group** variable. The **Group** variable groups the data based on the values of the category data item that you assign. A separate set of scatter points is created for each value of the group variable.

You can add data items to the **Data tips** role. The values for the data items in the **Data tips** role are displayed in the data tips for the scatter plot.

Specify Properties for a Scatter Plot

On the **Properties** tab, you can specify the following options:

Name

specifies the name of the visualization.

Title

specifies the title that appears above the graph.

Note: The **Title** option is disabled if you select **Generate graph title**.

Generate graph title

specifies that the graph title is generated automatically based on the data items in the visualization.

Show grid lines

displays grid lines for each tick on the plot axes.

Marker size

specifies the size of each marker in pixels.

Fit Line

adds a fit line to the scatter plot. For information about the fit types that are available, see [“Fit Lines” on page 319](#).

Note: Fit lines are not available if a grouping variable is assigned to the scatter plot.

Reference Lines

adds reference lines to the visualization. To create a reference line, click , and then specify the parameters for the line in the New Reference Line window.

The name of each reference line appears below the **Reference Lines** option. You can edit or delete your reference lines by using the icons next to each name.

Applying Data Analysis

About Data Analysis

For scatter plots, you can apply the following data analyses:

Correlation

identifies the degree of statistical correlation between the variables in the visualization. For more information, see [“Correlation” on page 318](#).

Fit Line

plots a model of the relationship between the variables in the visualization.

There are many types of fit lines, including linear fit, quadratic fit, cubic fit, and penalized B-spline. For more information, see [“Fit Lines” on page 319](#).

Correlation is applied to your visualization automatically when you add a linear fit line. It is not available with other fit types.

Enable Data Analysis

To add a fit line to your visualization, select the  drop-down list from the visualization toolbar, and then select **Fit Line** ► *fit-type*. For details about the fit types that are available, see [“Fit Lines” on page 319](#).

Working with Bubble Plots

About Bubble Plots

A bubble plot displays the values of at least three measures by using differently sized plot markers (bubbles) in a scatter plot. The values of two measures are represented by the position on the plot axes, and the value of the third measure is represented by the marker size.

You can create animated bubble plots to display changing data over time.

Data Roles for a Bubble Plot

The basic data roles for a bubble plot are:

X axis

specifies the measure that is assigned to the X axis.

Y axis

specifies the measure that is assigned to the Y axis.

Bubble size

specifies the measure that determines the marker size.

In addition to the basic data roles, you can assign these roles:

Group

groups the data based on the values of the category data item that you assign. A separate set of points is created for each value.

Note: You cannot assign both the **Group** role and the **Color** role at the same time.

Color

specifies a data item that determines the color of the bubbles. If you specify a category, then each value of the category is represented by a different bubble color. If you specify a measure, then the measure value is represented by the bubble color.

Note: You cannot assign both the **Group** role and the **Color** role at the same time.

Animation

specifies a datetime data item that is used to animate the bubble plot.

Note: The **Animation** role is enabled only if you assign a data item to the **Group** role.

Lattice columns

creates a lattice of charts with a column for each value of the category data item that you assign.

Lattice rows

creates a lattice of charts with a row for each value of the category data item that you assign.

Specify Properties for a Bubble Plot

On the **Properties** tab, you can specify the following options:

Name

specifies the name of the visualization.

Title

specifies the title that appears above the graph.

Note: The **Title** option is disabled if you select **Generate graph title**.

Generate graph title

specifies that the graph title is generated automatically based on the data items in the visualization.

Show grid lines

displays grid lines for each tick on the response axis.

Size scale

specifies the type of scaling that is used to draw the bubbles. Select one of the following values:

Linear

specifies that the bubble sizes are scaled relative to the minimum and maximum values (or frequencies) in your data. A negative value is displayed as a smaller bubble than a positive value.

For the **Linear** scaling type, the difference in bubble sizes might not be proportional to the difference in values.

Magnitude

specifies that the bubble sizes are scaled relative to zero and the greatest absolute value in your data. A negative value is displayed as a hexagon.

For the **Magnitude** scaling type, the difference in bubble sizes is proportional to the difference in absolute values.

Frequency

specifies whether the frequency is displayed as a count (**Count**) or as a percentage (**Percent**).

Note: The frequency values are based on the data that is shown in the visualization (after filters and other data selections have been applied).

Note: This option has no effect if a measure is assigned to the **Bubble size** role.

Color gradient

selects the gradient colors for the visualization.

You can click  to select the values that are used to assign the colors. See [“Specify a Custom Data Range” on page 219](#).

Reference Lines

adds reference lines to the visualization. To create a reference line, click , and then specify the parameters for the line in the New Reference Line window.

The name of each reference line appears below the **Reference Lines** option. You can edit or delete your reference lines by using the icons next to each name.

Using Animated Bubble Plots

About Animated Bubble Plots

An animated bubble plot displays the changes in your data values over time. Each frame of the animation represents a value of the datetime data item that is assigned to the **Animation** data role.

For example, if you assign a category with the YEAR format to the **Animation** data role, then each frame of the animation displays a bubble plot of your data for a specific year.

Create an Animated Bubble Plot

To create an animated bubble plot:

- 1 Select an existing bubble plot, or create a new bubble plot.
- 2 Assign a data item to the **Group** data role.
- 3 Assign a data item with a datetime format to the **Animation** data role.

Display an Animated Bubble Plot

For an animated bubble plot, a set of animation controls appears at the bottom of the visualization.

Table 25.3 Animation Control Tasks

Task	Action
Start the animation.	Click ►.
Go to the previous animation frame.	Click ◀.
Go to the next animation frame.	Click ▶.
Jump to a specific animation frame.	Use the slider.

Task	Action
Specify whether to repeat the animation.	Select or deselect Loop .
Select the animation speed.	Use the Speed slider.
Track the movement of a specific bubble.	Click the bubble that you want to track.

Note: If you select a bubble to track, the selected bubble is highlighted in the current animation frame.

Working with Network Diagrams

About Network Diagrams

A network diagram displays the relationships between category values as a series of linked nodes.

You can create two types of network diagrams:

Hierarchical

creates a hierarchical structure by using a hierarchy or a set of categories.

Ungrouped

creates a structure by using a source data item and a target data item. A node is created for each value of the source data item, and a link is created from each node to the node that corresponds to the value of the target data item.

For example, if your source data item specifies the name of every employee in an organization, and your target data item specifies the manager of each employee, then the network diagram has a node for each employee that is linked to the node for the employee’s manager.

Data Roles for a Network Diagrams

Basic Data Roles for a Hierarchical Network Diagram

The basic data role for a hierarchical network diagram is **Levels**. Specify a hierarchy or any number of categories. The data items in the **Levels** role specify the nodes of the network diagram. If you add categories to the **Levels** role, then the order of the categories determines their hierarchical relationship. You can drag and drop the categories to arrange them.

Basic Data Roles for an Ungrouped Network Diagram

The basic data roles for an ungrouped network diagram are the **Source** and the **Target**. The **Source** specifies a category that contains all of the node values for the plot. The **Target** specifies a category that creates the links between nodes. The **Target** category must contain a subset of the values of the **Source** category.

Additional Data Roles for a Network Diagram

In addition to the basic data roles, you can specify the following additional data roles for a network diagram:

Node size

specifies a measure that determines the size of the nodes in the diagram.

Node color

specifies a data item that determines the color of the nodes in the diagram.

Link width

specifies a measure that determines the width of the links in the diagram.

Link color

specifies a data item that determines the color of the links in the diagram.

Data tips

specifies data items whose values are included in the data tips for the diagram.

Measure values are aggregated by sum.

Specify Properties for a Network Diagram

On the **Properties** tab, you can specify the following options:

Name

specifies the name of the visualization.

Title

specifies the title that appears above the graph.

Note: The **Title** option is disabled if you select **Generate graph title**.

Generate graph title

specifies that the graph title is generated automatically based on the data items in the visualization.

Show map

displays the network as an overlay on a geographic map.

Note: This option is available only if geographies are assigned to all of the data roles that create nodes. For hierarchical diagrams, all of the **Levels** must be geographies. For ungrouped diagrams, the **Source** and **Target** must be geographies.

Show labels

shows the node values as text inside each node.

Show direction

shows the links in the diagram as arrows.

Map service

if your diagram contains a map, specifies the source for the background map.

Node color

selects the color gradient for the nodes in the diagram. You can click  to select the values that are used to assign the colors. See [“Specify a Custom Data Range” on page 219](#).

Note: This option is available only if you assign a measure to the **Node Color** data role.

Link color

selects the color gradient for the links in the diagram. You can click  to select the values that are used to assign the colors. See [“Specify a Custom Data Range” on page 219](#).

Note: This option is available only if you assign a measure to the **Link Color** data role.

Additional levels

for hierarchical diagrams only, specifies the number of levels that are displayed beneath the current level.

Node spacing

specifies the amount of space between nodes in the diagram.

Source node

displays the current node selection. To remove the node selection, select .

Predecessors

selects the number of levels of predecessors (parents) of the source node to select. 0 specifies the source node. Note that you can specify a range by making multiple selections. For example, select both 0 and 1 to specify that the source node and the first level of predecessors are selected.

Successors

selects the number of levels of successors (children) of the source node to select. 0 specifies the source node. Note that you can specify a range by making multiple selections. For example, select both 0 and 1 to specify that the source node and the first level of successors are selected.

Arrange Nodes in a Network Diagram

Move Nodes

You can move any node in the diagram by clicking the node and dragging it. You can move multiple nodes in the diagram by selecting the nodes that you want to move and dragging them.

Note: The positions of the nodes in your diagram are saved with your exploration.

Refresh the Node Layout

You can refresh your node layout by clicking . The network diagram creates a new node layout based on your current node layout. This is especially useful after you have moved nodes manually. Refreshing the node layout adjusts the spacing and orientation of your nodes.

Use the Spotlight Tool to View Multiple Data Tips

The spotlight tool enables you to view data tips for all of the nodes that are within a circular area around the cursor.

Click  to enable or disable the spotlight tool.

Select Nodes in a Network Diagram

You can select nodes in the diagram by using any of the following methods:

- Click and drag the cursor to create a rectangular selection.
- Hold down the Ctrl key and click the nodes that you want to select.
- Select a series of linked nodes by setting a node as the source node.

Right-click a node, and then select **Set as Source for Selection**.

On the **Properties** tab, specify the range of levels of **Predecessors** (parents) and **Successors** (children) of the source node to select. 0 specifies that the source node is selected.

For example, if you specify a range of 0–1 for **Predecessors** and a range of 0–2 for **Successors**, then the source node, one level of predecessors, and two levels of successors are selected.

Control the View of a Network Diagram

You can control the view of a network diagram by using the following controls:

Zoom	Zoom in and out at the location of the cursor by scrolling the mouse wheel.
Pan (scroll)	Pan (scroll) the diagram by holding down the Shift key and dragging the diagram.
Reposition the view	When you have zoomed in on a diagram and scroll bars are displayed, reposition your zoomed view by holding the Shift and Alt keys and dragging the diagram.
Rotate	Rotate the diagram by holding down the Ctrl key and dragging the diagram.

Create a Hierarchy from a Network Diagram

If your network diagram contains categories in the **Levels** role, then you can create a new hierarchy by using the categories.

On the **Roles** tab, click on the drop-down list for the **Levels** role, and then select **Create Hierarchy**. A new hierarchy is created with the name of the first category in the hierarchy.

Working with Sankey Diagrams

About Sankey Diagrams

A Sankey diagram enables you to perform path analytics. Path analytics displays flows of data from one event (value) to another as a series of paths.

The following display shows the parts of a Sankey diagram.

Figure 25.3 *Parts of a Sankey Diagram*

- 1** Nodes contain the events in each path. The node displays the width of each link that enters and exits the node. The same event can appear at multiple nodes in the diagram.
- 2** Links between nodes make up the paths in the diagram. The width of each link can represent either the frequency of the path or the value of a weight measure.
- 3** Drop-off links are links that end at the current node. Drop-off links are displayed only if some links continue onward from the current node.

Transaction Identifier

specifies a data item whose values identify the transactions in the diagram.

Note: The paths in a Sankey diagram exclude any missing values in the data items that are assigned to the **Event**, **Transaction Identifier**, or **Sequence Order** role.

In addition to the basic data roles, you can specify the following role:

Weight

specifies a measure for the weight of each event in a transaction. The weight values for each transaction, for each event in a path are aggregated to determine the path weight.

Specify Properties for a Sankey Diagram

On the **Properties** tab, you can specify the following:

Name

specifies the name of the visualization.

Title

specifies the title that appears above the graph.

Note: **Title** is disabled if you select **Generate graph title**.

Generate graph title

specifies that the graph title is generated automatically based on the data items in the visualization.

Show labels

displays the event name for each node.

Show nodes

displays link width values at each node.

Show outline

displays a box around each node.

Vertical layout

displays the diagram vertically.

Link color

specifies the method that is used to group and color the paths or links in the diagram.

Select one of the following:

Path

displays each path as a separate group with a distinct color.

Event

groups links together by event. Links that originate from the same event have the same color. For links between the same two events, the links are combined even if their transactions are part of different paths.

Drop off

groups links together based on whether they are drop-off links. A drop-off link represents a link that ends at the current node while other links continue onward from the current node. For links between the same two events, the links are combined even if their transactions are part of different paths.

Link width

specifies whether the width of a link in a path represents the path frequency (**Frequency**) or the aggregated value of the weight measure (**Weight**).

Note: If you do not assign the **Weight** data role, then **Frequency** is always used for the link width.

Note: If the aggregated value of the weight measure for any path is negative, zero, or missing, then **Frequency** is used for the link width.

Minimum path length

specifies the minimum length for a path that is displayed. The path length that you specify indicates the number of nodes in the path.

For example, if the **Minimum path length** is 3 and the **Maximum path length** is 5, then the diagram displays only paths that have lengths of 3, 4, or 5 nodes.

Maximum path length

specifies the maximum length for a path that is displayed. The path length that you specify indicates the number of nodes in the path.

For example, if the **Minimum path length** is 3 and the **Maximum path length** is 5, then the diagram displays only paths that have lengths of 3, 4, or 5 nodes.

Note: A hyphen character (-) specifies that there is no maximum path length.

Minimum frequency

specifies the minimum path frequency for a path that is displayed. For example, if you specify a minimum path frequency of 5, then the diagram displays only paths that have a frequency of 5 or greater.

Maximum frequency

specifies the maximum path frequency for a path that is displayed. For example, if you specify a maximum path frequency of 10, then the diagram displays only paths that have a frequency of 10 or fewer.

Note: A hyphen character (-) specifies that there is no maximum frequency.

Path ranking

specifies a ranking method for the paths in the diagram. If you specified a measure for the **Weight** role, then ranking is based on the aggregated value of the weight measure for each path. If there is no measure for the **Weight** role, then ranking is based on the frequency of each path.

From the drop-down list, select **Top** to select the paths with the highest values. Select **Bottom** to select the paths with the lowest values. In the text field, enter the number of paths to select.

By default, path ranking selects the top 200 paths.

Note: If your ranking method reduces the number of paths that are displayed, then a message appears at the bottom of the diagram.

Compress

combines repeated, consecutive events in each path into a single event. If you specified a measure for the **Weight** role, then the weight value for a compressed event is the average of the weight values for the repeated, consecutive events that were combined.

Note: For all of the options under **Path Analytics**, click  to apply your changes.

Managing the Path Selection for a Sankey Diagram

About Path Selections

You can subset the paths in a Sankey diagram by creating a path selection. A path selection uses a set of conditions to select or exclude paths based on the nodes or events in each path.

Create a New Condition By Using the Add New Condition Window

To create a new condition by using the Add New Condition window, follow these steps:

- 1 In the visualization toolbar, click the  drop-down list, and then select **Add New Condition**. The Add New Condition window appears.
- 2 From the **Condition** drop-down list, select the condition type.
- 3 From the **Events** drop-down list, select the events for the condition.
- 4 From the **Type** drop-down list, select one of the following:

Include Only

specifies that the path selection includes only paths that contain one or more of the selected events.

Exclude

specifies that the path selection excludes all paths that contain one or more of the selected events.

- 5 Click **OK** to apply the new condition to your path selection.

TIP You can create a condition for the path selection when only the **Event** role is assigned to the visualization. For large data sources, you might want to create your path selection before assigning all of the data roles to avoid long loading times.

Create a New Condition from Selected Nodes

To add a new condition from selected nodes in the diagram, follow these steps:

- 1 Select one or more nodes in the diagram.

Note: To select multiple nodes, press the Ctrl key.

- 2 Click the  drop-down list, and then select either **Include Only** ► *condition-type* or **Exclude** ► *condition-type*, where *condition-type* can be any of the following:

Paths Containing All the Selected Nodes

includes or excludes paths that contain all of the selected nodes. This condition type is based on specific nodes in the diagram, rather than the event values.

Paths Containing Any of the Selected Nodes

includes or excludes paths that contain any of the selected nodes. This condition type is based on specific nodes in the diagram, rather than the event values.

Paths Containing the Selected Events on Any Node

includes or excludes paths that contain any of the selected events, on any node. This condition type is based on the event values of the selected nodes.

Paths Starting With the Selected Events

includes or excludes paths that start with any of the selected events.

Paths Ending With the Selected Events

includes or excludes paths that end with any of the selected events.

The new condition appears on the **Path Selection** tab of the details table.

Edit a Condition for a Path Selection

To edit a condition for a path selection, follow these steps:

- 1 Open the details table for your visualization by clicking the  drop-down list from the visualization toolbar, and then selecting **Show Details**.
- 2 In the details table, select the **Path Selection** tab.
- 3 In the **Type** column, select the condition type:

Include Only

includes only the paths that satisfy the condition.

Exclude

excludes the paths that satisfy the condition.

Remove Conditions from a Path Selection

To remove a condition a path selection, perform the following steps:

- 1 Open the details table for your visualization by clicking the ▼ drop-down list from the visualization toolbar, and then selecting **Show Details**.
- 2 In the details table, select the **Path Selection** tab.
- 3 To remove specific conditions, select the conditions that you want to remove, right-click one selected condition, and select **Remove Selected Conditions**.

To remove all of the conditions, right-click any condition, and select **Remove All Conditions**.

Explore the Transaction Identifier Values for a Path Selection

You can explore the transaction identifier values for your path selection by creating a new visualization. To create a new visualization from your path selection, perform either of the following steps:

- On the **Path Selection** tab of the details table, right-click a condition, and then select **Create Visualization from All Conditions**. All of the conditions in your path selection are used to filter the data in your new visualization.
- In the Sankey diagram, select one or more nodes, click the ▼ drop-down list, select **Create New Visualization**, and select a condition for your path selection. For more information, see [“Create a New Condition from Selected Nodes” on page 254](#).

The new condition and any existing conditions are all used to filter the data in your new visualization.

The new visualization appears as a bar chart of the data item assigned to the **Transaction Identifier** role. A visualization filter selects all of the transaction identifier values that correspond to your path selection. If your Sankey diagram includes a weight measure, then the weight measure also appears in the bar chart.

Note: You can perform any standard visualization tasks with the new visualization. For example, you can add data items and change the visualization type.

Use the Spotlight Tool to View Multiple Data Tips

The spotlight tool enables you to view data tips for all of the nodes that are within a circular area around the cursor.

Click  to enable or disable the spotlight tool.

Display the Overview

For large diagrams, the overview enables you to select the portions of the diagram that are visible.

To display the overview, click the  drop-down list from the visualization toolbar, and then select **Show Overview**.

Zoom a Sankey Diagram

You can zoom a Sankey diagram by using either of the following controls:

- in the overview, select the part of the diagram that you want to zoom
- scroll the mouse wheel over the visualization to zoom in or zoom out at the location of the cursor

Pan (Scroll) a Sankey Diagram

You can pan (scroll) the diagram by using any of the following controls:

- In the overview, drag the selection box.
- Hold down the Shift key and drag the diagram.
- When you have zoomed in on a diagram and scroll bars are displayed, reposition your zoomed view by holding down the Shift and Alt keys and dragging the diagram.

Working with Histograms

About Histograms

A histogram displays the distribution of values for a single measure. A series of bars represents the number of observations in the measure that match a specific value or value range. The bar height can represent either the exact number of observations or the percentage of all observations for each value range.

Note: If you use the default number of bins, then the minimum and maximum values on the histogram axis might not match the actual extent of your data values. If you specify the number of histogram bins, then the histogram axis matches your data values exactly.

Data Roles for a Histogram

The basic data role for a histogram is a measure. You can assign only one measure to a histogram.

Specify Properties for a Histogram

On the **Properties** tab, you can specify the following options:

Name

specifies the name of the visualization.

Title

specifies the title that appears above the graph.

Note: The **Title** option is disabled if you select **Generate graph title**.

Generate graph title

specifies that the graph title is generated automatically based on the data items in the visualization.

Show grid lines

displays grid lines for each tick on the response axis.

Bar direction

specifies whether the bars are vertical or horizontal.

Frequency

specifies whether the frequency is displayed as a count (**Count**) or as a percentage (**Percent**).

Note: The frequency values are based on the data that is shown in the visualization (after filters and other data selections have been applied).

Use default bin count

specifies whether to use the default number of bins (value ranges) for the histogram. The default number of bins is determined by the number of data values in your histogram.

Bin count

specifies the number of bins (value ranges) for the histogram.

Reference Lines

adds reference lines to the visualization. To create a reference line, click , and then specify the parameters for the line in the New Reference Line window.

The name of each reference line appears below the **Reference Lines** option. You can edit or delete your reference lines by using the icons next to each name.

Working with Box Plots

About Box Plots

A box plot displays the distribution of data values by using a rectangular box and lines called “whiskers.”

Figure 25.5 *Parts of a Box Plot*

Figure 25.5 on page 259 shows a diagram of a box plot. The bottom and top edges of the box indicate the interquartile range (IQR). That is, the range of values that are between the first and third quartiles (the 25th and 75th percentiles). The marker inside the box indicates the mean value. The line inside the box indicates the median value.

You can enable outliers, which are data points whose distances from the interquartile range are greater than 1.5 times the size of the interquartile range.

The whiskers (lines protruding from the box) indicate the range of values that are outside of the interquartile range. If you do not enable outliers, then the whiskers extend to the maximum and minimum values in the plot. If you enable outliers, then the whiskers indicate the range of values that are outside of the interquartile range, but are close enough not to be considered outliers.

If there are a large number of outliers, then the range of outlier values is represented by a bar. The data tip for the bar displays additional information about the outliers. To explore the outliers, double-click on the outlier bar to view the values as a new histogram visualization.

Data Roles for a Box Plot

The basic data roles for a box plot are categories and measures. You can assign one category only, and the category values are plotted on the category axis. You can assign many measures, and the measure values are plotted on the response axis. At least one measure is required.

In addition to the basic data roles, you can assign these roles:

Lattice columns

creates a lattice of charts with a column for each value of the category data item that you assign.

Lattice rows

creates a lattice of charts with a row for each value of the category data item that you assign.

Specify Properties for a Box Plot

On the **Properties** tab, you can specify the following options:

Name

specifies the name of the visualization.

Title

specifies the title that appears above the graph.

Note: The **Title** option is disabled if you select **Generate graph title**.

Generate graph title

specifies that the graph title is generated automatically based on the data items in the visualization.

Show grid lines

displays grid lines for each tick on the response axis.

Box direction

specifies whether the boxes are vertical or horizontal.

Overview

specifies whether the chart overview is enabled.

Measure layout

specifies whether the measures share a single response axis (**Shared axis**) or have separate response axes for each measure (**Separate axes**).

Note: The **Measure layout** option is disabled if your visualization contains exactly one measure.

Show averages

displays the mean value as a marker inside the box.

Show outliers

shows outliers outside of the whiskers. Outliers are data points whose distances from the interquartile range are greater than 1.5 times the size of the interquartile range.

Rotate axis labels

displays the category labels at an angle.

Note: The **Rotate axis labels** option has no effect if the box plot contains no categories.

Reference Lines

adds reference lines to the visualization. To create a reference line, click , and then specify the parameters for the line in the New Reference Line window.

The name of each reference line appears below the **Reference Lines** option. You can edit or delete your reference lines by using the icons next to each name.

Working with Heat Maps

About Heat Maps

A heat map displays the distribution of values for two data items by using a table with colored cells. If you do not assign a measure to the **Color** data role, then a cell's color represents the frequency of each intersection of values. If you assign a measure to the **Color** data role, then a cell's color represents the aggregated measure value for each intersection of values.

Data Roles for a Heat Map

The basic data roles for a heat map are:

X axis

specifies the data item that is assigned to the X axis.

Y axis

specifies the data item that is assigned to the Y axis.

Color

specifies a measure that determines the cell color. If you do not assign the **Color** role, then the cell color indicates frequency.

Specify Properties for a Heat Map

On the **Properties** tab, you can specify the following options:

Name

specifies the name of the visualization.

Title

specifies the title that appears above the graph.

Note: The **Title** option is disabled if you select **Generate graph title**.

Generate graph title

specifies that the graph title is generated automatically based on the data items in the visualization.

Bin count

specifies the number of value ranges that are represented as cells. **Bin count** affects only measures.

Show borders

specifies that the borders between cells are visible.

Rotate axis labels

displays the category labels at an angle.

Note: The **Rotate axis labels** option affects only the values on the X axis.

Note: The **Rotate axis labels** option has no effect if the heat map contains no categories.

Color gradient

selects the gradient colors for the visualization.

You can click  to select the values that are used to assign the colors. See [“Specify a Custom Data Range” on page 219](#).

Fit line

adds a fit line to the heat map. For information about the fit types that are available, see [“Fit Lines” on page 319](#).

Note: Fit lines are not available if a category is assigned to the heat map.

Applying Data Analysis

About Data Analysis

For heat maps, you can apply the following data analyses:

Correlation

identifies the degree of statistical correlation between the variables in the visualization. For more information, see [“Correlation” on page 318](#).

Fit Line

plots a model of the relationship between the variables in the visualization.

There are many types of fit lines, including linear fit, quadratic fit, cubic fit, and penalized B-spline. For more information, see [“Fit Lines” on page 319](#).

Correlation is applied to your visualization automatically when you add a linear fit line. It is not available with other fit types.

Enable Data Analysis

To add a fit line to your visualization, select the  drop-down list from the visualization toolbar, and then select **Fit Line** ► *fit-type*. For information about the fit types that are available, see [“Fit Lines” on page 319](#).

Note: Fit lines are not available if your heat map contains categories or hierarchies.

Working with Geo Maps

About Geo Maps

A geo map overlays your data on a geographic map. You can display your data either as bubbles, as a scatter plot, or as colored regions on the geo map.

To display a geo map, you must define one or more of the categories as geography data items. For more information, see [“Defining a Geography Data Item” on page 191](#).

Data Roles for a Geo Map

The basic data roles for a bubble plot are:

Map style

specifies the type of data overlay for the map. Select one of the following values:

Coordinates

displays your data as a simple scatter plot on the map. Each point is located at the center of a geographic region or at the coordinates of a location.

Bubbles

displays your data as a series of bubbles. Each bubble is located at the center of a geographic region or at the coordinates of a location.

Regions

displays your data as colored regions on the map.

Note: The **Regions** map style is not available for custom geographic roles.

Geography

specifies the geography data item that identifies geographic regions for your map.

Geography data items are identified by the  icon.

Bubble size

for the **Bubbles** map style, specifies the measure that determines the bubble size.

Color

for the **Regions** map style, specifies the measure that determines the regions' colors.

for the **Bubbles** map style, specifies a measure that determines the bubble color.

Specify Properties for a Geo Map

On the **Properties** tab, you can specify the following options:

Name

specifies the name of the visualization.

Title

specifies the title that appears above the graph.

Note: The **Title** option is disabled if you select **Generate graph title**.

Generate graph title

specifies that the graph title is generated automatically based on the data items in the visualization.

Map service

specifies the source for the background map.

Size scale

specifies the type of scaling that is used to draw the bubbles. Select one of the following values:

Linear

specifies that the bubble sizes are scaled relative to the minimum and maximum values (or frequencies) in your data. A negative value is displayed as a smaller bubble than a positive value.

For the **Linear** scaling type, the difference in bubble sizes might not be proportional to the difference in values.

Magnitude

specifies that the bubble sizes are scaled relative to zero and the greatest absolute value in your data. A negative value is displayed as a circle with a waving edge.

For the **Magnitude** scaling type, the difference in bubble sizes is proportional to the difference in absolute values.

Note: This option is available only for the **Bubbles** map style.

Frequency

specifies whether the frequency values are displayed as the number of values (**Count**) or as the percentage of values (**Percent**).

Show map navigation control

specifies whether the map zoom and pan controls are visible.

Color gradient

selects the gradient colors for the visualization.

You can click  to select the values that are used to assign the colors. See [“Specify a Custom Data Range” on page 219](#).

Transparency

specifies the amount of transparency for the data overlay.

Zoom a Geo Map

You can zoom the map by using any of the following controls:

- click the zoom bar to select your zoom level
- press the + and – buttons on the zoom bar
- scroll the mouse wheel to zoom in or zoom out at the location of the cursor

Pan (Scroll) a Geo Map

You can pan (scroll) the map by using any of the following controls:

- click and drag the map
- click the arrows on the pan control

Working with Treemaps

About Treemaps

A treemap displays a hierarchy or a category as a set of rectangular tiles. Each tile represents a category value or a hierarchy node. The size of each tile represents either the frequency count or the value of a measure. If you assign a measure to the **Color** role, then the color of each tile represents the value of that measure.

Data Roles for a Treemap

The basic data roles for a treemap are:

Tile

specifies categories or a hierarchy that are used to create the tiles in the treemap. If you specify categories for the **Tile** role, the order of the categories determines the

level of each category. Drag and drop the categories to place them in the order that you want.

Size

specifies a measure that determines the size of each tile. If you do not specify the **Size** role, then the tile size is determined by the frequency count.

Note: If any of the aggregated values for the **Size** role results in a negative size value or a value of zero, then an error appears.

Color

specifies a measure that determines the color of the tiles.

Specify Properties for a Treemap

On the **Properties** tab, you can specify the following options:

Name

specifies the name of the visualization.

Title

specifies the title that appears above the graph.

Note: The **Title** option is disabled if you select **Generate graph title**.

Generate graph title

specifies that the graph title is generated automatically based on the data items in the visualization.

Show data labels

shows a text label for each tile in the treemap.

Frequency

specifies whether the frequency values are displayed as the number of values (**Count**) or as the percentage of values (**Percent**).

Arrangement

specifies the layout of the tiles in the treemap. Select one of the following values:

Standard

arranges the tiles into squares, with the largest tiles generally at the bottom left.

Flow

arranges the tiles from largest to smallest, with the largest tile at the top left.

Toggle

arranges the tiles into a single row or column, with the largest tile on the left or at the top.

The orientation of the tiles alternates between hierarchy levels. The top level is arranged as a row, the second level is a column, and so on.

Additional levels

specifies the number of levels that are displayed beneath the current level.

Color gradient

selects the gradient colors for the visualization.

You can click  to select the values that are used to assign the colors. See [“Specify a Custom Data Range” on page 219](#).

Create a Hierarchy from a Treemap

If your treemap contains categories in the **Tile** role, then you can create a new hierarchy by using the categories.

On the **Roles** tab, click on the drop-down list for the **Tile** role, and then select **Create Hierarchy**. A new hierarchy is created with the name of the first category in the hierarchy.

Working with Correlation Matrices

About Correlation Matrices

A correlation matrix displays the degree of correlation between multiple intersections of measures as a matrix of rectangular cells. Each cell in the matrix represents the

intersection of two measures, and the color of the cell indicates the degree of correlation between those two measures.

A correlation matrix can either compare within a single set of measures or it can compare between two sets of measures.

The correlation values are calculated by using Pearson's product-moment correlation coefficient. Correlation values are identified as weak, moderate, or strong as follows:

Weak

the absolute value is 0.3 or lower

Moderate

the absolute value is greater than 0.3 and less than or equal to 0.6

Strong

the absolute value is greater than 0.6

Data Roles for a Correlation Matrix

The basic data role for a correlation matrix is a measure. You must assign at least two measures.

Note: The maximum number of measures is 60.

The **Show Correlations** option specifies whether the correlation matrix uses a single set of measures (**Within one set of measures**) or two sets of measures (**Between two sets of measures.**)

If you select **Between two sets of measures**, then assign measures to the **X axis** and **Y axis** roles.

Specify Properties for a Correlation Matrix

On the **Properties** tab, you can specify the following options:

Name

specifies the name of the visualization.

Title

specifies the title that appears above the graph.

Note: The **Title** option is disabled if you select **Generate graph title**.

Generate graph title

specifies that the graph title is generated automatically based on the data items in the visualization.

Show borders

specifies that the borders between cells are visible.

Rotate axis labels

displays the axis labels at an angle.

Color gradient

selects the gradient colors for the visualization.

Sort Correlation Values

For a correlation matrix between two sets of measures, you can sort by the correlation values for a measure.

To apply sorting, right-click the **Measures** button on the axis that you want to sort, and then select **Sort**. You can select any of the measures on the selected axis, and you can select whether to sort the correlation values in ascending or descending order.

Explore the Data for a Cell

For any cell (crossing) in the correlation matrix, you can explore the measures for that cell as a heat map.

To explore the measures, right-click the cell that you want to explore, and then select **Explore measure by measure**.

A new heat map visualization displays the two measures from your selected cell.

Working with Decision Trees

About Decision Trees

A decision tree uses the values of one or more predictor data items to predict the values of a target data item. A decision tree displays a series of nodes as a tree, where the top node is the target data item, and each branch of the tree represents a split in the values of a predictor data item. Decision trees are also known as classification and regression trees.

Figure 25.6 Example Decision Tree

Each branch of the tree displays the name of the predictor for the branch at the top of the split. The thickness of the branch indicates the number of values that are associated with each node. The predictor values for each node are displayed above the node.

Each node in the tree displays the data for the node either as a histogram (if the target contains continuous data) or as a bar chart (if the target contains discrete data). The histogram or bar chart in each node displays the values of the target data item that are selected by the splits in the tree. The number at the top right of the node indicates the greatest value or frequency for the bar chart or histogram. At the bottom of each node, the total number of data values (count) for the node is displayed.

Decision trees in SAS Visual Analytics use a modified version of the C4.5 algorithm.

The details table for a decision tree contains two additional data columns, Node ID and Parent ID. Node ID specifies a unique value for each node in the tree. Parent ID specifies the ID of the parent node.

Data Roles for a Decision Tree

The basic data roles for a decision tree are:

Target

specifies the target for the decision tree. You can specify any category or measure. The decision tree attempts to predict the values of the target data item. The bar chart or histogram inside each node of the tree displays the frequency of values for the target data item.

Predictors

specifies predictors for the decision tree. You can specify one or more categories or measures as predictors. The values of predictor data items are displayed above the nodes in the tree. The order of the data items in the **Predictors** list does not affect the tree.

Note: If a predictor does not contribute to the predictive accuracy of the tree, then it is not used in the tree.

Specify Properties for a Decision Tree

On the **Properties** tab, you can specify the following options:

Name

specifies the name of the visualization.

Title

specifies the title that appears above the graph.

Note: The **Title** option is disabled if you select **Generate graph title**.

Generate graph title

specifies that the graph title is generated automatically based on the data items in the visualization.

Include missing

specifies whether missing values are included in the tree.

Frequency

specifies whether the frequency value for each node is displayed as a count (**Count**) or as a percentage (**Percent**).

Note: The frequency values are based on the data that is shown in the visualization (after filters and other data selections have been applied).

Growth strategy

specifies the parameters that are used to create the decision tree. Select one of the following values:

Basic

specifies a simple tree with a maximum of two branches per split and a maximum of six levels. For details, see [Table 25.4 on page 275](#).

Advanced

specifies a complex tree with a maximum of four branches per split and a maximum of six levels. For details, see [Table 25.4 on page 275](#).

Expert

enables you to select the values for each of the expert parameters.

If you select **Expert** as the value for **Growth strategy**, then the following additional options appear:

Maximum branches

specifies the maximum number of branches for each node split.

Maximum levels

specifies the maximum number of levels in the tree.

Leaf size

specifies the minimum number of values (count) for each node.

Target bins

specifies the number of bins that are used for the target data item.

Note: This option has no effect if the target data item contains discrete data.

Predictor bins

specifies the number of bins that are used for predictor data items.

Note: This option has no effect if the predictor data items contain discrete data.

Pruning

specifies the level of pruning that is applied to the tree. Pruning removes leaves and branches that contribute the least to the predictive accuracy of the tree. A more **Lenient** pruning value specifies that fewer leaves and branches are removed from the tree. A more **Aggressive** pruning value specifies that more leaves and branches are removed from the tree.

Reuse predictors

specifies that predictors can be used more than once in the tree.

The following parameter values are used for the **Basic** and **Advanced** growth strategies:

Table 25.4 Parameter Values for the Basic and Advanced Growth Strategies

Property	Basic Value	Advanced Value
Maximum branches	2	4

Property	Basic Value	Advanced Value
Maximum levels	6	6
Leaf size	1	1
Target bins	10	10
Predictor bins	2	10
Reuse predictors	No	Yes

Explore a Node as a New Visualization

For each node in the tree, you can explore the data values as a new histogram or bar chart visualization. To create a new visualization for a node, right-click on the node, and then select **Create Visualization from Node**. A new visualization appears.

Note: If you create a visualization from a node that displays a histogram, then the new histogram might have visual differences from the histogram that is displayed in the decision tree. For example, the bins and the extent of data on the X axis might be different. However, the two histograms use exactly the same data.

Calculate a Data Item from a Decision Tree

You can create a calculated data item to represent the results of a decision tree. The calculated data item creates values that correspond to the node IDs that can be seen in the details table for the decision tree.

You can use the calculated data item in filters to select the values for a decision tree node in other types of visualizations.

To calculate a data item from a decision tree:

- 1 Select the ▼ drop-down list from the visualization toolbar, and then select **Create Calculated Item**.

- 2 In the New Calculated Item window, enter a **Name** for the new calculated item.
- 3 Click **OK** to create the new item.

Display the Overview

For large decision trees, the overview enables you to select the portions of the tree that are visible.

To display the overview, select the  drop-down list from the visualization toolbar, and then select **Show Overview**.

Zoom a Decision Tree

You can zoom a decision tree by using either of the following controls:

- in the overview, select the part of the decision tree that you want to view
- scroll the mouse wheel over the visualization to zoom in or out at the location of the cursor

Note: If the target contains discrete data, and you zoom out on the decision tree, then each node displays a single bar for the greatest value in that node.

When you have zoomed in on a decision tree and scroll bars are displayed, you can reposition the decision tree by holding down the Shift and Alt keys and dragging it.

Pan (Scroll) a Decision Tree

You can pan (scroll) the decision tree by using any of the following controls:

- in the overview, drag the selection box
- hold down the Shift key and drag the decision tree

Working with Word Clouds

About Word Clouds

A word cloud displays a set of words from a character data item. Depending on the type of word cloud and your data roles, the size of each word in the cloud can indicate the importance (topic term weight) of the word, the frequency of the word, or the value of a measure.

You can create two types of word cloud:

Word clouds that use text analytics

Word clouds that use text analytics analyze each value in a document collection data item as a text document that can contain multiple words. Words that often appear together in the document collection are identified as topics. For the selected topic, the word cloud displays the terms with the greatest topic term weight values. The topic term weight indicates the importance of the term within the topic.

A word cloud that uses text analytics can also display whether the documents in a topic express positive, negative, or neutral sentiment.

The details table for a text analytics word cloud contains additional information about the terms, topics, and documents in the word cloud. For more information, see [“Explore Text Analytics Results” on page 283](#).

To enable text analytics, you must set a unique row identifier and define one or more categories as document collections. See [“Define Data Items for Text Analytics” on page 193](#).

Note: Text analytics can be applied only to English or German text.

Note: Depending on the number of rows in your data source and the length of the values in your document collection, a word cloud with text analytics might require a significant amount of time to display.

Note: Text analytics in SAS Visual Analytics uses a different algorithm from SAS Text Miner. Your results might be different from the results that SAS Text Miner produces.

Word clouds that use category values

Word clouds that use category values analyze each value in a category data item as a single text string. The word cloud can display either the string values that have the highest frequency or the string values that have the greatest value for a measure. The color of each word can indicate the value of a measure.

Data Roles for a Word Cloud

About Data Roles for a Word Cloud

The data roles for a word cloud are dependent on the type of word cloud that you select.

The **Show Word Cloud** option selects whether the word cloud is generated by using text analytics or by using category values.

Data Roles for a Word Cloud That Uses Text Analytics

For a word cloud that uses text analytics, the basic role is a **Document collection**. A document collection is a category data item that contains the words that you will analyze.

Note: To enable text analytics, you must set a unique row identifier and define one or more categories as document collections. See [“Define Data Items for Text Analytics” on page 193](#).

In addition to the basic role, you can specify the following role:

Document details

specifies data items that are displayed as columns in the **Documents** tab of the details table.

Data Roles for a Word Cloud That Uses Category Values

For a word cloud that uses category values, the basic role is **Words**. Specify a category whose values are used in the word cloud.

In addition to the basic role, you can specify these roles:

Size

specifies a measure that determines the size of each word. If you do not specify a measure, then the word size indicates the frequency of each word.

Color

specifies a measure that determines the color of each word.

Specify Properties for a Word Cloud

On the **Properties** tab, you can specify the following options:

Name

specifies the name of the visualization.

Title

specifies the title that appears above the graph.

Note: The **Title** option is disabled if you select **Generate graph title**.

Generate graph title

specifies that the graph title is generated automatically based on the data items in the visualization.

Frequency (for category values only)

specifies whether the frequency is displayed as a count (**Count**) or as a percentage (**Percent**).

Note: The frequency values are based on the data that is shown in the visualization (after filters and other data selections have been applied).

Note: This option has no effect if a measure is assigned to the **Size** role.

Word display limit

specifies the maximum number of words that are displayed in the word cloud.

Font scale

specifies the amount of difference in font sizes between the largest and smallest words in the cloud. The number value specifies the ratio in points of the largest font size to the smallest font size.

For word clouds that use category values, you can specify the following addition option:

Color gradient

selects the gradient colors for the visualization.

You can click  to select the values that are used to assign the colors. See [“Specify a Custom Data Range” on page 219](#).

For word clouds that use text analytics, you can specify the following additional basic options:

Analyze document sentiment

Enables sentiment analysis for the word cloud.

Sentiment analysis determines whether a document has a positive sentiment, negative sentiment, or neutral sentiment based on the content of the document.

When sentiment analysis is enabled, the number of positive, neutral, and negative documents in the topic is displayed at the top of the word cloud. In addition, sentiment values are displayed on the **Topics** and **Documents** tabs of the details table.

Identify term roles

identifies terms by their parts of speech. In addition, this option identifies groups of nouns as single terms and identifies text entities such as names, addresses, telephone numbers, and so on.

Note: This option is equivalent to the advanced options **Include parts of speech**, **Extract noun groups**, and **Use entity extraction**.

Maximum topics

specifies the maximum number of topics to create. Specify a number from 4 to 20.

For word clouds that use text analytics, you can specify the following additional advanced options:

Analyze document sentiment

Enables sentiment analysis for the word cloud.

Sentiment analysis determines whether a document has a positive sentiment, negative sentiment, or neutral sentiment based on the content of the document.

When sentiment analysis is enabled, the number of positive, neutral, and negative documents in the topic is displayed at the top of the word cloud. In addition, sentiment values are displayed on the **Topics** and **Documents** tabs of the details table.

Maximum topics

specifies the maximum number of topics to create. Specify a number from 4 to 20.

Resolution

specifies the resolution that is used to identify topics. A **Low** resolution identifies fewer topics. A **High** resolution identifies more topics.

Cell weight

specifies whether to weight the frequency of each term for every document that it appears in. Selecting **Logarithmic** de-emphasizes terms that appear many times in relatively few documents.

Term weight

specifies a weighting algorithm for the terms in the document collection. The **Entropy** weighting algorithm emphasizes terms that have a low frequency across the document collection.

Document threshold

specifies the minimum number of documents that a term must appear in. Specify a number from 1 to 20. If a term does not appear in the minimum number of documents, then it is not included in the word cloud.

Topic label length

specifies the number of terms that are included in a topic name. Specify a number from 2 to 8. This property does not affect the number of terms that are used to select topics; only the topic names are changed.

Include parts of speech

specifies that terms are classified by parts of speech (for example, a noun, a verb, or an adjective.) The part of speech for each term is displayed in the data tip for the term.

Extract noun groups

specifies whether to identify groups of nouns as terms.

Use entity extraction

specifies whether to identify text entities such as names, addresses, telephone numbers, and so on. If this option is disabled, then text entities are not treated differently from other text.

Stem words

specifies whether all forms of a given word are identified as a single term. For example, if you select **Stem words**, then the words “sell,” “sells,” “selling,” and “sold” are identified as a single term “sell.”

Use stop list (if available)

specifies whether to use a stop list to exclude common words such as “the,” “with,” and “is” when identifying terms. If no stop list is available, then a message appears at the bottom of the word cloud.

Stop list

specifies the stop list that is used, if the **Use stop list** option is enabled.

Explore Text Analytics Results

For a word cloud visualization that uses text analytics, a large amount of additional information is available in the details table. To display the details table, click the ▼ drop-down list from the visualization toolbar, and then select **Show Details**.

The details table for a text analytics word cloud contains the following tabs:

Results

displays all of the terms in the current topic. For each term, the **Topic Term Weight** value indicates the importance of the term in the current topic.

If the **Identify term roles** property or the **Include parts of speech** property is enabled, then the **Role** value identifies the grammatical role of each term.

Note: You can sort any column by clicking the column heading.

Topics

displays all of the topics in the document collection. If sentiment analysis is enabled, then the number of positive, neutral, and negative documents for each topic is displayed.

Note: You can sort any column by clicking the column heading.

Documents

displays each of the documents that contains the selected term. For each document, the **Relevance** value indicates how relevant the document is to the current topic.

To view the full text for a document, right-click the document, and then select **View Full Document**.

If sentiment analysis is enabled, then the **Sentiment** value identifies how positive or negative the document is. You can filter the documents to exclude documents with positive, negative, or neutral sentiment.

Note: You can sort any numeric column by clicking the column heading.

Analysis

provides definitions of the key concepts for text analytics.

Explore Selected Documents as a New Visualization

You can explore a set of selected documents as a new table visualization. To create a new visualization from your selected documents, follow these steps:

- 1 Select the topic and the term that you want to explore.
- 2 On the **Documents** tab in the details table, select the documents that you want to explore in a new visualization. To select all of the documents, right-click any document, and then select **Select All**.

- 3 Right-click any document, and then select **Create Visualization from Selected Documents**.

A new table visualization appears with your selected document values.

About Filters in SAS Visual Analytics Explorer

In SAS Visual Analytics Explorer (the explorer), you can create filters to subset your data.

Three types of filters are available:

Basic filters

subset the data for your visualizations by using a single data item. Basic filters can be modified by using visual filter controls or by using the Edit Filter window.

For more information, see [“Working with Basic Filters” on page 292](#).

Advanced filters

subset the data for your visualizations by using any number of data items. Visual filter controls are not available for advanced filters.

For more information, see [“Working with Advanced Filters” on page 298](#).

Data source filters

subset a data source for the entire exploration. Data source filters are applied before all other data processing, so statistics like cardinality values and the percentage of total rows that is displayed in the right pane are based on the filtered data. Data source filters can use any number of data items to select data.

For information about data source filters, see [“Working with Data Source Filters” on page 299](#).

All of your filters are saved when you save your exploration.

Managing Your Filters

Set the Scope of a Filter (Global or Local)

A filter can be either local (applies only to the current visualization) or global (applies to all of the visualizations in the exploration that use the selected data source).

To set the scope of a filter, click the  drop-down list for the filter on the **Filters** tab, and then select **Filter on *data-source*** to make it a global filter or **Filter on Visualization** to make it a local filter.

Note: If you change a global filter’s scope to local, then a local filter is created for all of the visualizations in the exploration that use the selected data source.

Note: If local filters exist in your other visualizations for the same data item, then changing a local filter to a global filter replaces those local filters. A confirmation window enables you to continue or cancel.

Collapse or Expand a Filter

To collapse (minimize) or expand (restore) a filter, click the filter name on the **Filters** tab.

To collapse all of the filters in an area, click the  drop-down list in the global filters area or in the local filters area on the **Filters** tab, and then select **Collapse All Filters**.

To expand all of the filters in an area, click the  drop-down list in the global filters area or in the local filters area on the **Filters** tab, and then select **Expand All Filters**.

Arrange Filters

To arrange the filters in an area of the **Filters** tab, click the  drop-down list in the global filters area or in the local filters area and then select **Arrange Filters**.

In the Arrange Filters window, you can change the order of your filters.

Delete a Filter

To delete a filter, click  beside the filter on the **Filters** tab, or click the  drop-down list for the specific filter, and then select **Delete Filter**.

You can delete all of the filters in an area by clicking the  drop-down list in the global filters area or in the local filters area on the **Filters** tab, and then selecting **Delete All Filters**.

Note: If you delete a global filter, then the filter is removed from all of the visualizations that use the selected data source.

Resize the Global Filters and Local Filters Areas

To resize the global filters and local filters areas of the **Filters** tab, drag the resizing tab  between the two areas.

Copy a Local Filter to Another Visualization

For a local filter, you can copy your filter to any visualization that uses the same data source.

To copy your filter, click the  drop-down list for the filter on the **Filters** tab, and then select **Copy Filter to ► visualization-name**.

Copy All Local Filters from the Current Visualization to Another Visualization

For local filters, you can copy all of your filters to any visualization that uses the same data source.

To copy your filters, click the  drop-down list for the local filters (**Visualization**) area of the **Filters** tab, and then select **Copy All Filters to ► visualization-name**.

Copy a Local Filter to New Visualization

For a local filter, you can copy your filter to new blank visualization.

To copy your filter, click the  drop-down list for the filter on the **Filters** tab, and then select **Copy Filter to ► New Visualization** to copy your filter to a new blank visualization.

Link a Global Filter to Another Data Source

You can create a single filter that affects multiple data sources by linking a global filter from one data source to another.

To create a linked global filter, follow these steps:

- 1 Create a global, basic filter or select an existing global, basic filter. See [“Create a Basic Filter” on page 293](#).

Note: You cannot link an advanced filter to another data source.

- 2 Click the ▼ drop-down list for the filter on the **Filters** tab, and then select **Link Filter to ► data-source**. The Link Filters window appears.

Note: If the target data source has a different locale from your current data source, then a message appears. A linked filter between data sources that use different encodings might cause query errors.

- 3 Specify the **New filter name**, and select the **Target data item**.

The values for the original data item and the target data item are displayed. For discrete data items, an asterisk marks any values that are identical between the two data items.

- 4 Click **OK** to create the linked filter. The linked filter appears in the global filters area of each visualization that uses any of the linked data sources.

Note: You can link a linked filter to additional data sources to filter all of the linked data sources at once.

Working with Basic Filters

About Basic Filters

For all visualization types, you can subset your data by using the **Filters** tab. You can base your filters on any data item, regardless of whether the data item is assigned to the current visualization.

Your filters can be either *local filters* that apply only to the current visualization or *global filters* that apply to all of the visualizations for the selected data source. In the **Filters** tab, the local filters area is labeled **Visualization** and the global filters area is labeled with the name of the selected data source for the current visualization. For more information, see [“Set the Scope of a Filter \(Global or Local\)” on page 289](#).

The total percentage of values that are selected by your filters is displayed at the bottom of the **Filters** tab. The tooltip for the percentage displays the exact number of data rows. The percentage is calculated after data source filters are applied.

Create a Basic Filter

To create a basic filter:

- 1 From the **Data** pane, select the data item that you want to use as the base of the filter. You can select any data item, regardless of whether it is assigned to the current visualization.
- 2 For a local filter, either right-click on the data item, and select **Add as Filter on Visualization**, or drag and drop the data item onto the local filters area of the **Filters** tab.

For a global filter, either right-click on the data item, and select **Add as Filter on data-source**, or drag and drop the data item onto the global filters area of the **Filters** tab.

Note: If a local filter exists for a data item in any of your visualizations, then you cannot create a new global filter for that data item. Remove the local filter, or change its scope to global. Similarly, if a global filter exists for a data item, then you cannot create a local filter for that data item.

- 3 Set the parameters for your filter. You can use either [visual filter controls](#) or the [Edit Filter window](#).

Note: By default, your filter changes are applied automatically to the active visualization. To apply multiple changes together, deselect **Auto-Update**, and then click **Update** when you are ready to apply your filter changes.

Create a Basic Filter from a Data Selection

When you select data values in a visualization, you can use the selected values to create a basic filter.

To create a new filter from a data selection:

- 1 Select one or more data values in a visualization.

2 Right-click on the visualization, and then select one of the following:

Include Only Selection

creates a filter that includes the selected values only.

Exclude Selection

creates a filter that excludes the selected values.

The new filter appears on the **Filters** tab.

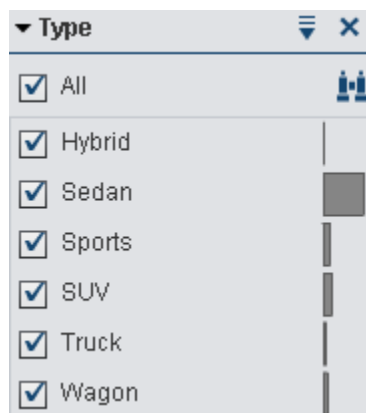

Edit a Filter By Using Visual Filter Controls

About Visual Filter Controls

Visual filter controls are accessible directly from the **Filters** tab. The visual filter controls are different, depending on the model type of the filter data item.

Filtering Discrete Data

Display 26.1 A Visual Filter for a Discrete Data Item

Note: If your data contains a large number of discrete values, then the top 1,000 most frequent values are displayed.

For data items that use the discrete data model, the filter displays all of the distinct values for the data item. To the right of each value, a bar indicates the frequency.

Use the check boxes next to each value to select the values for the filter. You can search for a value in the displayed list by clicking . Enter a text string in the field. The search locates values from the displayed list that begin with your text string.

Select **All** to select or deselect all of the values. If the filter displays the top 1,000 most frequent values, then select **Include unlisted values** to select the unlisted values.

To invert your selection, click the  drop-down list, and then select **Invert Selection**.

You can sort the values by frequency or alphabetically by value. Click the  drop-down list, and then select **Sort by Frequency** or **Sort by Values**.

To display the selected values at the top of the list, click the  drop-down list, and then select **Show Selected at Top**.

If your data item contains more than 1,000 discrete values, then you can exclude the unlisted values by deselecting **Include unlisted values**.

If your data item contains missing values, then you can exclude missing values by deselecting **Include missing values**.

By default, your filter changes are applied automatically to the active visualization. To apply multiple changes together, deselect **Auto-Update** at the bottom of the **Filters** tab, and then click **Update** when you are ready to apply your filter changes.

Filtering Continuous Data

Display 26.2 A Visual Filter for a Continuous Data Item

For measures that use the continuous data model, the filter shows the range of data values as a histogram. Sliders at each side of the histogram enable you to select the data that is selected by the filter.

The visual filter can select data by using different filter conditions. By default, the **Between (Inclusive)** condition is used. To change the condition for your filter, click the

▼ drop-down list, and then select **Condition Type** ► **type**. Select one of the following conditions:

Between (Exclusive)

specifies that a matching value must be in the range between the lower bound and the upper bound. Matching values do not include the bounding values.

Between (Inclusive)

specifies that a matching value must be in the range between the lower bound and the upper bound. Matching values can include the bounding values.

Equal To

specifies that a matching value must be equal to the value specified by the filter.

Greater Than

specifies that a matching value must be greater than the value specified by the filter.

Greater Than or Equal To

specifies that a matching value must be greater than or equal to the value specified by the filter.

Less Than

specifies that a matching value must be less than the value specified by the filter.

Less Than or Equal To

specifies that a matching value must be less than or equal to the value specified by the filter.

Not Between (Exclusive)

specifies that a matching value must be outside the range between the lower bound and the upper bound. Matching values do not include the bounding values.

Not Between (Inclusive)

specifies that a matching value must be outside the range between the lower bound and the upper bound. Matching values can include the bounding values.

Not Equal To

specifies that a matching value must not be equal to the value specified by the filter.

You can specify the values for the filter by using sliders or by entering the values explicitly:

- For numeric data, click on a value below the histogram, and then enter a new value in the text field.
- For a continuous datetime data item, click , and then select a date or time.

If your data item contains missing values, then you can exclude the missing values by deselecting **Include missing values**.

To invert your selection, click the  drop-down list, and then select **Invert Selection**.

By default, your filter changes are applied automatically to the active visualization. To apply multiple changes together, deselect **Auto-Update** at the bottom of the **Filters** tab, and then click **Update** when you are ready to apply your filter changes.

Edit a Basic Filter By Using the Edit Filter Window

To edit a basic filter by using the Edit Filter window:

- 1 Select the **Filters** tab.
- 2 Click the  drop-down list for the filter that you want to edit, and then select **Edit Filter**. The Edit Filter window appears.
- 3 Edit the expression for the filter. For more information, see [“Editing a Filter Expression” on page 301](#).

Reset a Basic Filter

To restore a basic filter to its initial state, click the  drop-down list for the filter, and then select **Reset Filter**.

You can reset all of your filters by clicking the  drop-down list in the global filters area or the local filters area of the **Filters** tab, and then selecting **Reset All Filters**.

Working with Advanced Filters

About Advanced Filters

For all visualization types, you can create advanced filters to subset your data by using the **Filters** tab.

Advanced filters enable you to create filters that use more than one data item.

Your advanced filters can be either *local filters* that apply only to the current visualization, or *global filters* that apply to all of the visualizations that use the selected data source.

The total percentage of values that are selected by your filters is displayed at the bottom of the **Filters** tab. The tooltip for the percentage displays the exact number of data rows. The percentage is calculated after data source filters are applied.

Create an Advanced Filter

To create an advanced filter:

- 1 Click the  drop-down list in the global filters area or in the local filters area of the **Filters** tab, and then select **New Advanced Filter**. The Edit Filter window appears.
- 2 Specify a **Filter name**. The filter name identifies the advanced filter on the **Filters** tab.
- 3 Build the expression for your filter by dragging and dropping data items, global parameters, conditions, and operators onto the expression.

For information about the conditions and operators that are available, see [Appendix 6, “Conditions for Filters,” on page 717](#) and [Appendix 5, “Operators for Data Expressions,” on page 685](#).

You can also build your expression as text by using the **Text** tab. See [“Editing a Data Expression in Text Mode” on page 677](#).

- 4 Click **OK** to apply the filter.

Edit an Advanced Filter

To edit an advanced filter:

- 1 Select the **Filters** tab.
- 2 Click the ▼ drop-down list for the filter that you want to edit, and then select **Edit Filter**. The Edit Filter window appears.
- 3 Edit the expression for the filter. For more information, see [“Editing a Filter Expression” on page 301](#).

Working with Data Source Filters

About Data Source Filters

A data source filter enables you to subset a data source for an entire exploration. A data source filter differs from a global advanced filter in the following ways:

- A data source filter updates the cardinality values that appear in the **Data** pane.
- A data source filter updates the total number of rows that is used in the filtered rows percentage at the bottom of the right pane.
- A data source filter is not shown on the **Filters** tab.
- An exploration can contain only one data source filter for each data source.

Create a Data Source Filter from a Global Filter

To convert an existing global filter to a data source filter:

- 1 On the **Filters** tab, select the global filter that you want to convert.
- 2 Click the ▼ drop-down list, and select **Convert to Data Source Filter**. The global filter disappears from the **Filters** tab.

Note: If your exploration already contains a data source filter for the selected data source, then the global filter is appended to the filter expression using the AND operator.

You can convert all of your global filters together into a single data source filter by clicking the ▼ drop-down list in the global filters area of the **Filters** tab, and then selecting **Convert All to Data Source Filter**. The expressions from the global filters are joined with AND operators.

To view the data source filter settings, select **Data ► Data Source Details** from the main menu. The data source filter settings are displayed in the **Data source filter** field.

Create a New Data Source Filter

To create a data source filter:

- 1 In the **Data** pane, select the data source that you want to filter.
- 2 Click ▼ and then select **New Data Source Filter**.

Note: If the current exploration contains an existing data source filter, then select **Edit Data Source Filter** to add conditions to the existing data source filter.

The Edit Filter window appears.

- 3 Build the expression for your filter by dragging and dropping data items, global parameters, conditions, and operators onto the expression.

For information about the conditions and operators that are available, see [Appendix 6, “Conditions for Filters,” on page 717](#) and [Appendix 5, “Operators for Data Expressions,” on page 685](#).

You can also build your expression as text by using the **Text** tab. See [“Editing a Data Expression in Text Mode” on page 677](#).

- 4 Click **OK** to apply the filter.

Edit a Data Source Filter

To edit a data source filter:

- 1 In the **Data** pane, select the data source that you want to filter.
- 2 Click  and then select **Edit Data Source Filter**.
The Edit Filter window appears.
- 3 Edit the expression for the filter. For more information, see [“Editing a Filter Expression” on page 301](#).

Delete a Data Source Filter

To delete a data source filter:

- 1 In the **Data** pane, select the data source for which you want to remove the filter.
- 2 Click  and then select **Delete Data Source Filter**.

Editing a Filter Expression

Specify the Filter Name

To specify a name for the filter, enter a name in the **Filter name** field. The filter name identifies the advanced filter on the **Filters** tab.

Note: You cannot specify the name for a basic filter or a data source filter.

Edit a Parameter Value

To edit a parameter value for a condition or operator, select the parameter, and enter a new value. Or, right-click the parameter field, and select **Replace with** to select a data item or a global parameter.

Add a Condition

To add a new condition:

- 1 From the **Data items** list, select the data item on which the condition is based.
- 2 From the **Conditions** list, select a condition. For a list of the conditions that are available, see [Appendix 6, “Conditions for Filters,” on page 717](#).
- 3 Drag and drop the condition onto the expression.
- 4 For any required parameters, select the parameter, and enter a value, or right-click the parameter field, and select **Replace with** to select a data item.

Add an Operator

To add an operator to the expression:

- 1 From the **Operators** list, select the operator that you want to add. For a list of the operators that are available, see [Appendix 5, “Operators for Data Expressions,” on page 685](#).
- 2 Drag and drop the operator onto the expression.
- 3 For any required parameters, select the parameter, and enter a value. Or, right-click the parameter field, and select **Replace with** to select a data item.

Replace an Operator

To replace an operator, drag and drop a new operator onto the existing operator in the expression. You can also right-click an operator in your expression, and select **Replace Operator with ► operator**.

Add a Global Parameter

To add an existing global parameter to your expression, drag and drop the parameter from the **Data Items** list onto your expression.

To create a new global parameter, in the expression editor, right-click the **Parameter** heading in the **Data Items** list, and then select **Create Parameter**. For more information about creating global parameters, see [“Working with Global Parameters” on page 174](#).

Delete Part of an Expression

To delete a part of an expression, highlight the part of the expression that you want to delete, right-click, and select **Delete** or **Clear**.

Subset an Expression

To subset an expression and delete the remainder:

- 1 Highlight the part of the expression that you want to keep.
- 2 Right-click, and select **Keep Operand**. The parts of the expression that were not selected are removed.

Edit an Expression as Text

On the **Text** tab of the expression editor, you can edit an expression as text code. See [“Editing a Data Expression in Text Mode” on page 677](#).

Display the Current Expression as Text

To display the current expression as text on the **Display Text** tab, click the  drop-down, and then select **Show display text**.

Manage the Scratch Area

The scratch area of the expression editor enables you to store elements of an expression, and then add them back into the expression as needed.

You can see the contents of the scratch area on the **Scratch** tab.

To move items to the scratch area, right-click part of the expression, and select **Move to Scratch Area**. You can also drag and drop items from your expression onto the **Scratch** tab.

To move an item from the scratch area to your expression, drag and drop the item from the **Scratch** tab onto your expression.

To delete an item in the scratch area, click the  button next to the item.

Export an Exploration as a Report

You can export your exploration as a report, which can be refined in the designer interface or viewed directly on a mobile device or in SAS Visual Analytics Viewer (the viewer).

To export your current exploration as a report:

- 1 Select **File** ► **Export** ► **Exploration as Report**.

Note: If you have only one visualization in your exploration, the Save As window is displayed at this point. Select the location where you want to save the report, and then click **Save** to export it as a report.

- 2 In the Export as Report window, select the visualizations that you want to include in the report.

Note: The following types of visualizations are not available to include in the report:

- visualizations that do not contain any data
- decision trees
- network diagrams
- Sankey diagrams
- word clouds
- treemaps that display additional levels
- line charts with forecasting analysis are not available if the visualization has not been displayed during the current session
- geo maps that use calculated geography data items

Note: If your scatter plot or heat map contains correlation data, the correlations are not included in the report.

The Export to Report window enables you to perform the following tasks:

Task	Action
Add visualizations to the selection list. (Restore visualizations.)	Select a visualization from the Available list, and then click ➞, or click ➞➞ to add all of the available visualizations.
Remove visualizations from the selection list. (Minimize visualizations.)	Select a visualization from the Selected list, and then click ⬅, or click ⬅⬅ to remove all of the visualizations.
Change the order of the selected visualizations.	In the Selected list, drag and drop the visualizations in the order that you want, or select a visualization and click the up and down arrows to move it.
Search the available visualizations.	<p>In the Search field, enter a string to search for. A visualization matches the search if the string appears anywhere in the visualization name.</p> <p>Only the matching visualizations appear in the Available list.</p>

Task	Action
Filter the available visualizations.	<p>Click , and then select your filter parameters. You can filter either on the visualization type or on the data items that are used in each visualization.</p> <p>Only the matching visualizations appear in the Available list.</p>

When you have finished selecting your visualizations, click **OK**.

- 3 Select the location where you want to save the report, and then click **Save**.
- 4 Click **OK** to return to the explorer, or select **Open the report now**, and click **OK** to view the report in the designer.

Export an Exploration as a PDF

To export your current exploration as a PDF:

- 1 Select **File ► Export ► Exploration as PDF**.
- 2 In the **Export as PDF** wizard, enter a **Title** and a **Description** for the PDF document. Then, select the following options:

Page numbers

specifies that the PDF document contains page numbers.

Summary data

specifies whether the PDF document contains summary data tables for each visualization.

Filter descriptions

specifies whether each visualization includes a description of its active filters.

Click **Next**.

3 Select the visualizations that you want to include in the PDF document.

Note: The following types of visualizations are not available to include in the PDF document:

- visualizations that do not contain any data
- crosstabs
- tables that contain more than 1,000 rows

The Export as PDF window enables you to perform the following tasks:

Task	Action
Add visualizations to the selection list. (Restore visualizations.)	Select a visualization from the Available list, and then click ➞, or click ➞➞ to add all of the available visualizations.
Remove visualizations from the selection list. (Minimize visualizations.)	Select a visualization from the Selected list, and then click ⬅, or click ⬅⬅ to remove all of the visualizations.
Change the order of the selected visualizations.	In the Selected list, drag and drop the visualizations in the order that you want, or select a visualization and click the up and down arrows to move it.
Search the available visualizations.	<p>In the Search field, enter a string to search for. A visualization matches the search if the string appears anywhere in the visualization name.</p> <p>Only the matching visualizations appear in the Available list.</p>
Filter the available visualizations.	<p>Click 🗑, and then select your filter parameters. You can filter either on the visualization type or on the data items that are used in each visualization.</p> <p>Only the matching visualizations appear in the Available list.</p>

Click **Next**.

- 4 Click **Finish** to open a download window for your browser.
- 5 Select the location where you want to save the PDF document.

Note: If the legend for a visualization is too large, then it is not included in the PDF document.

Save a Visualization as an Image File

To save your current visualization as an image file:

- 1 Select the visualization that you want to save as an image.
- 2 If your visualization contains hierarchies, drill down to the hierarchy levels that you want to show in the image.
- 3 Select the  drop-down list from the visualization toolbar, and then select **Export Image**.
- 4 If necessary, scroll and zoom the visualization to show the data items that you want to include in the image. If your visualization contains filters, legends, or hierarchy breadcrumbs, select whether to include these elements.
- 5 Click **Save** to open a download window for your browser.
- 6 Select the location where you want to save the image.

Export Data from a Visualization

You can export the data from a visualization in comma-separated values (.csv) format. You can open .csv files in other software such as SAS Enterprise Miner, SAS Enterprise Guide, or Microsoft Excel.

To export data for a visualization:

- 1 Select the visualization for which you want to export data.

Note: For crosstab visualizations, a data summary is exported instead of a full data table.

- 2 If your visualization contains hierarchies, drill down to the hierarchy levels that you want to export.

- 3 Select the ▼ drop-down list from the visualization toolbar, and then select **Export Data** to open a download window for your browser.

Note: For a crosstab visualization, select **Export Data Summary** instead of **Export Data**.

- 4 Specify a filename and select the location where you want to save the file.

Note: To export data from a table visualization, your browser must allow pop-ups.

E-mail an Exploration as a Link

To e-mail your exploration as a link:

- 1 Select **File ► E-mail**. The E-mail window appears.

- 2 Enter the following information:

To

specifies the e-mail destination. To enter multiple addresses, separate the addresses by using commas, semicolons, or spaces.

From

specifies the e-mail address that is shown as the sender of the e-mail. This e-mail address is used for notifications if the e-mail cannot be delivered to the addresses in the **To** field.

Subject

specifies the subject line of the e-mail.

Message

specifies the text for the e-mail message body. This field is optional.

Note: The message body of the e-mail automatically includes a link to the current exploration. If you specify text for the **Message** field, then your text appears before the link in the e-mail.

- 3 Click **OK** to send the e-mail.

28

Managing Hierarchies

<i>What Is a Hierarchy?</i>	313
<i>Create a New Hierarchy</i>	314
<i>Derive a Hierarchy from a Date, Time, or Datetime Data Item</i> ..	314
<i>Create a Hierarchy from a Visualization</i>	315
<i>Edit a Hierarchy</i>	315
<i>Delete a Hierarchy</i>	316

What Is a Hierarchy?

A hierarchy is an arrangement of category columns that is based on parent-child relationships. The levels of a hierarchy are arranged with more general information at the top and more specific information at the bottom.

For example, you might create a hierarchy of date-time columns with Year as the top level, Month as the next level, and Day as the bottom level.

Creating hierarchies enables you to add drill-down functionality to your visualizations. For example, if you use a date-time hierarchy, you can drill down to the data for a specific year. Then, you can drill down to the data for a specific month.

When you drill down a hierarchy, a set of breadcrumb links at the top of your visualization enables you to drill back up the hierarchy.

Create a New Hierarchy

To create a new hierarchy:

- 1 Select **Data** ► **New Hierarchy**. The New Hierarchy window appears.
- 2 In the **Name** field, enter a name for the hierarchy.
- 3 Select the categories that you want to include in the hierarchy, and then click ➡ to add them to the hierarchy.

Note: You can also drag and drop categories.

To change the order of the categories in your hierarchy, select the category that you want to move. Then, click ⬆ to move the category up, or click ⬇ to move the category down.

To remove a category from the hierarchy, select the category that you want to remove. Then, click ⬅.

- 4 Click **OK** to finish creating the hierarchy.

Note: You can create a hierarchy from within a crosstab visualization. See [“Create a Hierarchy from a Crosstab” on page 228](#).

Derive a Hierarchy from a Date, Time, or Datetime Data Item

For date, time, and datetime data items, you can derive a hierarchy automatically. To derive a hierarchy, right-click on a date, time, or datetime data item in the **Data** pane, and then select one of the following values:

Create Date Hierarchy

creates a hierarchy with levels for year, quarter, month, and day. Depending on the format of the data item, some of the levels might not be created.

Create Date and Time Hierarchy

creates a hierarchy with levels for year, quarter, month, day, hour, minute, and second. Depending on the format of the data item, some of the levels might not be created.

Create Time Hierarchy

creates a hierarchy with levels for hour, minute, and second. Depending on the format of the data item, some of the levels might not be created.

New calculated items are created for each level in the hierarchy. By default, the new calculated items are hidden in the **Data** pane. If you delete a derived hierarchy, then a window appears. The window enables you to delete the calculated items that are associated with the hierarchy.

Create a Hierarchy from a Visualization

You can create a hierarchy from a treemap, crosstab, or network diagram visualization. See the following topics:

- [“Create a Hierarchy from a Treemap” on page 269](#)
- [“Create a Hierarchy from a Crosstab” on page 228](#)
- [“Create a Hierarchy from a Network Diagram” on page 247](#)

Edit a Hierarchy

To edit an existing hierarchy:

- 1 From the **Data** pane, right-click on the hierarchy that you want to edit, and then select **Edit**. The Edit Hierarchy window appears.

- 2** In the **Name** field, enter a name for the hierarchy.
- 3** To add a category to the hierarchy, select the category, and then click ➡.

Note: You can also drag and drop categories.

To change the order of the categories in your hierarchy, select the category that you want to move. Then, click ⬆ to move the category up, or click ⬇ to move the category down.

To remove a category from the hierarchy, select the category that you want to remove. Then, click ⬅.

- 4** Click **OK** to save the changes to your hierarchy.

Delete a Hierarchy

To delete a hierarchy:

From the **Data** pane, right-click on the hierarchy that you want to delete, and then select **Delete**. Click **Yes** to confirm that you want to delete the hierarchy.

Overview of Data Analysis in SAS Visual Analytics Explorer

Types of Data Analysis

SAS Visual Analytics enables you to perform three basic types of data analysis:

Correlation

identifies the degree of statistical relationship between measures.

Fit Line

plots a model of the relationship between measures. There are many types of fit lines, including linear fit, quadratic fit, cubic fit, and penalized B-spline.

Forecasting

estimates future values for your data based on statistical trends.

Correlation

Correlation identifies the degree of statistical relationship between measures. The strength of a correlation is described as a number between -1 and 1. A value that is close to -1 implies a strong negative correlation, a value that is close to 0 implies little or no correlation, and a value that is close to 1 implies a strong positive correlation.

To apply correlation to a visualization, add a linear fit line, or select the correlation matrix visualization type.

For a heat map or a simple scatter plot, the correlation is identified by a text label in the visualization legend. Select ⓘ to view additional details about the correlation, including the exact correlation value.

For a scatter plot matrix, the correlation for each plot is identified by a colored border around the plot. The visualization legend displays a key for the color values. Select ⓘ to view additional details about the correlation, including the exact correlation values for each plot.

Note: For nonlinear fit types, a scatter plot matrix displays additional plots to show each intersection of variables in two orientations. For example, if a scatter plot matrix plots the variables A, B, and C, then plots are created for both $A * B$ and $B * A$ when a nonlinear fit line is applied.

For a correlation matrix, the correlation for each cell is identified by the color of the cell background. The visualization legend displays a key for the color values. The data tip for each cell displays the correlation value.

Fit Lines

A fit line plots a model of the relationship between measures. You can apply fit lines to scatter plots and heat maps.

You can apply the following types of fit line to your visualization:

Best Fit

selects the most appropriate model (linear, quadratic, or cubic) for your data. The **Best Fit** method uses backward variable selection to select the highest-order model that is significant. To see the final model that was used, select ⓘ from the visualization legend.

Linear

creates a linear fit line from a linear regression algorithm. A linear fit line produces the straight line that best represents the relationship between two measures. For more information about the linear fit line, select ⓘ from the visualization legend.

For a linear fit, correlation is automatically added to the visualization. Correlation is not available with other fit types.

Quadratic

creates a quadratic fit line. A quadratic fit produces a line with a single curve. A quadratic fit line often produces a line with the shape of a parabola. For more information about the quadratic fit line, select ⓘ from the visualization legend.

Cubic

creates a cubic fit line. A cubic fit line produces a line with two curves. A cubic fit line often produces a line with an “S” shape. For more information about the cubic fit line, select ⓘ from the visualization legend.

PSpline

creates a penalized B-spline. A penalized B-spline is a smoothing spline that fits the data closely. A penalized B-spline can display a complex line with many changes in its curvature. For more information about the penalized B-spline, select ⓘ from the visualization legend.

Forecasting

Forecasting estimates future values for your data based on statistical trends.

Forecasting is available only for line charts that contain date or datetime data items.

A forecast adds a line with predicted values to your visualization and a colored band that represents the confidence interval. For example, a 95% confidence interval is the data range where the forecasting model is 95% confident what the future values will be.

The explorer automatically tests multiple forecasting models against your data, and then selects the best model. To see which forecasting model was used, select ⓘ from the visualization legend.

The forecast model can be any one of the following:

- Damped-trend exponential smoothing
- Linear exponential smoothing
- Seasonal exponential smoothing
- Simple exponential smoothing
- Winters method (additive)
- Winters method (multiplicative)

Note: Forecasting accounts for cyclical patterns by using standard intervals of time (for example, 60 minutes in an hour, 24 hours in a day, and so on). If your data uses nonstandard intervals (for example, 48 30-minute cycles per day), then cyclical patterns are not considered in the forecast.

Add a Fit Line to an Existing Visualization

To add a fit line to a scatter plot or heat map, select the  drop-down list from the visualization toolbar, and then select **Fit Line** ► *fit-type*. For information about the fit types that are available, see [“Fit Lines” on page 319](#).

Add Forecasting to an Existing Visualization

To enable forecasting for a line chart, select **Forecasting** on the **Roles** tab.

Note: To apply forecasting, the line chart must contain a date or datetime item.

On the **Properties** tab for the line chart visualization, you can adjust the number of data points to predict by using the **Duration** option. You can also specify the degree of confidence for the confidence band by using the **Confidence** option.

On the **Roles** tab, you can add measures to the forecast as **Underlying factors**. The forecasting model evaluates the additional measures to determine whether they contribute to the accuracy of the forecast. If the additional measures do not increase the accuracy of the forecast, then they are not used. If the additional measures do increase the accuracy of the forecast, then the forecast line is adjusted, and the confidence bands are narrowed.

Note: Underlying factors are available only if your line chart contains a single measure in the **Measures** role.

If your forecast includes underlying factors, then you can apply scenario analysis and goal seeking to the forecast. For more information, see [“Working with Scenario Analysis and Goal Seeking” on page 323](#).

Forecast Measures as a New Visualization

To create a visualization that forecasts multiple measures:

- 1 Select **Analysis** ► **Forecast**. The Forecast window appears.
- 2 From the **Date category** drop-down list, select the date or datetime data item for the forecast.
- 3 From the **Forecast** area, select the measures that you want to include in the forecast.
- 4 (Optional) If you selected a single measure for **Forecast**, then you can also select additional measures to use as **Underlying factors** in the forecast. The forecasting model evaluates the additional measures to determine whether they contribute to the accuracy of the forecast. If the additional measures do not increase the accuracy of the forecast, then they are not used. If the additional measures do increase the accuracy of the forecast, then the forecast line is adjusted, and the confidence bands are narrowed.
- 5 In the **Forecast duration** field, enter the number of data values that you want to predict for the forecast.
- 6 Click **OK** to create the visualization. The visualization is created as a line chart.

Working with Scenario Analysis and Goal Seeking

About Scenario Analysis and Goal Seeking

Scenario analysis enables you to forecast hypothetical scenarios by specifying the future values for one or more underlying factors that contribute to the forecast.

For example, if you forecast the profit of a company, and material cost is an underlying factor, then you might use scenario analysis to determine how the forecasted profit would change if the material cost increased by 10%.

In addition to scenario analysis, you can perform goal seeking. Goal seeking enables you to specify a target value for your forecast measure, and then determine the values of your underlying factors that would be required to achieve the target value.

For example, if you forecast the profit of a company, and material cost is an underlying factor, then you might use goal seeking to determine what value for material cost would be required to achieve a 10% increase in profit.

Scenario analysis and goal seeking can be used together in the same forecast.

Apply Scenario Analysis and Goal Seeking to a Forecast

To apply scenario analysis and goal seeking:

- 1 On the **Roles** tab, select **Scenario Analysis**. The Scenario Analysis window appears.

Note: The **Scenario Analysis** option is available only if one or more underlying factors contribute to the forecast.

- 2 For the forecast measure and for each of the measures that are assigned to the forecast as underlying factors, a line displays the values of the measure, and a series of points enables you to set the future values for the measure.

Note: You can also display the forecast values as a table. Click  to display the table mode.

To perform scenario analysis, set the future values for the underlying factors.

To perform goal seeking, set the target future values for the forecast measure.

You can set the values by using any of the following methods:

- drag each data point upward or downward on the line chart. To select the accuracy of the points, click the measure heading on the plot axis, and select **Snap Interval**.
- enter the value for each data point. Right-click on a data point, and select **Set Point Value**.
- set all of the values for the measure. Click the measure heading on the plot axis, and select **Set Series Values**. The Change Future Values window enables you to set all of the values to a specific value or to adjust the future values relative to the forecasted values of the measure.

Note: If you change future values for either scenario analysis or goal seeking, you must apply your changes before you can change future values for a different analysis type.

To reset any data point to its original value, right-click on the data point, and then select **Reset Point**.

To reset all of the data points for a measure, click the measure heading on the plot axis, and then select **Reset Entire Series**.

- 3 If you perform goal seeking and there are multiple underlying factors, then choose which of the underlying factors are optimized to achieve the target value.
- 4 (Optional) If you perform goal seeking, you can set bounds for each underlying factor to limit the minimum and maximum values that are possible.

To set the minimum value for an underlying factor, click the measure heading, and then select **Bounds ► Add Lower Bound**.

To set the maximum value for an underlying factor, click the measure heading and then select **Bounds ► Add Upper Bound**.

- 5 When you are finished setting the future values for the scenario, click **Apply** to apply the scenario to the forecast.

The forecast is updated to show the results of the scenario. The original forecast is displayed as an additional line that is labeled **(Baseline)**.

Remove Scenario Analysis and Goal Seeking from Your Forecast

To remove the scenario analysis and goal seeking from a forecast, follow these steps:

- 1 On the **Roles** tab, select **Scenario Analysis**. The Scenario Analysis window appears.
- 2 For each measure, click the measure heading, and then select **Reset Entire Series**.
- 3 Click **Apply** to apply your changes.

Sharing Comments in the Explorer

About Comments in the Explorer

Comments enable you to share feedback with other users. You can create comments for visualizations and for explorations. Exploration comments can be viewed both in the explorer and on the SAS Visual Analytics home page.

View Comments

- To display the comments for the current exploration, select **File ► Exploration Comments** from the main menu.
- To display comments for a visualization, select the visualization and then select the **Comments** tab from the right pane.

Comments are grouped by topic. If there are many comments in a topic, then only the most recent comments are displayed. Click **Show All Comments** to view all of the comments for a topic.

To search the comments, enter a search term in the **Search within comments** field.

Create a Comment under an Existing Topic

To create a comment under an existing topic:

- 1 Enter your comment text in the **Respond to topic** field that is beneath the topic that you want to comment on.
- 2 (Optional) Click  to attach a file to the comment.
- 3 When you are finished with the comment, click **Post**. Your comment is saved and shared immediately.

Create a Comment under a New Topic

To create a comment under a new topic:

- 1 Enter the name of the topic in the **Enter a topic name** field.
- 2 Enter your comment text in the **Enter a comment** field.
- 3 (Optional) Click  to attach a file to the comment.
- 4 When you are finished with the comment, click **Post**. Your comment is saved and shared immediately.

Edit a Comment

To edit a comment, select the comment that you want to edit, and then click **Edit**.

Note: To edit other users' comments, you must belong to the **Comments:Administrator** role.

Delete a Comment

To delete a comment, select the comment that you want to delete, and then click **Delete**.

Note: To delete comments, you must belong to the **Comments:Administrator** role.

About the SAS Visual Analytics Designer

The SAS Visual Analytics Designer (the designer) enables users to easily create reports or dashboards that can be saved and viewed on either a mobile device or in the viewer. The designer is part of the SAS Visual Analytics product that enables a user with either the **Visual Analytics: Analysis** role or the **Visual Analytics: Administration** role to

view, interact with, and create reports. Simply open an existing report and interact with the information based on your current needs. Report designers can easily point and click to query central sources of data. You can drag and drop tables, graphs, and gauges to create a well-designed report. You can also add text, images, stored processes, and controls to reports. All of this is accomplished by using the designer, which runs in a web browser. You do not need to understand a programming language to create reports.

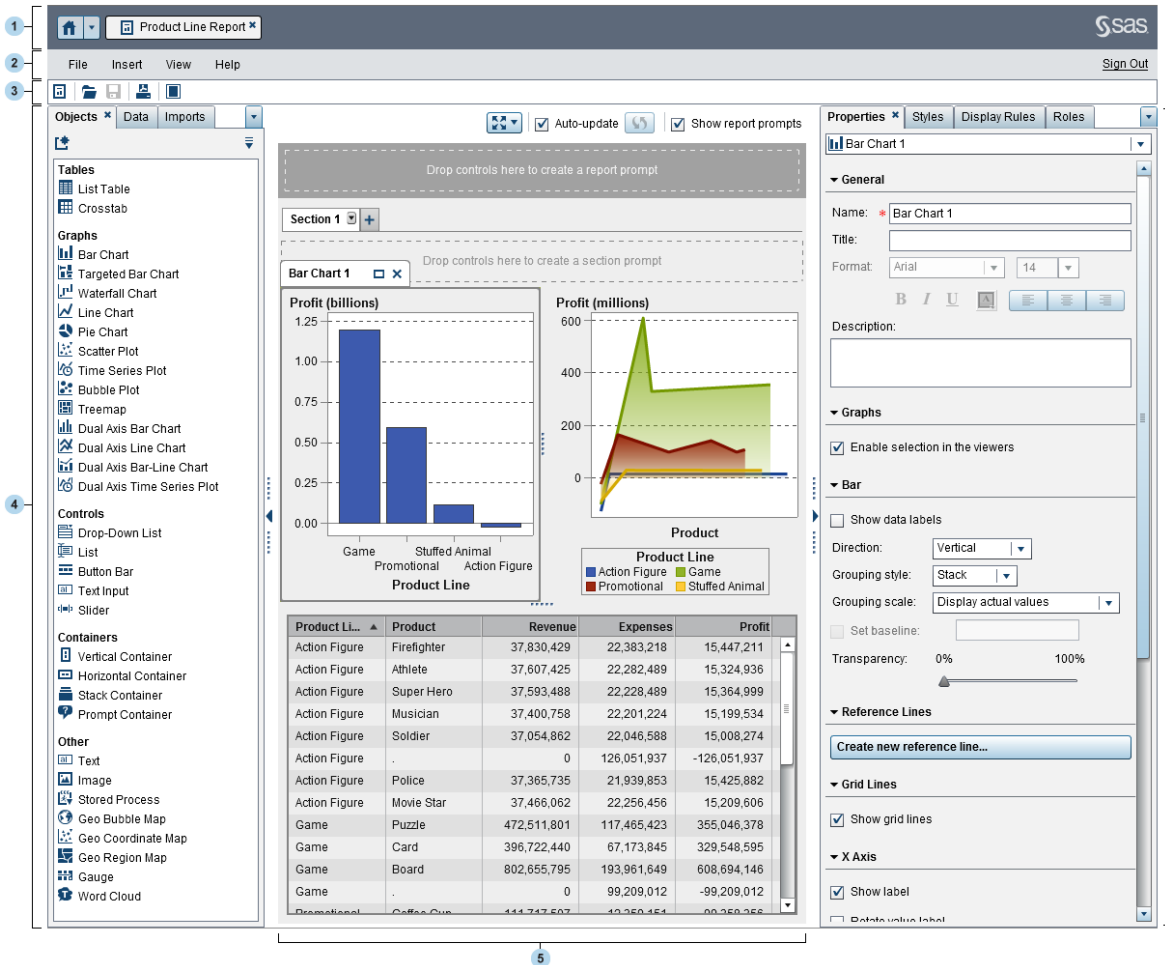

Report designers can easily create reports and dashboards based on data sources that have been provided by a system administrator. They can update reports that were created from visual explorations. Report designers can create reports by importing report objects or visuals from other reports. They can also define interactions (either filtering or brushing) for report objects, and then include SAS analytical results in a single report.

Your First Look at the Designer

When you are designing reports in SAS Visual Analytics, you see the designer. In general, data-related tasks are initiated from the leftmost pane, and presentation-related tasks are initiated from the rightmost pane.

Here are the features of the designer:

Figure 31.1 The Designer

- 1 The application bar enables you to return to the home page and to access other parts of SAS Visual Analytics and other SAS applications that integrate with the home page. You can access your recently created or viewed reports, explorations, stored processes, data queries, or other objects in your recent history. Buttons are displayed for each open application.
- 2 The menu bar provides menu items that apply to the entire report or to the currently displayed report section. Actions include creating a new report, adding a new

section, inserting new report objects, adding interactions, and launching the viewer without returning to the home page. You can also sign out of SAS Visual Analytics.

- 3 The toolbar contains icons that enable you to manage and print your reports. You can click  to hide the left and right panes. Or, you can click  to display the left and right panes.
- 4 The tabs in the left pane enable you to work with new report objects, data, imported report objects, and shared rules.
- 5 The canvas is the workspace for building a report. The appearance of the canvas is affected by the report theme.
- 6 The tabs in the right pane enable you to work with details about the report and report objects.

Understanding the Tabs in the Designer

Working with Tabs in the Left Pane

The **Objects**, **Data**, **Imports**, and **Shared Rules** tabs are in the left pane. The **Objects**, **Data**, and **Imports** tabs are displayed by default. You can choose to display icons instead of names on the tabs. To display the icons on the tabs, click ▼ after the last tab name, and select **Show icons only**. From this menu, you can also choose which tabs are displayed.

The following table lists the available tabs:

Tab	Description
Objects	<p>This tab provides a list of the tables, graphs, gauges, controls, containers, other objects, and custom objects that can be used in a report or dashboard.</p> <p>Note: You can use the Show or Hide Objects window to specify which report objects are displayed on the Objects tab. For more information, see “Show or Hide Report Objects in the Objects Tab” on page 363.</p>
Data	<p>This tab enables you to select a data source (or data sources) and the data items for your report. You can add, refresh, import, or remove a data source using the icons above the list of data items. Using the menu, you can change the data source, define a hierarchy, define a calculated item, define an aggregated measure, show or hide data items, and filter on a data item. You can check the details for the measures in the data set. You can use this tab to add parameters to a filter, a calculated item, a display rule, or a rank.</p> <p>The data item table on the Data tab provides information about a selected item, including the name, classification, format, aggregation, sort options, and parameters. These data item properties can be modified, which impacts all of the report objects that use the data item.</p> <p>When a report has multiple data sources, the Data tab provides information about the data source and data items for the selected report object. When you select a report object that has a different data source, the Data tab updates automatically to provide information about the selected data source.</p>
Imports	<p>This tab provides a list of reports and report objects that have been created in the designer or exported from the explorer. This enables you to create reports from multiple data sources and create full-featured reports. You can choose objects or sections in these reports to include in either a new report or an existing report.</p>
Shared Rules	<p>This tab enables you to create a new display rule for a gauge, which is used by other gauges to designate intervals and colors for ranges. You can edit or delete an existing shared display rule. These display rules are shared across multiple gauges and can be created at any time.</p>

Working with Tabs in the Right Pane

The **Properties**, **Styles**, **Display Rules**, and **Roles** tabs are displayed by default. You can choose to display icons instead of tab names on the tabs. To display the icons on the tabs, click ▼ after the last tab name, and select **Show icons only**. From this menu, you can also choose which tabs are displayed.

The following table lists the available tabs:

Tab	Description
Properties	<p>This tab lists the properties for the currently selected report, section, info window, or report object.</p> <ul style="list-style-type: none"> ■ When a report is selected, the report's title and description are listed. ■ When a section is selected, the section's name and layout are listed, as well as any section prompts. When an info window is selected, the name and layout, any section prompts, and the size of the window are listed. For more information, see “Overview of Report Sections and Info Windows” on page 549. ■ When a report object is selected, the object's name, title, and description are listed. Information that is specific to the report object type, such as the axes and legend, is listed. ■ If a report object is not selected on the canvas, then the properties are for the section, info window, or report.
Styles	<p>This tab enables you to specify the data styling, frame styling, text styling, and data colors for a selected report object. You can specify the report theme for the report.</p>
Display Rules	<p>This tab enables you to populate intervals, add intervals, or add color-mapped values to an object that is currently selected on the canvas. You can edit or delete an existing display rule for the selected table, graph, gauge, or control.</p>
Roles	<p>This tab enables you to add or update data role assignments in a selected report object that has a data source.</p>
Alerts	<p>This tab enables you to add, update, or delete alerts for report objects.</p>

Tab	Description
Comments	This tab enables you to add comments to the report after you save it.
Filters	This tab enables you to add a filter (or filters) to the selected report object.
Interactions	This tab enables you to create interactions and links.
Ranks	This tab enables you to add rankings to report objects. For example, you might want to see the top 10 products that sold last year.

About the Canvas in the Designer

The canvas is the workspace for building a report.

You can change the report view by clicking the icons at the top of the canvas. You can access the report views by clicking ▼ beside the  icon. For more information about report views, see [“Choose a Report View” on page 346](#).

Above the canvas, there is an **Auto-update** check box. You can clear this check box so that you can design your report without waiting for a query to finish. When you are finished designing your report, select the **Auto-update** check box to run and refresh all of the queries.

There is an area at the top of the canvas on which you can drag and drop filter controls and then categories to create report-level prompts. If you do not want to see this area, clear the **Show report prompts** check box. For more information, see [“Use a Control to Create a Report Prompt” on page 377](#).

A report can have multiple sections or info windows, which can be accessed by using the tabs at the top of the canvas.

There is an area below the section tabs on which you can drag and drop filter controls and then categories to create section prompts. For more information, see [“Use a Control to Create a Section Prompt” on page 379](#).

About Report Themes

Report themes are available in the designer. You can select a report theme for each report using the **Styles** tab. By default, the designer provides the following report themes: **Application theme**, **SAS Light**, **SAS Dark**, or **SAS High Contrast**. Your site might also have custom report themes. Custom report themes are automatically created when a coordinating custom application theme is created in SAS Theme Designer for Flex. For more information, see [“About Application Themes in SAS Visual Analytics” on page 9](#).

Alternatively, you can set a preference for a default report theme. For more information, see [“Specifying Your Preferences for the Designer” on page 340](#).

You can use the **Styles** tab in the designer to override the default report background color, prompt background color, font, and font color for the report theme. You can use the **Reset Theme** button on the **Styles** tab to reset the default report style when you have overridden the background color, font, or font color.

The **Customize Theme** button is displayed on the **Styles** tab for users who have the Customize Themes capability (through a direct or indirect role membership). For more information about application themes, see *SAS Theme Designer for Flex: User's Guide*.

Specifying Your Preferences for the Designer

Specify Global Preferences

If you receive distributed reports, it is recommended that you set the **User locale** preference. The report distribution feature does not have access to the browser locale, so it depends on the locale specified for the **User locale**. For more information about setting global preferences, see [“Specify Global Preferences” on page 27](#).

Note: If you change the **User locale** preference, then you must sign out and sign in to SAS Visual Analytics for the change to take effect.

Specify General Preferences for the Designer

To specify general preferences for how alert notifications are sent from both the designer and the viewer:

- 1 Select **File** ► **Preferences** to open the Preferences window.
- 2 Click **General** in the left pane.
- 3 Specify your **Alert Notifications** preference. The options are **Send e-mail messages**, **Send SMS text messages**, or **Use the system default for alert notifications**.

Note: If your preference for alert notifications is set to e-mail when you add an alert, you will always receive notifications for that alert via e-mail. If you decide later that your preference for alert notifications is a text message, then after you change your preference to **Send SMS text messages**, you will have to delete your existing alerts and create new ones.

The **Use the system default for alert notifications** option specifies that you want to use the system default that is set by your system administrator in the SAS Preferences Manager. For more information, see the SAS Preferences Manager topic in *SAS Intelligence Platform: Middle-Tier Administration Guide*. When you select either **Send e-mail messages** or **Send SMS text messages**, you override the system default.

TIP If you select the **Send SMS text messages** preference, and do not receive alerts via text message, contact your system administrator. Your mobile number must be set up correctly as an **SMS** type in SAS Management Console.

To specify general preferences for SAS Visual Analytics, see [“Specify the SAS Visual Analytics General Preferences” on page 28](#).

Specify Preferences for the Designer

To specify preferences that are specific to the designer:

- 1 Select **File** ► **Preferences** to open the Preferences window.
- 2 Click **SAS Visual Analytics Designer** in the left pane.
- 3 Specify your **Report** preferences.
 - Specify your default view for new or existing reports. Select **Full screen**, **Tablet**, or **Wide-screen tablet**.
 - Select your default report theme. The designer provides the following report themes: **Application theme** (default), **SAS Light**, **SAS Dark**, or **SAS High Contrast**. Your site might also have custom report themes.
- 4 Specify your **Geo Map** preferences.
 - Select your default **Map provider mode**. Your choices are **OpenStreetMap** and **Esri**.
 - If you select **Esri** as the map provider, you can specify the **Esri map service** in the Esri Map Service Selector window. Your choices in the Esri Map Service Selector window depend on your site's local Esri server.

Note: The **Esri** option is available only if your site has its own Esri server and if your system administrator has set the `va.SASGeomapEsriURL` configuration property in SAS Management Console.
- 5 Specify your **Data Tab** preference. If you are trying to optimize performance, then select the **Bypass cardinality checks** check box.

Note: If you select the **Bypass cardinality checks** check box, then the distinct counts of data items are not displayed on the **Data** tab.
- 6 Click **OK** to apply your changes.

32

Creating and Working with Reports

<i>About Reports</i>	343
<i>Create a New Report</i>	344
<i>Choose a Report View</i>	346
<i>Choose a Report Layout</i>	346
<i>View Report Properties</i>	348
<i>Change a Report's Name or Title</i>	350
<i>Import a Report or Report Objects</i>	351
<i>Repurpose an Existing Report</i>	352
<i>Open a Report</i>	353
<i>Refresh a Report</i>	354
<i>Delete a Report</i>	355

About Reports

You can drag and drop tables, graphs, gauges, and controls to create a well-designed report in SAS Visual Analytics Designer (the designer). You can add text, images, and other controls to reports. A report can be divided into one or more sections. (Sections

are like pages.) Each section can have a different layout and contain different report objects.

When you design a report, keep in mind that it might look slightly different on a mobile device or in the viewer. For example, the layout of the tiles in the treemap is dependent on the size of the display area. This means that the same treemap might appear slightly different in the designer than it does in the viewer or on a mobile device.

Reports that are imported from SAS Visual Analytics Explorer (the explorer) might look slightly different in the designer.

The designer provides a report view that enables you to change the size of the canvas that you use for laying out reports. For more information, see [“Choose a Report View” on page 346](#).

Two report layouts are available in the designer: **Precision** and **Tiled**. For more information, see [“Choose a Report Layout” on page 346](#).

Create a New Report

There is no single process for creating a new report in the designer. For example, some users select their data source (or data sources) before they add the report objects while other users add report objects to the canvas and then select their data source (or data sources). Some users choose to update the properties and styles for their reports while other users choose not to. The following list of steps is one way that you can create a new report in the designer.

To create a new report:

- 1 Select one or more data sources with the associated data items.
- 2 (Optional) Select the layout (**Precision** or **Tiled**) for the first section of the report using the **Properties** tab for Section 1.
- 3 Add report objects by dragging and dropping them onto the canvas or by double-clicking the report object on the **Objects** tab. You can tab over a report object and press Enter to add the report object to the canvas.

4 Add data items to report objects by dragging and dropping one or more data items onto the report object or by right-clicking on the report object and using the pop-up menu.

5 (Optional) Modify the report.

- Update the properties for the report and the report objects.
- Update the styles for the report objects.
- Modify data role assignments.
- Create or modify advanced data items (for example, hierarchies or geographic data items).
- Create or modify display rules and add alerts for report objects.
- Add filters to the report.
- Add interactions between the report objects in a section.
- Add a rank to a report object.
- Import report objects from the explorer.
- Add a new section to the report.
- Add comments to the report.

Note: If you add a graph to your report, and there is not enough space for both the graph and the legend to display, then the legend will be dropped.

6 (Optional) View the report in SAS Visual Analytics Viewer (the viewer) by selecting **File ► View Report**. Once you have viewed the report, you can return to the designer by selecting **File ► Edit Report**.

7 Save the report. The default location for the first save is **My Folder**. After that, the default save location is the last accessed folder.

8 (Optional) View or change the report properties using the **File** menu.

9 (Optional) E-mail the report.

10 (Optional) Print the report.

You can create a new report based on an existing report or on existing report objects. For more information, see [“Repurpose an Existing Report” on page 352](#).

Choose a Report View

There are three report views available in the designer: **Full Screen**, **Tablet**, or **Wide-screen Tablet**. The default report view is **Full Screen**. You can access the report views from the **View** menu or by clicking ▼ beside the  icon. You can choose , , or .

The report layout is not automatically adjusted for optimal viewing on a device. However, the report does not necessarily display poorly. Before making the report available to users, see how the report is displayed in each view.

Note: Reports can appear to be distorted when they are viewed using different screen resolutions. It is recommended that you design a report using the smallest resolution that you think a user would use to view the report.

Choose a Report Layout

The following report layouts are available in the designer:

Precision

enables you to place, align, and size report objects. The precision layout allows report objects to overlap, and it lets users control the depth order of these overlapping objects by sending objects backward or bringing them forward. (For example, you might want your company logo to display behind a bar chart and a pie chart in your report.)

This layout option is keyboard accessible.

Note: Stored processes are not allowed in the precision layout.

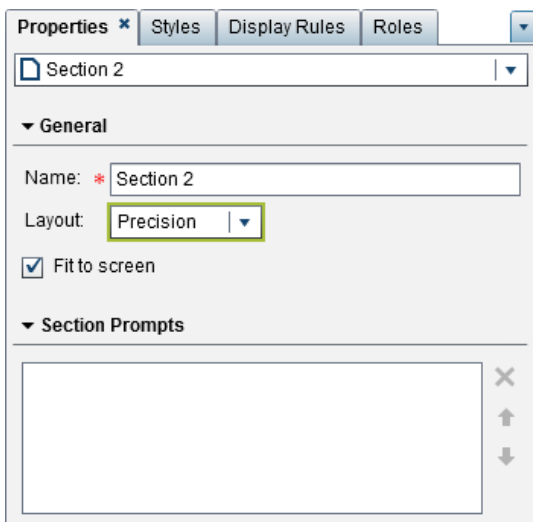

Tiled

enables you to place report objects directly next to other report objects. The report objects cannot overlap. All report objects in the section are sized to fit in one screen. If you adjust the size of an object, then the other objects automatically resize to ensure that all objects continue to fill the entire screen.

Note: You can switch from the tiled layout to the precision layout after you have added report objects to your report. However, this action can change the size and the position of the report objects. It can also change whether a report object is allowed in the layout. For example, stored processes are not allowed in the precision layout.

To choose your report layout:

- 1 Select a section tab.
- 2 In the right pane, click the **Properties** tab.
- 3 For **Layout**, select either **Precision** or **Tiled**. The **Tiled** layout is the default.

- 4 (Optional) If you select **Precision**, then you can specify **Fit to screen**. The **Fit to screen** option prevents objects from being sized too wide or too tall, which can cause the report viewing area for the section to scroll.

View Report Properties

You can use the Report Properties window to get an overview of the report. With the exception of the **Name** field, the information in the Report Properties window is different from the information that appears on the **Properties** tab in the right pane of the designer. The Report Properties window provides information such as who created the report and when it was last modified.

All of the information in the Report Properties window is generated after a report is saved. You can add or change only the **Description** and **Keywords** for the report in the Report Properties window.

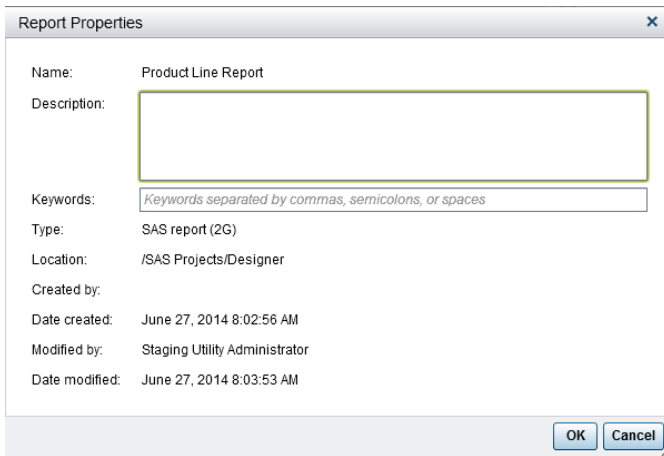

To view a report's properties:

- 1 Select **File ► Report Properties**. The Report Properties window is displayed.
- 2 (Optional) Update the **Description** or **Keywords** for the report.

TIP There is a limit of 200 characters in the **Description** field.

TIP There is a limit of 60 characters for each keyword in the **Keywords** field.

Here is an example of the Report Properties window:

The screenshot shows a 'Report Properties' dialog box with the following fields and values:

Property	Value
Name:	Product Line Report
Description:	
Keywords:	Keywords separated by commas, semicolons, or spaces
Type:	SAS report (2G)
Location:	/SAS Projects/Designer
Created by:	
Date created:	June 27, 2014 8:02:56 AM
Modified by:	Staging Utility Administrator
Date modified:	June 27, 2014 8:03:53 AM

At the bottom right of the dialog are 'OK' and 'Cancel' buttons.

By comparison, the **Properties** tab in the right pane of the designer can be used to update the properties for individual report objects or report sections. The available properties depend on the selected report object. To move to the properties of different report objects or report sections, click ▼ after the report name, and then select another report object or report section from the list.

This example shows a report title and description and lists two sections.

The screenshot shows the 'Properties' window for a report. The 'General' tab is selected, showing the report title 'Product Line Report' and a description: 'This report compares the quarterly profits for our main product lines.' Below the description, the 'Sections' section lists 'Section 1' and 'Section 2'. The 'Report Prompts' section is empty. The window has tabs for 'Properties', 'Styles', 'Display Rules', and 'Roles'.

Properties * Styles Display Rules Roles

Product Line Report

▼ General

Title: Product Line Report

Description:

This report compares the quarterly profits for our main product lines.

▼ Sections

Section 1
Section 2

▼ Report Prompts

For information about updating report object properties, see [“About Report Objects” on page 358](#).

Change a Report's Name or Title

A report's name and title are the same in the designer. The title is displayed on the **Properties** tab and the name is displayed in the Report Properties window.

To change a report's name and title:

- 1 Select **File** ► **Save As**. The Save As window is displayed.

- 2 Enter a new **Name**, and click **Save**. The new report name is displayed as the title on the **Properties** tab and as the name in the Report Properties window.

Import a Report or Report Objects

You can import an entire existing report, any section from an existing report, or any report object from an existing report. You can immediately save the imported report with a new name, or you can customize it, and then save it.

Note: Reports that are imported from the explorer might look slightly different in the designer.

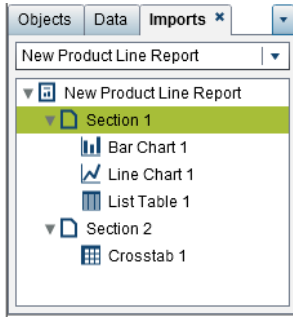

To import a report into the designer:

- 1 Click **Imports** in the left pane. If the **Imports** tab is not visible, select **View ► Imports**.
- 2 Select a report name from **Select a report to import**, or click **Import another report** to display the Open window, where you can select a report. The report is displayed on the **Imports** tab.

Note: Report objects that cannot be imported from the explorer are not displayed on the **Imports** tab.

- 3 In the tree view on the **Imports** tab, a list of the report name, the sections, and the report objects is displayed. Drag the report, a single report object, multiple report objects, or an entire section and drop it onto the canvas.

- 4 Select **File** ► **Save As**, or click , which displays the Save As window. Enter a **Name**. Report names cannot use these characters: / \
- 5 Modify the report objects, properties, styles, roles, filters, display rules, ranks, and interactions as needed.
- 6 Select **File** ► **Save**, or click 

Repurpose an Existing Report

If there is an existing saved report that closely matches the report that you want to create, then you can open the existing report that contains the report objects that you want to reuse. (For example, you might want to reuse calculated data items or hierarchies from an existing report in your current report.)

To base a new report on report objects in one or more existing reports:

- 1 Open the existing report by doing one of the following:
 - On the home page, double-click on the report that you want to open.
 - In the designer, do one of the following:
 - Select **File** ► **Recent**, and then select the report name.
 - Click ▼ beside the recent content drop-down list at the top of the window, and then select a report name.

- Click  on the menu bar to navigate to a report, and then select it.
 - Select **File** ► **Open** to display the Open window and select a report.
- 2** Select **File** ► **Save As**, or click , which displays the Save As window. Enter a **Name**. Report names cannot use these characters: / \
- 3** Modify the report as needed.
- For existing objects, modify the properties, styles, roles, filters, display rules, ranks, and interactions.
 - To import objects from other reports, click **Imports** in the left pane. If the **Imports** tab is not visible, select **View** ► **Imports**. From the **Imports** tab, drag a single report object, multiple report objects, or an entire section and drop it onto the canvas.
- 4** Select **File** ► **Save**, or click .

Open a Report

Reports in the designer are saved when you use either the Save window or the Save As window. A saved report contains at least one section. Typically, a section uses data items from a data source to perform queries. The section displays the results with one or more report objects (for example, a table, a graph, a gauge, a control, and so on). For more information about sections, see [“Overview of Report Sections and Info Windows” on page 549](#).

A section is not required to contain any report objects. For example, you might have a report that you use only as a template to create other reports if you want all reports to have a similar appearance. A template-like report might contain data sources, calculated items, global data filters, and shared display rules, but it might not contain report objects.

To open a report:

- 1 Select **File** ► **Open** or click . The Open window is displayed.
- 2 (Optional) Search for a report by clicking . The Search window is displayed. Enter your search criteria, and then click **Search**. When the results are displayed, select the report name. Click **OK** to open the report.

TIP Searching does not include report content.

TIP If you search for a single word, then the search assumes a wildcard character before and after the word. For example, if you perform a search with *low* in the **Name** field, then the search results include report names such as *Low Activity*, *Regions with Lowered Sales*, and *Monthly Travel Allowance*.

TIP The search is not case sensitive. For example, if you search for *profit*, then the search results include report names such as *Sports Equipment Profits* and *Company profits last year*.

- 3 Select a report name, and then click **Open**. The report is displayed in the canvas.

Alternatively, you can open a report using the object inspector on the SAS Visual Analytics home page. For more information, see [“Discover Details Using the Object Inspector on the Home Page” on page 23](#).

Refresh a Report

You can reopen the current report and save any unsaved changes by selecting **File** ► **Refresh Report**. When you are prompted to save changes, choose **Save** or **Don't Save**. Unsaved changes can include changes to the underlying data sources or changes that another user might have saved to the report.

This is especially useful if you have closed the current report without saving your changes.

Note: You are not prompted to save the report if there are no unsaved changes.

Delete a Report

To delete a report:

- 1 Select **File** ► **Open**. The Open window is displayed.
- 2 Select the report that you want to delete, and then click .

You can also delete a report from the home page. Click , and then click **Manage** (next to **My Content** or **Other Content**). For more information, see [“Manage Content on the Home Page” on page 16](#).

About Report Objects

After selecting your data source and data items, add one or more report objects to display the results. The SAS Visual Analytics Designer (the designer) provides report objects for all of your reports. (You can also select data after you add report objects to the canvas.) Report objects in the designer are grouped into types on the **Objects** tab in the left pane and in the **Insert** menu: **Tables, Graphs, Gauges, Controls, Containers,**

Other, and **Custom**. **Custom** is displayed only if one or more custom graphs are saved in your **My Folder** location or if custom graphs are selected in the Show or Hide Objects window. For more information, see [“Show or Hide Report Objects in the Objects Tab” on page 363](#).

For a definition and a picture of each report object, see [Appendix 2, “Gallery of Report Objects,” on page 647](#).

The following table lists the available table objects:

Icon	Table Type
	List Table
	Crosstab

The following table lists the default graph objects:

Icon	Graph Type
	Bar Chart
	Targeted Bar Chart
	Waterfall Chart
	Line Chart
	Pie Chart
	Scatter Plot
	Time Series Plot
	Bubble Plot
	Treemap

Icon	Graph Type
	Dual Axis Bar Chart
	Dual Axis Line Chart
	Dual Axis Bar-Line Chart
	Dual Axis Time Series Plot

Note: You can display the additional graph objects using the Show or Hide Objects window. For more information, see [“Show or Hide Report Objects in the Objects Tab” on page 363](#). The additional graph objects are displayed in the gallery in the graph builder.

The following table lists the available controls:

Icon	Control Type
	Drop-down List
	List
	Button Bar
	Text Input
	Slider

The following table lists the available containers:

Icon	Container Type
	Vertical Container
	Horizontal Container
	Stack Container

Icon	Container Type
	Prompt Container

The following table lists the other report objects:

Icon	Other Type
	Text
	Image
	Stored Process
	Geo Bubble Map
	Geo Coordinate Map
	Geo Region Map
	Gauge
	Word Cloud

Report objects of the **Custom** type are created using the graph builder. They are identified by the  icon. For more information, see [“Using Custom Graphs to Display Results” on page 395](#).

In the designer, you have access to report objects from SAS Visual Analytics Explorer (the explorer). You can open a histogram, heat map, box plot, or correlation matrix in a report that has been exported from the explorer. However, you cannot create new histograms, heat maps, box plots, or correlation matrices in the designer.

Insert a Report Object into a Report

To insert a report object into a report, choose one of the following methods:

- Drag the report object from the **Objects** tab in the left pane and drop it onto the canvas.
- Double-click the report object on the **Objects** tab in the left pane. The report object is automatically placed in the canvas. If you want the report object to appear in a different location, then drag and drop it in a new location.
- Select the report object on the **Objects** tab in the left pane, and press Enter. The report object is automatically placed in the canvas. If you want the report object to appear in a different location, then drag and drop it in a new location.

TIP Use the Show or Hide Objects window to specify which report objects are displayed on the **Objects** tab. For more information, see [“Show or Hide Report Objects in the Objects Tab” on page 363](#).

- Use the **Insert** menu to select the report object that you want to insert. The report object is automatically placed in the canvas. If you want the report object to appear in a different location, then drag and drop it in a new location.

Additional steps are required for some report objects.

- If you insert a container, then you can drag and drop other report objects onto the container.
- Inserting images requires additional steps. For more information, see [“Insert an Image into a Report” on page 385](#).
- Inserting stored processes requires additional steps. For more information, see [“Use a Stored Process” on page 387](#).

TIP Use the **Clear Selection** or **Select All** option on the report object’s pop-up menu to clear the selected data or to select data in the report object.

Show or Hide Report Objects in the Objects Tab

You can customize which report objects you want to see on the **Objects** tab. Once you hide a report object, it remains hidden until you choose to show it again.

TIP To quickly hide a report object on the **Objects** tab, right-click the object, and select **Hide Object**.

Note: Custom graphs appear under the **Custom** heading on the **Objects** tab if they are saved to your **My Folder** location or if custom graphs are selected in the Show or Hide Objects window.

To show or hide report objects:

- 1 On the **Objects** tab, click , and then select **Show or Hide Objects**. The Show or Hide Objects window is displayed. Report objects that are available in the designer by default are selected. The list of report objects includes additional graph objects, which are not selected by default. Graph objects are also displayed in the graph builder gallery.
- 2 Select the report objects that you want to show on the **Objects** tab. If there are report objects that you do not want to see on the **Objects** tab, then clear one or more check boxes for one or more report objects.
- 3 (Optional) To find a custom graph object that is not listed, click **Select Custom**. The Choose an Item window is displayed. Select the custom graph object, and click **OK** to return to the Show or Hide Objects window.
- 4 Click **OK**. The **Objects** tab is updated.

Using Tables to Display Results

For a definition and a picture of each table type, see [“Tables” on page 648](#).

About List Tables

By default, a list table contains aggregated data with one row for each distinct combination of category values. However, if the **Show detail data** check box has been selected, then all of the data is not aggregated.

TIP To rearrange the columns in a list table, drag and drop the column headings.

You can add sparklines to a column (if the data source contains a date data item) when aggregated data is displayed in the list table. For more information, see [“Add Sparklines to a List Table” on page 368](#).

Starting in the 6.4 release, list tables are sorted in ascending order by the first data item that you add. Only new list tables have a default sort selection. The sorting of data items in list tables in existing reports does not change. To sort the list table by a column, click on the column heading. An arrow appears in the column heading to indicate the sorting.

Note: If you sort a list table, then the list table displays only the first 5,000 sorted rows.

Note: You cannot select the totals in a list table.

About Crosstabs

You can show subtotals and totals by selecting the appropriate check box (or check boxes) on the **Properties** tab for the crosstab. You can show a percentage of total or percentage of subtotal in a crosstab. For more information about percentage of total or percentage of subtotal, see [“Create Derived Items for Measures” on page 422](#).

You cannot add a sparkline to a crosstab.

You should consider placing lower cardinality (fewer distinct values) categories on the columns and higher cardinality (more distinct values) categories on the rows. Crosstabs can help you improve readability especially when there are several category data items to include in your table.

By default, frequency is displayed only when there are no measures in the crosstab. If you add a category data item first, then the Frequency column is automatically added. When you add a measure data item, the Frequency column is automatically replaced by the measure that you added. If you add a measure data item first, then the Frequency column is added only if you manually add it.

Note: You can create a brush interaction for totals and subtotals in a crosstab.

Note: A crosstab does not show data if the query is too large.

Specify Table Properties

To specify the properties for list tables and crosstabs:

- 1 If it is not already selected, select the table in the canvas that you want to update.
- 2 In the right pane, click the **Properties** tab.
- 3 Update the general properties for the table. You can update the **Name**, **Title**, **Format** (for the title's font style), and **Description**.
- 4 Update the object-specific properties for the table. The available properties depend on the selected table type.

Here are some details about the properties for list tables:

- By default, the **Enable selection in the viewers** property is selected for list tables. This means that users who use the web viewer or a mobile device can select the list table, and click ⓘ to see the list table name and any incoming filter information.
- You can use the **Data Options** properties to enable sorting, show detail data, combine excluded rows into “all other,” and to show totals. These properties are

available when you use summarized data. They apply to both ranks and post-aggregate filters.

Note: By default, a list table contains aggregated data with one row for each distinct combination of category values. However, if the **Show detail data** check box has been selected, then all of the data is not aggregated.

For list tables, you can select the **Combine excluded rows into “All Other”** property, under the **Data Options** heading, to summarize all excluded rows. For more information, see [“Use the Combine Excluded Rows \(or Cells\) into “All Other” Properties” on page 369.](#)

TIP Select the **Show labels for totals** property to turn off or turn on the aggregation labels for totals.

Here are some details about the properties for crosstabs:

- By default, the **Enable selection in the viewers** property is selected for crosstabs. This means that users who use the web viewer or a mobile device can select the crosstab, and click ⓘ to see the crosstab name and any incoming filter information.
- You can specify that you want to display missing labels as blanks instead of the string (`missing`) being displayed.
- You can specify that you want an indented layout and totals and subtotals for columns, rows, or both.
- You can specify the placement of totals and subtotals.

Specify Table Styles

To specify styles for tables:

- 1 If it is not already selected, select the table in the canvas that you want to update.
- 2 In the right pane, click the **Styles** tab.

- 3 Update the styles for the table. The available styles depend on the selected table type. For example, you can specify **Border and Fill**, **Cells**, **Column Headings**, and **Totals** for list tables and crosstabs.

Here are some details about the styles for list tables:

- Select **Wrap text** to wrap text in the cells of a list table.
- Select **Enable alternating background color** to specify that the color of every other row appears darker in the list table. Use the **Alternating background color** to specify the color of every other row in the list table. Use the **Selection color** style to specify the color of the selected row in the list table.

Your custom colors are saved between SAS Visual Analytics sessions. Your custom colors are displayed in the color palette. Here is an example:

Display 33.1 A Color Palette in the Designer

Add Sparklines to a List Table

A *sparkline* is a small line graph that presents a single trend over time. A sparkline is about the size of one or two words, so it fits in a single cell and repeats for each row in a column. A sparkline does not have axes or labels. They are frequently used to present stock trends or production rates over time. A sparkline is intended to be both succinct and noteworthy.

In the designer, you can add sparklines to a column in a list table. The data source for the list table must include a date, datetime, or time data item before you can add a sparkline.

Here is an example of a simple list table with a sparkline:

Product Line	Revenue	Expenses	Profit ▼	Profit Trend
Game	1,671,890,035	477,809,929	1,194,080,107	
Promotional	813,699,290	223,822,374	589,876,916	
Stuffed Animal	276,990,966	159,548,680	117,442,285	
Action Figure	262,318,761	281,390,254	-19,071,493	

To add sparklines:

- 1 If it is not already selected, select the list table in the canvas that you want to update.
- 2 Right-click the list table, and then select **Add Sparkline**. The Add Sparkline window is displayed.
- 3 Enter a **Column label**.
- 4 For **Time Axis**, select a date, datetime, or time data item in the current data source.
- 5 Select a **Measure (line)**.
- 6 (Optional) Select the **Set baseline** check box. Enter a **Value**, and select a **Fill type**. Your choices are **Gradient** or **Solid**.

The **Set baseline** option draws a horizontal line through the graph at the point on the Y axis where the baseline value resides. Everything above or below the baseline is filled in with either a solid or gradient color.

- 7 Click **OK**. The sparkline is added to the last column in the list table. You can move the sparkline to another location in the table.

To edit a sparkline, right-click in the sparkline column in the list table, and then select **Edit Sparkline**. The Edit Sparkline window is displayed. Update the information, and then click **OK** to save your changes.

To delete a sparkline, right-click in the sparkline column in the list table, and then select **Remove Sparkline**.

Use the Combine Excluded Rows (or Cells) into “All Other” Properties

You can use the **Combine excluded rows into “All Other”** property for list tables or the **Combine excluded cells into “All Other”** property for some graphs. These properties combine content across categories (for example, the content that is formed by combining the report object’s visible categories). These properties are frequently used with filters and ranks.

The effect of these properties can be influenced by certain types of interactions. For example, if you have a list table with a *Sales* measure data item, the list table might have the **Combine excluded rows into “All Other”** property selected and be targeted by a slider showing a range of *Sales* figures. The category combinations that are dropped based on the range selected in the slider control are grouped into a category named “All Other.”

There is a similar, but distinct per-category “All Other” option that is provided for ranking in the designer. For more information about the All Other concept for ranking, see [“Add a New Rank” on page 538](#).

Note: The **Combine excluded rows into “All Other”** property is not available for crosstabs.

Note: The **Combine excluded cells into “All Other”** property is not available for time series plots, bubble plots, scatter plots, geo maps, or word clouds.

The following list table shows how the content of combining visible categories is factored into “All Other”. The list table has two categories and a measure. The **Combine excluded rows into “All Other”** property is selected on the **Properties** tab. The list table is filtered by aggregate quantity values using the adjacent slider control.

Description:

Sliders

☐ Enable selection in the viewers

Value: ☐ Single ☒ Range

☒ Horizontal

☒ Interact on the data in view

☒ Set fixed range

Auto populate

Minimum: 5

Maximum: 346

Here are some key points about the **Combine excluded rows into “All Other”** property and the **Combine excluded cells into “All Other”** property:

- The property cannot be set when the report object is displaying detail data.
- The property cannot be set when a rank with the per-category All Other option selected exists.

- The property cannot be set for pie charts when the **Create “Other” slice for minimal values** property is selected.
- The property cannot be set when a hierarchy is assigned to the report object.
- The property cannot be set for line charts that are imported from the explorer.

Using Graphs to Display Results

About Graphs

For a definition and a picture of each graph type, see [“Graphs, Charts, and Plots” on page 650](#).

Some graphs are available by default in the designer. (These graphs are listed under the **Graphs** heading on the **Objects** tab.) There are additional graph objects, which are displayed in the graph builder gallery. For more information about the gallery, see [“About the Graph Template Gallery” on page 579](#). You can also display the additional graph objects using the **Show or Hide Objects** window in the designer. For more information, see [“Show or Hide Report Objects in the Objects Tab” on page 363](#).

You can also create custom graphs. For more information, see [“Using Custom Graphs to Display Results” on page 395](#).

Specify Graph Properties

To specify the properties for graphs:

- 1 If it is not already selected, select the graph in the canvas that you want to update.
- 2 In the right pane, click the **Properties** tab.
- 3 Update the general properties for the graph. You can update the **Name**, **Title**, **Format** (for the title's font style), and **Description**.

- 4 Update the specific properties for the graph. The available properties depend on the selected graph type.

Here are details about the properties for graphs:

- By default, the **Enable selection in the viewers** property is selected for graphs. This means that users who use the web viewer or a mobile device can select the graph, and click  to see the graph name and any incoming filter information.
- For select graphs only, you can use the **Combine excluded cells into “All Other”** property under **Data Options**. This property applies to both ranks and post-aggregate filters. For more information, see [“Use the Combine Excluded Rows \(or Cells\) into “All Other” Properties” on page 369](#).
- To add a new horizontal or vertical reference line to all graph types except the pie chart and the treemap, select **Create new reference line**. You can specify a **Label**, an **Axis**, a **Value**, and the **Style** of the new line.

Note: Properties for the axes or reference lines are not displayed for a custom graph that has merged or common axes.

- To rotate a graph’s X axis category labels by 45 degrees, select the **Rotate value label** property. This property is available for the bar chart, targeted bar chart, waterfall chart, line chart, dual axis bar chart, dual axis line chart, the dual axis bar-line chart, and custom graphs with a single X axis that has discrete values.

Note: You cannot use the **Rotate value label** property if you assign a data item to a lattice row or lattice column data role.

- For bar charts that are assigned multiple measure data items (in the **Measures** role) or if you group a data item, you can create a 100% stacked bar chart using the **Grouping style** and **Grouping scale** properties. Select **Cluster** or **Stack** for the **Grouping style**. Select **Normalize groups to 100%** for the **Grouping scale**.

Note: The **Grouping scale** property is not available for the dual axis bar chart, the dual axis bar-line chart, or any custom graph with at least one bar chart and a second Y axis.

Note: Negative values are ignored in the 100% stacked bar chart.

- To fill a line chart or a time series plot with color, select a **Grouping style**. The style choices are **Overlay Unfilled**, **Overlay Filled**, and **Stack Filled**. The default grouping style is **Overlay Unfilled**.
- To change the percentage for the “other” slice in a pie chart, change the amount listed in the **Minimum percentage for “Other”** field. The default is 4%.
- To display the measure label at the top of a pie chart, select the **Show label** check box.
- To change the transparency of the markers in a scatter plot, needle plot, step plot, or dot plot; or for the bubbles in a bubble plot or a bubble change plot; or for the bars in a schedule chart, move the slider for **Transparency** to any value between **0%** and **100%**. The default value for transparency is **0%**.
- For the treemap, the **Layout** property determines how the tiles are arranged. The **Show level indicator** check box determines whether the label of the data item that is in the **Tile** role is displayed above the treemap.
- Use the **Binning interval** for a time series plot or a dual axis time series plot when you have an uneven grouping of time data. The options are:

Automatic

Determines the best bin size for your data. This option is the default.

Fixed count

Enables you to specify an interval between 10 and 500 in the **Fixed bin count** field.

Use format

Uses the format of the date data item as the interval.

- To set a baseline for a needle plot or butterfly chart, specify a number for the **Set baseline** property.
- To change the arrowheads for the vector plot or the stock high-low plot, clear the **Show arrowheads** property. To change the transparency of the vector plot or the stock high-low plot, move the slider for **Transparency** to any value between **0%** and **100%**. The default value for transparency is **0%**.

Specify Graph Styles

To specify styles for graphs:

- 1 If it is not already selected, select the graph in the canvas that you want to update.
- 2 In the right pane, click the **Styles** tab.
- 3 Update the styles for the graph. The available styles depend on the selected graph type. For example, you can specify **Border and Fill**, **Data Styling**, **Frame Styling**, **Text Styling**, and **Data Colors** for all graphs.

By default, the background of a graph is set to white. Use the **Wall background** option (under **Frame Styling**) to specify a different color.

TIP Move the slider beside the color palette to set the transparency for the **Wall background**, the **Legend background**, or the **Header background** for graphs, except for treemaps. The default value for transparency is **0%**.

Note: A three-color **Gradient** data color style is available for bubble plots, treemaps, some bar charts, some waterfall charts, and word clouds.

Your custom colors are saved between SAS Visual Analytics sessions. Your custom colors are displayed in the color palette. For an example of the color palette, see [Display 33.1 on page 367](#).

Using Controls to Display Results

For a definition and a picture of each control type, see [“Controls” on page 669](#).

About Controls

A control is a report object that filters or narrows the scope of the data that you are currently viewing. A control enables you to group your data by a selected category, and then select which group you want to view. When you drag and drop a data item onto a

control, the control creates a group based on that data item. For example, you might have a data item called *Cars* that contains all of the models that a manufacturer produces. When you drag and drop the *Cars* data item onto a drop-down list, the control groups the car models, and then you can select a car model to use as a filter. Controls can be used in a report with interactions.

Report prompts are controls that are placed in the special area at the top of the canvas. Only the drop-down list, button bar, and text input controls can be used in report prompts. A report prompt automatically filters all of the other report objects as long as the report object uses the same data source as the report prompt control. For more information, see [“Use a Control to Create a Report Prompt” on page 377](#).

Section prompts are the controls that are placed in the special row area below the section tabs at the top of the canvas. Only the drop-down list, button bar, and text input controls can be used in section prompts. A section prompt automatically filters all of the other report objects in the same section, as long as the report object uses the same data source as the section prompt control. For more information, see [“Use a Control to Create a Section Prompt” on page 379](#).

You can place any control in the main area of the canvas below the section prompt row. You must define explicit interactions (using either the **Interactions** tab or the Interactions view) between these controls (as the source report objects) and one or more target report objects. For more information about interactions, see [“Overview of Interactions” on page 507](#).

The text input control, button bar control, drop-down list control, and slider control (single-point only) support parameters. For more information, see [“Overview of Parameters” on page 543](#).

The following controls are available in the designer:

- drop-down lists
- lists
- button bars
- text input fields
- sliders

Controls support parameters. For more information, see [Chapter 40, “Working with Parameters in Reports,”](#) on page 543.

Specify Control Properties

To specify the properties for a control:

- 1 If it is not already selected, select the control in the canvas that you want to update.
- 2 In the right pane, click the **Properties** tab.
- 3 Update the general properties for the control. You can update the **Name**, **Title**, **Format** (for the title's font style), and **Description**.
- 4 Update the specific properties for the control. The available properties depend on the selected control.

Here are some details about the properties for controls:

- By default, the **Enable selection in the viewers** property is not selected for controls. This means that users who use the web viewer or a mobile device cannot select the control, and click ⓘ to see the control name and any incoming filter information. However, users can still modify values for the control.
- For drop-down lists, lists, and button bars, select the **Required** property if you want to require users to make a selection in the control. If you select the **Required** property for a list, at least one check box must always be selected.
- By default, the **Allow multiple selection** property is selected for lists. If you clear the **Allow multiple selection** check box, radio button are displayed instead of check boxes and the **Required** property is applied automatically.
- For button bars and sliders, the **Horizontal** property is selected by default.
- For sliders, select the **Interact on the data in view** property if you want to have the control interactively filter the post-aggregated data.
- For sliders, select the **Set fixed range** property so that you can specify the **Minimum** and **Maximum** properties for the slider end points.

Note: You cannot have a filter or rank when the **Set fixed range** property is selected for a slider.

Specify Control Styles

To specify styles for controls:

- 1 If it is not already selected, select the control in the canvas that you want to update.
- 2 In the right pane, click the **Styles** tab.
- 3 Update the styles for the control. The available styles depend on the selected control type. For example, for a drop-down list, you can specify **Border and Fill**, **Drop-down Styling**, and **Text Styling**.

Your custom colors are saved between SAS Visual Analytics sessions. Your custom colors are displayed in the color palette. For an example of the color palette, see [Display 33.1 on page 367](#).

Use a Control to Create a Report Prompt

If you use a control to create a report prompt, then the user can select a value to filter the data in the report. For some control types, when the **Required** property is not selected, the user might need to press Ctrl+click to clear the value in the filter.

You cannot create cascading (or dependent) report prompts. However, you can use a report prompt to cascade filters to section prompts.

To use a control to create a report prompt:

- 1 Drag the control icon from the **Objects** tab in the left pane and drop it onto the area above the tabs on the canvas. (Look for the hint text that says, “Drop controls here to create a report prompt.”) The control appears above the tabs on the canvas.

Note: You can also use a prompt container to create a report prompt.

- 2 Drag and drop a category, measure, or parameter onto the control. For example, if you drag and drop a drop-down list control, then you can assign a category like

Facility City or *Facility State*. Then, the drop-down list is populated with the cities or states that are used in that category.

You can also use the **Roles** tab in the right pane to specify the **Category** and **Frequency** roles for the report prompt.

- 3 (Optional) Update the general properties for the report prompt. You can update the **Name** and **Description**.
- 4 (Optional) Update the specific properties for the report prompt. The available properties depend on the selected control.

Here are some details about the properties for controls:

- By default, the **Enable selection in the viewers** property is not selected for controls. This means that users who use the web viewer or a mobile device cannot select the control, and click ⓘ to see the control name and any incoming filter information. However, users can still modify values for the control.
- For drop-down lists and button bars, select the **Required** property if you want to require a user to make a selection in the control. If you select the **Required** property for a drop-down list, at least one check box must always be selected.
- For sliders, for **Value**, the **Range** property is selected by default. Select the **Interact on the data in view** property to have the control filter only the aggregated data that is currently displayed in the report. If you clear this property, then the detail data is filtered.

Note: If the **Interact on the data in view** property is not selected, then a slider does not filter crosstabs or time series plots.

- For button bars and sliders, the **Horizontal** property is selected by default.

If the report prompt uses one data source and the report objects on the canvas use another data source, you can change the data source mappings by right-clicking the control, and then selecting **Edit Data Source Mapping**. For more information, see [“Map Data Sources” on page 520](#).

Reordering Report Prompts

You can reorder the display of report prompts.

To change the order in which report prompts are displayed:

- 1 In the right pane, click the **Properties** tab.
- 2 Select the report name in the drop-down list.
- 3 In the **Report Prompts** area, select a report prompt. Click  or  to reorder the report prompts.

Use a Control to Create a Section Prompt

The drop-down list, button bar, and text input controls are the only controls that can be used as section prompts.

If you use a control to create a section prompt, then the user can select a value to filter the data. For some control types, when the **Required** property is not selected, the user might need to press Ctrl+click to clear the value in the filter.

Section prompts can be affected by report prompts.

Note: You cannot create cascading (or dependent) section prompts.

To use a control to create a section prompt:

- 1 Drag the control icon from the **Objects** tab in the left pane and drop it onto the area above the report objects and below the tabs on the canvas. (Look for the hint text that says, “Drop controls here to create a section prompt.”) The control appears below the tabs on the canvas.

Note: You can also use a prompt container to create a section prompt.

- 2 Drag and drop a category, a measure, or a parameter onto the control. For example, if you drag and drop a drop-down list control, then you can assign a category like

Facility City or *Facility State*. Then the drop-down list is populated with the cities or states that are used in that category.

You can also use the **Roles** tab in the right pane, and then specify the **Category** and **Frequency** roles.

TIP If you move a section prompt from one section to another section in a report, you must edit the data source mapping for an interaction to work. Right-click the control, and select **Edit Data Source Mapping**. For more information, see [“Map Data Sources”](#) on page 520.

If the section prompt uses one data source and the report objects on the canvas use another data source, you can change the data source mappings by right-clicking the control, and then selecting **Edit Data Source Mapping**.

Reordering Section Prompts

You can reorder the display of section prompts.

To change the order in which section prompts are displayed:

- 1 In the right pane, click the **Properties** tab.
- 2 Select the section name in the drop-down list.
- 3 In the **Section Prompts** area, select a section prompt. Click  or  to reorder the section prompts.

Using Container Object Types in Reports

About Container Objects

You can use containers to group other report objects. There are these types of containers:

- Vertical and horizontal containers.
- Stack containers. The report objects are displayed as if they are in a slide deck. Only one report object is displayed at a time. The stack container has a control bar instead of a scroll bar that lets you move between report objects. You cannot nest stack containers. However, you can place them side by side. When you use precision layout, you can resize the stack container.
- Prompt containers. These containers group prompt controls. Prompt containers are affected by report prompts, but not by other section prompts. They are not affected by interactions. Report objects inside prompt containers are filtered by the same rules as other objects.

TIP If a prompt container is open and there are unsaved changes, then the button bar changes. An **Apply** button is displayed so that you can apply changes.

Note: Stored processes cannot be added to any type of container.

Specify Container Properties

To specify the properties for a container:

- 1 If it is not already selected, select the container in the canvas that you want to update.
- 2 In the right pane, click the **Properties** tab.

- 3 Update the general properties for the container. You can update the **Name**, **Title**, **Format** (for the title's font style), and **Description**.
- 4 Update the object-specific properties for the container. Here are some details about the properties for containers:
 - By default, the **Enable selection in the viewers** property is selected for containers. This means that users who use the web viewer or a mobile device can select the container, and click ⓘ to see the container name and any incoming filter information.
 - Update the order in which the report objects appear inside the container.
 - For stack containers, the **Navigation control location** property changes the location of the control bar, and the **Navigation button type** property changes the appearance of the control bar. You can reorder the display of the report objects in the stack container using the **Objects** list.
 - For prompt containers, you can select the **Layout** and **Button text**. The **Automatically apply values** property is selected by default. If you clear the **Automatically apply values** check box, then you cannot work with any interactions to or from the prompt container until you apply or cancel changes.

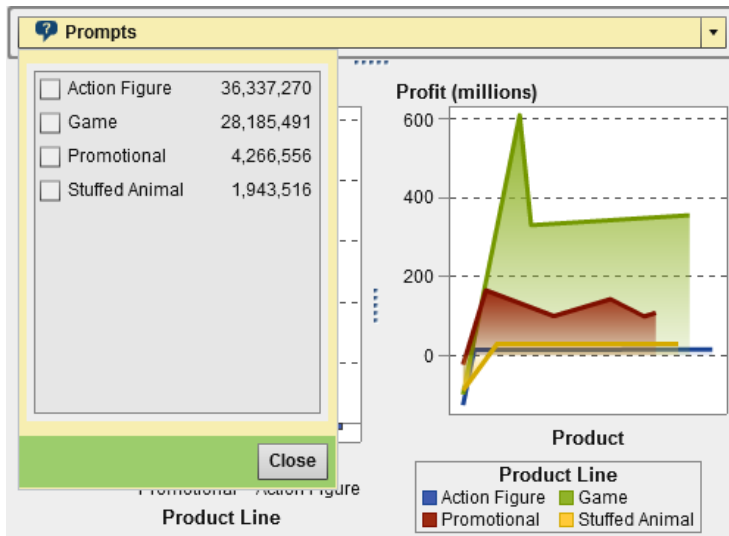

Specify Container Styles

To specify styles for containers:

- 1 If it is not already selected, select the container in the canvas that you want to update.
- 2 In the right pane, click the **Styles** tab.
- 3 Update the styles for the container. The available styles depend on the selected container type. **Border and Fill** is available for all containers. Prompt containers also have **Drop-down Styling** and **Text Styling** options.

The **Button bar color** style option for the prompt container enables you to change the background around the **Close** button.

Here is an example of a prompt container that has the **Background color** and **Button bar color** styles set.

Your custom colors are saved between SAS Visual Analytics sessions. Your custom colors are displayed in the color palette. For an example of the color palette, see [Display 33.1 on page 367](#).

Using Other Object Types in Reports

Use a Text Object

About Text Objects

Text objects display static text. You can use text to include company standards, such as text that indicates confidentiality, in your reports. You can have hyperlinks in text. For more information about links, see [“Create a Link from a Text Object” on page 531](#). You can also use text to annotate other objects in a report.

Specify Text Object Properties

To specify the properties for a text object:

- 1 If it is not already selected, select the text object in the canvas that you want to update.
- 2 In the right pane, click the **Properties** tab.
- 3 Update the general properties for the text. You can update the **Name**, **Title**, **Format** (for the title's font style), and **Description**.
- 4 (Optional) Update the object-specific properties for the text object. By default, the **Enable selection in the viewers** property is not selected for text objects. This means that users who view the report in the web viewer or a mobile device cannot select the text in a report.

Specify Text Object Styles

You can use the floating toolbar to change the font, font size, text color, and text background color. You can specify whether the text is bold, italic, or underlined, and whether it is left-aligned, centered, or right-aligned. You can also use the floating toolbar to create a link from a text object. For more information, see [“Create a Link from a Text Object” on page 531](#).

TIP You can use the pop-up menu to cut, copy, and delete text. However, you have to use the keyboard shortcut (Ctrl+V) to paste text.

Note: You cannot change text styles using the **Styles** tab.

Use an Image

About Images

You can use images to include your corporate logo or other graphics in your reports. You can insert images from a repository or from your local machine. If you select an image from your local machine, it is saved to the repository. You can also add tooltip text to an image.

Insert an Image into a Report

To insert an image into a report:

1 Choose one of the following:

- Drag the  from the **Objects** tab in the left pane and drop it onto the canvas. The Image Selection window is displayed.
- Select **Insert ► Other ► Image**. The Image Selection window is displayed. The image object is automatically placed in the canvas. If you want the image to appear in a different location, then drag and drop it in a new location.

2 Select the image from one of the following locations:

Load from repository

Select this option to choose an image that is stored on the same server as the reports.

Load from local machine

Select this option to choose an image from your local machine. Click **Browse** to choose a file on your local machine. Specify a repository in the **Save the local image to the repository** field. If you click **Browse**, the Save As window is displayed. Select a folder and then click **OK** to return to the Image Selection window.

A preview of the image is displayed.

3 (Optional) Specify the **Scale type**:

None

The actual size of the image is maintained. The image might or might not fill the entire area of the image's visual container. If the image is larger than the visual container, then scroll bars are displayed.

Stretch

The height and width of image are set to the height and width of the image's visual container. The image's original aspect ratio is not maintained.

Fit All

The image is modified to fit best into the image's visual container. The image's original aspect ratio is maintained.

Fit Width

The width of the image is set to the width of the image's visual container. The height maintains the image's original aspect ratio. Scroll bars are displayed if the set height of the image is greater than the height of the visual container.

Fit Height

The height of the image is set to the height of the image's visual container. The width maintains the image's original aspect ratio. Scroll bars are displayed if the set width of the image is greater than the width of the visual container.

Tile

The image is tiled in the visual container. The image's original size is maintained. There are no scroll bars.

4 (Optional) Specify the **Tooltip text**.

5 Click **OK**.

Specify Image Properties

To specify the properties for an image:

- 1** If it is not already selected, select the image in the canvas that you want to update.
- 2** In the right pane, click the **Properties** tab.
- 3** Update the general properties for the image. You can update the **Name**, **Title**, and **Description**.
- 4** Update the properties specific for the image. Your choices are **Location**, **Scale type**, and **Tooltip text**.

By default, the **Enable selection in the viewers** property is not selected for images. This means that users who use the web viewer or a mobile device cannot select the image, and click ⓘ to see the image name.

Specify Image Styles

No styles are available for images.

Use a Stored Process

About Stored Processes

A *stored process* is a SAS program that is stored on a server and that can be executed as requested by client applications such as SAS Visual Analytics. The embedded SAS code can contain instructions for displaying report elements that include queries, prompted filters, titles, images, and statistical analyses.

You can add one or more stored processes to a report. You can edit the prompts for a stored process using the **Properties** tab in the designer. When you set the value for a prompt in the designer, that prompt value becomes the default value for the viewer.

Any prompts in a stored process must follow the guidelines for entering prompt values. This is important if the stored process contains date values. See “Entering Prompt Values in the SAS Stored Process Web Application” in the *SAS Stored Processes: Developer’s Guide*.

You can also add a *stored process report*, which contains the predefined output from a stored process.

There are prerequisites for printing stored process output. For more information, see [“Printing a Report” on page 558](#).

There are limitations to where stored processes can be used in the designer:

- A stored process cannot be used in the precision layout.
- A stored process cannot be the source or target of an interaction in a report.
- A stored process cannot be added to a container.

Note: Users who view stored processes using SAS Mobile BI cannot be prompted. Instead, the stored process runs using the prompt values that were added when the report was created.

Note: The stored process output in a report is rendered as HTML regardless of the requested output type.

For information about creating a stored process and registering it in metadata, see *SAS Stored Processes: Developer's Guide*.

Specify Stored Process Properties

To specify the properties for a stored process:

- 1 If it is not already selected, select the stored process in the canvas that you want to update.
- 2 In the right pane, click the **Properties** tab.
- 3 Update the general properties for the stored process. You can update the **Name**, **Title**, **Format** (for the title's font style), and **Description**.
- 4 Update the properties specific to the stored process. Your choices are **Show metadata view** and **Show SAS log in the output**. If the stored process contains prompts, the **Edit Prompts** button is displayed.

The screenshot shows the 'Properties' tab of the SAS Stored Process Properties dialog. The 'General' section includes fields for Name (Stored Process 2), Title, Format (Arial, 14), and Description. The 'Stored Process' section includes a checked checkbox for 'Enable selection in the viewers', an 'Edit Prompts' button, a 'Location' field set to '/SAS Projects', and unchecked checkboxes for 'Show metadata view' and 'Show SAS log in the output'.

By default, the **Enable selection in the viewers** property is selected for stored processes. This means that users who use the web viewer or a mobile device can select the stored process, and click  to see the stored process name.

Click **Edit Prompts** to open a new window where you can edit the parameters for the stored process. Click **OK** to save your changes.

Selecting the **Show metadata view** check box can make it easier to work with the stored process while you are designing a report. In the metadata view, you can see information about when the stored process was created and last modified. You can also see the name of the stored process file.

Here is an example of the metadata view for a stored process:

Stored Process	
Name:	procTabulate
Description:	
Created by:	Staging Utility Administrator
Modified by:	Staging Utility Administrator
SAS server:	SASApp - Logical Stored Process Server
Source file:	procTabulate.sas
Source code repository:	Data/storedProcessCode
Created:	Jun 25, 2014 7:57:25 AM
Last modified:	Jun 25, 2014 7:57:25 AM

Selecting the **Show SAS log in the output** option means that both the log output and the stored process output are displayed in the report. This can assist you in debugging problems.

Specify Stored Process Styles

No styles are available for stored processes.

Use a Geo Map

About Geo Maps

Many types of data have a spatial aspect, including demographics, marketing surveys, and customer addresses. For example, if a user needs to evaluate population data for U.S. Census tracts, a report designer could display the information in a table. However, it would be easier and more effective for the person using the report to see the

information in the context of the geography of the tracts. When evaluating information that has a spatial component, users might find it easier to recognize relationships and trends in the data if they see the information in a spatial context.

A geo map overlays your data on a geographic map. You can add a geo map only if the report uses data items from a data source that is enabled for geographic mapping.

You can create a filter or brush interaction between a geo map and another report object in your report or dashboard. When you click on a specific region or city in the geo map, the other report object filters or highlights to show the same location.

The following geo maps are available in the designer:

Geo Bubble Map

A bubble plot that is overlaid on a geographic map. For a complete definition and picture of a geo bubble map, see [“Other Report Objects” on page 670](#).

A geo bubble map requires a geography variable with the role type of geography.

Geo Coordinate Map

A simple scatter plot that is overlaid on a geographic map. For a complete definition and picture of a geo coordinate map, see [“Geo Coordinate Maps” on page 671](#).

A geo coordinate map requires a geography variable with the role type of geography.

Geo Region Map

A two-dimensional map that uses color combinations to represent different regions on the map. For a complete definition and picture of a geo region map, see [“Geo Region Maps” on page 672](#).

A geo region map requires a geography variable with the role type of geography. However, it does not support custom geography data items or ZIP code data.

Note: Certain geo maps that are exported from the explorer (for example, geo maps that use custom roles or data sets that have centroids) cannot be fully modified in the designer.

Specify Geo Map Properties

To specify the properties for a geo bubble map, geo coordinate map, or geo region map:

- 1 If it is not already selected, select the geo bubble map, geo coordinate map, or geo region map in the canvas that you want to update.
- 2 In the right pane, click the **Properties** tab.
- 3 Update the general properties for the geo bubble map, geo coordinate map, or geo region map. You can update the **Name**, **Title**, **Format** (for the title's font style), and **Description**.
- 4 Update the properties that are specific to the geo bubble map, geo coordinate map, or geo region map. You can update **Show map navigation control**, **Transparency**, and **Show legend**.

Here are some details about the properties for geo maps:

- Use the **Map Service** property to change the map provider for a geo bubble map, geo coordinate map, or geo region map after you have placed it on the canvas. This property changes the map type from OpenStreetMap to any available Esri service if an Esri service is available.
- For a geo bubble map, you select the **Transparency** for the bubble plot. For a geo coordinate map, you select the **Transparency** for the scatter plot. For a geo region map, you select the **Transparency** for the regions.

Specify Styles for Geo Maps

To specify styles for a geo bubble map, geo coordinate map, or geo region map:

- 1 If it is not already selected, select the geo bubble map, geo coordinate map, or geo region map in the canvas that you want to update.
- 2 In the right pane, click the **Styles** tab.
- 3 Update the styles for the geo bubble map, geo coordinate map, or geo region map. You can specify **Border and Fill**, **Data Styling**, **Frame Styling**, **Text Styling**, and **Data Colors** for the geo bubble map, geo coordinate map, or geo region map.

Your custom colors are saved between SAS Visual Analytics sessions. Your custom colors are displayed in the color palette. For an example of the color palette, see [Display 33.1 on page 367](#).

Use a Gauge

About Gauges

A gauge is a dashboard indicator (also known as a KPI) that displays the status or measure of a variable or variables in relation to a target, goal, or interval. Gauges are designed to achieve this goal in a way that is familiar to users. Many real-life objects use gauges, such as cars and machines. Gauges can be used to display a quantity, range, variable, or status. They often appear in business intelligence dashboards.

Qualitative ranges are required for all gauges in the designer. You can populate the range intervals manually, or you can have them generated for you based on the range of the actual data.

Gauges in the designer support high cardinality.

For a definition and a picture of each gauge type, see [“Gauges” on page 673](#).

Specify Gauge Properties

Starting in the 7.1 release, there is one gauge object on the **Objects** tab. When the gauge is on the canvas, you can use **Type** on the **Properties** tab to specify which type of gauge (bullet, dial, slider, speedometer, or thermometer) you want displayed in a report.

To specify properties for a gauge:

- 1 If it is not already selected, select the gauge in the canvas.
- 2 In the right pane, click the **Properties** tab.
- 3 Update the general properties for the gauge. You can update the **Name**, **Title**, **Format** (for the title's font style), and **Description**.
- 4 Update the specific properties for the gauge. The available properties depend on the selected gauge type.

Here are some details about the properties for gauges:

- By default, the **Enable selection in the viewers** property is selected for gauges. This means that users who use the web viewer or a mobile device can select the gauge and click ⓘ to see the gauge name and any incoming filter information.
- (Optional) Clear **Show value label**, **Show range labels**, or both properties.
- Select a **Type** for the gauge. You can choose **Bullet**, **Dial**, **Slider**, **Speedometer**, or **Thermometer**.
- For the bullet, slider, and thermometer gauges, you can specify the **Direction** for displaying the gauge. The default for the bullet and slider gauges is **Horizontal**. The default for the thermometer gauge is **Vertical**.

Specify Gauge Styles

To specify styles for gauges:

- 1 If it is not already selected, select the gauge in the canvas that you want to update.
- 2 In the right pane, click the **Styles** tab.
- 3 Update the styles for the gauge. The available styles depend on the selected gauge type. For example, you can specify **Border and Fill**, **Data Styling**, **Frame Styling**, **Text Styling**, and **Data Colors** for gauges.

Note: The **Header value** enables you to set only the text color.

Your custom colors are saved between SAS Visual Analytics sessions. Your custom colors are displayed in the color palette. For an example of the color palette, see [Display 33.1 on page 367](#).

Use a Word Cloud Object

About Word Cloud Objects

A word cloud displays a set of words from a character data item. Depending on the type of word cloud and your data roles, the size of each word in the cloud can indicate the relevance of the word to a topic, the frequency of the word in a category, or the value of a measure.

Every word cloud has a descending sort based on its size.

TIP There is a limit of 100 rows for a word cloud. To reduce the amount of data, add a rank for the word cloud, and use a number less than 100. For more information, see [“Add a New Rank” on page 538](#).

Word clouds support display rules and interactions.

Specify Word Cloud Properties

To specify the properties for a word cloud:

- 1 If it is not already selected, select the word cloud in the canvas that you want to update.
- 2 In the right pane, click the **Properties** tab.
- 3 Update the general properties for the word cloud. You can change the **Name**, **Title**, **Format** (for the title's font style), and **Description**.
- 4 Update the object-specific properties for the word cloud. Here are some details about the properties for word clouds:
 - By default, the **Enable selection in the viewers** property is selected for word clouds. This means that users who use the web viewer or a mobile device can select the word cloud, and click  to see the word cloud name and any incoming filter information.
 - Use the **Arrangement** property to specify how the words are displayed in the word cloud. **Cloud** is the default. Use **Rows** to display the words in rows as if you were reading text in a book.
 - Use the **Font scale** to control the difference in the size of the smallest and largest words. If you select 1, there is a one-to-one ratio, so the smallest and largest words are displayed as the same size.
 - By default, the word cloud has a limit of 100 terms. After the results of a query come back, only the top 100 terms, based on a descending sort of the size

measure, will be displayed. Use the **Word display limit** property to display fewer terms. The slider can be set to a number between five and 100.

Specify Word Cloud Styles

To specify styles for word clouds:

- 1 If it is not already selected, select the word cloud in the canvas that you want to update.
- 2 In the right pane, click the **Styles** tab.
- 3 Update the styles for the word cloud. For example, you can specify **Border and Fill**, **Frame Styling**, **Text Styling**, and **Data Colors**.

TIP A three-color **Gradient** data color style is available for word clouds that have at least two measures.

Your custom colors are saved between SAS Visual Analytics sessions. Your custom colors are displayed in the color palette. For an example of the color palette, see [Display 33.1 on page 367](#).

Using Custom Graphs to Display Results

About Custom Graphs

The graph builder enables you to create custom graph objects. To access the graph builder, on the **Objects** tab, click . The Create Custom Graph window is displayed. For more information, see [Chapter 43, “Creating and Using Custom Graph Objects,” on page 577](#).

When a custom graph is saved in the **My Folder** location, it is displayed under the **Custom** heading on the **Objects** tab. Then, you can insert the custom graph into a report and add data to it. For information about adding a custom graph to the **Objects** tab, see [“Show or Hide Report Objects in the Objects Tab” on page 363](#).

For a definition and a picture of each custom graph type, see “[Graphs, Charts, and Plots](#)” on page 650.

Specify Custom Graph Properties

To specify the properties for custom graphs:

- 1 If it is not already selected, select the custom graph in the canvas that you want to update.
- 2 In the right pane, click the **Properties** tab.
- 3 Update the general properties for the graph. You can update the **Name**, **Title**, **Format** (for the title’s font style), and **Description**.
- 4 Update the specific properties for the graph. The available properties depend on the selected custom graph type.

By default, the **Enable selection in the viewers** property is selected for custom graphs. This means that users who use the web viewer or a mobile device can select the custom graph and click ⓘ to see the custom graph name and any incoming filter information.

Note: No properties are available for the schedule chart.

Specify Custom Graph Styles

To specify styles for custom graphs:

- 1 If it is not already selected, select the custom graph in the canvas that you want to update.
- 2 In the right pane, click the **Styles** tab.
- 3 Update the styles for the graph. The available styles depend on the selected custom graph type. For example, you can specify **Border and Fill**, **Data Styling**, **Frame Styling**, **Text Styling**, and **Data Colors** for custom graphs.

By default, the background of a graph is set to white. Use the **Wall background** option (under **Frame Styling**) to specify a different color.

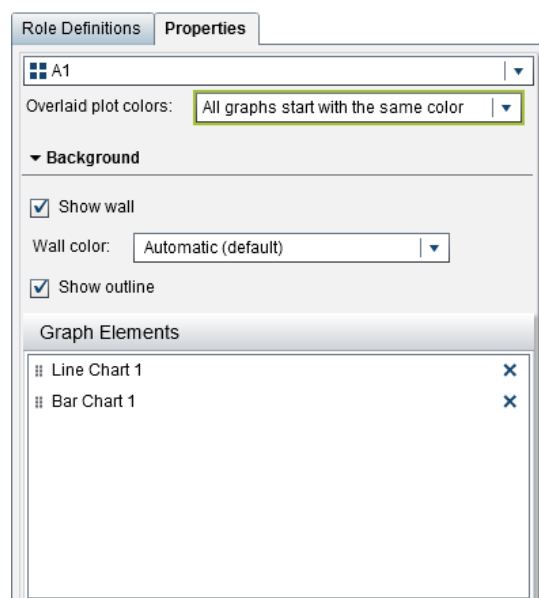

Note: A three-color **Gradient** data color style is available for custom graphs that have a **Color** role.

Your custom colors are saved between SAS Visual Analytics sessions. Your custom colors are displayed in the color palette. For an example of the color palette, see [Display 33.1 on page 367](#).

Assign Colors to Overlays in Custom Graph Elements

Each time a new graph element is overlaid on top of an existing graph element, the data colors that are assigned to each subsequent graph element are the colors after all of the colors have been assigned to the first graph and its elements. If 12 colors are assigned to the first graph element (for example, a bar chart), then the graph element that is overlaid (for example, a line chart) is assigned color 13.

To have the overlaid graph element start with the first color, change the **Overlaid plot colors** property for the cell in the graph builder to **All graphs start with the same color**.

Setting the **Overlaid plot colors** property affects the **Fill** colors on the **Styles** tab when you open the custom graph in the designer.

Display 33.2 Data Colors on the Styles Tab in the Designer

If a custom graph contains more than eight groupings, the **Fill** colors are repeated. Here is the pattern for colors:

Colors	Pattern
1-8	The colors are specified in the Fill color palette.
9-16	Repeat colors 1 through 8 in a lighter hue.
17-24	Repeat colors 1 through 8 in a darker hue.
25-32	Repeat colors 1 through 8 in the Fill color palette.
33-40	Repeat colors 1 through 8 in a lighter hue.
41-48	Repeat colors 1 through 8 in a darker hue.
More than 48 colors	Repeat the color patterns above.

Duplicate a Report Object

Duplicating a report object in the designer enables you to use a copy of the same object in the same section or another section of your report.

Note: If you duplicate a control with a parameter, the parameter is not copied from the original control because the parameter can get its value from only one control.

To duplicate a report object:

- 1 On the canvas, right-click the report object that you want to duplicate.
- 2 Select **Duplicate <ReportObject>**, where <ReportObject> is the name of the report object in the report. (For example, **List Table 1**, **Bar Chart 1**, and so on.) The duplicated report object is placed on the canvas with a name based on the original name. For example, if the original report object name is **List Table 1**, then the duplicate report object is displayed as **List Table 1 (1)**. If you choose to duplicate the same report object again, then it is displayed as **List Table 1 (2)**.
- 3 (Optional) Move the duplicate report object to another section. Right-click the report object that you want to move. Select **Move <ReportObject> to ► <SectionName>**, where <ReportObject> is the name of the report object and <SectionName> is the name of the section.
- 4 (Optional) If you want the report object to appear in a different location, then drag and drop it in a new location.

If you move an object to a section with precision layout, then you must manually move the object to its proper location. All objects are put in the top left corner by default.

Working with Alerts for Report Objects

Overview of Alerts

You can create alerts for a report object so that subscribers are notified via e-mail or a text message when the alert condition is met. You can specify how frequently the system checks to see whether the alert condition is been met.

You can add alerts to report objects using the **Alerts** tab. You can also add alerts when you create a display rule. For more information about display rules, see [“Adding Table-Level Display Rules” on page 468](#).

Note: You can specify a preference for receiving alert notifications via e-mail or a text message in both the designer and the viewer. For more information, see [“Specify General Preferences for the Designer” on page 341](#).

Add an Alert

To add an alert to a report object:

- 1 If it is not already selected, select the report object in the canvas to which you want to add an alert.
- 2 Do one of the following:
 - Right-click the report object, and select **Add Alert**. The Add Alert window is displayed.
 - In the right pane, click the **Alerts** tab. Click . The Add Alert window is displayed.
- 3 On the **Expression** tab, specify the criteria for the alert. You can create a new expression or use an existing expression.
- 4 (Optional) Specify how often you want the system to check for the criteria. You can use the system default, which is set by your administrator, or you can limit the check to a minute or hourly increment.

The screenshot shows the 'Add Alert' dialog box with the 'Subscription and Notification' tab selected. The 'Expression' tab is also visible. The 'Specify alert context' section has the 'Create new expression' radio button selected. Below it, the 'Column' dropdown is set to 'Profit', the 'Operator' dropdown is set to '>', and the 'Value' dropdown is set to '500,000'. The 'Use existing condition' radio button is unselected. The 'Options' section has a dropdown menu set to 'Select how often to query the system'. Below this, the 'Use the system default' radio button is unselected, and the 'Query the system every:' option is selected with a value of '1' and a unit of 'Hour'. At the bottom are 'OK' and 'Cancel' buttons.

- 5** On the **Subscription and Notification** tab, add or remove subscribers for the alert. You can specify how frequently alert notifications are sent. For example, suppose that you specify that you want alert notifications sent every five days. Then, it will be at least five days before you receive an alert notification.

Note: Only users who have e-mail addresses stored in metadata are displayed in the **Manage subscribers** list on the **Subscription and Notification** tab.

Note: The timing of when alert notifications are sent can vary depending on when the alert condition is met.

- 6** Click **OK**. The details for the alert are displayed at the bottom of the **Alerts** tab.

Note: An alert notification has a blank subject. Some cellular carriers convert text messages to e-mail messages. When a subject is not specified in an e-mail, these carriers try to add a subject. Some carriers add the alert condition as the subject. Other carriers cannot add the subject, so the e-mail message has a blank subject.

Edit an Alert

To edit an alert:

- 1 In the right pane, click the **Alerts** tab.
- 2 Select the alert that you want to edit, and click . The Edit Alert window is displayed.
- 3 Update the alert criteria, and then click **OK** to save your changes.

Delete an Alert

Alerts are not automatically deleted when a report is deleted. You can delete an alert on the **Alerts** tab. Select the alert that you want to delete, and click . Then, click **Delete** in the confirmation message that is displayed.

Overview of Data Sources and Data Items

Each data source that is available in SAS Visual Analytics Designer (the designer) includes one or more data items that you can use in reports. For example, a data source named **Order Information** might include standard data items such as **Order ID**, **Product ID**, **Unit Cost**, **Order Date**, and **Order Amount**. You decide which data items to use. You can select all of the data items in the data source or a subset of the data items.

For information about exporting data, see [“Exporting Data from Report Objects” on page 560](#).

Working with Data Sources in Reports

About Data Sources

Many data sources that are available in the designer are prepared by a data administrator or analyst so that you can easily define a report. Data administrators load tables into memory using SAS Visual Analytics Administrator (the administrator). Analysts can use SAS Visual Data Builder (the builder) to design queries that load tables into memory too.

The Add Data Source window can be used to add or import data sources. If you have the Import and Load Data capability, then you can import data from a file into the designer. Supported files are SAS data sets, Microsoft Excel spreadsheets, and delimited text files (such as CSV files). If you can import data sources, the Add Data Source window has **Import Data** in the right pane. For information about exporting data, see [“Exporting Data from Report Objects” on page 560](#).

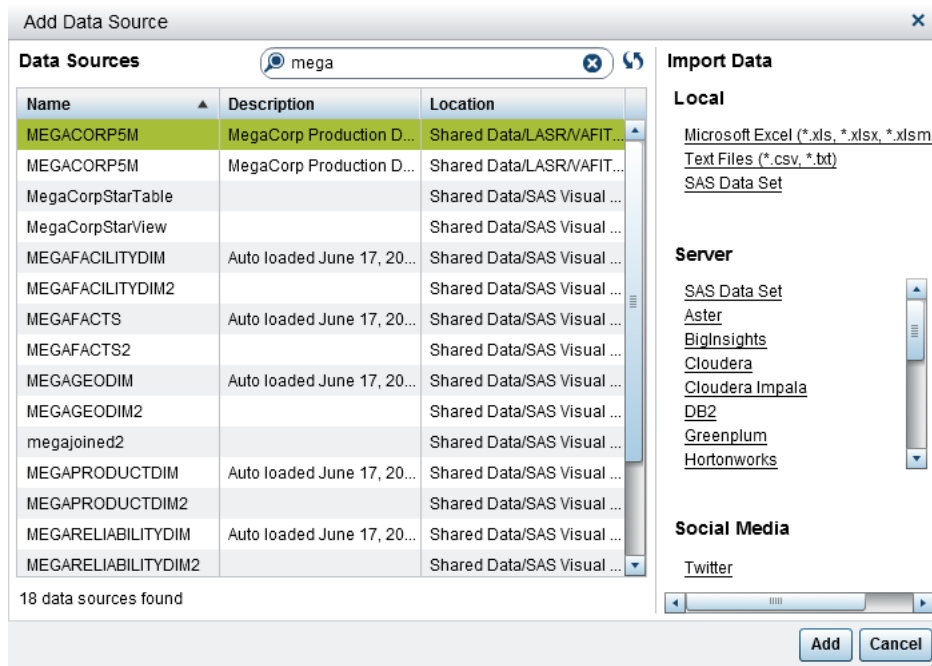

All data sources contain data items, which can refer to calculations or columns in physical data (tables). Reports can include query results from more than one data source.

Import a Data Source for a Report

If you have the Import and Load Data capability, then you can import a data source into the designer using either the Add Data Source or the Change Data Source window. When you import data, the data source is automatically added to the open report. For a list of supported files and more information about importing server data, see [Chapter 5, “Importing Local Data Files,”](#) on page 43.

To import a data source for a report using the Add Data Source window:

- 1 On the **Data** tab, click ▼ beside the **Select a data source** text to display the Add Data Source window.

- 2 In the **Import Data** pane, select a data source that you want to import.

TIP If you select a delimited text file, then you can specify additional options. For example, you can specify the delimiter, whether the first row contains column heading names, and where the data rows begin.

TIP If you select a spreadsheet, then you can specify additional options. For example, you can specify which worksheets to import, whether the first row contains column heading names, and where the data rows begin.

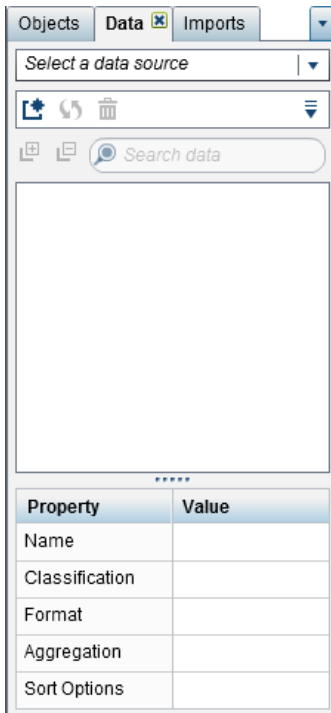

3 Click **Add**.

Add a Data Source to a Report

You can use one or more data sources in a report in the designer.

To add a data source to a report:

1 On the **Data** tab, click ▼ beside the **Select a data source** text.

The screenshot shows the 'Data' tab selected in a report designer. At the top, there are tabs for 'Objects', 'Data' (which is active and has a small 'x' icon), and 'Imports'. Below these tabs is a dropdown menu labeled 'Select a data source'. To the right of the dropdown is a small downward arrow icon. Below the dropdown is a toolbar with three icons: a blue square with a white plus sign, a circular arrow, and a trash can. To the right of these icons is a small downward arrow icon. Below the toolbar is a search bar with a magnifying glass icon and the text 'Search data'. Below the search bar is a large empty rectangular area. At the bottom of the panel is a table with two columns: 'Property' and 'Value'.

Property	Value
Name	
Classification	
Format	
Aggregation	
Sort Options	

The Add Data Source window is displayed.

- 2 In the Add Data Source window, select one or more data sources.

TIP Use the **Search** field to narrow the list of data sources that are displayed in the Add Data Source window. The search searches the **Name** and **Description** fields. It is a “begins with” search rather than a “contains” search. If you receive a message that a data source is not available, contact your data administrator.

- 3 Click **Add**. The list of available data items is displayed on the **Data** tab.
- 4 (Optional) To add additional data sources, click  on the **Data** tab, which displays the Add Data Source window. Select the data sources that you want, and then click **Add**. The **Data** tab is populated with a list of all of the data items that are in the data sources.

When you add multiple data sources, the last data source that you selected is displayed on the **Data** tab. If one of the data sources that you selected is not available, the last available data source that you selected is displayed on the **Data** tab.

Note: When you open a saved report that has multiple data sources, the designer displays the same data source that was displayed in the **Data** tab when the report was saved.

Refresh a Data Source for a Report

You can refresh the columns in a data source in the designer at any time. Be aware that refreshing a data source means that all live report objects that are connected to that data source will have their queries rerun.

Note: Refreshing a data source adds any new columns that have been added to the table metadata in the SAS LASR Analytic Server. The default formats and names of existing columns will be updated the next time you open the report.

Note: Data is refreshed from the table that is currently loaded into the SAS LASR Analytic Server.

To refresh a data source for a report, on the **Data** tab, select the data source, and then click .

To refresh the list of data sources when you are using the Add Data Source window, click  beside the search field. This updates the list of all possible data sources. Individual data sources are not refreshed.

When you refresh a data source for a report, columns that have been deleted from the table metadata in the SAS LASR Analytic Server are automatically removed if they do not impact any objects in the report. If deleted columns do impact objects in the report, then the Repair Report window is displayed so that you can repair the objects that are impacted by the deleted columns. For more information, see [Appendix 8, “Troubleshooting in SAS Visual Analytics Designer,”](#) on page 729.

Remove a Data Source from a Report

You can remove all references to a data source from a report in the designer. Be aware that removing a data source means that all related data items are also removed from the report objects within the report.

Note: Other reports that use the same data source are not affected when you remove a data source from a report.

To remove a data source from a report:

- 1 On the **Data** tab, select the data source, and then click .
- 2 Click **Delete** in the confirmation message that is displayed.

Change a Data Source in a Report

To change a data source in a report:

- 1 On the **Data** tab, click , and then select **Change Data Source**. The Change Data Source window is displayed.
- 2 In the Change Data Source window, select a data source.

3 Click **Change**.

If a data item with the same name does not exist in the replacement data source, then it is automatically removed from the replacement data source if there are no report objects that use the data item. If there are report objects that use the data item, then those report objects will not work. The Repair Report window is displayed so that you can repair the objects that use the data item. For more information about repairing reports, see [Appendix 8, “Troubleshooting in SAS Visual Analytics Designer,”](#) on page 729.

Data items in the replacement data source that have names that do not exist in the original data source are added to the **Data** tab automatically.

Note: For data item names, the case is ignored when data sources are compared by the designer.

View Measure Details

To view the details about all of the measures in a data source:

- 1 On the **Data** tab, click , and then select **Measure Details**. The Measure Details window is displayed.
- 2 Click **Close**.

Show or Hide Data Items on the Data Tab

You can specify which data items you want to see for the data source on the **Data** tab. Your selections for which data items are shown or hidden are stored with the report. For example, suppose that you hide data items in one report, and then you open a second report that uses the same data source. The data items in the second report are not hidden unless you specifically hid them in that report, too.

To show or hide data items:

- 1 On the **Data** tab, click , and then select **Show or Hide Items**. The Show or Hide Data Items window is displayed.

- 2 Select the data items that you want to appear on the **Data** tab. If there are data items that you do not want to see on the **Data** tab, then clear the check box (or check boxes) for that data item (or data items).
- 3 Click **OK**. The **Data** tab is updated.

Alternatively, you can select a data item that you want to hide on the **Data** tab. Right-click the data item, and select **Hide Data Item**.

You can also use a data source filter to restrict the data that is displayed in a report. For more information, see [“Use a Data Source Filter in a Report” on page 499](#).

Sort Data Items on the Data Tab

To sort data items on the **Data** tab, click , and then select one of the following:

- **Sort Items ► Ascending By Name**
- **Sort Items ► Descending By Name**

The data items are sorted on the **Data** tab within each grouping. The default sort is **Ascending By Name**.

For information about sorting data values in report objects, see [“Sorting Data in Reports” on page 456](#).

Group Data Items on the Data Tab

To group data items on the **Data** tab, click , and then select one of the following:

- **Group Items ► By First Letter**
- **Group Items ► By Data Type**
- **Group Items ► By Classification**
- **Group Items ► By Format**
- **Group Items ► By Aggregation**

The data items are grouped on the **Data** tab. The default is grouping **By Role**.

Working with Hierarchies in a Report

About Hierarchies

Creating hierarchies enables you to add drill-down functionality to your reports. A hierarchy is an arrangement of category columns that is based on parent-child relationships. The levels of a hierarchy are arranged with more general information at the top and more specific information at the bottom. For example, you might create a hierarchy of datetime columns with *Year* as the top level, *Month* as the next level, and *Day* as the bottom level.

You can also have a geographic hierarchy. For example, you might have a hierarchy with *Region* as the top level, *State* as the next level, and *City* as the bottom level.

You can have a maximum of two hierarchies for a report object.

Keep the following considerations in mind:

- List tables, controls, and gauges do not support hierarchies.
- Data item auto-assignment does not support hierarchies.
- Crosstabs can have either a hierarchy or categories on each row or column, but not both.
- Time series plot report objects allow only datetime data items in a hierarchy.
- Geo bubble maps, geo coordinate maps, and geo region maps allow only geographic data items in a hierarchy.

You can also have a date hierarchy.

Create a New Hierarchy for a Report

To create a new hierarchy:

- 1 On the **Data** tab, click , and then select **New Hierarchy**. The New Hierarchy window is displayed.
- 2 Enter a **Name**.
- 3 Select at least two categories, and drag them to the **Hierarchy** list.
- 4 (Optional) Use the up and down arrows to arrange the data items in the **Hierarchy** list.
- 5 Click **OK** to save the new hierarchy. The  icon identifies the new hierarchy in the list of data items on the **Data** tab.

TIP You can create a date hierarchy by right-clicking a date or datetime data item on the **Data** tab, and selecting **Create Date Hierarchy**. If you use a date data item, it must have a format that specifies the year or the **Create Date Hierarchy** option is not available.

Crosstab report objects enable you to create hierarchies from the categories on a crosstab axis. To create a hierarchy, right-click a category heading, and then select **Create Hierarchy**. The categories are replaced with a new hierarchy. The name of the new hierarchy is generated from the name of the outermost category with the suffix **Hierarchy**.

Edit a Hierarchy for a Report

To edit a hierarchy:

- 1 Right-click the hierarchy name on the **Data** tab, and select **Edit Hierarchy**. The Edit Hierarchy window is displayed.
- 2 (Optional) Edit the **Name**.

- 3 Add and remove categories. There must be at least two categories.

Note: If a geographic hierarchy is used in a geo bubble map, geo coordinate map, or geo region map, only geographic data items are displayed when you edit the hierarchy.

- 4 Click **OK** to save the updated hierarchy.

If the hierarchy that you edit is already used in a report object and is drilled or expanded, it returns to the top level after it is edited.

Delete a Hierarchy for a Report

To delete a hierarchy:

- 1 Right-click the hierarchy name on the **Data** tab, and select **Delete Hierarchy**.
- 2 Click **Delete** in the confirmation message that is displayed. The hierarchy is removed from the list of data items, as well as from any report objects, filters, or ranks that were using it.

Working with Data Items in a Report

About Data Items

You decide which data items to use to define a query for each report object. You can use all the data items in the data source or a subset of data items. Each data item is classified as either a category or a measure.

The designer can display data items using an existing user-defined format that has already been specified externally for a data column in a data source. However, you cannot specify a new or different user-defined format for a data item in the designer.

You can create a custom sort so that data items in a table or graph can sort to the top or to the bottom. Category data items, calculated items that are categories, and custom

categories also support custom sorts. For more information, see [“Using a Custom Sort” on page 459](#).

For information about filtering data items, see [“Use a Data Source Filter in a Report” on page 499](#).

Table 34.1 *Data Items That Are Available in the Designer*

Data Item	Icon	Description
Aggregated Measure or Time Period Calculation		<p>A data item that represents special predefined operations, like distinct count, percentage of totals, percentage of subtotals, or frequency percent. Or, users can define their own aggregated measure calculations.</p> <p>Aggregate measures can be used in only some report objects. They cannot be used in filters, controls, spark lines, or time series graphs. Percentage of subtotal items (including row total, row subtotal, column total, and column subtotal) can be used only in crosstabs. Some aggregated measure calculations cannot be used in a detail rank.</p>
Calculated	 or 	<p>A data item that is calculated from existing data items by using an expression. For example, you could create a calculated data item called <i>Profit</i>, which is created by using this expression: <code>[Revenue] – [Cost]</code>, where <i>Revenue</i> and <i>Cost</i> are measures in a data source.</p> <p>Calculated dates and times are treated as categories with distinct values being governed by the date or time format that you have chosen. Numeric calculated items can be treated as measures (with an aggregation type such as Sum, which is applied to each distinct category combination). Or, you can change numeric calculated items into category data items with distinct values being governed by the number of decimal places in the numeric format.</p>

Data Item	Icon	Description
Category		<p>A data item whose distinct values are used to group and aggregate measures. There are five types of categories: alphanumeric, date, datetime, time, and numeric. Alphanumeric categories can be made up of all letters, all digits, or a combination of the two. Categories that have values that are all digits might be physically stored as character or numeric data. The data type affects how values are handled in relation to some functionality, such as filtering, sorting, and formatting.</p> <p>Examples of alphanumeric categories include data items such as <i>Product ID</i>, <i>Country</i>, <i>Employee Number</i>, and <i>Employee Name</i>. Alphanumeric categories sort lexically.</p> <p>Date, datetime, time, and numeric categories are sorted by their underlying numeric values.</p> <p>Category data items can also be numeric. A category data item sorts differently than an alphanumeric data item. Numeric category data items sort by number.</p> <p>Note: If you change a measure to a category, then it uses this category icon.</p> <p>The  icon indicates a user-defined format category data item. User-defined format categories can be based on underlying numeric or character data.</p>
Date and Time		<p>A category data item whose distinct values are used to group and aggregate measures. There are three types of date categories: date, datetime, and time.</p> <p>Examples of date, datetime, and time categories are <i>Order Year</i>, <i>Date and Time of Sale</i>, and <i>Customer Wait Time</i>.</p>
Geography		<p>A category data item whose values are mapped to geographical locations or regions. Geography data items can be used in reports to show your data on a geographic map. For example, a geography data item can identify geographic information that is specific to your organization (for example, sales regions, warehouse locations, oil platforms, and so on). For more information, see “Working with Geography Data Items” on page 435.</p> <p>The geography icon can also indicate that all data items in a hierarchy are based on geography.</p>

Data Item	Icon	Description
Hierarchy		A data item whose values are arranged with more general information at the top and more specific information at the bottom. The first level in the hierarchy is the root level. For example, you might have a <i>Date</i> hierarchy, which includes the <i>Year</i> (the root level), the <i>Quarter</i> , and then the <i>Month</i> . You can also have geographic hierarchies.
Measure		<p>A data item whose values can be used in computations. These values are numeric. Examples of measures include <i>Sales Revenue</i>, <i>Units Sold</i>, and <i>Salary</i>.</p> <p>The designer assigns a default aggregation method to every measure. Almost all measures are assigned Sum. You can change the aggregation method.</p>

Note: Report objects that are imported from SAS Visual Analytics Explorer (the explorer) use either live or on-demand data. For on-demand data, you can update the properties and styles for these report objects in the designer, but you cannot change the data assigned to them.

Assign Data Items

To assign data items to use in queries for the current report section:

- 1 On the **Data** tab in the left pane, click the down arrow to display a list of available data sources. Select a data source, and the **Data** tab is populated with a list of all of the data items that are in the data source.

If the data source that you want is not in the list, click , which displays the Add Data Source window. Select the data source that you want, and then click **Add**. The **Data** tab is populated with a list of all of the data items that are in the data source.

If you do not want to use the data source that you originally selected, click . Click **Delete** in the confirmation message that is displayed.

- 2 Select an existing report object that uses the same data source name or add a new report object to the section.

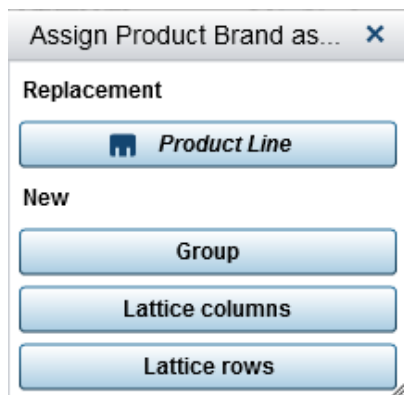

- 3 Drag and drop a data item onto the canvas. The data item is automatically assigned a data role. For more information, see [“Automatic Data Item Assignments” on page 419](#).

Note: You can use the Ctrl key to select multiple data items, and then drag and drop them onto the canvas.

Alternatively, you can right-click on a data item, and select **Add Data Item to <ReportObject>**, where <ReportObject> is the name of the report object in the report. (For example, **List Table 1**, **Bar Chart 1**, and so on.)

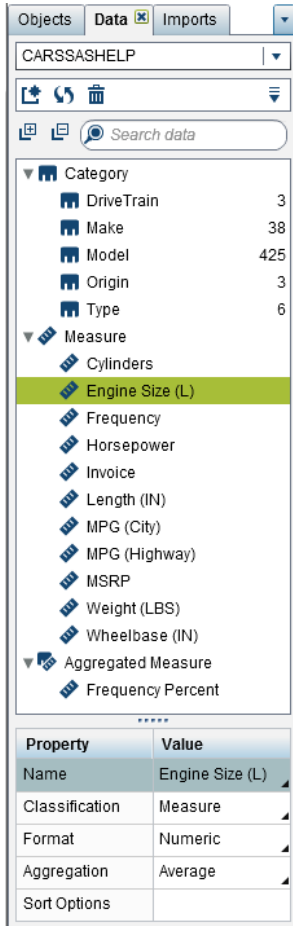

Note: You cannot double-click the icon for a data item and assign it to the report.

- 4 If the selected data item can replace a current data item in the report object or if the selected data item is valid for multiple data roles, then select the data assignment from the Assign <DataItemName> as window. A data assignment that is marked with a red asterisk (*) is required before the query can be run.

For more information about aggregations, see [Appendix 4, “Aggregations for Measures,” on page 681](#).

- 5 (Optional) To see more information about a data item, select it in the list. The **Name**, **Classification**, **Format**, and **Aggregation** are displayed in the data item table below the list of data items. For a category data item with a user-defined format that has an underlying numeric value, you can specify **Sort Options**.

Automatic Data Item Assignments

When you drag and drop data items on a report object, the designer automatically assigns them a data role. For a single data item, the data item is assigned to an empty and required data role before you are prompted to replace an already assigned data item. For multiple data items, the data items are assigned to all empty and required data roles that accept the data items. There is a special case for a measure data role that allows multiple data items. In this special case, the designer automatically assigns all of the data items to the **Measures** data role.

Note: Hierarchy data items cannot be used in the automatic assignment of multiple data items. Also, the animation role and data tip role are not automatically assigned.

For more information about data roles, see [“Working with Data Role Assignments” on page 445](#).

Duplicate Data Items

Duplicating measure data items in the designer enables you to see the aggregations of a data item side by side in a table. For a list of the available aggregation types, see [Appendix 4, “Aggregations for Measures,” on page 681](#). You can duplicate a numeric measure if you want to use it as a category to group other values in some tables or graphs. If you save a report with duplicate data items, then those data items are available when you edit the report the next time.

You can duplicate a calculated data item to make a variation of a calculation. For example, you might make similar calculations involving miles per gallon for a vehicle, but you create one calculation using **MPG (City)** and another using **MPG (Highway)**. You can duplicate any data item if you want to use it with more than one format in your report. For example, you might change **Month** to **Year** for a date data item.

To duplicate a data item:

- 1 On the **Data** tab in the left pane, right-click the data item that you want to duplicate. Select **Duplicate Data Item**.

All of the properties of the original data item are copied to the duplicate data item. The duplicate data item appears in the list of data items on the **Data** tab. For example, if the original data item name is **Engine Size**, then the duplicate data item is displayed as **Engine Size (1)**. If you choose to duplicate the same data item again, then it is displayed as **Engine Size (2)**.

- 2 (Optional) Rename the duplicate data item.
- 3 (Optional) Change the format or aggregation for the duplicate data item.
- 4 (Optional) Edit the calculation for a calculated data item or aggregated measure.
- 5 (Optional) Change the sort options for a category data item with a user-defined format that is based on an underlying numeric value.

- 6 (Optional) Change the classification for the data item. For example, a numeric data item that has been duplicated and is not yet assigned to a report object can be a category or a measure.

Rename Data Items

You can rename data items in the data source using the **Data** tab.

To rename data items:

- 1 On the **Data** tab, right-click on a data item, and then select **Rename Data Item**. The Rename Data Item window is displayed.
- 2 Enter a new name. The name cannot be used by another data item in the same data source.
- 3 Click **OK**.

Alternatively, you can use the data item table at the bottom of the **Data** tab to rename a data item. For the **Name** property, enter a new name for **Value**.

Search for Data Items

If your data source contains many data items, you can search for particular data items using the **Data** tab.

To search for data items:

- 1 Enter the name of a data item in the search field on the **Data** tab. The field is located above the list of data items.

- 2 (Optional) Click  to collapse the list of data item groupings or click  to expand the list of data item groupings.
- 3 Click  to clear the search term and display all of the data items in the data source.

Create a Distinct Count for a Category Data Item

A distinct count query is useful in many ways. For example, you might want to know the number of distinct products that were purchased during a specific time period. Or, you might want to know which products have the most customers or which products have the most customers in a particular geographic region. You can create a distinct count for category data items only.

To create a distinct count aggregated measure data item:

- 1 On the **Data** tab in the left pane, right-click the category data item that you want to use for the distinct count.
- 2 Select **Create Distinct Count**.

The distinct count data item appears in the list of data items with a name that is derived from the original name. For example, if the original data item name is **Date**, then the distinct count data item is displayed as **Date (Distinct Count)**. The  icon identifies the new distinct count data item on the **Data** tab.

Create Derived Items for Measures

You can create derived data items that are aggregated measures in the designer. The aggregated measure does not contain data values in itself, but when it is used in a report object, it displays the value for the measure and formula type on which it is based. An example is a percentage of total.

Here are some key points about derived items:

- Derived data items cannot be used in filters or controls.
- Period calculations cannot be derived from measures with certain aggregations.

To create a derived item from a report object:

- 1 In the report object, right-click on the measure data item that you want to use for the derived item.
- 2 Select **Create and Add**, and then select one of the following:

Difference from Previous Period

Displays the difference between the value for the current time period and the value for the previous time period. For example, you might derive the difference between sales for the current month and sales for the previous month.

Note: This derived item is not available if your data source does not contain a date data item that includes the year.

Difference from Previous Parallel Period

Displays the difference between the value for the current time period and the value for the previous parallel time period within a larger time interval. For example, you might derive the difference between sales for the current month and sales for the same month of the previous year.

Note: This derived item is not available if your data source does not contain a date data item that includes the year.

Percent Difference from Previous Period

Displays the percentage difference between the value for the current time period and the value for the previous time period. For example, you might derive the percentage difference between sales for the current month and sales for the previous month.

Note: This derived item is not available if your data source does not contain a date data item that includes the year.

Percent Difference from Previous Parallel Period

Displays the percentage difference between the value for the current time period and the value for the previous parallel time period within a larger time interval. For example, you might derive the percentage difference between sales for the current month and sales for the same month of the previous year.

Note: This derived item is not available if your data source does not contain a date data item that includes the year.

Percent of Subtotals

Displays the percentage of the subtotal value for the measure on which it is based. You can create a percentage of subtotals only when the source data item has an aggregation of Sum or Count.

Note: The percentage of the subtotal is available only for crosstabs.

Note: The percentage of subtotals is relative to the subset of data that is selected by your filters and ranks.

Percent of Total

Displays the percentage of the total value for the measure on which it is based. You can create a percentage of total only when the source data item has an aggregation of Sum or Count. For example, you might create the percentage of the total value for a measure that contains revenue values. If you create a bar chart of the aggregated measure and a category that contains product lines, then the bar chart shows the percentage of total revenue for each product line.

Note: The percentage of the total value is relative to the subset of data that is selected by your filters and ranks.

Period to Date

Displays the aggregated value for the current time period and all of the previous time periods within a larger time interval. For example, you might derive the year-to-date total for each month.

Note: This derived item is not available if your data source does not contain a date data item that includes the year.

Year to Date

Displays the aggregated value for the current time period and all of the previous time periods within the year. For example, you might derive the year-to-date total for each month.

The year-to-date calculation subsets the data for each year using today's date (where today is evaluated each time you view the report). To use all data for every period, edit the expression for the derived item.

Note: This derived item is not available if your data source does not contain a date data item that includes the year.

Year to Date Growth

Displays the percentage difference between the year-to-date value for the current time period and the year-to-date value for the same time period of the previous year. For example, you might derive the difference in year-to-date sales between the current month and the same month of the previous year.

The year-to-date calculation subsets the data for each year using today's date (where today is evaluated each time you view the report). To use all data for every period, use a **Period to Date** item or edit the expression for the derived item.

For the month that contains today's date, the data for an earlier year is subset to the same corresponding date.

Note: This derived item is not available if your data source does not contain a date data item that includes the year.

Year over Year Growth

Displays the percentage difference between the current time period and an equivalent time period from the previous year. For example, you might derive the difference in sales between the current month and the same month of the previous year.

The year-over-year growth calculation subsets the data for each year using today's date (where today is evaluated each time you view the report). To display a percentage of growth using full periods, use **Percent Difference from Previous Parallel Period** or edit the generated formula.

For the month that contains today's date, the data for an earlier year is subset to the same corresponding date.

Note: This derived item is not available if your data source does not contain a date data item that includes the year.

Alternatively, you can use the **Data** tab to create derived data items.

Create a Percentage of Total Using the Data Tab

A measure is required to have a Sum or Count aggregation before you can create a percentage of total.

To create a percentage of total from a measure data item using the **Data** tab:

- 1 On the **Data** tab in the left pane, right-click on the measure data item that you want to use for the percentage of total.
- 2 Select **Create ► Percent of Total**.

The percentage of total measure data item appears in the list of aggregated data items with a name that is derived from the original name. For example, if the original measure data item name is **Revenue**, then the percentage of total measure data item is displayed as **Revenue (Percent of Total)**. The  icon identifies the new percentage of total measure data item on the **Data** tab.

Create a Custom Category

You can create a custom category based on either a category or measure data item. A custom category data item is always a category data item with an alphanumeric value.

When you create a custom category from a measure, you can use intervals, ranges, or specific values to group the data.

TIP The labels for your custom categories must use characters that are compatible with the locale of the data source. If the data source uses Unicode, then your labels can contain characters from any locale.

To create a custom category:

- 1 On the **Data** tab, right-click on the category or measure data item that you want to use to create the new custom category. Select **New Custom Category**. The New Custom Category window is displayed.

New Custom Category

Name:

Based on: Date by Year (MEGACORP5M)

Values

1980 2011

☒ Include missing values

1980
1981
1982
1983
1984
1985
1986
1987
1988
1989
1990
1991
1992
1993
1994

New label

Label1

Click the New label icon to get a new group label. Click the Label name to edit labels.

Drag and drop category values from the left panel to the right panel to create new groups for the new category.

Options for remaining values

☒ Group remaining values as

☐ Show as missing

OK Cancel

Note: In the New Custom Category window, **Based on** identifies the type and the name of the data item that the custom category is based on.

- 2 Select the **Values** that you want to include. Drag and drop the values onto the right pane under **New label**.

TIP To rename a custom group label, right-click the label name, and select **Edit**.

- 3 (Optional) Specify the **Options for remaining values**. You can specify a name when you select **Group remaining values as**. The default label for **Group remaining values as** is `Other`. Alternatively, you can specify **Show as missing** or **Show as is**.

Note: The **Show as is** option is available only for data items that are based on string categories. It is not available for numeric or date values.

- 4 Specify a **Name** for the new custom category. The default name is `CustomCategory1`.

5 Click **OK**. The new custom category is displayed on the **Data** tab.

Modify Data Item Properties

Rename a Data Item

To rename a data item:

- 1 Select a data item on the **Data** tab.
- 2 In the data item table, select the existing name for the data item, and then enter a new name. The name cannot be used by another data item in the same data source. Your change is saved automatically.

Alternatively, you can right-click the data item, and select **Rename Data Item**.

Modify a Data Item's Classification

You can modify a data item's classification. For example, you might want to modify a measure data item to be a category data item. A data item's classification cannot be modified if that data item is in use in the report or if the data item can have one classification only. However, duplicating the data item allows the new data item to have a different classification.

Here are some key points about modifying a data item's classification:

- You can modify a category data item to be a measure data item only if the data item started as a numeric measure. For example, if you change a measure to a category in the report, then the designer allows you to change it back to a measure. In addition, you can change a category to a measure if it was originally in the data source as a numeric column. In this case, your data administrator converted the numeric column to a character string by applying a user-defined format. As a result, you can use the designer to change the category's format to one of the standard numeric formats, and then you can change it to a measure.
- You cannot change the classification for the frequency data item or the frequency percent data item.
- You cannot change the classification for an aggregated measure.

- You cannot convert calculated data items into geography data items.

TIP For geography data items, use the pop-up menu instead of the drop-down menu to change the classification. The pop-up menu enables you to specify additional classification information for the geography data item.

To modify a data item's classification:

- 1 Select a data item on the **Data** tab.
- 2 In the data item table, select the existing classification for the data item.
- 3 Click ▼ to open the drop-down menu. Select **Measure** or **Category**. Your change is saved automatically.

Modify the Format of a Numeric Measure Data Item or a Date, Datetime, or Time Data Item

You can modify the format of a numeric measure data item or a date, datetime, or time data item. You can also modify the format of a data item with a user-defined format as long as the user-defined format is based on an underlying numeric value. For more information about user-defined formats, see [“Modify User-Defined Formats” on page 430](#).

Note: You cannot modify the format of a data item that is being used in a filter, as part of a calculated or aggregated measure, or in a custom category.

To change the format:

- 1 Select a data item on the **Data** tab.
- 2 In the data item table, select the existing format. A list is displayed with the **Format type**, **Width**, and **Decimals** (for numeric data items). Make your selections. A sample of your selection is displayed under the list.

Note: There are different format variations available for some format types for date, datetime, and time data items. Select the format variation based on the sample value displayed in the **Format** drop-down list.

Here is an example of the list for a numeric data item:

The dialog box shows the 'Format type' dropdown set to 'Reset to Default'. Below it is a list of format types: Comma, Currency, Dollar (highlighted), Euro, Float, Numeric, and Percent. At the bottom, there are input fields for 'Width' (15, range 2-32) and 'Decimals' (0, range 0-32). A 'Sample' field shows '\$56,790'. 'OK' and 'Cancel' buttons are at the bottom right.

Here is an example of the list for a date data item:

The dialog box shows the 'Format type' dropdown set to 'Reset to Default'. Below it is a list of format types: MMYYYY, Month, Month, Day, Year (highlighted), Year, Year, Quarter, YYYYMM, and YYYYMMDD. At the bottom, a 'Format' field shows 'June 25, 2011'. 'OK' and 'Cancel' buttons are at the bottom right.

Note: The **Reset to Default** option is displayed only if the format has been changed from the default.

Note: The **Reset to Default** option is available for user-defined format data items after they have been modified to a standard numeric format as long as the data item is still a category data item.

3 Click **OK** to save your changes.

Modify User-Defined Formats

In the designer, user-defined formats that are defined in the SAS LASR Analytic Server are applied to the results. You can change the format for an underlying numeric data item, but you cannot change the format for an underlying character-based data item. If

you change the format for an underlying numeric data item, you can restore the user-defined format by selecting **Reset to Default**.

The **Format** property of the data item displays the name for a user-defined format.

The  icon identifies a category data item with an active user-defined format on the **Data** tab.

Modify How a Measure Is Aggregated

You can change the aggregation method for a measure in a data source using the **Data** tab or a report object in the canvas.

Note: You need to understand your data because some aggregation methods are not always appropriate. For example, an average of an average is not valid.

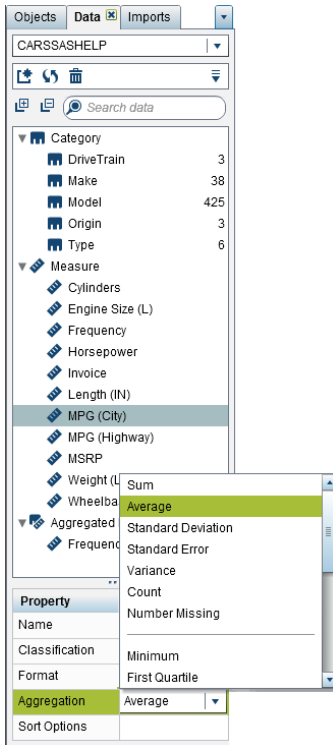

To change the aggregation method using the **Data** tab:

- 1 Select a measure data item on the **Data** tab.
- 2 In the data item table, select the existing aggregation, and then click ▼. A drop-down list is displayed with aggregations. For a list of the available aggregation types, see [Appendix 4, “Aggregations for Measures,” on page 681](#).

When you select an aggregation, your change is saved automatically.

Note: All of the report objects in the report that use this data item are affected by this change unless you have selected a local aggregation override.

Note: Depending on the aggregation, formats might be overridden when they are used in report objects. For example, skewness becomes a floating point number with four decimals.

To change the aggregation method when you are working with a report object in the canvas:

- 1 Choose one of the following:
 - For a list table, right-click on a measure header in the report object.

Product Line	Expenses	Revenue	Profit
Game			1,194,080,107
Action Figure			-19,071,493
Promotional			589,876,916
Stuffed Animal			

Replace Expenses	Sum
Remove Expenses	Average
Create and Add	Standard Deviation
Aggregation	Standard Error
Sort	Variance
Add Rank	Count
Add Link	Number Missing
Add Display Rule	Minimum
Add Alert...	First Quartile
Add Sparkline	Median
Export List Table 1 (1)	Third Quartile
Print List Table 1 (1) to PDF	Maximum
Delete List Table 1 (1)	Skewness
Duplicate List Table 1 (1)	Kurtosis
Move List Table 1 (1) to	Coefficient of Variation
Select All	Uncorrected Sum of Squares
	Corrected Sum of Squares
	T-statistic (for Average = 0)
	P-value (for T-statistic)
	• Default (Sum)

- For a crosstab, right-click on the header row with the measure. Depending on the aggregation, formats might be overridden when they are used in a crosstab.
- For a graph, right-click on the measure name hotspot. Or, you can right-click on a measure data item name on the **Roles** tab.

- 2 Select **Aggregation** ► **<aggregation-name>**, where **aggregation-name** is one of the available aggregations. For a description of the available aggregation types, see [Appendix 4, “Aggregations for Measures,” on page 681](#).

Your change is saved automatically.

Note: This is a local override for only this report object. It does not affect the default aggregation for this data item in other report objects.

Modify the Sort Options for a Category Data Item

Using the data item table on the **Data** tab, you can change the **Sort Options** for a category data item with a user-defined format that is based on an underlying numeric value. The sort options are the following:

Formatted

Uses the formatted character output of the user-defined format and sorts lexically. (For example, the names of the months in the year would sort as April, August, December, February, and so on.) Formatted is the default.

Unformatted

Uses the underlying numeric value and sorts numerically. (For example, if the underlying numeric value for January is 1, for February is 2, for March is 3, and for April is 4, then the months of the year would sort as January, February, March, April, and so on.)

Delete Data Items

You can delete data items that you have created in the designer (for example, calculated data items or duplicated data items) so that they no longer appear on the **Data** tab in the left pane.

You cannot delete a data item that is inside a hierarchy if it reduces the hierarchy to a single level. You cannot delete a data item if it is the last or only reference to a column in the original data source. You cannot delete a data item if it is used in a calculated data item, aggregated measure, a geography data item, or a custom category.

TIP You can hide a data item that you cannot delete by right-clicking on the data item name in the **Data** tab, and then selecting **Hide Data Item**. For more information, see [“Show or Hide Data Items on the Data Tab”](#) on page 410.

To delete a data item:

- 1 On the **Data** tab in the left pane, right-click the data item that you want to delete.
- 2 Select **Delete Data Item**.
- 3 Click **Delete** in the confirmation message that is displayed. The data item is removed from the list of data items, as well as from any report objects, filters, or ranks that were using it.

Working with Geography Data Items

About Geographic Data Items

A geography data item can be useful if your data contains values that are mapped to geographical locations or regions. For example, a geography data item can identify geographic information that is specific to your organization (for example, sales regions, warehouse locations, oil platforms, and so on).

If you change a numeric measure to a geography data item, then it automatically becomes a category data item.

Note: Calculated and custom data items cannot be turned into geography data items.

Use a Predefined Geography Data Item

You can use the geography data items that are available in SAS Visual Analytics or you can create custom geography data items. To access existing geography data items, select the **Data** tab in the left pane. Right-click the data item that you want to use for the

geography data item, and then select **Geography**. Then, select one of the following items:

- **Country or Region Names**
- **Country or Region ISO 2-Letter Codes**
- **Country or Region ISO Numeric Codes**
- **Country or Region SAS Map ID Values**
- **Subdivision (State, Region, Province) Names**
- **Subdivision (State, Region, Province) SAS Map ID Values**
- **US State Names**
- **US State Abbreviations**
- **US ZIP Codes**

Note: For predefined geographic roles, the values of your geography data items must match the lookup values that are used by SAS Visual Analytics. To view the lookup values, see <http://support.sas.com/va71geo>.

TIP To get geographic maps to work with any data set, add a column with the predefined codes to your data set.

Create a Custom Geography Data Item

A custom geography data item consists of three values:

- Latitude
- Longitude
- A category (other than the latitude or the longitude)

For example, suppose you have data that includes airport location identifiers, latitude, and longitude. You can convert the airport location identifiers to custom geography data items.

To create a custom geography data item:

- 1 On the **Data** tab in the left pane, right-click the data item that you want to use for the custom geography data item. Select **Geography**, and then select **Custom**. The Geography window is displayed.

TIP Make sure that the data item that you select is a category data item other than the latitude or the longitude.

- 2 Select a measure for the **Latitude**. You can also enter the first letter of the name of the latitude column to quickly search for it in the drop-down menu.
- 3 Select a measure for the **Longitude**. You can also enter the first letter of the name of the longitude column to quickly search for it in the drop-down menu.
- 4 Select a **Coordinate space** (coordinate system) that is used to project the longitude and latitude coordinate values. Your choices are **World Geodetic System (WGS84)**, **Web Mercator**, and **British National Grid (OSGB36)**. The default is **World Geodetic System (WGS84)**.

Note: The coordinate space should match the projection that your data is in. The designer supports the World Geodetic System (WGS84), Web Mercator (EPSG: 3857), and British National Grid (EPSG:27700) for data coordinate space.

- 5 Click **OK**. The  icon identifies the new geography data item on the **Data** tab.

Working with Calculated Items in Reports

About Calculated Data Items

The designer enables you to calculate new data items from your existing data items by using an expression. For example, you might want to calculate a company's profits by subtracting expenses from revenues.

In addition to performing mathematical calculations on numeric values, you can use calculated data items to create date and time values. For example, if your data contains separate categories for *month*, *day*, and *year*, then you can calculate a date value from those categories.

Note: All calculations are performed on unaggregated data. The calculation expression is evaluated for each row in the data source before aggregations are performed. To perform calculations on aggregated data, see [“Add a New Aggregated Measure to a Report” on page 443](#).

Calculated data items can accept parameters. For more information, see [Chapter 40, “Working with Parameters in Reports,” on page 543](#).

A hierarchy can contain calculated data items as long as they are categories.

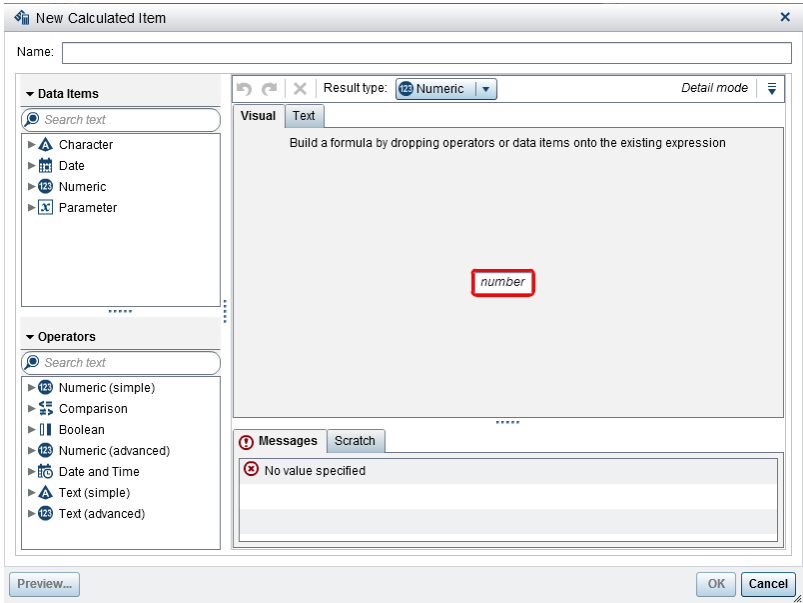

Using the designer, you can work with calculated data items or aggregated measures.

For information about deleting calculated data items, see [“Delete Data Items” on page 434](#).

Add a New Calculated Data Item to a Report

To add a new calculated data item:

- 1 On the **Data** tab, click , and then select **New Calculated Item**. The New Calculated Item window is displayed.

- 2 Enter a **Name**.
- 3 Select a **Result type** from the drop-down list. **Numeric** is the default data type. The following table lists the available result types:

Icon	Result Type
	Character
	Date
	Datetime
	Numeric
	Time

Calculated data items in the designer always default to the following formats, which are based on the data type:

- Date: DATE9

- Datetime: DATETIME10
- Time: TIME8
- Numeric: COMMA12.2

After you create the new calculated data item, you can change its format using the data item table on the **Data** tab unless it is a character calculated data item. You cannot specify a format for a character calculated data item.

Sum is the default aggregation for new numeric calculated data items in the designer. You can change the aggregation for numeric calculated data items using the data item table on the **Data** tab.

- 4 (Optional) Click  beside **Detail mode** to clear the **Show all drop zones** option. You can also select **Show display text**, which adds a new tab between the **Messages** and **Scratch** tabs.
- 5 Use the **Visual** tab to build the expression for your calculated data item by dragging **Data Items** and **Operators** onto the expression in the right pane. For each rectangular field in the expression, you can insert a data item, an operator, or a specific value.

When you drag and drop data items or operators onto your expression, the precise location of the cursor determines where and how the new element is added to the expression. As you drag the new element over the expression, a preview appears that displays how the expression changes if you drop the element at that location.

For example, if your current expression is `(Profit / Revenue)`, and you drag and drop the **x - y (subtract)** operator inside the open parenthesis symbol, then the expression changes to `([number] - (Profit / Revenue))`. If you drag and drop the operator over the division symbol, then the expression changes to `(Profit - Revenue)`, and so on.

Alternatively, you can use the **Text** tab to enter the expression.

You can use the **Scratch** tab to build temporary expressions.

There are a large number of operator types available to perform mathematical functions, process datetime values, handle text, and evaluate logical processing

such as IF clauses. For more information, see [Appendix 5, “Operators for Data Expressions,”](#) on page 685.

- 6 (Optional) Click **Preview** to preview the results of the calculation. The Preview Results window is displayed. Click **Close** to return to the New Calculated Item window.
- 7 Click **OK**. The new calculated data item appears on the **Data** tab. The , , or  icon identifies the new calculated data item on the **Data** tab.

Note: The  icon is displayed if you change a calculated numeric measure to a category data item. It is also displayed for a character calculated data item (which is always a category).

Preview the Expression for a Calculated Data Item

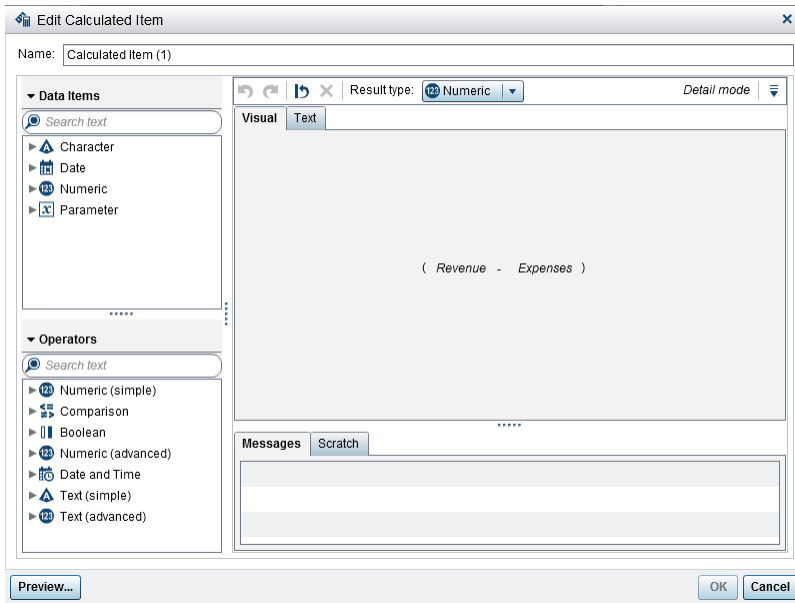

For calculated data items only, you can preview the results of your expression by clicking **Preview**.

You can preview the results of a subset of your expression by right-clicking a part of your expression, and then selecting **Preview Subexpression Results**.

Edit a Calculated Data Item

To edit a calculated data item:

- 1 Right-click on a calculated data item on the **Data** tab, and select **Edit Calculated Item**. The Edit Calculated Item window is displayed.

- 2 Modify the **Data Items** and **Operators** for the calculated data item as needed. For information about the operators that are available, see [Appendix 5, “Operators for Data Expressions,”](#) on page 685.

Note: If the calculated data item has not been used in a report, then you can modify the **Result type**.

- 3 Click **OK**.

You can duplicate, rename, hide, and delete calculated data items using the same steps as any other data item. If a calculated data item is used inside another calculated data item, then it cannot be removed.

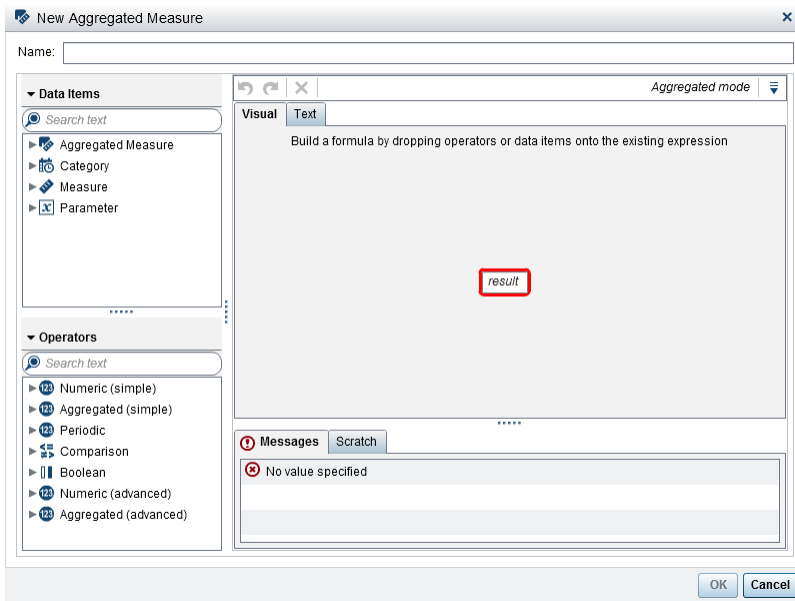

TIP You can cut and paste from the **Text** area between different reports as well as between the explorer and the designer to transfer calculations or to e-mail them to others. For more information, see [“Editing a Data Expression in Text Mode”](#) on page 677.

Add a New Aggregated Measure to a Report

Aggregated measures enable you to calculate new data items by using aggregated values. For example, you might want to calculate a company's profit margin by region by taking the aggregated sum of the profit for all of the stores in a region group and dividing it by the aggregated sum of the revenue for all of the stores in that same region group. Aggregations are evaluated as part of a calculated expression.

To add an aggregated measure:

- 1 On the **Data** tab, click , and then select **New Aggregated Measure**. The New Aggregated Measure window is displayed.

- 2 Enter a **Name**.
- 3 (Optional) Click  to **Show all drop zones**. You can also choose to **Show scratch area** to build temporary expressions.
- 4 Use the **Visual** tab to build the expression for your aggregated measure by dragging and dropping **Data Items** and **Operators** onto the expression in the right pane. For

each field in the expression, you can insert a data item, an operator, or a specific value.

When you drag and drop data items and operators onto the expression, the precise location of the cursor determines where and how the data item or operator is added to the expression. As you drag the new element over the expression, a preview appears, which displays how the expression would change if you drop the element at the current location.

Alternatively, you can use the **Text** tab to enter the expression.

There are a large number of operator types available to perform mathematical functions and evaluate logical processing such as IF clauses. For more information, see [Appendix 5, “Operators for Data Expressions,” on page 685](#).

- 5 For each data item in your expression, select an aggregation type. By default, **Sum** is used for measures and **Distinct** is used for categories. To select a new aggregation type, drag and drop an aggregated operator from the **Operators** list onto the aggregation type in the expression. See [Appendix 5, “Operators for Data Expressions,” on page 685](#) for a list of the aggregated operators that are available.
- 6 For each aggregation in your expression, select the aggregation context. A drop-down list beside each aggregation enables you to select one of the following context values:

ByGroup

calculates the aggregation for each subset of the data item that is used in a visualization. For example, in a bar chart, an aggregated measure with the **ByGroup** context calculates a separate aggregated value for each bar in the chart.

ForAll

calculates the aggregation for the entire data item (after filtering). For example, in a bar chart, an aggregated measure with the **ForAll** context uses the same aggregated value (calculated for the entire data item) for each bar in the chart.

By using the **ForAll** and **ByGroup** contexts together, you can create measures that compare the local value to the global value. For example, you might calculate the difference from mean by using an expression such as the following:

`Avg ByGroup(X) - Avg ForAll(X)`

For more information, see [“Periodic Operators” on page 698](#).

- 7 Click **OK**. The new aggregated measure appears on the **Data** tab. The  icon identifies the new aggregated measure.

Edit an Aggregated Measure

To edit an aggregated measure:

- 1 Right-click on an aggregated measure on the **Data** tab, and select **Edit Aggregated Measure**. The Edit Aggregated Measure window is displayed.
- 2 Modify the **Data Items** and **Operators** for the aggregated measure as needed. For information about the operators that are available, see [Appendix 5, “Operators for Data Expressions,” on page 685](#).
- 3 Click **OK**.

You can duplicate, rename, hide, and delete aggregated measures using the same steps as any other data item.

TIP You can cut and paste from the **Text** area between different reports, as well as between the explorer and the designer, to transfer calculations or to e-mail them to others. For more information, see [“Editing a Data Expression in Text Mode” on page 677](#).

Working with Data Role Assignments

After you have selected a report object and a data source, the **Roles** tab in the right pane shows which data items have been assigned to which roles.

Modify Data Role Assignments in Report Objects

Note: You cannot change data role assignments for any report object that is imported from the explorer and uses on-demand data.

To modify data role assignments:

- 1 Select a report object in the canvas that has one or more data items assigned.
- 2 Click the **Roles** tab in the right pane.
- 3 Click ▼ beside the role that you want to edit. For data roles that allow multiple data items, the menu items that are available can vary.

If you select a data item in **Roles**, then the **Aggregation** (if appropriate), **Add**, **Remove**, and **Replace** menu items are displayed. You can also right-click on a data item and the actions specific to that data item are displayed.

Different data roles are available for different report objects.

In addition to the basic data roles, you can assign additional data roles. Here is a list of all the data roles available for each report object:

Report Object	Basic Data Roles	Additional Data Roles
Tables		
List table	Columns	None
Crosstab	<div><div></div> Columns</div> <div><div></div> Rows</div>	Measures
Graphs		

Report Object	Basic Data Roles	Additional Data Roles
Bar chart	<ul style="list-style-type: none"> ■ Category ■ Measures 	<ul style="list-style-type: none"> ■ Group ■ Lattice columns ■ Lattice rows ■ Data tip values ■ Animation

Word cloud	Word Size Color	None

* This report object is not displayed by default in the designer.

Here are definitions for some of the additional data roles:

Animation

animates the date category that you assign. You can specify a **Loop** for the animation, and you can specify the **Speed** of the animation. For more information, see [“Add Animation to Charts, Bubble Plots, and Geo Bubble Maps” on page 453](#).

Note: For a bubble plot only, you must assign the **Group** role to enable the **Animation** role. If you remove the **Group** role after assigning animation, the animation control is disabled.

Data tip values

enables you to add more measures to your data tips.

Note: For pie charts, the Other slice does not show the additional information.

Group

groups the data based on the category data item that you assign.

Lattice columns

creates a lattice of charts with a column for each value of the category data item that you assign.

Lattice rows

creates a lattice of charts with a row for each value of the category data item that you assign.

Add Animation to Charts, Bubble Plots, and Geo Bubble Maps

An animated bubble plot displays the changes in your data values over time. Each frame of the animation represents a value of the datetime data item that is assigned to the **Animation** data role.

For example, if you assign a category with the **Year** format to the **Animation** data role, then each frame of the animation displays a bubble plot of your data for a specific year.

Starting in the 7.1 release, you can select bubbles, bars, pie slices, and lines in an animated graph. The interaction filter is based on the category value (or values) and the selected frame in the animation. When a bubble, bar, pie slice, or line is selected, its row lists all of the category and date values of the selection. For example, the resulting filter that is applied to any downstream interactions could be filtered by `car="Toyota"` and `year="2014"`.

If you select a bubble for one frame in the animation and click ►, then any downstream interactions play with the animation. This means that as the animation is running, the interaction targets are filtered with each frame in the animation.

TIP To improve animation performance, use a color for the graph's reference line instead of a pattern.

TIP When you add animation to a pie chart, it is recommended that you sort the Category in ascending or descending order. To sort, right-click on a category name in the pie chart, and select **Sort**. Then, select either **Ascending** or **Descending**.

To add animation:

- 1 Select an existing chart, bubble plot, or geo bubble map, or create a new one.
- 2 Add the required roles:
 - For a bubble plot, on the **Role** tab, assign a data item to the **Group** data role.

Note: If you remove the **Group** data role after assigning animation, the animation control is disabled.

- For a bar chart or geo bubble map, on the **Role** tab, assign the other required roles.
- 3** Assign a data item with a datetime format to the **Animation** data role.

When an animated bubble plot is displayed, a set of animation controls appears at the bottom of the report object.

Table 34.2 Animation Controls

Task	Action
Start the animation.	Click ►.
Go to the previous animation frame.	Click ◀.
Go to the next animation frame.	Click ▶.
Jump to a specific animation frame.	Use the slider.
Specify whether to repeat the animation.	Select or deselect Loop .
Select the animation speed.	Use the Speed slider.
Track the movement of a specific bubble.	Click the bubble that you want to track.

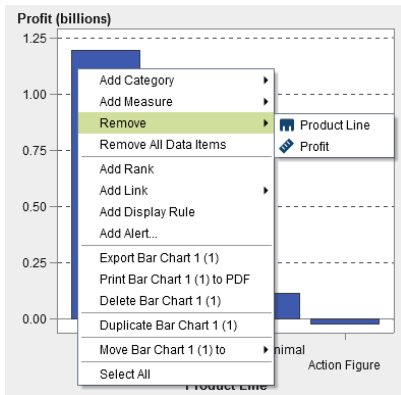

Note: If you select a bubble to track, the selected bubble is highlighted in the current animation frame.

Remove Data Role Assignments from Report Objects

To remove data items from their assigned data roles in a specific report object:

- 1** Right-click the report object in the canvas. A menu is displayed.

Here is an example of a bar chart with the object menu:

- 2 Select **Remove All Data Items**. All data items are removed from the assigned data roles as well as the data-dependent features like filters, ranks, conditions, and so on. The report object turns gray, and the  status icon appears in the lower right corner to let you know that the required data roles are not assigned.

Here is an example of what a bar chart looks like after all the data items have been removed from their assigned data roles:

Sorting Data in Reports

How Sorting Can Help with Analysis

Information can be easier to understand when it appears in an intentional order. Applying a sort order to one or more data items in the designer enables you to arrange rows and columns in tables and axis labels on charts in some order, such as alphabetically or highest to lowest numerically. Interactively changing the order of data can provide you with a different perspective that often facilitates valuable insight. For example, in a report, sales employees who are initially arranged alphabetically can be re-sorted by sales amount.

You can create a custom sort so that data items in a table or graph can sort to the top or to the bottom. For more information, see [“Using a Custom Sort” on page 459](#).

Ranking can help reduce the amount of visible data and is often used in combination with sorting. For more information, see [“Add a New Rank” on page 538](#).

Sort Data in a List Table

To sort values in a list table, right-click on a column heading, and select **Sort**. Then, select either **Ascending** or **Descending**.

Display 34.1 Sort Menu Items for List Tables

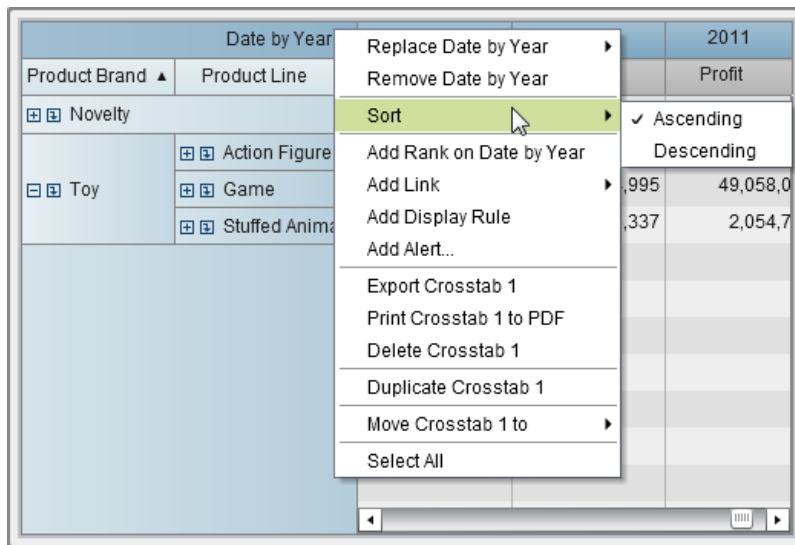

Product Line	Product	Revenue	Expenses ▲	Profit
Promotional		5,221,934		98,696,012
Stuffed Animal		10,045,899		29,551,130
Stuffed Animal				29,154,175
Stuffed Animal				29,032,586
Stuffed Animal		10,104,329		29,408,283
Stuffed Animal		10,149,757		29,644,048
Stuffed Animal		10,164,874		29,749,196
Stuffed Animal		10,195,261		29,627,124
Promotional		12,359,151		99,358,356
Promotional		13,900,367		142,075,951
Action Figure		21,939,853		15,425,882
Action Figure		22,046,588		15,008,274
Action Figure		22,201,224		15,199,534

Note: You can also press the spacebar to sort a single column in a table.

TIP Use the Ctrl key to select and sort multiple columns.

Sort Data in a Crosstab

To sort by category or measure values in a crosstab, right-click on a column or row heading, and select **Sort**. Then, select either **Ascending** or **Descending**.

Display 34.2 Sort Menu Items for a Crosstab

You can also sort categories, rather than measures, by clicking the category name.

Sort Data in a Graph

To sort by values in a graph, right-click on a measure name or category name, and select **Sort**. Then, select either **Ascending** or **Descending**.

Here are some key points about sorting data in a graph:

- Sorting in a pie chart is based on the measure. If you do not use a measure, then sorting is based on the frequency (and automatically applied).
- Only the Category role in a schedule chart can be sorted.

Display 34.3 Sort Menu Items for a Graph

Using a Custom Sort

Add a Custom Sort

You can create a custom sort so that data items in a table or graph can sort to the top or to the bottom. Category data items, calculated items that are categories, and custom categories support custom sorts. You can select up to 25 data items for a custom sort. For example, suppose that your company has manufacturing facilities in multiple cities across the country. You can use a custom sort to make sure that certain cities are always sorted before or after other cities in a list table.

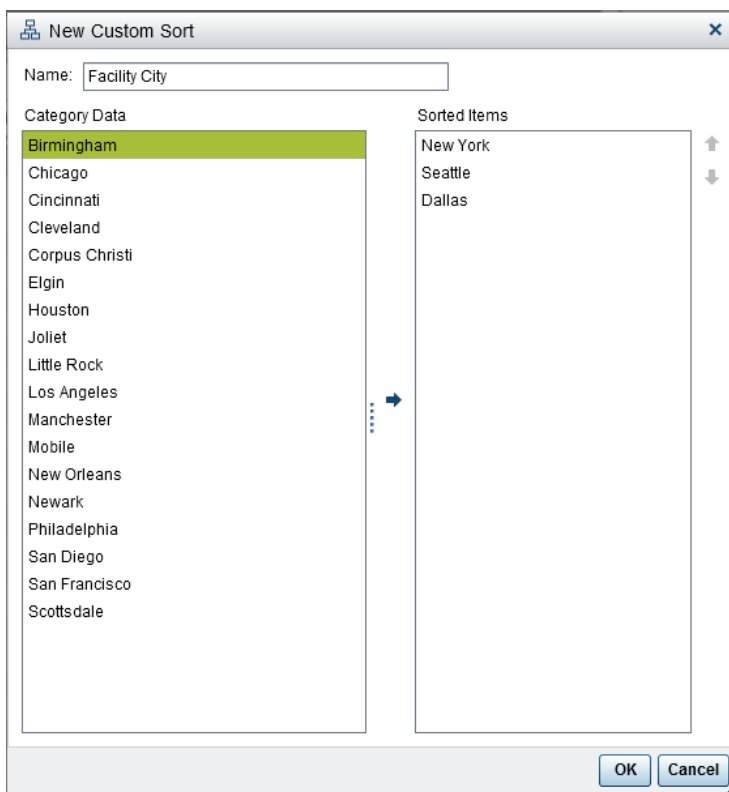

Here are some key points for custom sorting:

- For graphs, a custom sort works only if the data item containing the custom sort is on the X axis, Y axis, or the outermost lattice role.
- For graphs, a custom sort does not work if the data item is assigned to one of the legend data roles (either **Color** or **Group**). The same restriction applies when sorting on the raw values of a data item that has a user-defined format.

- Because user-defined formats have their own sort order, a custom sort works only on the X axis (the Category role).
- A custom sort takes precedence over both formatted and unformatted user-defined formats.

To create a custom sort:

- 1 On the **Data** tab, select a category data item. Right-click, and select **New Custom Sort**. The New Custom Sort window is displayed.
- 2 Select the category data items that you want to sort. Click ➡ to move the data items to the **Sorted Items** list. You can also drag and drop data items in the New Custom Sort window. Use the Ctrl key to select multiple data items.

- 3 (Optional) Use the up and down arrows to arrange the data items in the **Sorted Items** list.

- 4 Click **OK**.

Edit a Custom Sort

To edit a custom sort:

- 1 On the **Data** tab, select a category data item, calculated item that is a category, or a custom category. Right-click, and select **Edit Custom Sort**. The Edit Custom Sort window is displayed.
- 2 Modify the **Sorted Items** list.
- 3 Click **OK**.

Delete a Custom Sort

You can delete a custom sort on the **Data** tab. Select the category data item with a custom sort. Right-click, and select **Delete Custom Sort**. Click **Delete** in the confirmation message that is displayed.

When you delete a custom sort, the data item is sorted on the data.

Cancel a Slow-Running Query for a Report Object

To cancel slow-running queries for a report object, position your mouse over the progress indicator for the report object, and click the icon.

Here is an example of the progress indicator for a list table with a slow-running query:

Display 34.4 The Progress Indicator for List Table with a Slow-Running Query

The screenshot shows the SAS Visual Analytics Designer interface. On the left, a list table titled 'List Table 1' is displayed with columns 'Date by Month', 'Facility City', and 'Expenses'. The table contains 20 rows of data. On the right, the 'Properties' pane is visible, showing settings for 'List Table 1', including 'Date by Month' and 'Add Rank'. At the bottom of the list table, a progress indicator is shown, consisting of a circular arrow icon and the text 'Updating. Click the icon to cancel the query.' This progress indicator is circled in red.

Date by Month	Facility City	Expenses
Mar2008	Los Angeles	15,592
May2008	Los Angeles	18,574
Sep2008	Los Angeles	17,292
Nov2008	Los Angeles	18,731
Jun2009	Los Angeles	18,141
Feb2008	Los Angeles	24,154
Jun2008	Los Angeles	25,494
Aug2008	Los Angeles	23,682
Oct2008	Los Angeles	24,853
Jan2009	Los Angeles	25,747
Sep2009	Los Angeles	25,747
Jul2008	Los Angeles	27,992
Mar2010	Los Angeles	24,526
Apr2008	Los Angeles	31,623
Dec2008	Los Angeles	32,988
Oct2009	Los Angeles	38,812
Sep2010	Los Angeles	37,624
Apr2009	Los Angeles	32,785
May2009	Los Angeles	34,302
Jan2008	Los Angeles	178,284
Mar2009	Los Angeles	42,741
Dec2009	Los Angeles	39,065
Jan2010	Los Angeles	75,384

After you cancel the query, the progress indicator is replaced by the refresh icon. To resume a query that you canceled, click .

Overview of Display Rules

Display rules include all types of highlighting of report objects. They provide a flexible structure to specify conditions. There are several types of display rules. Display rules enable conditions to be shared across objects, but not all display rules apply across all report object types.

SAS Visual Analytics Designer (the designer) provides the following interfaces for display rules:

- The **Display Rules** tab in the right pane enables you to populate intervals, add intervals, or add color-mapped values for the report object that is currently selected in the canvas. You can use this pane to specify both report-level or object-level display rules, depending on what you have selected in the canvas.
- The **Shared Rules** tab in the left pane enables you to create a new display rule for a gauge, which is used by other gauges to designate intervals and colors for ranges. You can edit or delete an existing shared display rule. These rules are shared across multiple gauges and can be created at any time.

TIP The **Shared Rules** tab is not displayed by default. To display the tab, click ▼ after the last tab name, and select **Shared Rules**.

Display rules can accept parameters. For more information, see [Chapter 40, “Working with Parameters in Reports,” on page 543](#).

For list tables and graphs, you can create display rules that reference a measure that is not included in the currently displayed report object. This feature is not available for crosstabs.

Here are some key points about color-mapped display rules:

- Color-mapped display rules are not allowed if there are multiple overlays.
- Color-mapped values for a report object can be applied only to category data items.

The following report objects that are imported from SAS Visual Analytics Explorer (the explorer) or created in SAS Visual Analytics Graph Builder (the graph builder) do not support display rules:

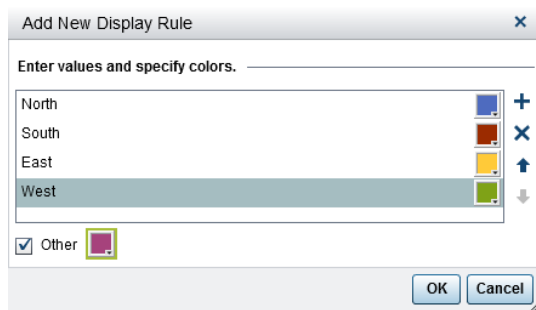

- heat maps (which are imported from the explorer)
- band plots (which are created in the graph builder)
- step plots (which are created in the graph builder)

Add Report-Level Display Rules

To add a report-level display rule:

- 1 Without any report objects or the section selected in the canvas, click the **Display Rules** tab in the right pane. Click **New**. The Add New Display Rule window is displayed.
- 2 Enter a value for the display rule in the field.
- 3 Select a color for the display rule.
- 4 (Optional) Repeat the steps for entering a value and selecting a color.
- 5 (Optional) Select the **Other** check box. Then, select a color so that any of the other categories that do not have a color will have the one that you just selected.

In the following example, values and colors have been specified for each region in a list table. And, a color has been selected for the **Other** check box.

- 6 Click **OK**. The report objects in the report update with the new display rule. And, the display rule appears on the **Display Rules** tab in the right pane.

The following table illustrates the report-level display rules that were defined in the Add New Display Rule window above.

Facility Region	Product Line	Profit	Expenses	
East	Action Figure	-10,515,368	29,014,382	
East	Game	5,328,719	1,900,170	
East	Promotional	81,456,122	45,807,236	
East	Stuffed Animal	1,544,003	8,284,070	
North	Action Figure	-21,211,851	60,883,053	
North	Game	220,653,512	110,853,384	
North	Stuffed Animal	16,039,542	56,849,706	
South	Action Figure	9,202,487	165,466,767	
South	Game	607,956,582	241,557,659	
South	Stuffed Animal	51,908,425	39,659,003	
West	Action Figure	3,453,239	26,026,052	
West	Game	360,141,294	123,498,715	

Adding Table-Level Display Rules

You can add three different types of display rules to tables. You cannot create a display rule to highlight dates in a table.

Add Display Rules to a List Table Using an Expression

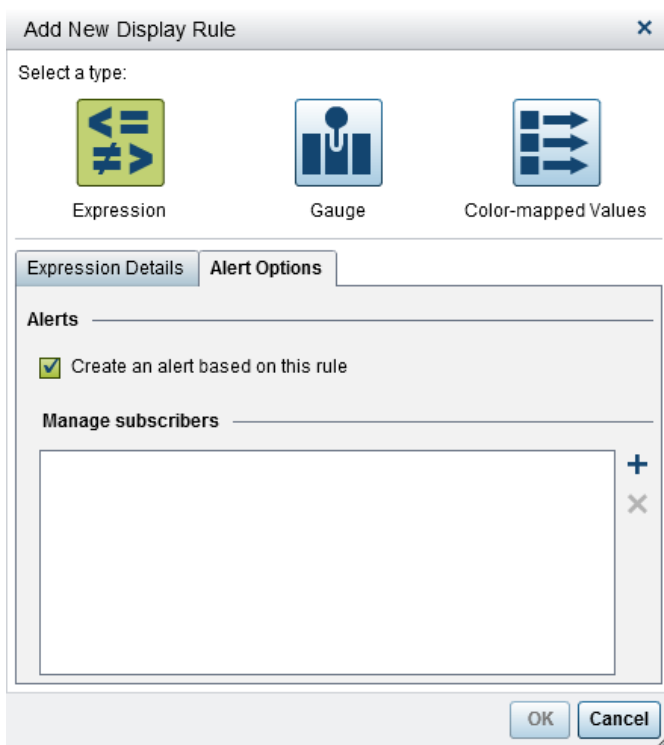

To specify a new display rule for a table using an expression:

- 1 If it is not already selected, select the table in the canvas that you want to update.
- 2 In the right pane, click the **Display Rules** tab. Click **New**. The Add New Display Rule window is displayed.
- 3 Click **Expression**. The Add New Display Rule window expands to show the details for the expression.

The screenshot shows the 'Add New Display Rule' dialog box with the 'Expression' tab selected. The 'Specify the details for your expression' section contains three dropdown menus: 'Column' (set to 'Expenses'), 'Operator' (set to '>'), and 'Value' (set to '0'). The 'Specify styles and where they apply' section contains a 'Style' dropdown (set to 'Arial'), a font size dropdown (set to '12'), and a 'Applies to' dropdown (set to 'Expenses'). There are 'OK' and 'Cancel' buttons at the bottom right.

- 4 On the **Expression Details** tab, select the **Column** or any measure value.
- 5 Select the **Operator**. You can select =, <, >, **BetweenInclusive**, <=, >=, **Missing**, or **NotMissing**. The default is >.
- 6 Enter or select a **Value**.

- 7 Modify the style, size, and color of the font. There is no default style for list table display rules. You must specify a style to enable the **OK** button in the Add New Display Rule window.
- 8 Select the row or column in the **Applies to** drop-down list.
- 9 (Optional) On the **Alert Options** tab, select the **Create an alert based on this rule** check box. For more information about alerts, see [“Working with Alerts for Report Objects” on page 399](#).

- a Click **+** beside the **Manage subscribers** list to add users who you want notified when the alert condition is met. The Add Recipients window is displayed.
- b Select one or more users. Click **OK** to return to the Add New Display Rule window.

Note: A user’s e-mail address must be stored in metadata to be displayed on the **View All** tab in the Add Recipients window.

- 10** Click **OK**. The table updates with the new display rule. The display rule appears on the **Display Rules** tab in the right pane.

Here is an example of a display rule that uses an expression:

- 11** (Optional) Click  on the **Display Rules** tab to edit the new display rule.

Add Display Rules to a List Table Using a Gauge

To specify a new display rule for a table using a gauge:

- 1** If it is not already selected, select the table in the canvas that you want to update.
- 2** In the right pane, click the **Display Rules** tab. Click **New**. The Add New Display Rule window is displayed.
- 3** Click **Gauge**. The Add New Display Rule window expands to show the details for the gauge.

Add New Display Rule

Select a type:

Expression Gauge Color-mapped Values

Select a gauge type, a column, and the cell placement.

Gauge type: Icon

Based on column: Expenses

Cell placement: Left of text

Define intervals and specify colors.

Add an interval + ⊕

1	<input type="text" value="Value"/>	\geq	$<$	<input type="text" value="Value"/>	Red	🗑️
2		\geq	$<$	<input type="text" value="Value"/>	Yellow	🗑️
3		\geq	\leq	<input type="text" value="Value"/>	Green	🗑️

Specify the column in which the gauge appears.

Column: Expenses

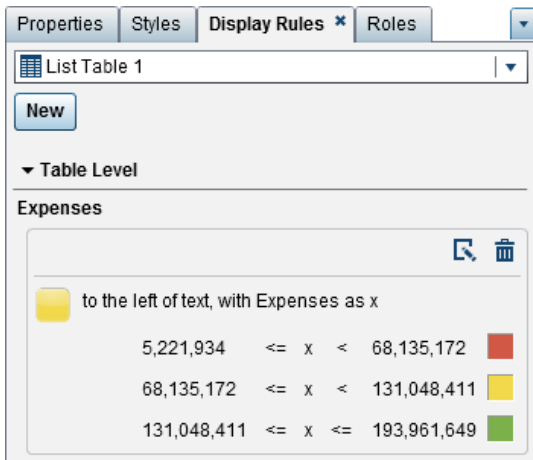

OK Cancel

- 4 Select a **Gauge type** from the drop-down list. Your choices are a bullet, an icon, a slider, or a thermometer. **Icon** is the default.
- 5 Using the **Based on column** drop-down list, specify which column the rule should be based on in the report.
- 6 Specify where the gauge should appear in the column for the **Cell placement**. Your choices are **Left of text**, **Right of text**, or **Replace text**.
- 7 Define the intervals and colors for the rule:
 - Enter the individual values for the intervals and then select a color. You can click the operator between the intervals to change it.
 - Click ⊕ to automatically populate the intervals. The Populate Intervals window is displayed.

You can specify **Number of intervals**, **Lower bounds**, and **Upper bounds**. Click **OK**.

- 8 Specify the **Column** in which you want the gauge to be displayed
- 9 Click **OK**. The table updates with the new display rule. The display rule appears on the **Display Rules** tab in the right pane.

Here is an example of an automatically populated display rule that uses an icon:

Here is a list table with the display rules applied:

Product Li...	Product	Revenue	Expenses	Profit
Action Figure	Firefighter	37,830,429	22,383,218	15,447,211
Action Figure	Athlete	37,607,425	22,282,489	15,324,936
Action Figure	Super Hero	37,593,488	22,228,489	15,364,999
Action Figure	Musician	37,400,758	22,201,224	15,199,534
Action Figure	Soldier	37,054,862	22,046,588	15,008,274
Action Figure	.	0	126,051,9...	-126,051,937
Action Figure	Police	37,365,735	21,939,853	15,425,882
Action Figure	Movie Star	37,466,062	22,256,456	15,209,606
Game	Puzzle	472,511,801	117,465,4...	355,046,378
Game	Card	396,722,440	67,173,845	329,548,595
Game	Board	802,655,795	193,961,6...	608,694,146
Game	.	0	99,209,012	-99,209,012
Promotional	Coffee Cup	111,717,507	12,359,151	99,358,356
Promotional	Backpack	278,485,882	113,686,2...	164,799,628

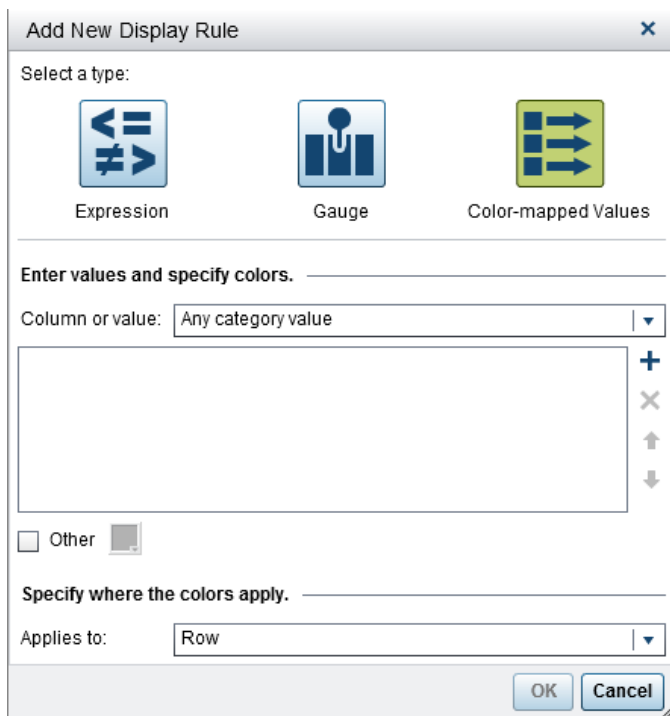

Note: If a value falls outside the bounds of the display rule intervals, no icon is displayed in the list table

10 (Optional) Click  on the **Display Rules** tab to edit the new display rule.

Add Display Rules to a List Table Using Color-Mapped Values

To specify a new display rule for a list table using color-mapped values:

- 1** If it is not already selected, select the list table in the canvas that you want to update.
- 2** In the right pane, click the **Display Rules** tab. Click **New**. The Add New Display Rule window is displayed.
- 3** Click **Color-mapped Values**. The Add New Display Rule window expands to show the details for the color-mapped values.

Add New Display Rule

Select a type:

Expression Gauge Color-mapped Values

Enter values and specify colors.

Column or value: Any category value

Other

Specify where the colors apply.

Applies to: Row

OK Cancel

- 4 Select the **Column or value** to which you want to apply the display rule.

Note: Color-mapped values for a report object can be applied only to category data items.

- 5 Click in the box to enter a value for the display rule.
- 6 Select a color for the display rule.
- 7 (Optional) Repeat the steps for entering a value and selecting a color.
- 8 (Optional) Select the **Other** check box. Then, select a color.
- 9 Using the list, specify where you want to apply the colors.

In the following example, values and colors have been specified for products in a list table.

Add New Display Rule

Select a type:

Expression Gauge **Color-mapped Values**

Enter values and specify colors.

Column or value: Any category value

Athlete		+
Movie Star		x
Super Hero		↑
		↓

☐ Other

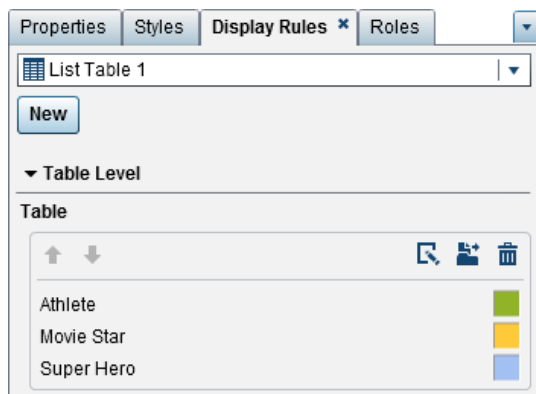

Specify where the colors apply.

Applies to: Row

OK Cancel

- 10 Click **OK**. The table updates with the display rules.

The display rule appears on the **Display Rules** tab in the right pane.

- 11 (Optional) Click  on the **Display Rules** tab to change the table-level display rule to a report-level display rule.

Adding Display Rules to a Crosstab

To specify a new display rule for a crosstab using an expression:

- 1 If it is not already selected, select the crosstab in the canvas that you want to update.
- 2 In the right pane, click the **Display Rules** tab. Click **New**. The Add New Display Rule window is displayed.

The screenshot shows the 'Add New Display Rule' dialog box with the 'Expression Details' tab selected. The 'Specify the details for your expression' section contains three dropdown menus: 'Column' set to 'Expenses', 'Operator' set to '>', and 'Value' set to '0'. Below these is a 'Specify Intersections...' button. The 'Specify styles and where they apply' section shows 'Style' set to 'Arial', '12' font size, and 'Applies to' set to 'Expenses'. There are also buttons for bold, italic, underline, and text color. At the bottom are 'OK' and 'Cancel' buttons.

- 3 On the **Expression Details** tab, select the **Column** or any measure value.
- 4 Select the **Operator**. You can select =, < >, **BetweenInclusive**, <, <=, >, >=, **Missing**, or **NotMissing**. The default is >.
- 5 Enter or select a **Value**.
- 6 If your crosstab contains a hierarchy, then you can specify the hierarchy levels in which the display rule is applied.
 - a Click **Specify Intersections**. The **Specify Intersections** window is displayed.

- b** Select one or more hierarchy levels, the grand total, or all of the levels. Click **OK** to return to the Add New Display Rule window. The intersections that you selected are displayed above the **Edit Intersections** button.
- 7** Modify the style, size, and color of the font.
- 8** Select the row or column in the **Applies to** drop-down list. For crosstabs, the **Applies to** drop-down list displays only the measures that have been added to the crosstab. There are no row or column options.
- 9** (Optional) On the **Alert Options** tab, select the **Create an alert based on this rule** check box. For more information about alerts, see [“Working with Alerts for Report Objects” on page 399](#).
 - a** Click **+** beside the **Manage subscribers** list to add users who you want notified when the alert condition is met. The Add Recipients window is displayed.
 - b** Select one or more users. Click **OK** to return to the Add New Display Rule window.

Note: A user’s e-mail address must be stored in metadata to be displayed on the **View All** tab in the Add Recipients window.

- 10 Click **OK**. The crosstab updates with the new display rule. The display rule appears on the **Display Rules** tab in the right pane.
- 11 (Optional) Click  on the **Display Rules** tab to edit the new display rule.

Adding Graph-Level Display Rules

You can add display rules to graphs. Note that you cannot create a display rule to highlight dates in a graph.

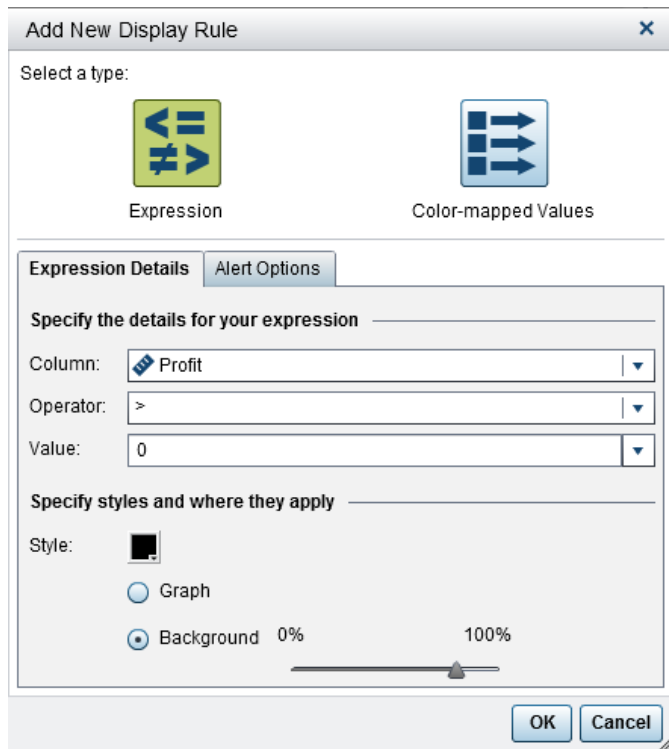

Add Display Rules to a Graph Using an Expression

Here are some key points about adding an expression-based display rules to a graph:

- Display rules can be added to a waterfall chart only if the **Color by response sign** check box is selected on the **Properties** tab in the right pane.
- You can create an expression-based display rule for a 100% stacked bar chart, which uses the **Grouping style** and **Grouping scale** properties. However, the display rule cannot be based on a percentage.

To specify a new expression-based display rule for a graph:

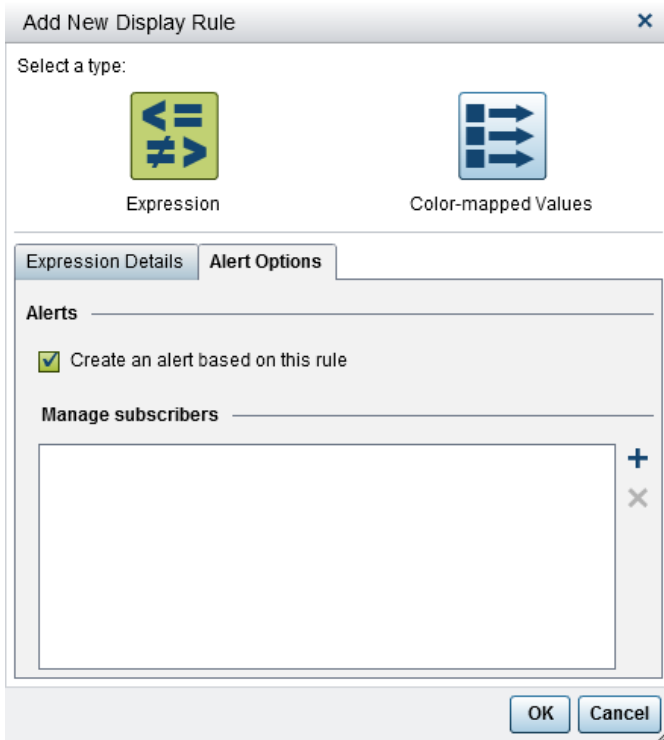

- 1 If it is not already selected, select the graph in the canvas that you want to update.
- 2 In the right pane, click the **Display Rules** tab. Click **New**. The Add New Display Rule window is displayed.
- 3 Click **Expression**. The Add New Display Rule window expands to show the details for the expression.

- 4 On the **Expression Details** tab, select the **Column** or any measure value.
- 5 Select the **Operator**. You can select =, < >, **BetweenInclusive**, <, <=, >, >=, **Missing**, or **NotMissing**. The default is >.
- 6 Enter or select a **Value**.
- 7 If your graph contains a hierarchy, then you can specify the hierarchy levels in which the display rule is applied.
 - a Click **Specify Intersections**. The **Specify Intersections** window is displayed.
 - b Select one or more hierarchy levels. Click **OK** to return to the Add New Display Rule window. The intersections that you selected are displayed above the **Edit Intersections** button.
- 8 Modify the **Style**, which includes color and graph or background.

Note: **Background** is available only for bar charts, waterfall charts, line charts, scatter plots, time series plots, and bubble plots. It is also available for needle plots, which are created in the SAS Visual Analytics Graph Builder (the graph builder).

- 9 (Optional) On the **Alert Options** tab, select the **Create an alert based on this rule** check box. For more information about alerts, see [“Working with Alerts for Report Objects” on page 399](#).

Use the **Manage subscribers** list to add users who you want notified when the alert condition is met.

- 10 Click **OK**. The graph updates with the new display rule. The display rule appears on the **Display Rules** tab in the right pane.

Here is an example of a display rule that uses an expression:

11 (Optional) Click  on the **Display Rules** tab to edit the new display rule.

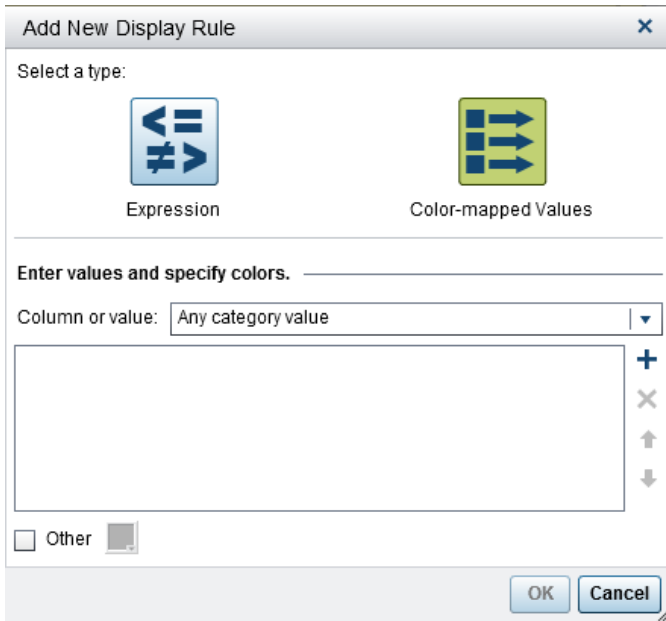

Note: A warning badge is displayed on a graph when the color is overloaded. This happens when multiple measures are assigned, a color or group role is assigned, or multiple overlays are present (which have cycling colors).

Add Display Rules to a Graph Using Color-Mapped Values

Note: Display rules can be added to a waterfall chart only if the **Color by response sign** check box is selected on the **Properties** tab in the right pane.

To specify a new display rule for a graph using color-mapped values:

- 1** If it is not already selected, select the graph in the canvas that you want to update.
- 2** In the right pane, click the **Display Rules** tab. Click **New**. The Add New Display Rule window is displayed.
- 3** Click **Color-mapped Values**. The Add New Display Rule window expands to show the details for the color-mapped values.

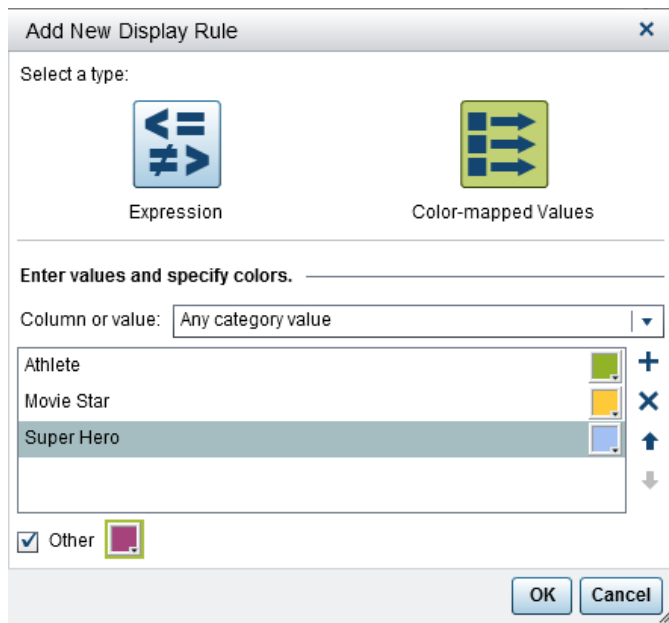

- 4** Select the **Column or value** to which you want to apply the display rule.

Note: Color-mapped values for a report object can be applied only to category data items.

- 5** Click in the box to enter a value for the display rule.
- 6** Select a color for the display rule.
- 7** (Optional) Repeat the steps for entering a value and selecting a color.
- 8** (Optional) Select the **Other** check box. Then, select a color.
- 9** Using the list, specify where you want to apply the colors.

In the following example, values and colors have been specified for products in a graph.

10 Click **OK**. The graph updates with the display rules.

The display rule appears on the **Display Rules** tab in the right pane.

11 (Optional) Click  on the **Display Rules** tab to change the graph-level display rule to a report-level display rule.

Adding Gauge-Level Display Rules

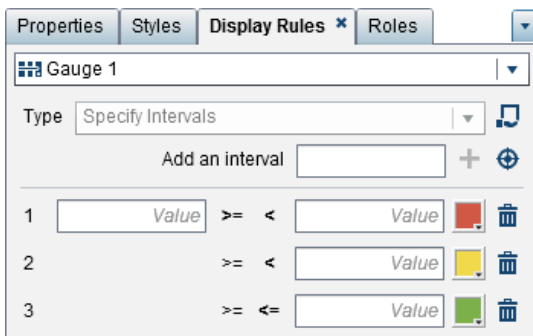

A display rule is used by a gauge to designate intervals and colors for ranges. You can add a shared display rule for a gauge, which is used by other gauges to designate intervals and colors for ranges.

Add Display Rules to a Gauge

To specify a new display rule for a gauge:

- 1 If it is not already selected, select the gauge in the canvas that you want to update.
- 2 In the right pane, click the **Display Rules** tab.

Here is an example of the **Display Rules** tab for a gauge:

- 3 Specify (or modify) the display rules for the gauge. You can populate intervals, edit the display rule, and specify the **Type**.

To automatically populate the intervals:

- a Click  beside the **Add an interval** field to display the Populate Intervals window.
- b (Optional) Review or change the values for the **Number of intervals**, **Lower bounds**, and **Upper bounds** fields.

- c Click **OK**. The gauge updates and the new display rule is displayed on the **Display Rules** tab.

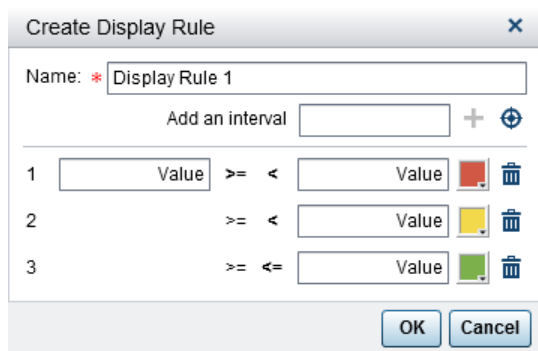

To edit the display rule for a gauge, use the fields on the **Display Rules** tab. You can update the conditions for the values, the intervals, and the color for the range. Select a color to open the color palette. To add new intervals to the display rule, enter a number, and click **+** beside the **Add an interval** field.

Add a Shared Display Rule for Gauges

There are two ways to create a shared display rule for a gauge in the designer. You can use either the **Shared Rules** tab in the left pane or the **Display Rules** tab in the right pane.

To create a shared display rule for a gauge using the **Shared Rules** tab:

- 1 Click  on the **Shared Rules** tab. The Create Display Rule window is displayed.

- 2 Enter a **Name**.
- 3 Add an interval or automatically populate the intervals.

To automatically populate the intervals:

- a Click  beside the **Add an interval** field to display the Populate Intervals window.
- b (Optional) Review or change the values for the **Number of intervals**, **Lower bounds**, and **Upper bounds** fields.

c Click **OK** to return to the Create Display Rule window.

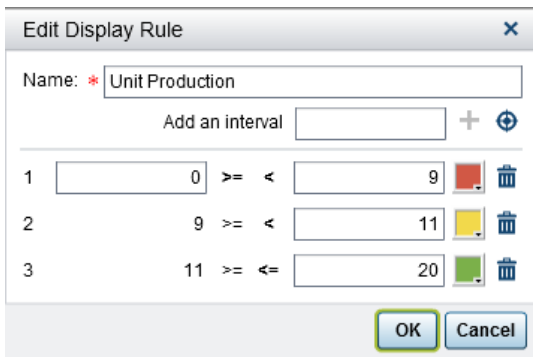

4 Click **OK**. The new shared display rule is added to the **Shared Rules** tab.

To create a shared display rule for a gauge using the **Display Rules** tab:

- 1 Click  on the **Display Rules** tab. The Shared Rule Name window is displayed.
- 2 Enter a **Name**.
- 3 Click **OK**. The new shared display rule is displayed below the **Type** field on the **Display Rules** tab. The new shared display rule is also added to the **Shared Rules** tab.

To edit a shared display rule for a gauge:

- 1 Select the shared display rule on the **Shared Rules** tab, and then click . The Edit Display Rule window is displayed.

Edit Display Rule

Name: * Unit Production

Add an interval + 

1	<input type="text" value="0"/>	>=	<	<input type="text" value="9"/>		
2	<input type="text" value="9"/>	>=	<	<input type="text" value="11"/>		
3	<input type="text" value="11"/>	>=	<=	<input type="text" value="20"/>		

OK Cancel

- 2 Update the conditions for the values, the intervals, and the color for the range. Select a color to open the color palette. To add new intervals to the shared display rule, enter a number, and click **+** beside the **Add an interval** field.
- 3 Click **OK**.

Working with Report Filters

<i>About Report Filters</i>	489
<i>Using Detail Report Filters</i>	491
Use a Basic Report Filter	491
Use an Advanced Report Filter	495
Use a Data Source Filter in a Report	499
<i>Using Post-Aggregate Report Filters</i>	502
About Post-Aggregate Report Filters	502
Create a Post-Aggregate Report Filter	502
Edit a Post-Aggregate Report Filter	504
Delete a Post-Aggregate Report Filter	505

About Report Filters

In SAS Visual Analytics Designer (the designer), you can create filters to subset your data. These types of filters are available:

- Detail Report Filters

Basic filters

subset the data for individual report objects in your reports by using a single data item. A basic filter is constrained to use only the data item that was selected when the basic filter was created. Basic filters can be created and modified by using the pop-up menu for a report object or by using the Edit Filter window. For more information, see [“Use a Basic Report Filter” on page 491](#).

Advanced filters

subset the data for individual report objects in your reports by using any number of data items and operators (for example, OR and AND) in the same expression. Advanced filters can be created and modified by using the Advanced Filter window. For more information, see [“Use an Advanced Report Filter” on page 495](#).

Data source filters

subset the data for the entire report. The data source filters that you create are applied to every report object in the report that uses that data source. For more information, see [“Use a Data Source Filter in a Report” on page 499](#).

■ Post-aggregate Report Filters

For more information, see [“Using Post-Aggregate Report Filters” on page 502](#).

Here are some key points about report filters:

- If you change a report filter from a detail filter to a post-aggregate filter, then all of the selections for the filter will be lost. The same is true if you change a post-aggregate filter to a detail filter. There is a warning message for both cases.
- One data item cannot have both a detail data item filter and a post-aggregate data item filter.
- Clear the **Auto-update** check box above the report canvas until you are ready to apply your filter changes.

All of your filters are saved when you save your report.

Filters can accept parameters. For more information, see [Chapter 40, “Working with Parameters in Reports,” on page 543](#).

When a report object imported from SAS Visual Analytics Explorer (the explorer) has a local filter, that filter is displayed on the **Filters** tab. You cannot edit or delete these filters on imported report objects that use on-demand data.

Note: Report linking is a type of filter. The report section that is the target of the link is filtered by the values selected in the linked report object. For more information, see [“Overview of Linking” on page 525](#).

Using Detail Report Filters

Use a Basic Report Filter

About Basic Report Filters

For certain report objects, you can subset your data by using the **Filters** tab in the right pane of the designer. You can base your filters on any data item in the current data source for this report object, regardless of whether the data item is assigned to a report object in the current report.

Create a Basic Report Filter

To create a basic report filter:

- 1 If it is not already selected, select the report object in the canvas that you want to filter. The report object must have at least one data item assigned.

TIP Clear the **Auto-update** check box above the report canvas until you are ready to apply your filter changes.

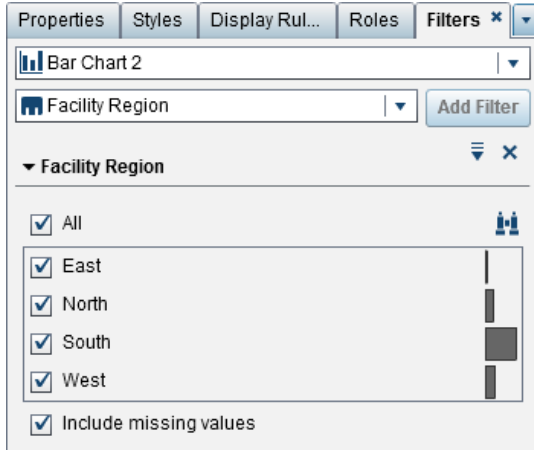

- 2 In the right pane, click the **Filters** tab.
- 3 Click ▼ beside the **Add Filter** button, and select a data item from the list. Then, click **Add Filter**. The filter appears on the tab.
- 4 Select the data values for the filter.

TIP Use the arrow to the left of the filter name on the **Filters** tab to expand or collapse the filter details when you are working with multiple filters.

- For a basic filter that uses discrete values, a check box is displayed for each distinct value that uses the current format applied to the data item. To the right of each value, a bar indicates the frequency. Select the data values that you want to

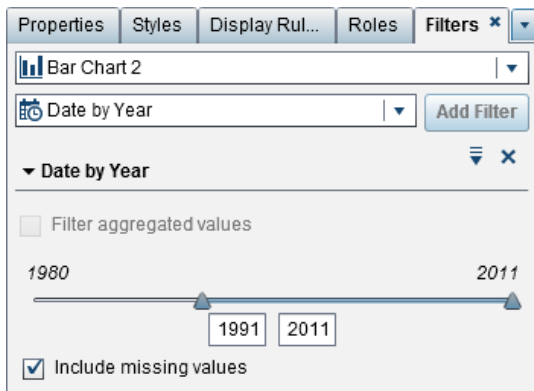

filter or clear the selections for the data values that you do not want to filter. Select **All** to select all of the values.

Here is an example of a basic filter for discrete values:

- For a filter that uses continuous values, a slider shows you the maximum values and the minimum values that exist for the data item using the current data item format. Use the slider to select a range of target values.

Here is an example of a basic filter for continuous values:

- 5 (Optional) If your data contains missing values, and you want to exclude those missing values from your report, then clear the **Include missing values** check box.
- 6 Click  (to the left of the delete icon) for options. The available options depend on whether you are filtering characters, dates, or numerics. You can sort the values or frequencies in the filter.

The following options are available:

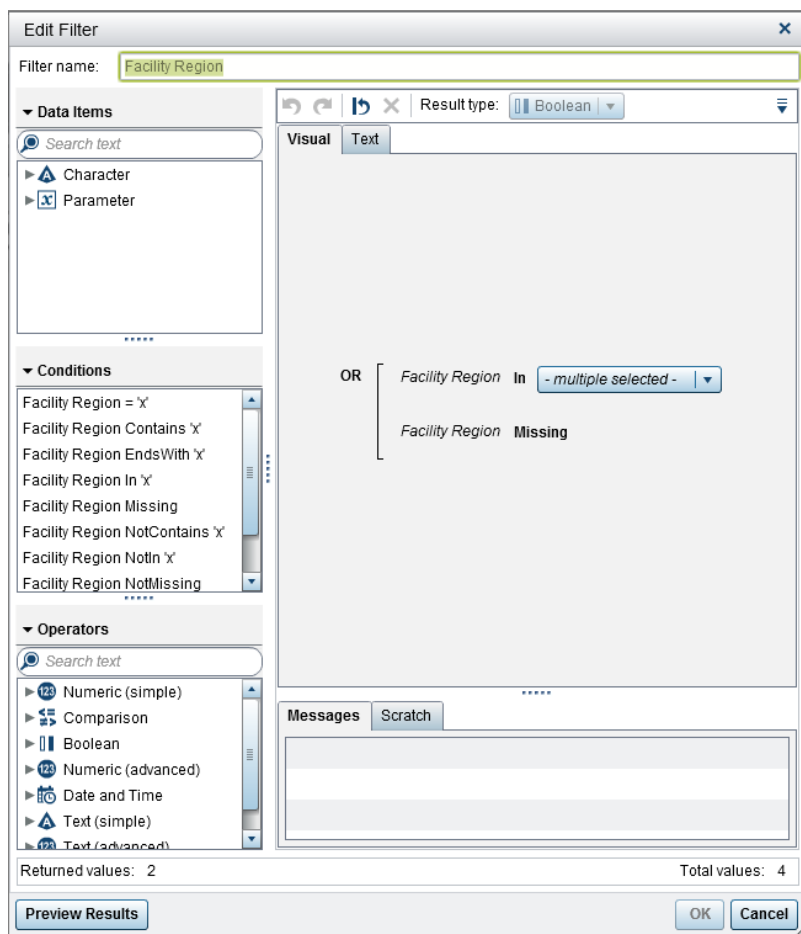

Option	Availability
Edit Filter	This option is always available.
Filter Using Continuous Values	This option is available only for measure data items.
Filter Using Discrete Values	This option is available for measure and category data items.
Include Missing Values	This option is available when you filter continuous values. It works the same as selecting the Include missing values check box.
Exclude Missing Values	This option is available when you filter continuous values. It works the same as clearing the Include missing values check box.
Select All	This option is available when you filter discrete values. It selects all of the current discrete values that are listed. This option does not affect the Include missing values setting.
Clear All	This option is available when you filter discrete values. It clears the selections of all of the current discrete values that are listed. This option does not affect the Include missing values setting.
Invert Selection	This option is available when you filter discrete values. It changes all of the discrete value check boxes so that if they are selected, then they are cleared. If they are cleared, then they are selected. This option does not affect the Include missing values setting.
Sort by Values	This option enables you to sort by the values in the filter.
Sort by Frequency	This option enables you to sort by the frequencies in the filter.

- 7** (Optional) If you cleared the **Auto-update** check box above the report canvas while you worked on your filter, then select it when you are ready to apply your filter changes.

Edit a Basic Report Filter

To edit a basic report filter:

- 1 If it is not already selected, select the report object in the canvas that you want to filter. The report object must have at least one data item assigned.
- 2 In the right pane, click the **Filters** tab.
- 3 Click  beside the filter name. Then, select **Edit Filter**. The Edit Filter window is displayed.

- 4 Edit the expression for your filter.

- You can drag and drop conditions and operators onto the expression on the **Visual** tab in the right pane.
- You can enter the expression on the **Text** tab in the right pane.
- You can create an expression using both the **Visual** and **Text** tabs in the right pane.

For information, see [Appendix 6, “Conditions for Filters,” on page 717](#).

Note: The AND and OR operators can accept more than two conditions. To add a condition to the operator, drag and drop a condition onto the operator name in the right pane. For example, to add a third condition to an AND operator, drag and drop the new condition onto AND in the expression.

TIP Right-click the AND or OR operator in the expression, and then select **Add ► New Condition**.

- 5 Click **OK** to apply the filter.

Delete a Basic Report Filter

To delete a basic report filter, click  beside the filter on the **Filters** tab.

Use an Advanced Report Filter

About Advanced Report Filters

For most report objects, you can create advanced filters to subset your data by using the **Filters** tab in the right pane of the designer.

Advanced filters enable you to create filters that use more than one data item.

Here are some key points about advanced filters:

- Advanced filters that are created in the explorer might contain expressions that you cannot create in the designer.
- Advanced global filters that are created in the explorer are supported by the designer, but you cannot create advanced global filters in the designer.

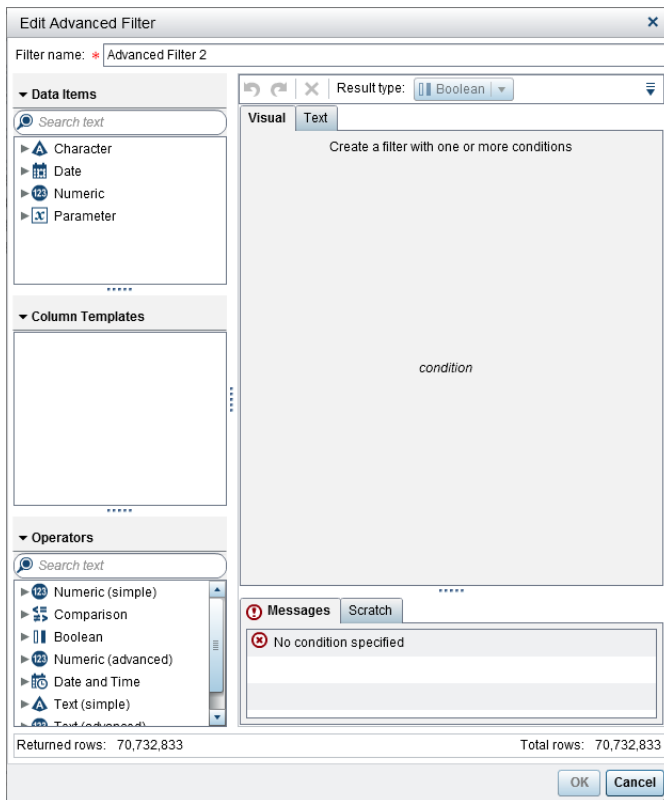

Create an Advanced Report Filter

To create an advanced report filter:

- 1 If it is not already selected, select the report object in the canvas that you want to filter. The report object must have at least one data item assigned.

TIP Clear the **Auto-update** check box above the report canvas until you are ready to apply your filter changes.

- 2 In the right pane, click the **Filters** tab.
- 3 Click  to select **Advanced** instead of a specific data item.
- 4 Click **Add Filter**. The Edit Advanced Filter window is displayed.

- 5 Specify a **Filter name**. The filter name identifies the advanced filter on the **Filters** tab.

- 6 Create a condition for the filter. You can use the **Visual** tab, **Text** tab, or a combination of both tabs.

To create a condition using the **Visual** tab:

- a From the **Data Items** list, select the data item on which the condition is based.
 - b From the **Column Templates** list, select a condition. For information, see [Appendix 6, “Conditions for Filters,” on page 717](#).
 - c Drag and drop the condition onto the expression.
 - d For any required parameters, select the parameter, and enter a value, or right-click on the parameter field, and select **Replace with** to select a data item.
- 7 (Optional) Add operators to the expression. You can use the **Visual** tab, **Text** tab, or a combination of both tabs.

To add operators using the **Visual** tab:

- a From the **Operators** list, select an operator to join the conditions in your expression. For more information, see [Appendix 6, “Conditions for Filters,” on page 717](#).
- b Drag and drop the operator onto the expression.
- c From the **Column Templates** list, select another condition. Then, drag and drop the additional condition onto the expression. Complete any required parameters.

TIP Right-click the AND or OR operator in the expression, and then select **Add ► New Condition**.

- 8 Click **OK** to apply the filter.
- 9 (Optional) If you cleared the **Auto-update** check box above the report canvas while you worked on your filter, then select it when you are ready to apply your filter changes.

Edit an Advanced Report Filter

To edit an advanced report filter:

- 1 If it is not already selected, select the report object in the canvas that you want to filter. The report object must have at least one data item assigned.
- 2 In the right pane, click the **Filters** tab.
- 3 Click  beside the advanced filter name. Then, select **Edit Filter**. The Edit Advanced Filter window is displayed.
- 4 Edit or add a condition for the filter. You can use the **Visual** tab, **Text** tab, or a combination of both tabs.

To add conditions using the **Visual** tab:

- a From the **Data Items** list, select the data item on which the condition is based.
 - b From the **Column Templates** list, select a condition. For more information, see [Appendix 6, “Conditions for Filters,” on page 717](#).
 - c Drag and drop the condition onto the expression.
 - d For any required parameters, select the parameter, and enter a value, or right-click the parameter field, and select **Replace with** to select a data item.
- 5 (Optional) Replace a condition by dragging and dropping a new condition onto the existing condition in the expression on the **Visual** tab. Or, remove a condition using the **Text** tab.
 - 6 (Optional) Add an operator to the expression. You can use the **Visual** tab, **Text** tab, or a combination of both tabs.

To add an operator using the **Visual** tab:

- a From the **Operators** list, select an operator to join the conditions in your expression. For more information, see [Appendix 6, “Conditions for Filters,” on page 717](#).

- b** Drag and drop the operator onto the expression.
- c** (Optional) Add a condition.

TIP Right-click the AND or OR operator in the expression, and then select **Add ► New Condition**.

- 7** (Optional) Delete part of an expression by highlighting the part of the expression that you want to delete, and then selecting **Delete** or **Clear**.
- 8** Click **OK** to apply the advanced filter.

Delete an Advanced Report Filter

To delete an advanced filter, click  on the filter on the **Filters** tab.

Use a Data Source Filter in a Report

About Data Source Filters

Data source filters are used to restrict the data that is displayed in a report. The data source filters that you create in the designer are applied to every report object in the report that uses the data source. A report that has multiple data sources can contain multiple data source filters.

You can use either continuous values or discrete values to create a data source filter. Continuous value filters can be used only for measures. Discrete value filters can be used for any character; numeric; or date, datetime, or data item; as long as the total number of distinct values does not exceed a maximum number.

Data source filters are not displayed on the **Filters** or the **Data** tabs. A data source filter updates the cardinality values that appear on the **Data** tab.

There is a limit of one data source filter per data source. However, if you want to filter on more than one data source, you can create a combination filter.

Create a Data Source Filter

- 1** On the **Data** tab, click , and then select **New Data Source Filter**. The New Data Source Filter window is displayed.

- 2 Add a condition for the filter. You can use the **Visual** tab, **Text** tab, or a combination of both tabs.

To add conditions using the **Visual** tab:

- a From the **Data Items** list, select the data item on which the condition is based.
 - b From the **Column Templates** list, select a condition. For more information, see [Appendix 6, “Conditions for Filters,” on page 717](#).
 - c Drag and drop the condition onto the expression.
 - d For any required parameters, select the parameter, and enter a value, or right-click the parameter field, and select **Replace with** to select a data item.
- 3 (Optional) Replace a condition by dragging and dropping a new condition onto the existing condition in the expression on the **Visual** tab. Or remove a condition using the **Text** tab.
 - 4 (Optional) Add an operator to the expression. You can use the **Visual** tab, **Text** tab, or a combination of both tabs.

To add an operator using the **Visual** tab:

- a From the **Operators** list, select an operator to join the conditions in your expression. For more information, see [Appendix 6, “Conditions for Filters,” on page 717](#).
- b Drag and drop the operator onto the expression.
- c (Optional) Add a condition.

TIP Right-click the AND or OR operator in the expression, and then select **Add ► New Condition**.

- 5 (Optional) Delete part of an expression by highlighting the part of the expression that you want to delete, and then selecting **Delete** or **Clear**.
- 6 Click **OK** to apply the filter.

Edit a Data Source Filter

- 1 If a data source is not already added, add a data source.
- 2 On the **Data** tab, click , and then select **Edit Data Source Filter**. The Edit Data Source Filter window is displayed.
- 3 Add or modify the condition for the filter. You can use the **Visual** tab, **Text** tab, or a combination of both tabs.

To edit conditions using the **Visual** tab:

- a From the **Data Items** list, select the data item on which the condition is based.
 - b From the **Column Templates** list, select a condition. For more information, see [Appendix 6, “Conditions for Filters,” on page 717](#).
 - c Drag and drop the condition onto the expression.
 - d For any required parameters, select the parameter, and enter a value, or right-click the parameter field, and select **Replace with** to select a data item.
- 4 Edit the operator in the expression. You can use the **Visual** tab, **Text** tab, or a combination of both tabs.
 - 5 Click **OK** to apply the filter.

Delete a Data Source Filter

To delete a data source filter:

- 1 On the **Data** tab, click , and then select **Delete Filter**.
- 2 Click **Delete** in the confirmation message that is displayed.

Using Post-Aggregate Report Filters

About Post-Aggregate Report Filters

Post-aggregate filters subset the data for individual report objects in your reports by using the aggregated values, not the summarized values. You can use the **Filters** tab in the right pane of the designer to filter data in a report object using an aggregated value instead of a detail value. Post-aggregate filters are available only for measure data items.

When a report object has both ranks and post-aggregate filters applied, the ranks are applied before the post-aggregate filters.

Here are some key points about post-aggregate filters:

- Post-aggregate filters are not available for report objects that use detail data.
- Crosstabs, time series plots, and dual axis time series plots do not support post-aggregate filters.

Create a Post-Aggregate Report Filter

To create a post-aggregate filter:

- 1 If it is not already selected, select the report object in the canvas that you want to filter. The report object must have at least one data item assigned.

TIP Clear the **Auto-update** check box above the report canvas until you are ready to apply your filter changes.

- 2 In the right pane, click the **Filters** tab.
- 3 Click ▼ beside the **Add Filter** button, and select a measure data item from the list. Then, click **Add Filter**. The filter appears on the **Filters** tab.

- 4 Select the data values for the post-aggregate filter. If the data item allows aggregate values, the **Filter aggregated values** check box is displayed. A slider shows you the maximum and minimum data values that exist for the data item using the current data item format. Use the slider to select a range of target values.

The screenshot shows the 'Filters' tab of a report tool. At the top, there are tabs for 'Properties', 'Styles', 'Display Rul...', 'Roles', and 'Filters'. Below the tabs, there is a dropdown menu labeled 'List Table 1' with 'sales' selected. To the right of this dropdown is an 'Add Filter' button. Below the dropdown, the filter name is displayed as 'sales (Sum)'. There is a small arrow icon to the left of the filter name and a close icon to the right. Below the filter name, there is a checkbox labeled 'Filter aggregated values' which is checked. Below this checkbox is a slider control. The slider has two handles, one at the left labeled '27000' and one at the right labeled '86000'. Below the slider, the values '27000' and '86000' are displayed. At the bottom, there is another checkbox labeled 'Include missing values' which is also checked.

Note: The post-aggregate filter tracks the aggregation associated with the data item. If you change the **Aggregation** using the data item table on the **Data** tab, then the filter name on the **Filter** tab reflects that change. For example, if you create a post-aggregate filter for a data item called *Sales*, it is initially displayed on the **Filters** tab as *Sales (Sum)*. In the data item table, you change the aggregation to **Average**. On the **Filters** tab, the filter name is displayed as *Sales (Average)*. The post-aggregate filter attempts to keep the same range of data values that you originally selected for the aggregation.

TIP Use the arrow to the left of the filter name on the **Filters** tab to expand or collapse the filter details when you are working with multiple filters.

- 5 (Optional) Click  beside the filter name to change the operator. Select **Condition Type**, and then select an operator.
- 6 (Optional) Change the lower and upper values for the post-aggregate filter by clicking the value, and then entering a new value.

- 7 (Optional) If your data contains missing values, and you want to exclude those missing values from your report, then clear the **Include missing values** check box.
- 8 (Optional) If you cleared the **Auto-update** check box above the report canvas while you worked on your filter, then select it when you are ready to apply your filter changes.

Edit a Post-Aggregate Report Filter

To edit a post-aggregate filter:

- 1 If it is not already selected, select the report object in the canvas that you want to filter. The report object must have at least one data item assigned.
- 2 In the right pane, click the **Filters** tab.
- 3 Click  beside the filter name. Then, select **Edit Filter**. The Edit Filter window is displayed.
- 4 Edit the expression for your post-aggregate filter.
 - You can drag and drop conditions and operators onto the expression on the **Visual** tab in the right pane.
 - You can enter the expression on the **Text** tab in the right pane.
 - You can create an expression using both the **Visual** and **Text** tabs in the right pane.

For information, see [Appendix 6, “Conditions for Filters,” on page 717](#).

Note: The AND and OR Boolean operators can accept more than two conditions. To add a condition to the operator, drag and drop a condition onto the operator name in the right pane. For example, to add a third condition to an AND operator, drag and drop the condition onto AND in the expression.

TIP Right-click the AND or OR operator in the expression, and then select **Add ► New Condition**.

- 5 Click **OK** to apply the post-aggregate filter.

Delete a Post-Aggregate Report Filter

To delete a post-aggregate filter, click  beside the post-aggregate filter on the **Filters** tab.

Working with Interactions

<i>Overview of Interactions</i>	507
<i>Creating an Interaction</i>	508
Create a Filter Interaction	508
Create a Data Brushing Interaction	514
Map Data Sources	520
<i>Delete an Interaction</i>	523

Overview of Interactions

Interactions are used to direct a report viewer's attention to specific results in a report. Interactions allow data to be subset to reduce the amount of data, and enables users to understand it within a particular context.

The interactions view in SAS Visual Analytics Designer (the designer) enables report designers to specify which interactions they would like to add to tables, graphs, gauges, and controls in a report.

There are these types of interactions:

filter

is used to restrict the data that is returned from a query to a data source. Filters are simply a set of rules or conditions that you specify to subset the data that is displayed in a table or graph. The goal is to display only the data that you need to see to perform your analysis.

brush

is short for *data brushing*, which enables you to show the same data selected simultaneously in two or more tables, graphs, or controls. Brushing highlights a percentage that reflects the number of shared observations in the data set. Brushing does not highlight a percentage that corresponds to the aggregated value. The brushed data has the same appearance in each object, which makes the data easily apparent to report viewers.

Tables, graphs, and gauges can be the source of an interaction, with the exception of time series plots. Report objects that use detail data cannot be the source of an interaction. Controls that are used on the canvas can also be the source of an interaction. Controls that are used as section prompts are treated as automatic filters and are not displayed in the interactions view.

The **Interactions** tab in the right pane enables you to create interactions and links.

Here are some key points about interactions:

Note: Interactions are available only for report objects in the same section.

Note: Report linking is a type of interaction. The report section that is the target of the link is subset by the values selected in the linked report object. For more information, see [“Overview of Linking” on page 525](#).

Creating an Interaction

Create a Filter Interaction

You can create interactions using the interactions view or the **Interactions** tab in the right pane.

The following objects that are imported from the explorer can be the source of a filter interaction:

- Box plots
- Heat maps with a relational category measure

- Forecast plots
- Geo maps

Imported correlation matrices, histograms, scatter plots with fit lines, heat maps without a selectable relational category measure, and box plots without a selectable relational category measure cannot be the source of an interaction. Hierarchy data items are not supported for interactions.

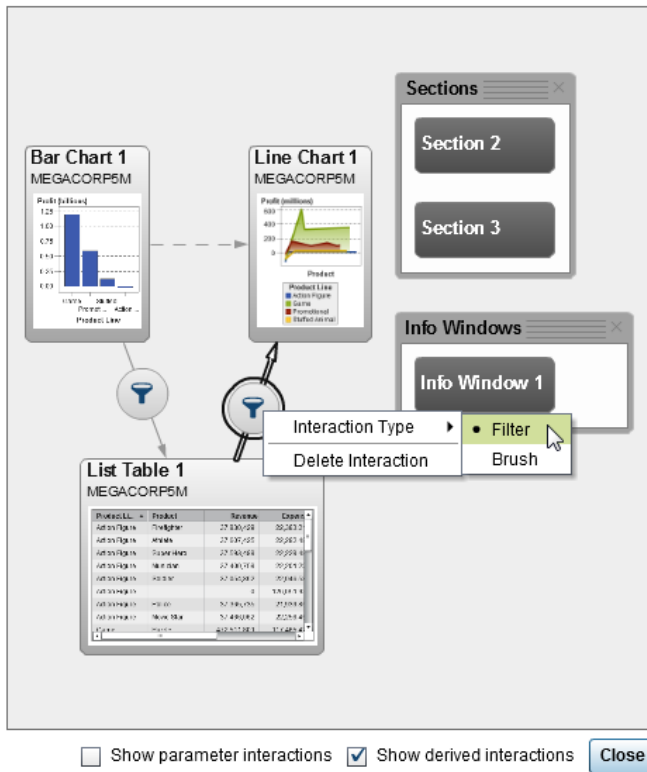

Here are some key points about creating filter interactions:

- You cannot create interactions from list tables, bubble plots, and scatter plots that use detail data. However, a list table that uses detail data can be the target of an interaction.
- Scatter plots cannot be the source of an interaction.
- Bubble plots can be the source of an interaction only if they have a **Grouping** role assigned.
- Sliders can be the target of an interaction. However, a slider that has the **Set fixed range** property set will not do anything when it is filtered because its data is fixed.
- Prompt containers enable you to delay the execution of interactions to report objects that are outside of the prompt container. However, interactions between report objects that are inside a prompt container are never delayed.

To create a filter interaction using the interactions view:

- 1 Add the report objects that you want to use to the canvas. For example, you might have a bar chart, a line chart, and a list table.
- 2 Click **Interactions View** on the **Interactions** tab to switch to the interactions view. You can also select **View ► Show Interactions**.
- 3 In the interactions view, draw a connection between the source and target report objects. When you have created an interaction, the  is displayed between the report objects. Here is an example of an interaction between a bar chart (the source) and a list table (the target):

Interactions View - Section 1

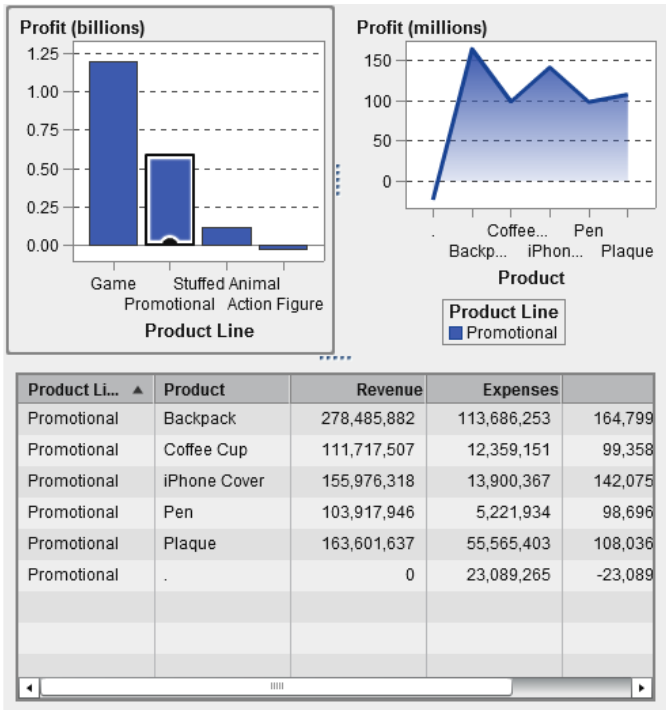

- 5 (Optional) Select the **Show parameter interactions** check box. (Parameter interactions are represented by dashed lines in the Interactions View. If the parameter is affecting a report object in another section, a link is drawn to that section. If a section contains a parameter that is targeting a report object in the current section, then a link is drawn from that section to the report object in the current section.)
- 6 (Optional) Clear the **Show derived interactions** check box. (Derived interactions are represented by dashed lines in the Interactions View.)
- 7 (Optional) Add other filter interactions.
- 8 Click **Close**. The new interaction (or interactions) appears on the **Interactions** tab in the right pane.

The following example shows the **Interactions** tab for the filtering example shown in Display 37.1 on page 512.

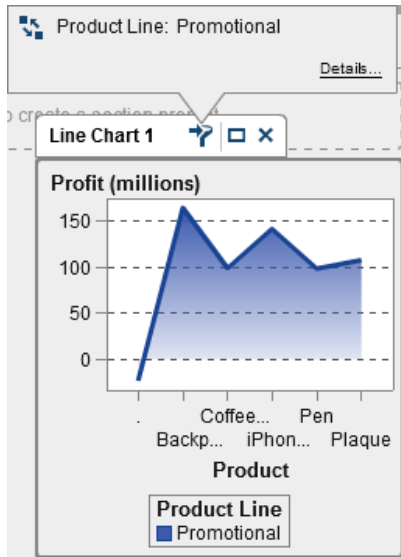

Select data in the source report object to filter data in the target report object (or objects). In the following example, the promotional product line was selected in the bar chart. Simultaneously, the line chart and the list table show the same filter.

Display 37.1 A Filtering Example with a Bar Chart, a Line Chart, and a List Table

Clicking on another selection applies the filter based on your new selection. For example, in the report above, you can click on the game product line to change the filter. An icon is added to the report object that is filtered.

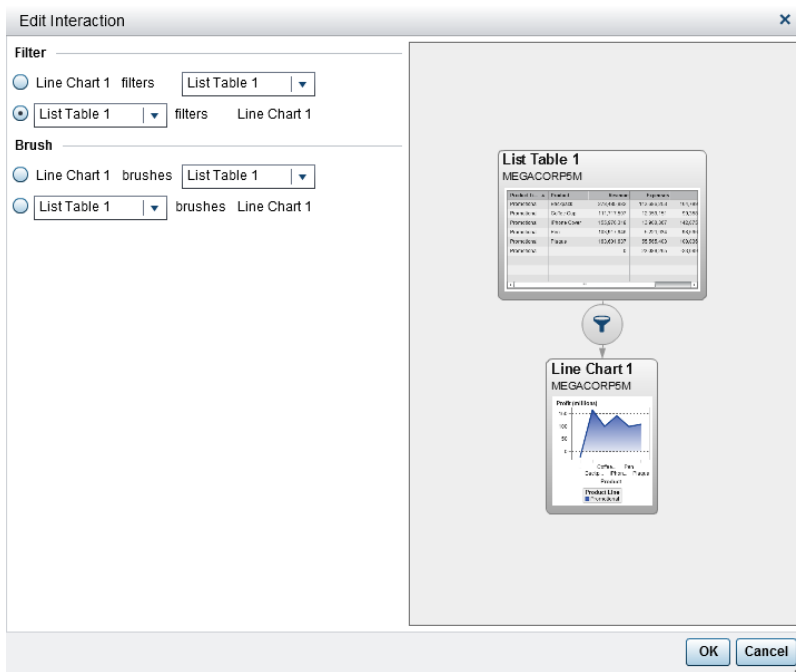

Here is the line chart that was used in the previous example. The incoming filter icon appears above the report object when it is selected in the canvas. Click  to get details about the filter that has been applied. Click **Details** to find out more about the filter. The Visual Element Filters window is displayed. It shows the exact query that was sent to the server.

To clear the selection and reset the filter (or filters), press Ctrl+click while viewing the original report object.

To create an interaction using the **New** button on the **Interactions** tab:

- 1 Select a report object in the canvas. For example, you might have a bar chart.
- 2 Select the **Interactions** tab.
- 3 Click **New**, and then select **Interaction**. The **Edit Interaction** window is displayed.

- 4 In the Edit Interaction window, select the report object that you want to use as the source of a filter or brush interaction. For example, if your report has a bar chart, and you want it to filter a line chart, the first line should read *Bar Chart 1 filters List Table 1*.

The Edit Interaction window disables options for filter or brush interactions if they are not possible.

- 5 When you are finished working with interactions, click **OK**. The new interaction is displayed in the **Interactions** tab.

Create a Data Brushing Interaction

The following objects that are imported from the explorer cannot be the source of a brush interaction:

- Box plots
- Heat maps with a relational category measure

- Forecast plots
- Geo maps

To create an interaction using data brushing:

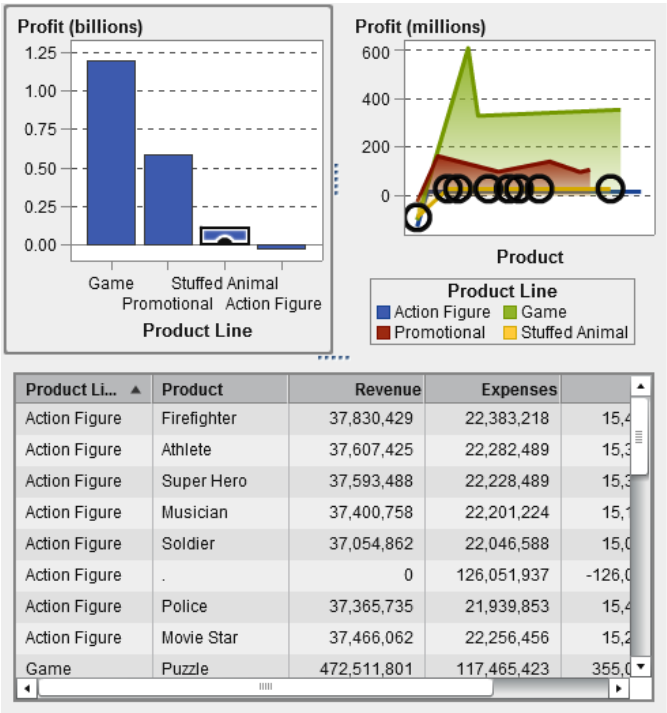

- 1 Add the report objects that you want to use to the canvas. For example, you might have a bar chart, a line chart, and a list table.
- 2 Select the **Interactions** tab.
- 3 Click **Interactions View** on the **Interactions** tab to switch to the interactions view. You can also select **View ► Show Interactions**.
- 4 In the interactions view, draw a connection between the source and target report objects. When you have created an interaction, the  is displayed between the report objects.

Note: The source and target of a data brushing interaction should be based on the same data source. If you have multiple data sources, you are prompted to map the data sources to create the interaction. For more information, see [“Map Data Sources” on page 520](#).

- 5 Right-click . Then, select **Interaction Type ► Brush**. The filter icon changes to .
- 6 Click **Close**. The new interaction (or interactions) appears on **Interactions** tab in the right pane.

Select data in the source report object to brush data in the target report object (or objects). In the following example, the stuffed animal product line was selected in the bar chart. Simultaneously, the line chart and the crosstab highlight the same data.

Display 37.2 A Data Brushing Example with a Bar Chart, a Line Chart, and a List Table

Note: If a graph contains a frequency measure, then a crosshatch pattern indicates when it is selected or brushed.

The brush interaction between controls behaves differently than a brush interaction between tables and graphs. When there is a brush interaction between controls, instead of highlighting or selecting the values in the other control, the values that match are moved to the top of the control, and the values that do not match are grayed out. If a frequency data item exists, then the frequency value is updated.

Here is an example of a report with three list controls that have brush interactions:

Display 37.3 Example: Three List Controls in a Report

Section 1 +

Drop controls here to create a section prompt

List 1 [] [x]

<input type="checkbox"/> Europe	123	<input type="checkbox"/> Sedan	262	<input type="checkbox"/> Audi	19
<input type="checkbox"/> Asia	158	<input type="checkbox"/> Sports	49	<input type="checkbox"/> BMW	20
<input type="checkbox"/> USA	147	<input type="checkbox"/> SUV	60	<input type="checkbox"/> Jaguar	12
		<input type="checkbox"/> Wagon	30	<input type="checkbox"/> Land Rover	3
		<input type="checkbox"/> Hybrid	3	<input type="checkbox"/> Mercedes-Benz	26
		<input type="checkbox"/> Truck	24	<input type="checkbox"/> MINI	2
				<input type="checkbox"/> Porsche	7
				<input type="checkbox"/> Saab	7
				<input type="checkbox"/> Volkswagen	15

<input type="checkbox"/> Ford	0
<input type="checkbox"/> GMC	0
<input type="checkbox"/> Honda	0
<input type="checkbox"/> Hummer	0

In step 2, the user has selected **Porsche** as the car manufacturing company in the third list. Notice the changes in the second list. **Hybrid**, **Sedan**, **Truck**, and **Wagon** are grayed out, and their frequency values have all changed to 0.

Display 37.6 Example: Three List Controls in a Report with Two Brush Interactions

Map Data Sources

The source and target of an interaction or link should be based on the same data source. You might be prompted to map data sources so that an interaction or link works properly in these situations:

- When you try to create an interaction or link between a report object that uses one data source and another report object that uses a different data source.
- When you try to create a link between a report object that uses one data source and a report section that uses a different data source.

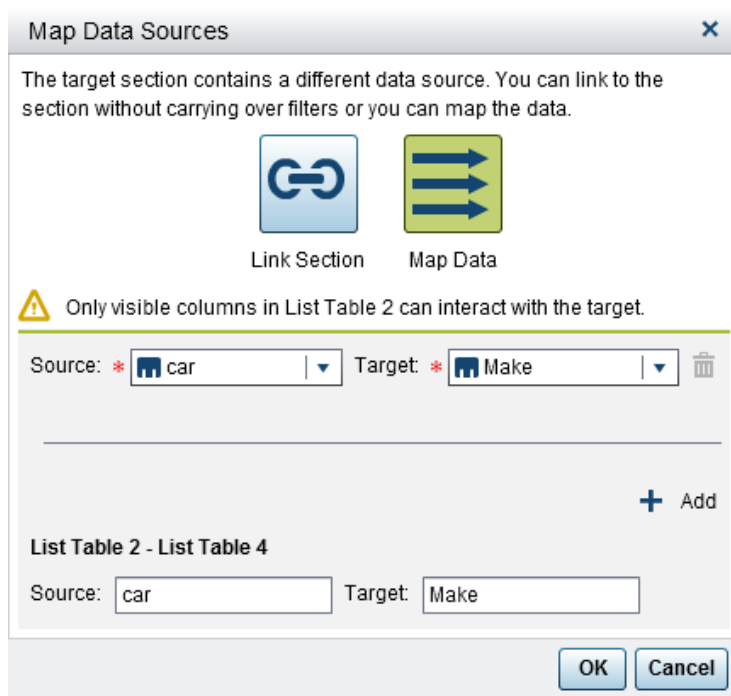

- When you try to create a link between a report object that uses one data source and a report that uses a different data source.

Note: A column in one data source can be mapped only once to another data source. If you need to map a column more than once, then the column needs to be duplicated in the data source.

To map data sources using the Map Data Sources window:

- 1 Use the **Source** drop-down list to select a column from the first data source.
- 2 Use the **Target** drop-down list to select a corresponding column from the second data source.

Here is an example of the Map Data Sources window for an interaction between two list tables that have different data sources:

TIP If there are multiple data sources, and you do not want to link to all of them, you can select the **Enable data source mapping** check box. For more information, see [“Map Data Sources” on page 520](#).

For section links, you are not required to map the data sources. If you choose not to map the data sources, then the filters are not carried over. For more information, see [“Create a Link to One or More Sections in a Report” on page 527](#).

Here is an example of the Create Section Link window with the map data sources information.

Create Section Link

Link List Table 2 to:

☐ All

☐ Section 1

☒ Section 3: Bar Chart 2

The target section contains a different data source. You can link to the section without carrying over filters or you can map the data.

Link Section Map Data

 Only visible columns in List Table 2 can interact with the target.

Source: *  car Target: *  Model

+ Add

List Table 2 - List Table 4

Source: Target:

OK Cancel

- 3 (Optional) Map additional data items. Click . A new row is displayed in the Map Data Sources window.
- 4 The lower half of the window shows you how the mappings are applied to the objects shown in the **Source** and **Target** relationship. Depending on the interaction or link, you might need to map additional **Source** and **Target** objects.
- 5 Click **OK**.

Delete an Interaction

You can delete an interaction using the interactions view or the **Interactions** tab in the right pane.

To delete either a filter or data brushing interaction using the interactions view:

- 1 Select the **Interactions** tab.
- 2 Click **Interactions View** to switch to the interactions view. You can also select **View ► Show Interactions**.
- 3 Right-click  or the , depending on which type of interaction you want to delete. Then, select **Delete Interaction**.
- 4 Click **Delete** in the confirmation message that is displayed.
- 5 (Optional) Remove other interactions.

You can delete an interaction using the **Interactions** tab. Click  next to the interaction that you want to delete. Then, click **Delete** in the confirmation message that is displayed.

Working with Report Links

<i>Overview of Linking</i>	525
<i>Creating Links</i>	526
Create a Link to Another Report	526
Create a Link to One or More Sections in a Report	527
Create a Link to One or More Info Windows in a Report	528
Create a Link to an External URL	529
Create a Link from a Text Object	531
<i>Edit a Link</i>	532
<i>Delete a Link</i>	533
<i>Example: How Linking and Interactions Work Together</i>	533

Overview of Linking

Report links enable single-step access to a report or web page that is related to a report that you are currently viewing. For example, you might be looking at a bar chart that has sales information for each geographical region of your company. If you click the bar for the Northeast region, then a report link associated with the graph could take you to a different report that provides information about employees in each region. You can click  in the top left corner of a destination report to return to the previous report.

Using SAS Visual Analytics Designer (the designer), you can add a link from a report object to another report, to a specific section or an info window in the current report, or

to an external URL. If a destination report contains multiple sections, then you are able (when defining the link) to choose the initial section of the destination report that you want to open first.

When a report has an info window, you can provide additional information to a user who is viewing the report. For example, you might want a list table to provide additional information for a bar chart, or you might want to provide additional text about what is displayed in the data for a particular report object. In the SAS Visual Analytics Viewer (the viewer), a user double-clicks the data (for example, a bar, a bubble, a pie slice, a table row, and so on) in a report object that has an info window, and then the additional information is displayed in a new window in the viewer. For more information, see [“Overview of Report Sections and Info Windows” on page 549](#).

Linking has elements of both a filter and an interaction. A report section that is the target of a link is filtered by the values that are selected in the linked report object.

For information about how links appear in the viewer, see [“View Links in Reports” on page 637](#).

Imported box plots and heat maps with a relational category measure and imported forecast plots can be the source of section, report, or external links.

Creating Links

Create a Link to Another Report

Note: The following steps do not apply to text objects. For more information, see [“Create a Link from a Text Object” on page 531](#).

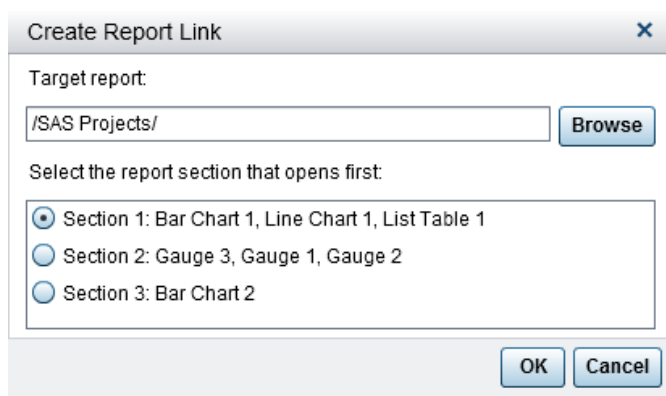

To add a link from a report object or image to another report:

- 1 Click the **Interactions** tab.
- 2 Click **New**, and then select **Report Link**. The Choose an Item window is displayed.
- 3 Select a target report, and then click **OK**. The Create Report Link window is displayed.

- 4 Verify the name of the target report. If you want to select a different target report, click **Browse**.

Note: The source and target of report link should be based on the same data source. If you have multiple data sources, you are prompted to map the data sources to create the report link. For more information, see [“Map Data Sources” on page 520](#).

If the target report contains more than one section, then select the report section that you want to open first.

- 5 Click **OK**. The new report link is displayed on the **Interactions** tab in the right pane.

Double-click on an item in the report object (for example, a bar, a row in a table, a pie slice, and so on) to activate the report link. You are prompted to save changes to the report object before you can follow the link to the target report. To return to the source report object, use the button above the canvas.

Here is an example of the button that enables you to return to the source report object:

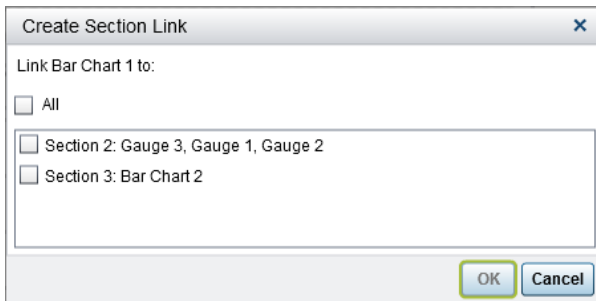

Create a Link to One or More Sections in a Report

Note: The following steps do not apply to text objects. For more information, see [“Create a Link from a Text Object” on page 531](#).

To add a link from a report object, text, or image to a specific section in the same report:

- 1 Click the **Interactions** tab.
- 2 Click **New**, and then select **Section Link**. The Create Section Link window is displayed.

- 3 Select **All** to link to all of the sections in the report or select a specific section (or sections) in the report.

Note: The source and target of section link should be based on the same data source. If you have multiple data sources, you are prompted to map the data sources to create the section link. For more information, see [“Map Data Sources” on page 520](#).

- 4 Click **OK**. The new section link is displayed on the **Interactions** tab in the right pane. If you selected multiple sections, those links are displayed on the **Interactions** tab.

Alternatively, you can create a section link using the interactions view.

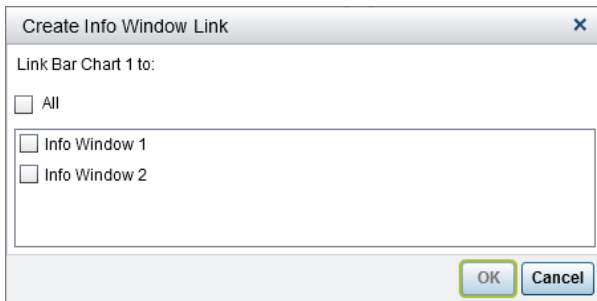

Note: If you use a section link to navigate to another section, and then you change the value of a report prompt, the section link filter is removed.

Create a Link to One or More Info Windows in a Report

Note: The following steps do not apply to text objects. For more information, see [“Create a Link from a Text Object” on page 531](#).

To add a link from a report object, text, or image to an info window in the same report:

- 1 Click the **Interactions** tab.
- 2 Click **New**, and then select **Info Window Link**. The Create Info Window Link window is displayed.

- 3 Select **All** to link to all of the info windows in the report, or select a specific info window in the report.

Note: The source and target of the info window link should be based on the same data source. If you have multiple data sources, you are prompted to map the data sources to create the info window link. For more information, see [“Map Data Sources” on page 520](#).

- 4 Click **OK**. The new info window link is displayed on the **Interactions** tab in the right pane. If you selected multiple info windows to link to, those links are displayed on the **Interactions** tab.

Create a Link to an External URL

You can add a link from a report object, text, or image to an external URL. The `http://` part of the link is provided. The link can be relative to the current web application server. For example, you can link to a stored process, which means that you would not need to specify `http://server-name:port` because you are already logged on to that server.

TIP Click the **Link to Stored Process** button in the Create External Link window to link to a stored process without having to enter the required link information.

Note: UTF-8 is supported for external URL links.

Note: The following steps do not apply to text objects. For more information, see [“Create a Link from a Text Object” on page 531](#).

To add a link to an external URL:

- 1 Click the **Interactions** tab.
- 2 Click **New**, and then select **External Link**. The Create External Link window is displayed.
- 3 Enter a **Label** and a **URL** for the link.
- 4 (Optional) Click **Link to Stored Process**. The Open window is displayed. Select a stored process, and then click **Open**. The **Label** field shows the name of the stored process, and the **URL** field shows the link information for the stored process.

Note: If the stored process accepts prompts, they are automatically added to the **Parameters**.

- 5 (Optional) Click **+** to specify additional parameters for the link. You can specify the **Format value** option, a **Source**, and a **Target**. The **Format value** option applies only to dates and numbers. You can add multiple parameters.

For example, you might have a report for your company’s product lines. When a user views the report, you want them to be able to double-click a product line in the line chart, and then link to a Google search for that product line. In the Create External Link window for this example, you would enter *http://www.google.com/search* as the **URL**, select **ProductLine** as the **Source**, and then enter *q* as the **Target**.

- 6 Press Enter or Tab to activate the **OK** button. Click **OK**. The new external link is displayed on the **Interactions** tab in the right pane.

Double-click on a report object to link to the external URL.

Create a Link from a Text Object

You can add a link from text to an external URL, to another report, or to a specific section or an info window in the current report.

To add a link from a text object:

- 1 Double-click inside a text object on the canvas and enter the text.
- 2 Selecting some or all of the text, and then click . Select **Hyperlink**. The Link Setup window is displayed.
- 3 Select the link **Type**. The options are:

External URL

The link target is an external URL. For example, you might want to link some text to your company's web page or Twitter feed. The link can be relative to the current web application server. Enter a **URL**. The `http://` part of the link is provided.

Report Link

The link target is another report. Enter the name of the **Target report** or browse to find it. If the target report has multiple sections, you can select which report section opens first.

Section Link

If your report has multiple sections, then the link target can be a section in the report. Select a **Target section** from the list.

Info Window Link

If your report has one or more sections and one or more info windows, then the link target can be an info window in the report. Select a **Target info window** from the list.

- 4 Click **OK**. The text that you selected is a link in the text object.

Edit a Link

To edit a report link or an external link:

- 1 Click  next to the link on the **Interactions** tab. For a report link, the Edit Report Link window is displayed. For an external link, the Edit External Link window is displayed.
- 2 Make changes to the link.
- 3 Click **OK** to save your changes.

Note: You cannot edit a section link.

Delete a Link

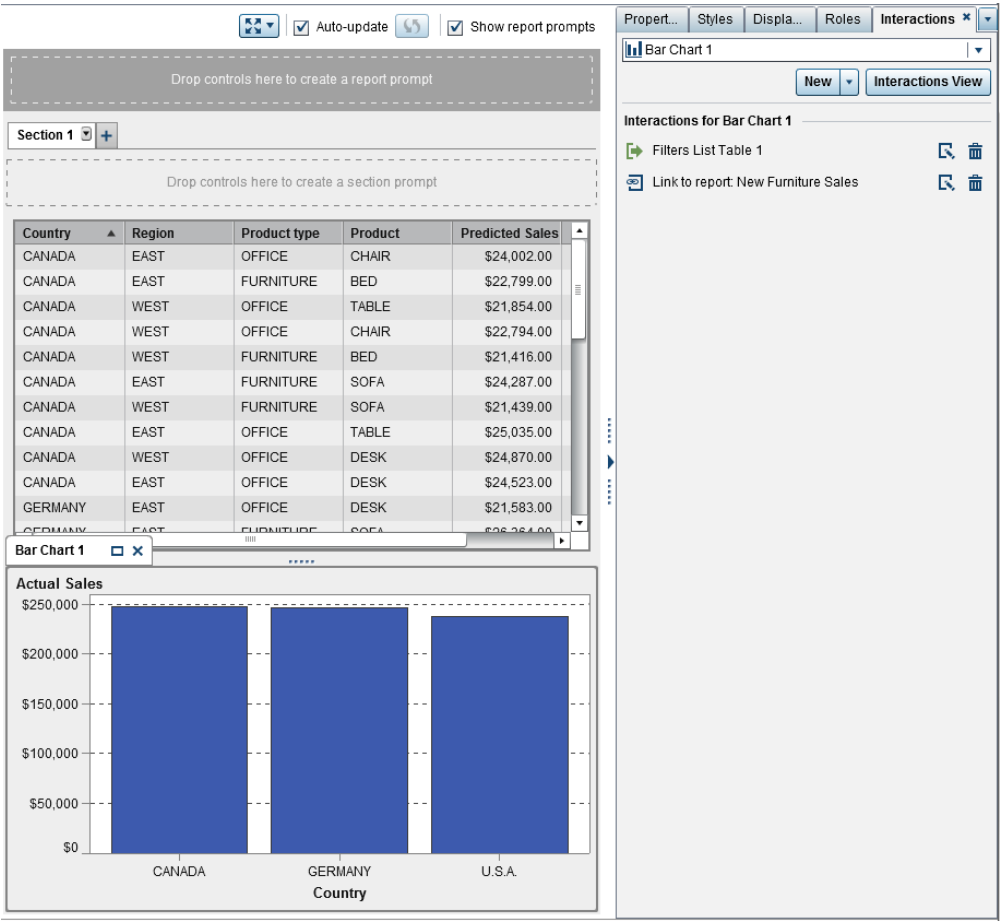

You can delete a section, report, or external link using the **Interactions** tab. Click  next to the link that you want to delete. Click **Delete** in the confirmation message that is displayed.

To delete a link from a text object, select the linked text, and then click . Select **Delete Link**.

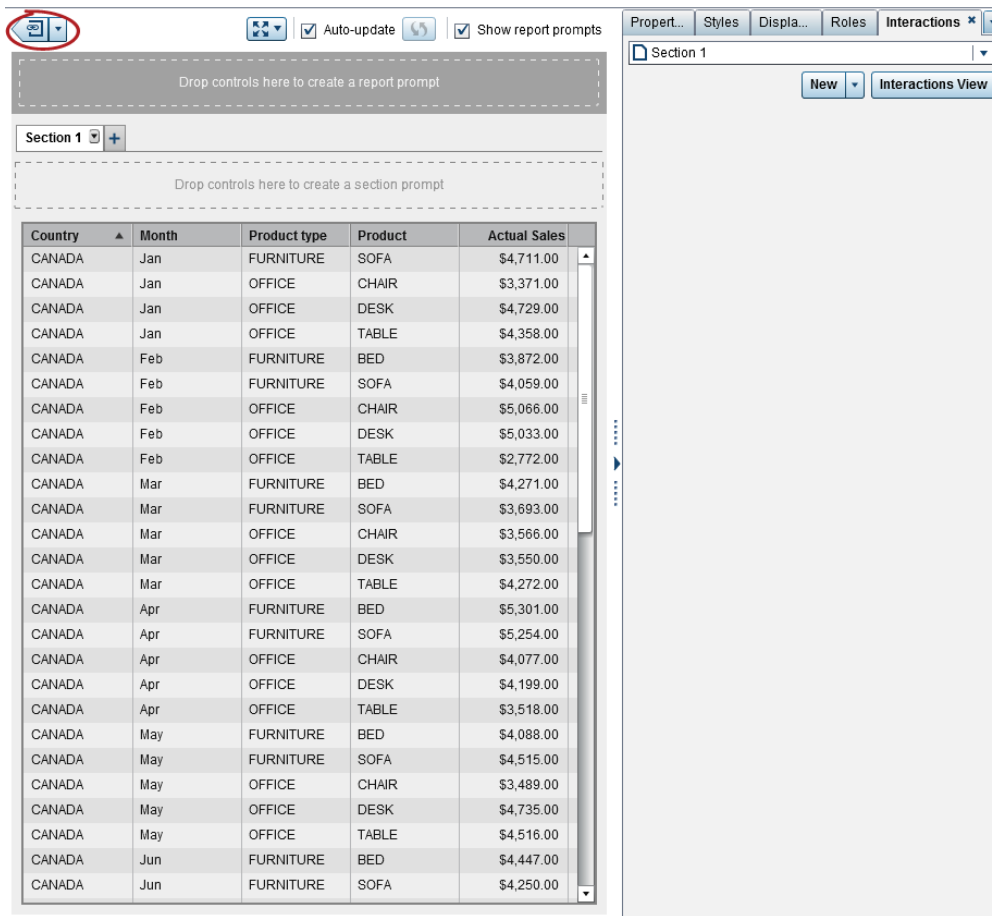

Example: How Linking and Interactions Work Together

Suppose that you have two reports about furniture sales. The first report contains an interaction between a bar chart and a list table. The bar chart links to a second report. The filter interaction and the link are displayed on the **Interactions** tab. Currently, **CANADA** is selected in the bar chart, so the list table is filtered by that country. Here is an example of the first report:

Display 38.1 Example: Furniture Sales Report

When you double-click the **CANADA** bar in the first report, the second report (which is the target of the report link) is displayed. The filter interaction for country in the first report is automatically passed to the second report when you link to it. Here is an example of the second report:

Display 38.2 Example: Furniture Sales Report

Drop controls here to create a report prompt

Section 1 +

Drop controls here to create a section prompt

Section 1

New Interactions View

You can remove the applied filter by clicking ▼ beside the  in the upper left corner. Select the **Apply report link filters** option. After you remove the applied filter, you can choose to apply it again by selecting the **Apply report link filters** option.

You can return to the source report by clicking .

For information about how links appear in the viewer, see [“View Links in Reports” on page 637](#).

39

Ranking Values in Reports

<i>Overview of Ranking in Reports</i>	537
<i>Add a New Rank</i>	538
<i>Delete a Rank</i>	542

Overview of Ranking in Reports

Using SAS Visual Analytics Designer (the designer), you can rank the data in a report object to show the top (greatest) value or bottom (least) value for a category that is based on a measure. For a list table, you can also rank across a set of categories for the top value or bottom value in the set. A rank filters the values of a category based on the aggregated measure by the top or bottom of the values. A rank greatly reduces the visible categories to make it easier to focus on the top value or bottom value that interests a user.

For example, you might create a rank of the top 10 countries by frequency to select the 10 countries that are most represented in your report. As another example, you might create a rank of the top 10 countries by population to select the 10 countries with the greatest populations.

Ranks can accept parameters. For more information, see [Chapter 40, “Working with Parameters in Reports,”](#) on page 543.

Note: Rank descriptions are displayed for report objects that are imported from SAS Visual Analytics Explorer (the explorer) and that use on-demand data. You cannot edit or delete the ranks for imported objects.

Add a New Rank

You can use the **Ranks** tab to create ranks to subset the data in your reports. You can also right-click on your graphs and tables to add a rank to limit the number of bars, rows, and so on. Controls and gauges support ranks.

A single category rank ranks the top of a single category.

To add a rank:

- 1 Click the **Ranks** tab.
- 2 Select a data item. You can select any category or geography data item, regardless of whether it is assigned to the current report object.

For list tables only, you can select **All visible categories**. This rank ranks across the intersection. The top or bottom combination of the visible categories is displayed. For example, you select the region and product data items. You rank on the top 10 by profit. The top 10 region and product combinations are displayed. In this case, the column is no longer considered a single column, it is considered the crossing of the columns.

Note: If a list table has a rank for **All visible categories**, then that is the only rank that it can have.

The **Detail rank** option is available for list tables, bubble plots, and scatter plots that show detail data. If the report object has a detail rank, then it is the only rank that it can have. Otherwise, report objects can have multiple ranks.

- 3 Click **Add Rank**. The **Ranks** tab expands.

The screenshot shows the 'Ranks' tab in a report designer. At the top, there are tabs for 'Properties', 'Styles', 'Display Rul...', 'Roles', and 'Ranks'. Below these, there's a dropdown for 'List Table 1' and a text field for 'Product' next to an 'Add Rank' button. A section titled 'All visible categories' contains a dropdown for 'Top Count'. Below this, there are two radio buttons: 'Count' (selected) and 'Parameter'. The 'Count' radio button has a numeric input field set to '10'. Below the radio buttons is a 'By:' label followed by a dropdown menu showing 'Expenses'. At the bottom, there is an 'Include:' label with a checked checkbox for 'Ties'.

- 4 Select the type of rank from the drop-down list. These types are available:
 - **Top Count** specifies that the rank selects the greatest values.
 - **Bottom Count** specifies that the rank selects the least values.
 - **Top Percent** specifies that the rank selects the greatest percentages.
 - **Bottom Percent** specifies that the rank selects the least percentages.
- 5 If you selected **Top Count** or **Bottom Count** for the rank, then specify one of the following:
 - Select **Count**, and then select a number for the rank. For example, if you select 5, then the rank selects the five greatest values.
 - Select a **Parameter**. If there is more than one parameter available, use the drop-down list to select the one that you want. For more information, see [Chapter 40, “Working with Parameters in Reports,”](#) on page 543.
- 6 If you selected **Top Percent** or **Bottom Percent** for the rank, then specify one of the following:
 - Select **Percent**, and then enter a number between 0.1 and 99.9 in the % field.
 - Select a **Parameter**. If there is more than one parameter available, use the drop-down list to select the one that you want. For more information, see [Chapter 40, “Working with Parameters in Reports,”](#) on page 543.

7 From the **By** drop-down list, select the measure that is used to create the rank. You can select any measure.

8 (Optional) Select **Ties** to include ties in the rank.

If you select **Ties**, then the rank selects as many values as necessary to include all of the ties. If you do not select **Ties**, then the rank selects only the number of values that are specified by the rank parameters.

For example, if your rank selects the top three values, but there are five values tied for the greatest value, then the number of values that are selected by the rank depends on the **Ties** option. If you select **Ties**, then the rank includes all five of the tied values. If you do not select **Ties**, then the rank includes only three of the tied values.

9 (Optional) For category-specific ranks, you can select **All Other** to show the measurements for the categories that did not qualify as a top or bottom value. This option is not available if the report object is showing only detail values.

Here are some key points about the **All Other** option:

- The option is available when you are ranking visible categories in certain types of report objects.
- The option applies only to the category that is being ranked. For example, suppose that you have *Region* and *Product* categories assigned to a list table. Then, you apply a *Region* rank with the **All Other** option set, so the “All Other” value might appear as a *Region* value, but not as a *Product* value.

If you want to combine category values that are excluded by rank into “All Other”, then you need to use the **All Other** property. For more information, see [“Use the Combine Excluded Rows \(or Cells\) into “All Other” Properties” on page 369](#).

- The option is not available if the rank is on a prompt control, geo bubble map, geo coordinate map, or geo region map.
- When the option is specified for a report object, the total, subtotal, and percent of total show values with respect to all of the data, rather than data just relative to data qualifying under the rank. The data that does not fit into the top or bottom of the rank is aggregated in the **All Other** category.

- You can use this option with a ranking to reduce the number of slices in a pie chart. However, this means the “Other” slice must be removed from the pie chart.
- If this option is selected, then any **All Other** value that appears in a table or graph cannot be selected. This means that the **All Other** value cannot be the source value for an interaction.
- If you do not select **All Other**, then the rank shows only the data as filtered by the category values that qualify as the top or bottom value.

By default, your new rank is applied automatically to the report object.

You can add more than one rank to a report object, as long as the first rank is not a **Detail rank**, or an **All visible categories** rank.

Here is an example of a pie chart that shows the profit for multiple product lines before a rank is applied:

Display 39.1 *Pie Chart with Profits for Each Product Line Displayed*

Here is the same pie chart after a rank of the top five product lines is added. The **All Other** option was selected, so the “Other” slice is not displayed.

Display 39.2 Pie Chart with Profits for the Top Five Product Lines Displayed

Delete a Rank

To delete a rank, click **X** on the rank on the **Ranks** tab.

You can also right-click on the report object, and select **Delete Rank**, as long as there is only one rank for the report object.

40

Working with Parameters in Reports

<i>Overview of Parameters</i>	543
<i>Where Parameters Can Be Used in the Designer</i>	545
<i>Create a New Parameter for a Report</i>	546
<i>Edit a Parameter for a Report</i>	547
<i>Delete a Parameter for a Report</i>	547

Overview of Parameters

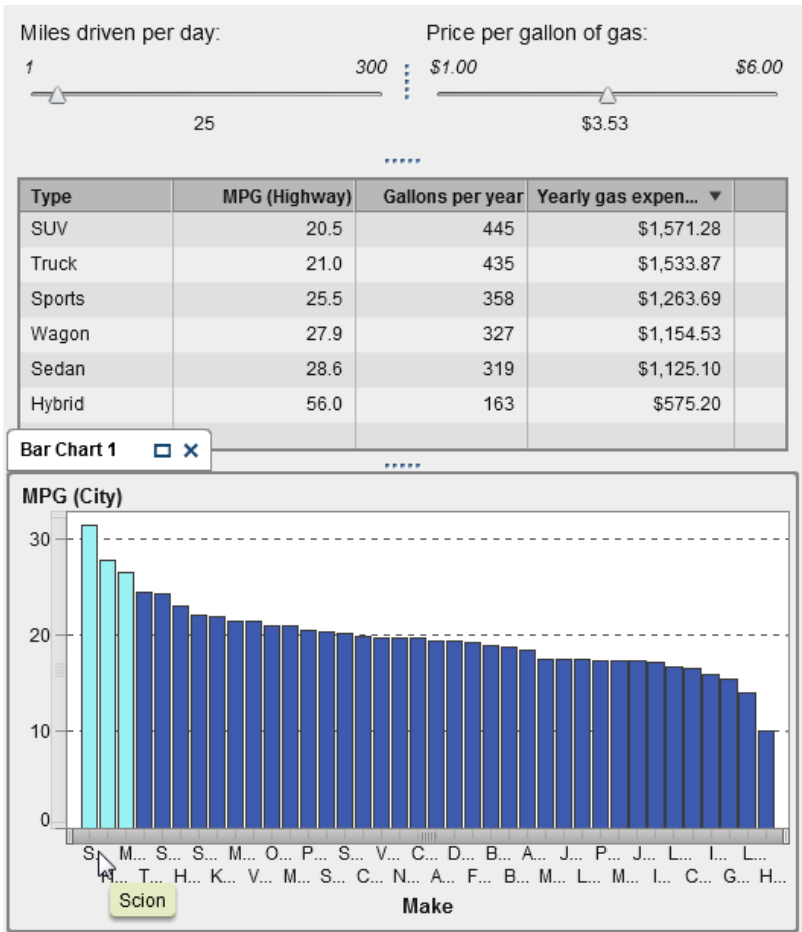

A *parameter* is a variable whose value can be changed and that can be referenced by other report objects. The SAS Visual Analytics Designer (the designer) supports parameters for control report objects. If a control has an associated parameter, then when the value of the control changes, the parameter is assigned that changed value. When the value of the parameter changes, any report objects that reference the parameter detect the change accordingly.

Whenever a parameter value is updated, then all display rules, ranks, calculations, and filters that use that parameter are updated. Any report object in the report that uses the display rule, rank, calculation, or filter is updated accordingly.

You can use parameters to design complex reports. For example, you might have a report with two sliders, a list table, and a bar chart. One slider lets you adjust the number of miles that you drive each day. The other slider lets you adjust the price per gallon of gasoline. The results of the selections in the sliders are calculated, and the

parameters are used in a calculated data item that is displayed in the list table. The bar chart has a display rule, *(MPG (City) > Miles per day)*, so that vehicles that have a fuel economy value that is better than the number of miles that you drive per day are highlighted.

Display 40.1 Example: A Report with Parameters

Where Parameters Can Be Used in the Designer

You can use parameters in calculations, display rules, filters, and ranks. You can create, modify, and manage parameters using the **Data** tab in the left pane.

The following controls in the designer support parameters:

- The text input control supports a character parameter or a numeric parameter.
- The button bar control or drop-down list control accepts a character parameter.
- The slider (single-point only) accepts a numeric parameter.

Parameters can be used with the following features in the designer:

calculations

calculated items and aggregated measures allow parameters. Parameters are supported wherever it makes sense to have a numeric or character value.

display rules

numeric parameters can be specified as the value of an expression rule.

filters (detail filters, aggregated filters, and data source filters)

a character or numeric parameter is supported wherever it makes sense to have a numeric or character value. The data source filter is a special case. Ordinarily, a data source filter applies to all of the report objects on the canvas. However, if the data source filter contains a parameter, then the filter is not applied to the control that has that parameter assigned to it.

ranks

for a rank, the parameter can be included for the n value of the rank. It is supported for **Top Count** or **Bottom Count** and **Top Percent** or **Bottom Percent**.

Here are some key points about creating parameters:

- You cannot create a parameter for a control that uses a date.

- If you duplicate a control with a parameter, the parameter is not copied from the original control.

Create a New Parameter for a Report

To create a new parameter using the **Data** tab in the left pane:

- 1 Click , and then select **New Parameter**. The Create Parameter window is displayed.
- 2 (Optional) Modify the **Name** of the parameter.
- 3 Select the **Type** for the parameter. You can select **Numeric** or **Character**.
- 4 For character parameters, specify a **Current value**.
- 5 For numeric parameters, specify a **Current value**. You must also specify the following options:
 - **Minimum value** (which is required).
 - **Maximum value** (which is required).
 - **Format**. Click **Select** to open the Select Format window, where you can select a **Format type**, **Width**, and **Decimals**. Click **OK** in the Select Format window.
- 6 Click **OK** in the Create Parameter window. The  icon identifies the new parameter in the list of data items on the **Data** tab.

You can create and edit parameters from the filter window and the calculated item window.

Edit a Parameter for a Report

To edit a parameter:

- 1 Right-click the parameter on the **Data** tab, and select **Edit Parameter**. The Edit Parameter window is displayed.
- 2 Make changes to the parameter.
- 3 Click **OK** to save your changes.

Delete a Parameter for a Report

You cannot delete a parameter that is being used by a calculation, rank, filter, or display rule.

To delete a parameter:

- 1 Right-click the parameter on the **Data** tab, and select **Delete Parameter**.
- 2 Click **Delete** in the confirmation message that is displayed. The parameter is removed from the list of data items on the **Data** tab and from any calculations, filters, display rules, or ranks that were using it.

41

Maintaining Multi-Section Reports

<i>Overview of Report Sections and Info Windows</i>	549
<i>Add a Section to a Report</i>	550
<i>Add an Info Window to a Report</i>	551
<i>Reorder Report Sections or Info Windows</i>	551
<i>Rename a Report Section or an Info Window</i>	552
<i>Duplicate a Report Section or an Info Window</i>	552
<i>Move a Report Object to Another Section or Info Window</i>	553
<i>Delete a Report Section or an Info Window</i>	553

Overview of Report Sections and Info Windows

Any report in SAS Visual Analytics Designer (the designer) can have multiple sections. (Sections are like pages.) Multiple sections can be used to present different views of the data to the person who views the report. Each section has one or more data sources. You can have one or more report objects in a section. There is no limit to the number of sections in a report.

Using the designer, you can add a link from a report object to a specific section in the current report. For more information, see [“Create a Link to One or More Sections in a Report” on page 527](#).

Section prompts are controls that are placed in the special row area above the report objects on the canvas. A section prompt enables the user to select a value to filter data. For more information, see [“Use a Control to Create a Section Prompt” on page 379](#).

When a report has an info window, you can provide additional information to a user who is viewing the report. For example, you might want a list table to provide additional information for a bar chart, or you might want to provide additional text about what is displayed in the data for a particular report object. In the SAS Visual Analytics Viewer (the viewer), a user double-clicks the data (for example, a bar, a bubble, a pie slice, a table row, and so on) in a report object that has an info window, and then the additional information is displayed in a new window in the viewer.

Info windows can be created only in the designer. A report can have one or more info windows, which are displayed as private tabs in the designer. Info windows are identified by the  icon on the tab above the canvas. Info windows can have one or more report objects. You must provide a link to an info window from an existing report object to display a new window in the viewer.

Note: Section prompts are not allowed in info windows.

Add a Section to a Report

You can add sections to any report, including reports that were created in SAS Visual Analytics Explorer (the explorer).

To add a new section to a report, click  to the right of the first section tab (or the last section tab that was added) in the report. The new tab appears to the right of the existing tab (or tabs).

Here is an example of multiple section tabs:

Display 41.1 Multiple Section Tabs

You can use the **Properties** tab for the report to add a new section. In the **Sections** area, click **+**. The new tab appears to the right of the existing tab (or tabs).

Add an Info Window to a Report

You can change any report section to an info window as long as the section does not have section prompts.

Here is an example of multiple **Info Window** tabs:

To add an info window, click **▼** on the **Section** tab, and then select **Display as Info Window**. The tab name changes to **Info Window**. The **Properties** tab also updates.

For information about adding a link to an info window, see [“Create a Link to One or More Info Windows in a Report” on page 528](#).

Reorder Report Sections or Info Windows

To change the order in which sections or info windows are displayed:

- 1 In the right pane, click the **Properties** tab.
- 2 Select the report name in the drop-down list.

- 3 In the **Sections** area, select the name of a section or an info window. Click  or  to reorder the sections or info windows.

Rename a Report Section or an Info Window

To rename a section or an info window:

- 1 Right-click the section tab or the info window tab that you want to rename. Select **Rename**. The existing name is highlighted.
- 2 Type a new name, and then press Enter. The new name also appears on the **Properties** tab in the right pane.

Alternatively, you can change the name on the **Properties** tab.

Duplicate a Report Section or an Info Window

To duplicate a section or an info window:

- 1 Right-click the section tab or the info window tab that you want to duplicate.
- 2 Select **Duplicate**. All of the report objects and the data in the original section or info window are copied to the duplicate section or info window. The duplicate appears on a new tab. For example, if the original section's name is **Marketing Reports**, then the duplicate section is named **Marketing Reports (1)**.
- 3 Rename the duplicated section or info window using the pop-up menu or the **Properties** tab.

Move a Report Object to Another Section or Info Window

To move a report object from one section in a report to another section or an info window, right-click the report object that you want to move. Select **Move <ReportObject> to ► <SectionName>**, where **<ReportObject>** is the name of the report object and **<SectionName>** is the name of the section tab or the info window.

TIP You can drag an object from one section and drop it onto the tab for another section to move it to that section.

Note: You cannot move a section prompt from a section to an info window.

If you move an object to a section with precision layout, then you must manually move the object to its proper location. All objects are put in the top left corner by default.

TIP If you move a section prompt from one section to another section in a report and there are multiple data sources, you must edit the data source mapping for an interaction to work. Right-click the control, and select **Edit Data Source Mapping**. For more information, see [“Map Data Sources” on page 520](#).

Delete a Report Section or an Info Window

To delete a section or an info window from a report, right-click the tab that you want to remove. Select **Delete**.

Note: The **Delete** menu option is not available if the report has only one section.

42

Sharing Reports with Other Users

<i>Overview of Sharing Reports</i>	555
<i>E-mail a Report</i>	556
<i>Printing a Report</i>	558
<i>Exporting Data from Report Objects</i>	560

Overview of Distributing Reports	566
Add a New Report Job	567
Create a Report Distribution	569
Manage Report Distributions	572
<i>Localize Reports</i>	572

Overview of Sharing Reports

Depending on your role and capabilities, the SAS Visual Analytics Designer (the designer) enables you to complete many tasks related to sharing reports. You can do the following:

- e-mail reports
- print reports
- export data from report objects
- add comments to reports
- distribute reports on a schedule
- localize (or translate) labels, tooltips, and other descriptive text in reports

E-mail a Report

You can e-mail a link to a report to someone. If the recipient opens the e-mail message on a PC or Mac with a Flash-enabled viewer, and then clicks the e-mail link, then the report is displayed in the viewer. If the recipient opens the e-mail message on a mobile device, and then clicks the e-mail link, then the report is displayed using the SAS Mobile BI app if the user has it installed.

TIP Use the **Order the actions associated with a content type** preference for the SAS Visual Analytics home page to specify which application opens the report when you click on an e-mail link.

To e-mail a report from the designer:

- 1 Select **File** ► **E-mail**. The E-mail window is displayed. The designer automatically adds your e-mail address to the **From** field. The URL for the report is automatically generated, and a preview appears in the e-mail message.

E-mail [X]

Send Cancel

2 Enter the recipient's e-mail address.

Alternatively, click the **To** label. The Add Recipients window is displayed. Select one or more names. Click **OK** to return to the E-mail window.

Note: You can select a maximum of 100 e-mail recipients in the Add Recipients window.

Note: A user's e-mail address must be stored in metadata to be displayed on the **View All** tab in the Add Recipients window.

TIP Position your mouse pointer over the **To** field to see all of the recipients.

3 (Optional) Update the **Subject** line.

- 4 (Optional) Enter a comment for the report.
- 5 Click **Send**.

Printing a Report

You can create a PDF for a report, a report section, or a report object. The PDF can then be printed. By default, an appendix is included in the PDF if the report, report section, or report object has descriptions, filters, warnings, errors, or display rule legends.

Here are some considerations for printing:

- Controls are not included in the PDF. However, the information in a control is displayed in the appendix.
- Info windows, report prompts, section prompts, and prompt containers are not included in the PDF. However, any filters that are applied to report objects in the prompt container are displayed in the appendix.
- Vertical containers print only the currently selected report object. Horizontal and stack containers might print more than the currently selected report object if there is enough space.
- If a list table or a crosstab has scroll bars, then some of the scrolled content might not be printed. However, more columns or rows might be printed than are visible in the designer. The print feature attempts to fill the space available on the page in the PDF.
- If a report object has a high-cardinality filter, and the **Show appendix information** option is selected, then the filter description might be truncated in the printed appendix.

Here are some key points about printing output from a stored process or a stored process report:

- Output from a stored process starts on a new page.

- The stored process must use the %STPBEGIN and %STPEND macros. These macros provide standardized functionality for generating and delivering output from a stored process. For more information, see “Using the %STPBEGIN and %STPEND Macros” in *SAS Stored Processes: Developer's Guide*.
- PDF security must be turned off for a stored process.
- The stored process report must be configured to produce PDF output. In the stored process that is referenced by the stored process report, set the _ODSDEST variable to **PDF**. Or, define a stored process parameter for the _ODSDEST variable and configure it with a value of **PDF** for the stored process report. It is recommended that you also set the _ODSOPTIONS variable to **notoc** to save processing time and to reduce the size of the PDF produced by the stored process and the final PDF. For more information about ODS options, see “Using the %STPBEGIN and %STPEND Macros” in *SAS Stored Processes: Developer's Guide*.

To create a PDF that can be printed:

- 1 Select **File** ► **Print to PDF**, or click . The Print window is displayed.
- 2 Select the **Paper size**, **Orientation**, **Options**, and **Margins**. Your selections are saved for that report.

If you select **Custom** for the paper size, you can specify the **Height**, and **Width** of the page. For custom paper sizes, you cannot change the page orientation.

The **Show appendix information** option is selected by default if the report, report section, or report object has descriptions, filters, warnings, errors, or display rule legends.
- 3 Make your selections in the **Select the items to be printed** list. You can select the report, the report sections, or the report objects.
- 4 Click **Print**. The PDF is displayed in a browser.

When the **Show appendix information** option is specified, and the report, report section, or report object has descriptions, filters, warnings, errors, or display rule legends, then an appendix is created. Each report object that is selected to be included in the PDF is automatically assigned a value so that you can reference that report object

in the appendix. For example, suppose that you select two report objects in the **Select the items to be printed** list. The first report object is assigned the value **A1.1** and the second report object is assigned the value **A1.2**. Suppose that the first report object has a description and the second report object has a filter that has been applied. The first report object's description is displayed in the appendix under the **A1.1** heading. The second report object's filter is displayed in the appendix under the **A1.2** heading.

The following table lists the icons that can appear in the appendix:

Icon	Description
	Indicates that a report object contains a filter.
	Indicates that a report object contains a warning.

To print a report section, click  on the **Section** tab, and then select **Print <section-name> to PDF**.

To print a report object, right-click on the report object in the canvas, and then select **Print <report-object-name> to PDF**. A stored process does not have the same pop-up menu selection.

Exporting Data from Report Objects

Overview of Exporting from the Designer

All users who have the Export Data capability can use the designer to export data from report objects to Microsoft Excel format for future viewing or printing. This exported output can be saved locally on disk, and then opened in Microsoft Excel. Or you can choose to create a delimited text file Tab-Separated Values (*.tsv) or Comma-Separated Values (*.csv) data file.

When you export a graph from the designer, you are exporting the data, not the visual graph representation.

Not all report objects in the designer support the exporting feature. For example, you cannot export data from gauges. If the export feature is not available for a particular report object, the **Export <reportObjectName>** menu item does not appear when you right-click on the object.

Export Data from a List Table

To export data from a list table:

- 1 If the list table that you want to export is not already selected, select it.
- 2 Right-click on the list table, and select **Export <listTableName>**, where **<listTableName>** is the name of the report object. The Export or Save As window is displayed.

- 3 Choose to export **All rows** or a range of **Rows**.
- 4 Choose to export **All columns** or **Selected columns**. If you choose **Selected columns**, select the check box (or check boxes) to the left of the column (or columns) that you want to export. At least one column is required. If you do not

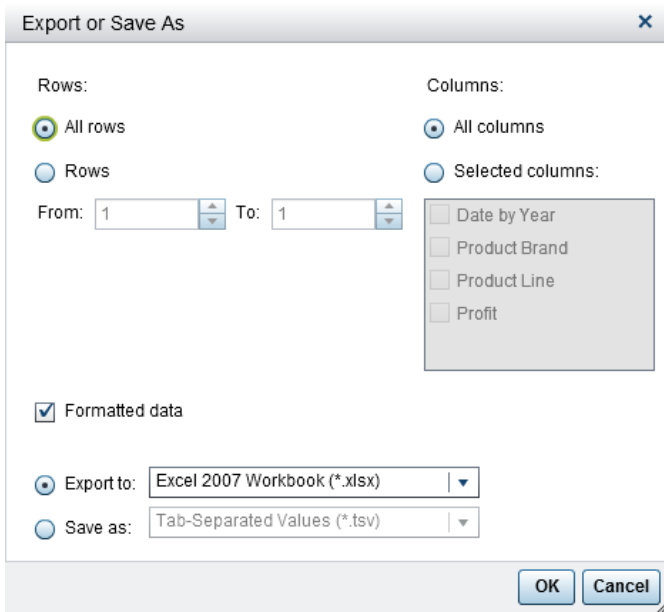

select a column, then a message is displayed, and the Export or Save As window cannot be closed.

- 5** (Optional) To choose whether the exported data is formatted, either select or clear the **Formatted data** check box. This check box is selected by default.
- 6** If you select **Export to**, then the only option is **Excel 2007 Workbook (*.xlsx)** to create a Microsoft Excel spreadsheet.
- 7** If you select **Save as**, choose either **Tab-Separated Values (*.tsv)** or **Comma-Separated Values (*.csv)** to create a data file.
- 8** Click **OK**.
- 9** When you are prompted, choose either to open the file or to save it.

Export Data from a Crosstab

To export detail data from a crosstab:

- 1** If the crosstab that you want to export is not already selected, select it.
- 2** Right-click on the crosstab, and select **Export <crosstabName>**, where **<crosstabName>** is the name of the report object. The Export or Save As window is displayed.

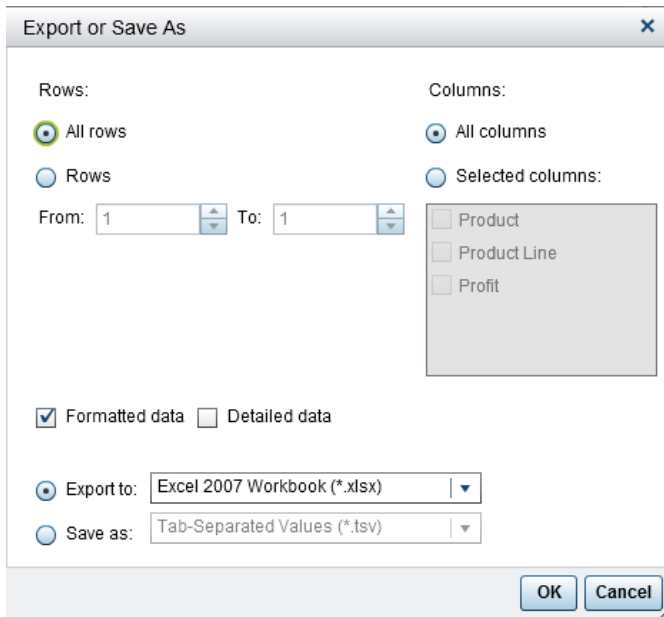

- 3 Choose to export **All rows** or a range of **Rows**.
- 4 Choose to export **All columns** or **Selected columns**. If you choose **Selected columns**, select the check box (or check boxes) to the left of the column (or columns) that you want to export. At least one column is required. If you do not select a column, then a message is displayed, and the Export or Save As window cannot be closed.
- 5 (Optional) To choose whether the exported data is formatted, either select or clear the **Formatted data** check box. This check box is selected by default.
- 6 If you select **Export to**, then the only option is **Excel 2007 Workbook (*.xlsx)** to create a Microsoft Excel spreadsheet.
- 7 If you select **Save as**, choose either **Tab-Separated Values (*.tsv)** or **Comma-Separated Values (*.csv)** to create a data file.
- 8 Click **OK**.
- 9 When you are prompted, choose either to open the file or to save it.

Export Data from a Graph

Note: You cannot export the actual visual graph. Only the data can be exported.

To export data from a graph:

- 1 If the graph that you want to export is not already selected, select it.
- 2 Right-click on the graph, and select **Export <graphName>**, where <graphName> is the name of the report object. The Export or Save As window is displayed.

- 3 Choose to export **All rows** or a range of **Rows**.
- 4 Choose to export **All columns** or **Selected columns**. If you choose **Selected columns**, select the check box (or check boxes) to the left of the column (or columns) that you want to export. At least one column is required. If you do not select a column, then a message is displayed, and the Export or Save As window cannot be closed.
- 5 (Optional) Choose whether the exported data is formatted, either select or clear the **Formatted data** check box. This check box is selected by default.

- 6 (Optional) Choose whether detail data is exported for the graph. If you select **Detailed data**, then you can select the columns that you want to export.

Note: The **Detailed data** option is not available for imported report objects, custom graph objects that have multiple data definitions, or for any graphs in which detail data is not allowed.

- 7 If you select **Export to**, then the only option is **Excel 2007 Workbook (*.xlsx)** to create a Microsoft Excel spreadsheet.
- 8 If you select **Save as**, choose either **Tab-Separated Values (*.tsv)** or **Comma-Separated Values (*.csv)** to create a data file.
- 9 Click **OK**.
- 10 When you are prompted, choose either to open the file or to save it.

Add Comments to a Report

In the designer, you can add comments to the whole report, but you cannot add comments to the individual report objects.

TIP You must save a report before you can add comments.

Here are some key points about adding comments to a report:

- If comments have been added to an individual report object using the home page, the explorer, or the viewer, then those comments cannot be displayed or edited in the designer.
- If you have the Add or View Comments capability, then you can add or view comments. You can edit your own comments and respond to other comments.

Distributing Reports

Overview of Distributing Reports

If you have the Distribute Reports capability, then you can distribute reports using the designer. Distributing reports automates the process of delivering updated content to report users. You can distribute reports once or at recurring intervals, such as daily, multiple times daily, weekly, or monthly. In addition, distributing reports gives you the ability to create a time event to generate reports during non-peak hours.

CAUTION! Use only the designer to schedule and distribute SAS Visual Analytics reports. If you try to use the Schedule Manager plug-in to SAS Management Console and set an option that is not available in the designer, the report job might be incompatible with the designer.

When you distribute a report, you are considered the report job owner.

Distributing reports requires two steps. First, you define a *report job*, which contains a list of one or more reports, a list of one or more recipients, and an optional e-mail message. Both the report job owner and the recipient must be registered and have e-mail addresses stored in metadata because the report generates using the recipients' data access rights. Second, you create a *distribution*, which contains a report job and a time event. The time event specifies when and how often the distribution occurs. When a distribution runs, a history record is created. After you create a distribution, you can schedule, unschedule, run, delete, and show the history for your distribution.

Recipients receive an e-mail message with one or more reports attached as PDF files. The e-mail message contains a link to the report.

If you distribute a multi-section report that uses multiple data sources, and one of the data sources is not accessible to a recipient, then a warning message about the non-accessible data source is appended to the PDF.

TIP If you distribute reports to multiple locales or if you receive distributed reports, then you can specify your **User locale** in the global SAS preferences. For more

information about setting global SAS preferences, see [“Specify Global Preferences” on page 27](#).

Add a New Report Job

To create a new report job:

- 1 Select **File ► Distribute Reports**. The Distribute Reports window is displayed.

Note: Only your report jobs are displayed in the New Report Job window. If another user has already used the name that you enter for the report job, a warning message is displayed. You must enter a different name for your report job.

- 2 Click **New Report Job**. The New Report Job window is displayed.

- 3 Enter a **Name**. The report job name cannot contain blanks, white space, or these characters: ! " \$ % & ' () * . + , / : ; < = > ? @ [\] ^ ` | ~ -

Note: Report jobs cannot be renamed.

- 4 On the **Properties** tab:

- Click **+** beside the **Reports** field. Select one or more reports from the list that is displayed. When you select a report, it is added to the **Reports** list.

TIP If the report that you want is not displayed in the pop-up list, click **Select another report**, and use the Open window to find the report that you want to distribute.

- Click **+** beside the **Recipients** field. The Add Recipients window is displayed. Select one or more users. Click **OK** to return to the New Report Job window.

Note: A user's e-mail address must be stored in metadata to be displayed on the **View All** tab in the Add Recipients window.

5 On the **E-mail Options** tab:

- Enter a **Subject** for the e-mail message. If you leave this field blank, the name of the first report in the list is used as the subject.
- (Optional) Enter a **Message** for the body of the e-mail message.
- The **Show the report job owner in the message** option enables you to have your name appear in the e-mail message. Because the mail service cannot display the report job owner's name in the **From** field of the e-mail message, this is the only way to inform recipients who created the report job.

6 Use the **Notifications** tab to specify that you want to receive the report job owner notifications. You can select **Send e-mail notification when the report job starts**, **Send e-mail notification when the report job ends**, or both.

Note: If there is a warning (for example, when a recipient or a report cannot be found), then you automatically receive a notification with the details when the report job ends.

7 Click **OK**. The report job is displayed in the table in the Distribute Reports window.

Create a Report Distribution

To create a distribution:

- 1 Select **Distributions** in the left pane of the Distribute Reports window.
- 2 Select a report job, and click **Schedule**. The Schedule window is displayed.
- 3 Click **New** to create a time event. The Specify Schedule Details window is displayed.
- 4 Specify whether the distribution should happen **One time only** or **More than once**. By default, a new time event is defined to occur only once at a time that is approximately five minutes later than the time that you opened the Specify Schedule Details window.

If you select **One time only**, then select an **Hour** and a **Minute** for the distribution.

If you select **More than once**, then specify the details about when the distribution should occur. The specific fields that are available depend on the recurrence interval (**Hourly**, **Daily**, **Weekly**, **Monthly**, or **Yearly**) that you select.

- If you select **Hourly**, then the time is calculated from hour zero on a 24-hour clock. For example, if you leave **Interval hour** set to 1, then the data query runs at hour zero (midnight) and runs each hour.

Select an **Interval hour**, and then select a **Starting hour** and **Minute**.

The **Duration in minutes** field is used to specify the maximum number of minutes after the specified time has been reached that the dependency is kept in an open state. This value is used when a report job has multiple dependencies. It specifies a window of time in which distribution remains open so that other time events can be met. If the report job does not have multiple dependencies, then it is recommended to use the default duration of 1 minute.

If needed, specify the range of recurrence (the start date and end date for distribution). The default is to start at the current date and to not have an end date.

- If you select **Daily**, **Weekly**, **Monthly**, or **Yearly** for **More than once**, then you can select start times.

Here is an example of a **Daily** recurrence interval.

The screenshot shows a dialog box titled "Specify Schedule Details". It has two main sections: "One time only" and "More than once". The "More than once" section is selected, and within it, the "Daily" option is chosen. The "Interval in days" is set to 1. The "Every weekday" option is also visible. Below these, there are three columns: "Hours", "Minutes", and "Selected start times". The "Hours" column has checkboxes for 17:00, 18:00, 19:00 (checked), 20:00, 21:00, 22:00 (checked), and 23:00. The "Minutes" column has checkboxes for 20-29, 30-39, 40-49, 40, 41, 42, 43 (checked), and 44. The "Selected start times" column shows 22:43 and 19:43. At the bottom, there is a "Duration in minutes" field set to 1, a "Range of Recurrence" section with "Starting date" set to 08/04/2014 and "Ending date" set to "No end date", and "OK" and "Cancel" buttons.

The following options are specific to the recurrence interval that you select:

Recurrence Interval	Options
Daily	Select a number for Interval in days or select Every weekday for the report job to run.
Weekly	Select a number for Interval in weeks , and then select the day (or days) that you want the report job to run.
Monthly	Select a number for Interval in months , and then select a Day number or a Week and Day that you want the report job to run.
Yearly	Select a number for Interval in years and the Month . Then, select a Day number or a Week and Day that you want the report job to run.

The following options are available for all recurrence intervals:

- Use the **Hours** and **Minutes** check boxes to select the times. The **Minutes** area contains groupings of 10-minute intervals. Selecting a check box for a minute grouping selects all of the minutes in that grouping. Your selections are displayed in the **Selected start times** area.

TIP To select individual minutes, expand the grouping.

- The **Duration in minutes** field is used to specify the maximum number of minutes after the specified time has been reached that the dependency is kept in an open state. This value is used when a report job has multiple dependencies. It specifies a window of time in which the distribution remains open so that other events can be met. If the report job does not have multiple dependencies, then it is recommended to use the default duration of 1 minute.
- If needed, specify the range of recurrence (the start date and end date for distribution). The default is to start at the current date and to not have an end date.

For more information, see *Scheduling in SAS*.

- 5 Click **OK** to return to the Schedule window. The new schedule details are displayed under the **Schedule** heading.
- 6 Click **OK** to return to the Distribute Reports window. The new schedule details are displayed in the **Schedule** column.
- 7 (Optional) Click **Run Now** to have the distribution run immediately. Click **Close** in the information window.
- 8 Click **Close**.

Manage Report Distributions

The Distribute Reports window enables you to schedule, unschedule, run now, delete, and show history for distributions that you own. Only distributions that contain at least one report job that you own are displayed. (Some distributions might contain report jobs that other users own, but they are not displayed.)

TIP You can delete a distribution if it contains only report jobs that you own.

To see the history record for a selected distribution that has been run, click **Show History**. The Show History window is displayed. You can see the **Start Time**, **Finish Time**, **State**, and **Status Message**. Click **Close** to return to the Distribute Reports window.

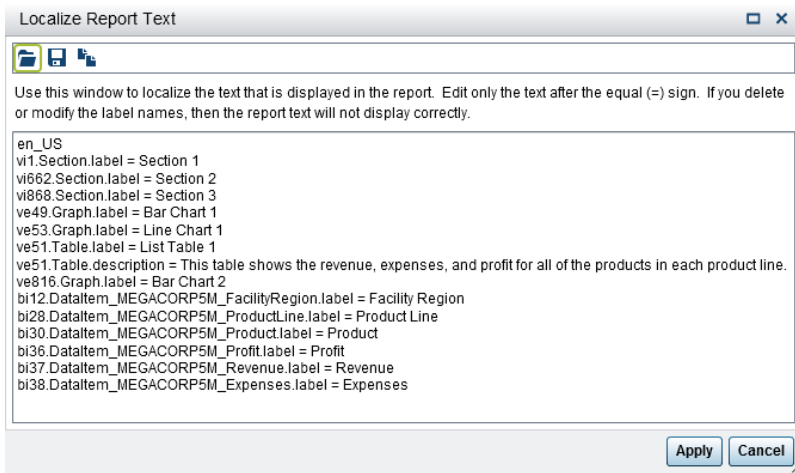

Localize Reports

The designer enables you to localize (or translate) the labels, tooltips, and other descriptive text that is part of your report. You can export localizable text from your report so that you can apply one or more translations. You can translate your report into a new language without removing the text from the designer.

There is no limit to the number of translations that you can add to the report.

To localize a report:

- 1 Select **File ► Save As** to save a copy of the report. This enables you to have a backup copy of your report.
- 2 Select **File ► Localize Report**. The Localize Report Text window is displayed. Identifiers, which provide context information, are displayed beside the original text. The text that is displayed after the equal sign (=) is the text that you can localize.

The first line in the Localize Report Text window contains the locale identifier, which is specified by the ISO 693 two-letter language code. If a language is created for a specific country or region, the language code can be followed by an underscore (`_`) and the ISO 693 two-letter country code. In the preceding screen capture, the `en_US` country code is displayed.

3 Localize the original text strings. You have the following options:

- Save the text in the Localize Report Text window to a file, modify the file, and then open the modified file in the Localize Report Text window.
- Modify the text in the Localize Report Text window.
- Copy and paste the text from the Localize Report Text window into an editor.

CAUTION! All report text is encoded as Unicode characters using the UTF-8 format. If you export the localizable text to an editor, make sure that the editor is capable of saving the data as UTF-8.

4 Click **Apply** to import the translations.

CAUTION! Your report is immediately updated and saved. You cannot revert to a previous version of the localized text or undo your changes.

For step-by-step instructions, examples, and a list of advanced features, see *One Report, Many Languages: Using SAS Visual Analytics 7.1 to Localize Your Reports*, which is available on the [SAS Visual Analytics](#) page on the SAS support site.

About the Graph Builder

SAS Visual Analytics Graph Builder (the graph builder) enables you to create custom graph objects, which then become available in the SAS Visual Analytics Designer (the designer) for use in reports.

You can create custom graph objects for all graph types that are used in the designer. In your custom graph object, you can change the layout, add new graph elements, modify roles, change the visual properties, and so on. Your custom graph object is displayed under the **Custom** heading on the designer's **Objects** tab. For more information, see [“Save a Custom Graph Object So It Appears in the Designer” on page 594](#).

You do not associate real data with the graph objects in the graph builder. Rather, you build graph objects or templates using sample data that is shipped with the graph builder. Report designers assign data when they include your graph objects in their reports.

The graph objects that you build have a consistent appearance that is compatible with the designer's graph objects. The graph builder enables you to produce a wide array of graph objects with more options for layouts and visual properties. Using the graph objects that you build, report designers can create simple or complex graphical views of their data.

You can do the following in the graph builder:

- drag and drop graph elements onto the canvas. Graph elements include the plots and charts that are available from the **Graph Elements** pane.

For a definition and a picture of each available graph element, see [“Graphs, Charts, and Plots” on page 650](#).

- use a gallery of predefined graph objects as templates from which you can build and customize custom graph objects. For more information, see [“About the Graph Template Gallery” on page 579](#).

- combine and arrange the graph elements as needed. For example, you can layer multiple graph elements in a cell, create a lattice of cells in rows and columns, or combine these layouts.

There are two types of lattice graphs:

- A data-driven lattice is a multi-cell graph in which the cell data is determined by the values of one or more class variables. The number of cells is determined by the unique values of the class variables. Each cell of the lattice has the same graph elements. However, these graph elements have different values of the class variables.
 - A user-defined lattice is a multi-cell graph in which you create each cell independently. Each cell can contain different types of plots.
- determine and configure which data roles become available for assignment. For more information, see [“Working with Roles” on page 581](#).
 - specify the visual attributes of the graph elements. You can specify properties for the graph, the graph cells, for individual graph elements, for the axes, and for legends. For more information, see [“Working with Properties” on page 606](#).

About the Graph Template Gallery

The graph builder includes a gallery that contains predefined graph objects. Using these predefined graph objects as templates, you can build and customize custom graph objects. The templates provide a useful starting point for creating interesting or complex graph objects.

TIP All of the graph objects in the gallery are available as is for use in reports. However, these graph objects are not all displayed in the designer by default. Use the designer’s [Show or Hide Objects window](#) to display the graph objects on the designer’s **Objects** tab.

Here are the main features of the gallery:

- By default, the gallery is displayed when you start the graph builder. You can disable this feature by selecting the **Don't show this window at start-up** check box in the window. You can also change the default setting in your preferences. For more information, see [“Specify Your Preferences for the Graph Builder” on page 595](#).
- If the gallery is not displayed, select **File ► New from Gallery** to display it.
- In the gallery, select a category in the left pane to see the available graph objects. You can then select the appropriate graph object from the right. For more information, see [“Build a Custom Graph Object” on page 580](#).
- Some of the gallery graphs are created as data-driven lattices. When you select one of these graphs from the gallery, row and column lattice roles are automatically created. If you want to create a user-defined lattice from one of these gallery graphs, you must first delete the row and column lattice roles.

Build a Custom Graph Object

To build a custom graph object:

- 1 Do either of the following:
 - Drag and drop a graph element from the **Graph Elements** pane onto the blank canvas.
 - Select a graph object from the gallery.
 - 1 If the gallery is not displayed, select **File ► New from Gallery** to display it.
 - 2 Select a category in the left pane to see the available graph objects. The **All** category shows all of the graph objects that are in the gallery.
 - 3 When you find the graph object that you want, select the object, and click **OK**.

Note: Some of the gallery graphs are created as data-driven lattices. For more information, see [“About the Graph Template Gallery” on page 579](#).

Sample data is used in the graph object. The report designer assigns real data when he or she includes the graph object in a report.

- 2 (Optional) On the **Role Definitions** tab, you can define roles for the graph object. You have the following options:
 - Provide more descriptive names for the default roles.
 - Click **Add Role** to add more roles.
 - Create a data-driven lattice by adding a lattice role. For more information, see [“Creating a Data-Driven Lattice ” on page 591](#).
- 3 (Optional) You can add additional graph elements to the graph object. See [“Adding a Graph Element to an Existing Graph Object” on page 584](#).
- 4 (Optional) You can change the properties for the graph object, the cell, the graph element, the legend, or one or more axes. Select the item, and make your changes on the **Properties** tab.
- 5 Save the graph object. Depending on where you save the graph object, it might be immediately displayed on the **Objects** tab in SAS Visual Analytics Designer (the designer). For more information, see [“Save a Custom Graph Object So It Appears in the Designer” on page 594](#).

Working with Roles

About Roles

When you create a custom graph object, you determine which data roles become available for assignment. However, you do not assign data to those roles in the graph builder. When the graph object becomes available to report designers for use in their reports, the report designers assign data items to the available roles.

Create Optional Roles

When you drag and drop a graph element onto the canvas, the required roles for that graph element are created on the **Role Definitions** tab. You can create additional, optional roles.

To create an optional role:

- 1 On the **Role Definitions** tab, click **Add Role**. The Add Role window is displayed. The contents of the Add Role window vary depending on the current graph element.
- 2 Select the type of role that you want to create. For more information, see [“Types of Roles” on page 582](#).
- 3 (Optional) You can change the default role name to provide a more meaningful name.
- 4 Select the data type, or classification, for the role. For information about the data types, see [“Working with Data Items in a Report” on page 414](#).
- 5 (Optional) Select **Required** to require report designers to assign data to the role. If this option is not selected, then report designers can choose whether to assign data to the role.
- 6 If the **Allow multiple data assignments** check box is available, then you can select or clear the check box. When this option is selected, the role can have more than one measure assigned. For example, in a line chart, if multiple measures are assigned to the Y axis, then the graph shows a line for each measure.
- 7 Click **OK**.

Types of Roles

In addition to the standard roles, such as Time, X, or Category, you can add the following roles by clicking **Add Role** on the **Role Definitions** tab. The roles that are available depend on the type of graph element.

- The Color role specifies a data column that is used to color the data.

The following example shows the heights of a group of students. A student's gender is specified for the Color role.

The Color role can be any data type. In this example, the Color role is assigned a Category data type.

Note: When you add the Color role to a graph element in a data-driven lattice, the Measure data type is not always available. The Measure data type is not available for a bar chart, a waterfall chart, or a scatter plot.

In some graph elements, such as a bar chart, the Group role also colors the graph based on the values of the group variable. In those graph elements, the Color role is used to color the data across a color gradient as shown in the following example. In this case, the Color role must be a Measure data type.

In this example, the color gradient indicates the age range of the students.

- The Group role specifies a data column that is used to group the data. The graph elements for each unique group value are automatically distinguished by different visual attributes, such as color, line style, and so on. The Group role can be a Category data type or a Datetime data type.
- The Data Label role specifies a data column that is used for data labels.
- The Data Tip role specifies a data column that is used for data tips. The Data Tip role must be numeric.
- The Target role specifies a data column that is used to generate a targeted bar chart. A targeted bar chart compares data that is summarized by the value of a category in reference to target values.

Adding a Graph Element to an Existing Graph Object

You have two options for adding a graph element to an existing graph object. You can overlay the new graph element on top of an existing graph element. Or, you can add the graph element so that it creates a cell in a new row or column.

Add an Overlay

In an overlay, one graph element is superimposed on another graph element. You can add an overlaid graph element to a single-cell graph as well as to a lattice.

In this example, a step plot is overlaid on a bar chart. The example shows the graph element with data assigned to it.

Display 43.1 Step Plot Overlaid on a Bar Chart

To create an overlay:

- 1 Drag and drop a graph element from the **Graph Elements** pane onto the canvas.
- 2 Drag and drop a second graph element directly onto the existing graph element.

If the graph elements are compatible, they are automatically assigned a shared role. This enables both graph elements to have a common X axis role. You can unshare the shared role if needed.

Some graph elements, such as the pie chart and the treemap, cannot be layered in an overlay. A message is displayed when you try to drag and drop these types of graph elements.

For more information, see the following topics:

- [“Incompatible Graph Elements” on page 589](#)
- [“Sharing Data Roles” on page 610](#)

- 3** (Optional) On the **Role Definitions** tab, you can change the default role names to provide more meaningful names.

TIP The graph elements are layered in the order in which they were added to the canvas. You can change the order by moving a graph element to the front or the back. For more information, see [“Change the Order of Graph Elements in a Cell ” on page 600](#).

Add a Graph Element to a New Row or Column

A graph element can be added so that it creates a cell in a new row or column. This arrangement results in a graph object with more than one cell. It is called a user-defined lattice. In a user-defined lattice, each cell is created independently and can contain different types of graph elements. Cells are aligned in rows and columns that you create by dragging and dropping graph elements.

Note: You cannot create new rows or columns in a data-driven lattice. For a description of a data-driven lattice, see [“About Data-Driven Lattices ” on page 591](#).

This example shows a user-defined lattice with four cells. One of the cells is empty. The example shows the graph element with data assigned to it.

Display 43.2 User-Defined Lattice

To create a user-defined lattice:

- 1 Drag and drop a graph element from the **Graph Elements** pane onto the canvas. The graph element is created in the center of the graph area of the canvas.
- 2 Drag and drop another graph element onto the canvas as follows:
 - Drag and drop the graph element onto the right or left border of the existing graph to create a new column. The area becomes shaded to indicate the location of the new column.

- Drag and drop the graph element onto the top or bottom border of the existing graph to create a new row.

- 3 To add more cells, continue dragging and dropping graph elements onto the borders of the existing graph to create new columns or rows. You can drag and drop a graph element onto the area between two columns to insert a new column. Or, you can drag and drop a graph element onto the area between two rows to insert a new row. If the existing graph contains a lattice with an empty cell, you can drag and drop the graph element into that empty cell.

You can create up to 10 rows and 10 columns.

- 4 (Optional) On the **Role Definitions** tab, you can change the default role names to provide more meaningful names.

Incompatible Graph Elements

Some graph elements can be layered in an overlay with one graph element superimposed on another. Other graph elements, however, are incompatible. They cannot be layered in the same cell. The following table shows which graph elements cannot be layered in the same cell.

Note: Pie charts and treemaps are not compatible with any other graph elements. They are not listed in the table.

Table 43.1 *Graph Element Type Incompatibility*

Graph Element	Not Compatible
Band plot	Bar chart, horizontal Schedule chart
Bar chart, horizontal	Band plot Bar chart, vertical Line chart Needle plot Schedule chart Vector plot Waterfall chart
Bar chart, vertical	Bar chart, horizontal Schedule chart Vector plot
Bubble plot	(Compatible with all graph elements except pie charts and treemaps)
Line chart	Bar chart, horizontal Schedule chart Vector plot

Graph Element	Not Compatible
Needle plot	Bar chart, horizontal Schedule chart
Scatter plot	(Compatible with all graph elements except pie charts and treemaps)
Schedule chart	Band plot Bar chart, horizontal Bar chart, vertical Line chart Needle plot Step plot Time series plot Vector plot Waterfall chart
Series plot	(Compatible with all graph elements except pie charts and treemaps)
Step plot	Schedule chart
Time series plot	Schedule chart
Vector plot	Bar chart, horizontal Bar chart, vertical Line chart Schedule chart Waterfall chart
Waterfall chart*	Bar chart, horizontal Schedule chart Vector plot Waterfall chart

* The waterfall chart requires the X axis to have a shared role to avoid unpredictable results.

Creating a Data-Driven Lattice

About Data-Driven Lattices

A data-driven lattice is a multi-cell graph in which the cell data is determined by the values of one or more class variables. Class variables are specified in the designer when the report designer creates a report that includes the lattice. The number of cells is determined by the unique values of the class variables. Each cell of the lattice has the same graph elements. However, these graph elements have different values of the class variables.

The following example shows a graph with data assigned to it. The custom graph object includes a data-driven lattice with a columnar role. The graph object allows multiple data assignments for the Measure role.

Display 43.3 Data-Driven Lattice Multi-Cell Graph

In the report, the graph object includes a three-cell lattice of bar charts showing engine size and miles per gallon for different types of automobiles. The country of origin is specified as the class variable. As a result, a cell is created for each country of origin.

The following example shows the graph object that was created in the graph builder. The lattice role was specified for columns.

Here are the characteristics of data-driven lattices:

- You can define up to two lattice roles: one role for the rows and another role for the columns. When the report designer uses the lattice in a report, the class variables are assigned to the lattice roles. All class variables must come from a single data source. The number of rows and columns in the graph is determined by the unique values of the class variables.
- If you specify that the role is required, then a report designer must assign data to the role.

If this option is not selected, then report designers can choose whether to assign data to the role. In that case, it is possible for a graph object to have no lattice.

- Graph elements can be overlaid the same way they are overlaid in single-cell or user-defined multi-cell graphs. When the report designer adds a lattice to a report, the overlaid graph element is displayed in every cell.
- Properties that you specify for graph elements are applied to all of the cells of the graph object.

Create a Data-Driven Lattice

To create a data-driven lattice:

- 1 Create the graph object that you want as the basis for your lattice. For more information, see [“Build a Custom Graph Object” on page 580](#).
- 2 (Optional) On the **Role Definitions** tab, you can change the default role names to provide more meaningful names.
- 3 Specify the role for a class variable. In the **Data-Driven Lattice** section of the **Role Definitions** tab, click **Add Lattice Role**.

The Add Role window is displayed.

The **Data-Driven Lattice** section is not available in either of the following cases:

- the graph object already contains more than one cell
- a Color role with a Measure data type has been added to the bar chart, waterfall chart, or scatter plot

In addition, data-driven lattices do not allow graph elements to be overlaid unless their aggregations are compatible. Graph elements with compatible aggregations either perform no aggregation at all or they use the same set of shared Category roles.

- 4 For the **Role Type**, select **Row** or **Column** to specify the layout for the cells.
- 5 Specify a role name or use the default name.
- 6 Select the data type, or classification, for the role. For information about the data types, see [“Working with Data Items in a Report” on page 414](#).
- 7 (Optional) Select **Required** to require report designers to assign data to the role. If this option is not selected, then report designers can choose whether to assign data to the role. In that case, it is possible for a graph to have no lattice.

- 8 If the **Allow multiple data assignments** check box is available, then you can select or clear the check box. When this option is selected, the role can have more than one measure assigned. For example, in a line chart, if multiple columns are assigned to the Y axis, then the graph shows a line for each measure.
- 9 Click **OK**.

Repeat the previous steps to specify a second role. For example, if you specified a role for a multi-row layout, you can specify an additional role for columns.

Save a Custom Graph Object So It Appears in the Designer

Custom graph objects are saved when you select either **File ► Save** or **File ► Save As**. Graph objects that are saved in the **My Folder** location are automatically displayed in the list of **Custom** objects on the designer's **Objects** tab.

Graph objects that you save in public folders are not automatically displayed on the **Objects** tab. However, you can add the graph objects manually. For more information, see [“Add a Graph Object to the Designer’s Objects Tab” on page 594](#).

Add a Graph Object to the Designer’s Objects Tab

Custom graph objects that are saved in the **My Folder** location are automatically added to the designer's **Objects** tab. Custom graph objects that you save in public folders are not automatically displayed on the **Objects** tab. However, you can add the graph objects manually.

TIP All of the graph objects in the gallery are available in the designer. However, by default, not all of these graph objects are displayed on the designer's **Objects** tab.

Use the designer's Show or Hide Objects window to display any of these graph objects on the designer's **Objects** tab.

To add a graph object to the designer's **Objects** tab:

- 1 On the **Objects** tab in the designer, click , and select **Show or Hide Objects**. The Show or Hide Objects window is displayed.
- 2 Click **Select Custom**. The Choose an Item window is displayed.
- 3 Navigate to the graph object that you want to add.
- 4 (Optional) To search for a graph object, do the following:
 - a Click  in the toolbar. The Search window is displayed.
 - b Enter the name of the graph object that you want to find.
 - c Click **Search**.

TIP As an alternative, you can search for all graph objects. Specify **Graph template** for **Type**.

- 5 Select the graph object, and click **OK**.

The selected graph object is now displayed with a check mark in the Show or Hide Objects window.

- 6 Click **OK**. The **Objects** tab is updated.

Specify Your Preferences for the Graph Builder

To specify preferences that are specific to the graph builder:

- 1** In the graph builder, select **File ► Preferences** to open the Preferences window.
- 2** Select **SAS Visual Analytics Graph Builder**.
- 3** Select or deselect **Show template gallery at start-up**. The gallery contains predefined graph objects as templates from which you can build and customize custom graph objects.
- 4** Click **OK**.

To specify global SAS preferences, see [“Specify Global Preferences” on page 27](#). To specify general preferences for SAS Visual Analytics, see [“Specify the SAS Visual Analytics General Preferences” on page 28](#).

Change a Custom Graph That Has Been Saved

When you save a custom graph object, depending on where you save it, it might be immediately displayed on the **Objects** tab in SAS Visual Analytics Designer (the designer). For more information, see [“Save a Custom Graph Object So It Appears in the Designer” on page 594](#).

To change a graph that has been saved, do either of the following:

- Right-click the graph object in the designer, and select **Edit Custom Graph**.
- Select **File** ► **Open**, and then locate and open the file for your graph object.

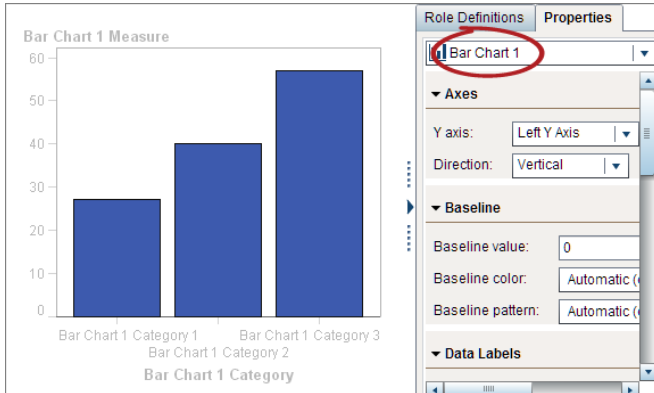

Note: Any changes that you make to the graph object do not appear in existing reports that were created from the original graph object. However, new reports that are created after a modified graph object has been saved reflect the changes to the graph object.

Select Components and Elements of a Graph Object

To change the properties of a graph element such as a bar chart, you must first select the graph element. Similarly, to change the properties of a legend or an axis, you must first select the component.

When you select a component in a graph object, the selected component is highlighted. The component is also displayed in the drop-down list at the top of the **Properties** tab. The available properties vary depending on the selected component.

The following display shows a highlighted bar chart. The **Properties** tab displays the properties for the bar chart, which is identified as **Bar Chart 1**.

TIP You can click  beside the drop-down list on the **Properties** tab, and then select the component that you want to modify.

Here are some suggestions for selecting graph elements:

- To select a line chart or a time series plot, click a data point on a line.
- To select the entire graph object, click above the graph element or cell area.
- To select a cell in a multi-cell graph object, click the background area just above the graph element. The cell is highlighted, and a tab appears in the upper left corner of the cell. From the cell's tab, you can delete and reorder graph elements. You can move graph elements to other cells.

In a multi-cell graph object, cells are identified by a combination of a letter and a number, such as A1, B1, A2, and so on. The letters identify columns and the numbers

identify rows. The following table represents the labeling for a multi-cell graph object that contains three columns and three rows:

A1	B1	C1
A2	B2	C2
A3	B3	C3

Change the Order of Graph Elements in a Cell

When you overlay a graph element on top of another, the graph elements are layered with the last one added on top. For example, suppose that you create a graph object with a line chart, and then you add a bar chart. Because the bar chart was added last, it appears in front of the line chart. Depending on the data that is assigned to the graph elements in the designer, the bar chart might obscure part of the line chart. You can reorder the graph elements so that the line chart appears in front of the bar chart.

To change the order of the graph elements in a cell:

- 1 From the drop-down list at the top of the **Properties** tab, select the cell that you want to change. Cells are identified by a combination of a letter and a number, such as A1, B1, A2, and so on. For more information, see [“Select Components and Elements of a Graph Object” on page 598](#).

In the **Graph Elements** area on the **Properties** tab, the graph elements in the cell are listed in the order in which they were added to the cell.

- 2 Drag a graph element to a new position.

Remove a Graph Element

To remove a graph element from a graph object, right-click the graph element, and select **Remove graph element name**.

Note: In a user-defined lattice, you can remove graph elements using the cell's tab. For more information, see [“Remove a Cell or a Graph Element in the Cell” on page 604](#).

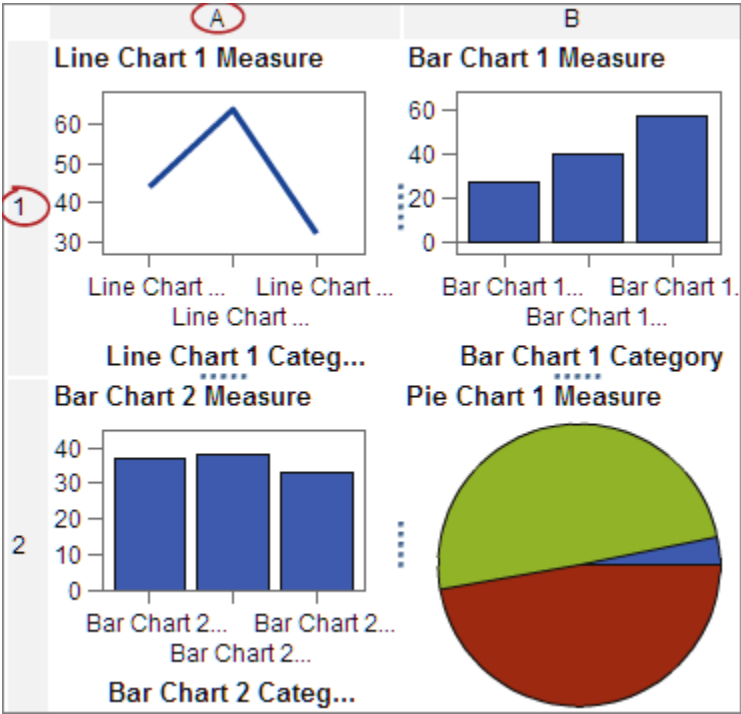

Working with User-Defined Lattices

About User-Defined Lattices

A user-defined lattice is a multi-cell graph in which each cell is created independently. And, each cell can contain different types of graph elements. Cells are aligned in rows and columns that you create by dragging and dropping graph elements.

The following example shows four cells arranged in two rows and two columns. Letters identify the columns and numbers identify the rows.

Display 44.1 User-Defined Lattice

When you select a cell, a tab appears in the upper left corner of the cell.

From the cell's tab, you can delete the cell and its contents by clicking . If you click , the graph elements in the cell are listed. From this list, you can delete and reorder the graph elements. You can move graph elements to other cells.

For more information about selecting cells and how they are labeled in the graph, see [“Select Components and Elements of a Graph Object” on page 598](#).

Move a Graph Element from One Cell to Another Cell

To move a graph element to a different cell:

- 1 Select the cell whose graph element you want to move. For more information, see [“Select Components and Elements of a Graph Object” on page 598](#).

- 2 In the cell's tab, click  to list the graph elements in the cell.

- 3 Drag and drop a graph element from one cell into the target cell.

You can also drag and drop the graph element so that it creates a new row or new column. For more information, see [“Add a Graph Element to a New Row or Column” on page 586](#).

Resize a Row or a Column

You can change the width of a column and the height of a row in a user-defined lattice. For example, you might want a particular column to be wider than the others.

To resize a row:

- 1 Select  between the row that you want to change and an adjacent row.
- 2 Drag the handle upward or downward to change the row height.

To resize a column:

- 1 Select  between the column that you want to change and an adjacent column.

- 2 Drag the handle left or right to change the column width.

Add a Row or a Column to a Lattice

To add a new row or column to a lattice, drag and drop a graph element to the location where you want the new row or column. For more information, see [“Add a Graph Element to a New Row or Column” on page 586](#).

You can also move a graph element from a row or column to another row or column. For more information, see [“Move a Graph Element from One Cell to Another Cell” on page 603](#).

Remove a Cell or a Graph Element in the Cell

You can remove a graph element from the cell. You can also remove the cell itself.

- 1 Select the cell.
- 2 To remove a graph element from the cell:
 - a Click  to list the graph elements in the cell.
 - b Click  next to the graph element.

You can also right-click the graph element, and select **Delete**.

- 3 To remove the cell, click  on the cell's tab.

The cell and its contents are removed. If the cell is the only cell in a row or column, then the respective row or column is removed as well.

Move or Delete a Row or a Column

In a graph, a heading contains a letter that identifies the column and a number that identifies the row.

From the headings, you can move and delete columns and rows. When you move a column or row, the column or row switches places with the adjacent column or row. For example, if you move column B to the left, column B switches places with column A.

To move or delete a column or row:

- 1 Select the graph.
- 2 Position the cursor over a heading. A button and arrows are displayed on the heading.

The following example shows a column heading that contains a button to delete the column and arrows to move the column. The button to move the column to the right is unavailable.

- 3 To delete the column or row, click **X**.
- 4 To move the column or row, click an arrow.
 - Click **<** or **>** to move a column left or right.
 - Click **▲** or **▼** to move a row up or down.

Some arrows might not be available. For example, the rightmost column can be moved only to the left, as is the case in the previous example. Only **<** is available for the column.

Working with Properties

About Properties

The **Properties** tab lists the properties for the selected graph component. Components that have properties include graph elements, cells, axes, legends, and the entire graph. Properties enable you to control the overall appearance of your graph, from the graph's background color to the tick value interval on the axis. Report designers can override some properties in their report.

To change the properties for a graph object, cell, graph element, legend, or one or more axes, select the item, and make your changes on the **Properties** tab.

See Also

[“Select Components and Elements of a Graph Object” on page 598](#)

About Style Properties

The color schemes and visual attributes for a graph come from the active report theme, which is a named collection of style elements. Each style element contains attributes such as fill color, marker symbol, line style, font face, and many others. Each part of a graph element, such as a marker, a bar, a line, or a label, derives its visual attributes from a specific style element from the active report theme. Similarly, the attributes for axes and legends come from a style element.

The style elements are developed to produce effective graphics without changing the default settings. However, you can change the default settings by changing style properties on the **Properties** tab. When you specify a style property, such as a color or font style, you are changing the style element that is applied to the graph component.

The following display shows the available style elements for bar chart labels. The list of style elements is displayed when you click ▼ beside the **Data label font color** drop-down list on the **Properties** tab.

Each color is shown in the list beside its style element. **Automatic** indicates the default value for the graph element. **Automatic** enables the graph element to cycle through a list of colors provided for group colors and multi-response colors.

Visual attributes that are referenced by a style element provide consistency within the report theme. If you later change the report theme, the graph element is compatible with the new theme. In addition, some of the properties that you specify can be overridden by report designers when they use your graph objects in their reports.

Create an Overview Axis

The overview axes that you create in the graph builder are similar to the overview axes that you create in the designer. In addition, you can do the following:

- select specific graph elements from the main graph to show in the overview axis
- select completely different graph elements from the main graph to show in the overview axis

To create an overview axis:

- 1 Drag and drop a graph element from the **Graph Elements** pane onto the canvas.
You can drag and drop another graph element to create an overlay. However, do not create a new cell for this additional graph element. You cannot create an overview axis when the graph object contains more than one cell.
- 2 Select the graph object.
- 3 On the **Properties** tab, select the **Show overview axis** check box.

The graph object displays the overview axis beneath the existing graph elements. By default, the existing graph elements are displayed in the overview axis, as shown in the following example:

- 4 To display different graph elements in the overview axis, do the following:
 - a On the **Properties** tab, select **Specify graph elements** from **Contents**.
 - b Drag and drop one or more graph elements from the **Graph Elements** pane onto the overview axis area of the canvas.
 The graph element names that you added are displayed in the **Graph elements** section on the **Properties** tab.
 - c If you added more than one graph element to the overview axis area, you can change the order of the graph elements by dragging and dropping a graph element to a different position.

Understanding and Changing Attribute Rotation

When you apply a group role to your graph element, by default, the graph builder rotates through predefined style elements to determine how to present each unique

group value. This type of rotation also occurs when multiple response roles are assigned to the graph element or when graph elements are overlaid.

When the graph element is rendered, the attributes for colors, line patterns, and marker symbols are rotated for the values in your group. Whether you change the attributes or keep the default attribute values, the manner in which the attributes are combined is determined by the attribute rotation priority.

To change the attribute rotation priority:

- 1 Select the graph object. For more information, see [“Select Components and Elements of a Graph Object” on page 598](#).
- 2 On the **Properties** tab, select an option from **Attribute rotation priority**.

You have two options for the attribute rotation priority:

Rotate color only until all colors used	attributes such as marker symbols and line patterns are held constant while each color in the list is applied exhaustively to the graph element.
Rotate all attributes	each attribute rotates through its own list to generate a unique combination for each group value. Attributes include colors, marker symbols, line patterns, and so on.

For example, the following figure shows an example rotation for an age grouping. The dotted-line pattern is held constant while red, green, and blue colors are applied to the dotted lines for the consecutive age group values. If there are more group values, red, green, and blue colors are applied to the solid lines.

If you change the rotation pattern, and specify **Rotate all attributes** for the attribute rotation priority, the contrasting colors and line patterns are rotated at the same time.

A red dotted-line pattern is applied to the first group crossing. Then, a green solid-line pattern is applied to the second crossing, a blue dotted-line pattern is applied to the third crossing, and so on.

Sharing Data Roles

About Shared Data Roles

If your graph object contains multiple graph elements, you can specify that some data roles be shared across two or more graph elements. You share data roles when you want the graph elements to use the same data role for either of their axes. When report designers who use the graph object in their reports assign roles, a single data column is assigned to all roles that use the shared role.

Note: If the graph element types are compatible, overlaid graph elements are automatically assigned a shared role. (See [“Incompatible Graph Elements”](#) on page 589.) You can unshare a role if needed.

Shared roles are very useful in user-defined lattices. They enable you to manage data roles across columns and rows. For example, you might share data roles if you want to analyze relationships in your data.

In this example, the X axis of the scatter plot shares a role with the Measure axis of the bar chart.

When the graph object is used in the designer, the data might be applied as shown in the following example.

The bar chart shows engine sizes for different regions of the world. (The engine size has been changed from a Sum to an Average measure.) The scatter plot shows the miles-per-gallon trend for the different engine sizes.

Share or Unshare a Data Role

To share a data role, on the **Role Definitions** tab, click ▼ next to the role that you want to share. Select **Create Shared Role With Another Role** ► **Name of Role**.

You can also click **Add Shared Role**, and then create and share the data role.

To unshare a data role, click ▼ next to the shared role, and select **Unshare**.

Example: Data-Driven Lattice

About the Data-Driven Lattice Example

This example shows the sales for a line of retail products over a period of time. The custom graph object specifies a row-based lattice in which the rows correspond to the corporate divisions that are responsible for the sales. The corporation has two divisions, resulting in a graph with two rows.

Display 45.1 Example Data-Driven Lattice

Build the Graph Object for the Data-Driven Lattice Example

- 1 In the graph builder, drag and drop a line chart from the **Graph Elements** pane onto the canvas.
- 2 On the **Role Definitions** tab, click ▼ next to **Category**, and select **Edit Role**. The Edit Role window is displayed.
- 3 Select **Datetime** for **Classification**.
Click **OK**.

Specifying **Datetime** forces the report designer to assign date and time data to the Category role.

- 4** Specify the role to which a class variable is assigned.
 - a** In the **Data-Driven Lattice** section on the **Role Definitions** tab, click **Add Lattice Role**. The Add Role window is displayed.
 - b** Select **Row** for **Role Type**.
 - c** Select **Category** for **Classification**.
 - d** Select **Required**. With this option selected, the report designer must assign data to this role to render the report with data assigned.
 - e** Click **OK**.
- 5** Save the graph object. See [“Save a Custom Graph Object So It Appears in the Designer” on page 594](#).

Example: User-Defined Lattice (Butterfly Chart)

About the User-Defined Lattice Example

This example uses a butterfly chart to show the actual sales compared to the predicted sales for a line of retail products. The butterfly chart is useful for comparing two unique values. In this chart, the two values are arranged on each side of the Y axis.

Display 45.2 Example User-Defined Lattice

Build the Graph Object for the User-Defined Lattice Example

TIP As a shortcut, you can select a butterfly chart from the graph gallery.

- 1 In the graph builder, drag and drop a bar chart from the **Graph Elements** pane onto the canvas.
- 2 Drag and drop a second bar chart from the **Graph Elements** pane onto the left edge of the canvas. This action creates a new column for the second bar chart.
- 3 Share the category roles. On the **Role Definitions** tab, click ▼ next to the **Category** for either bar chart. Select **Create Shared Role With Another Role** ► **Other graph element**.

The Add Shared Role window is displayed.

Click **OK**.

4 Change both bar charts to a horizontal layout.

- a** Select a bar chart.
- b** On the **Properties** tab, click ▼ next to **Direction**, and select **Horizontal**.
- c** Repeat the previous two steps for the other bar chart.

5 Specify a uniform column and row axis.

- a** Select the full graph. (**Custom Graph** should be displayed on the **Properties** tab).
- b** On the **Properties** tab, click ▼ next to **Y axis range (left axis only)**, and select **Same within each row**.
- c** On the **Properties** tab, click ▼ next to **X axis range**, and select **Same for all cells**.

The bar charts should resemble the following:

6 Reverse the order of the X (Measure) axis for the left bar chart.

- a Click the horizontal axis for the left bar chart.
- b On the **Properties** tab, select **Reverse order**.

The bar charts resemble the following:

- 7 Change the color of the right bar chart to distinguish it from the left bar chart.
 - a Select the right bar chart.
 - b On the **Properties** tab, click ▼ next to **Fill color**, and select **Data color 3**. The right bar chart changes to a different color. In the default theme, the color is deep red.
- 8 Display the grid lines for the X axes.
 - a Click the horizontal axis for the left bar chart.
 - b On the **Properties** tab, select **Show grid lines**.
 - c Repeat the previous two steps for the right bar chart.
- 9 Save the graph object. See [“Save a Custom Graph Object So It Appears in the Designer” on page 594](#).

The final graph object, complete with the legend, resembles the following:

Example: Filled Overlay

About the Filled Overlay Example

This example uses two time series plots to show actual sales compared to predicted sales for a line of retail products. The graph is enhanced by applying a filled area to one of the overlaid plots.

Display 45.3 Example Filled Overlay

Build the Graph Object for the Filled Overlay Example

- 1 In the graph builder, drag and drop a time series plot from the **Graph Elements** pane onto the canvas.
- 2 Drag and drop a second time series plot from the **Graph Elements** pane onto the first time series plot. This action creates an overlaid plot.

Note: When you overlay the plots, the Time role is automatically shared between the plots.

- 3 Specify a fill area for the first time series plot.
 - a Select the first time series plot. (On the **Properties** tab, the plot might be identified as Time Series Plot 1.)
 - b On the **Properties** tab, click ▼ next to **Grouping style**, and select **Overlay Filled**.
 - c Click ▼ next to **Fill color**, and select **Prediction limits color**.

- 4 Save the graph object. See [“Save a Custom Graph Object So It Appears in the Designer” on page 594](#).

Example: Vector Plot

About the Vector Plot Example

This example uses a vector plot to show the changes in SAT exam scores for different North Carolina school systems from 2012 to 2013. The graph is enhanced by adding bubble plot overlays.

Here are the main features of this graph:

- Vector lines show the changes in the average math and writing scores between 2012 and 2013.
- Bubbles represent the average score for each year. The size of the bubble represents the number of students who took the test.
- To modify the appearance, the arrow line thickness was reduced and the transparency for the bubbles was increased. In addition, grid lines and a sheen data skin were applied to the graph. (These changes were made in the designer.)
- To reduce the number of school systems for comparison, a filter was applied in the designer on the School System Name category.

Display 45.4 Example Vector Plot with Bubble Plots

Build the Graph Object for the Vector Plot Example

TIP As a shortcut, you can select a bubble change plot from the graph gallery.

- 1 In the graph builder, drag and drop a vector plot from the **Graph Elements** pane onto the canvas.
- 2 Drag and drop a bubble plot from the **Graph Elements** pane onto the vector plot.
- 3 Drag and drop a second bubble plot from the **Graph Elements** pane onto the vector plot.
- 4 On the **Role Definitions** tab, share the roles. This action joins the vector origin point to the first bubble, and the vector termination point to the second bubble.
 - a Click ▼ next to the **Bubble Plot 1 X** role. Select **Create Shared Role With Another Role** ► **Vector Plot 1 X Origin**.

In the Add Shared Role window, specify **Xstart** as the name of the shared role. Click **OK**.

- b** Click ▼ next to the **Bubble Plot 1 Y** role. Select **Create Shared Role With Another Role ► Vector Plot 1 Y Origin**.

In the Add Shared Role window, specify **Ystart** as the name of the shared role. Click **OK**.

- c** Click ▼ next to the **Bubble Plot 2 X** role. Select **Create Shared Role With Another Role ► Vector Plot 1 X**.

In the Add Shared Role window, specify **Xend** as the name of the shared role. Click **OK**.

- d** Click ▼ next to the **Bubble Plot 2 Y** role. Select **Create Shared Role With Another Role ► Vector Plot 1 Y**.

In the Add Shared Role window, specify **Yend** as the name of the shared role. Click **OK**.

5 On the **Role Definitions** tab, add a group role to all three plots.

- a** In the **Bubble Plot 1** section, click **Add Role**. The Add Role window is displayed. The **Group** type is selected by default.

Click **OK**.

- b** Repeat the previous step for the **Bubble Plot 2** section.

- c** In the **Vector Plot 1** section, click **Add Role**. The Add Role window is displayed. Select **Group** for the type of role. Click **OK**.

6 Share the **Group** role among all three plots.

- a** In the **Bubble Plot 1** section, click ▼ next to the **Group** role. Select **Create Shared Role With Another Role ► Bubble Plot 2 Group**.

In the Add Shared Role window, specify **Color** as the name of the shared role. Click **OK**.

- b** In the **Vector Plot 1** section, click ▼ next to the **Group** role. Select **Use Shared Role ► Color**.
- 7** Specify that the plots start with the same color.
 - a** On the **Properties** tab, select **A1** (the cell).
 - b** Click ▼ next to **Overlaid plot colors**, and select **All graphs start with the same color**.
- 8** Remove redundancy from the legend.
 - a** On the **Properties** tab, select the **Discrete Legend**.
 - b** In the **Display in legend** box, deselect the **Vector Plot 1** and the **Bubble Plot 2** check boxes.
- 9** Specify the bubble size. This is an optional change made only to improve the appearance of the bubble sizes with respect to the vector lines.
 - a** On the **Properties** tab, select **Bubble Plot 1**.
 - b** Next to **Radius of smallest bubble (pixels)**, enter the number **5**.
 - c** Next to **Radius of largest bubble (pixels)**, enter the number **12**.
 - d** Repeat the previous steps for Bubble Plot 2.
- 10** Save the graph object. See [“Save a Custom Graph Object So It Appears in the Designer” on page 594](#).

Viewing Reports

Chapter 46

Viewing Reports on a Mobile Device **627**

Chapter 47

Viewing Reports in SAS Visual Analytics Viewer **631**

46

Viewing Reports on a Mobile Device

<i>Open the App for the First Time</i>	627
<i>Add a Server Connection for iPad</i>	628
<i>Add a Server Connection for Android</i>	629

Open the App for the First Time

You can use the SAS Mobile BI for iPad or Android app to view SAS Visual Analytics reports on your mobile device. The SAS Mobile BI for iPad app is available in the iTunes App Store. The Android app is available from Google Play.

When you open either app for the first time, sample reports are available in the portfolio. The app provides online Help for using SAS Mobile BI. The online Help also provides access to tutorial videos about how to use the app.

Most servers require that you provide security credentials before you can connect and access reports. However, an organization can set up a server that accepts guest connections. A guest connection does not require security credentials. A guest connection enables you to access reports that an organization has made available to the public.

Add a Server Connection for iPad

To access your organization's library server, you must add a connection to that server. If your organization has more than one server, you can add connections to additional servers the same way.

Note: Contact your SAS Visual Analytics system administrator for your user ID, password, and server information.

To connect to a server:

- 1 Tap  in the bar at the bottom of the portfolio or library.
- 2 Tap **Add Connection**.
- 3 In the **Domain** field, enter the address of the new server.
- 4 In the **Port** field, enter the port number for the new server.
- 5 Tap the **Secure connection** switch if the server requires a secure connection (SSL).
- 6 Tap **Next** to verify the connection.

Note: If the connection fails, a message appears to help you correct the problem.
- 7 If the server provides guest access, the **Log on as guest** switch appears. Tap the **Log on as guest** switch to access the server without providing credentials.
- 8 If a server requires security credentials to access reports:
 - a In the **User ID** field, enter your user ID.
 - b In the **Password** field, enter your password.
- 9 (Optional) In the **Description** field, customize the description for the new connection.

Note: If you delete the default description, you must enter a new description. The field cannot be blank.

10 Tap **Next** to verify your access to the server.

Note: If the verification fails, a message appears to help you correct the problem.

The connection is saved, and the Add Connection window closes.

Note: Information about available reports is automatically downloaded and appears in the library.

Add a Server Connection for Android

To access your organization's library server, you must add a connection to that server. If your organization has more than one server, you can add connections to additional servers the same way.

Note: Contact your SAS Visual Analytics system administrator for your user ID, password, and server information.

To connect to a server:

- 1** Tap  to open the navigation drawer.
- 2** Tap **Settings**.
- 3** Tap **Add Connection**.
- 4** In the **Host** field, enter the address of the new server.
- 5** In the **Port** field, enter the port number for the new server.
- 6** Tap **Secure connection** if the server requires a secure connection (SSL).
- 7** Tap **Next** to verify the connection.

Note: If the connection fails, a message appears to help you correct the problem.

8 If the server provides guest access, **Log on as guest** appears. Tap **Log on as guest** to access the server without providing credentials.

9 If the server requires security credentials to access reports:

a In the **User ID** field, enter your user ID.

b In the **Password** field, enter your password.

10 (Optional) In the **Description** field, customize the description for the connection.

Note: If you delete the default description, you must enter a new description. The field cannot be blank.

11 Tap **Next** to verify your access to the server.

Note: If the verification fails, a message appears to help you correct the problem.

12 Tap **OK**.

The connection is saved, and the Add Connection window closes.

Note: If the connection fails, tap **Edit** to make corrections.

Note: Information about available reports is automatically downloaded and appears in the library.

<i>About Guest Access in the Viewer</i>	638
<i>Specify Your Preferences for the Viewer</i>	638

Overview of Viewing Reports in SAS Visual Analytics Viewer

As an alternative to viewing reports on a mobile device, you can use the web viewer. For users with a Report Viewing role, the SAS Visual Analytics Viewer (the viewer) enables them to view report content.

Open a Report in the Viewer

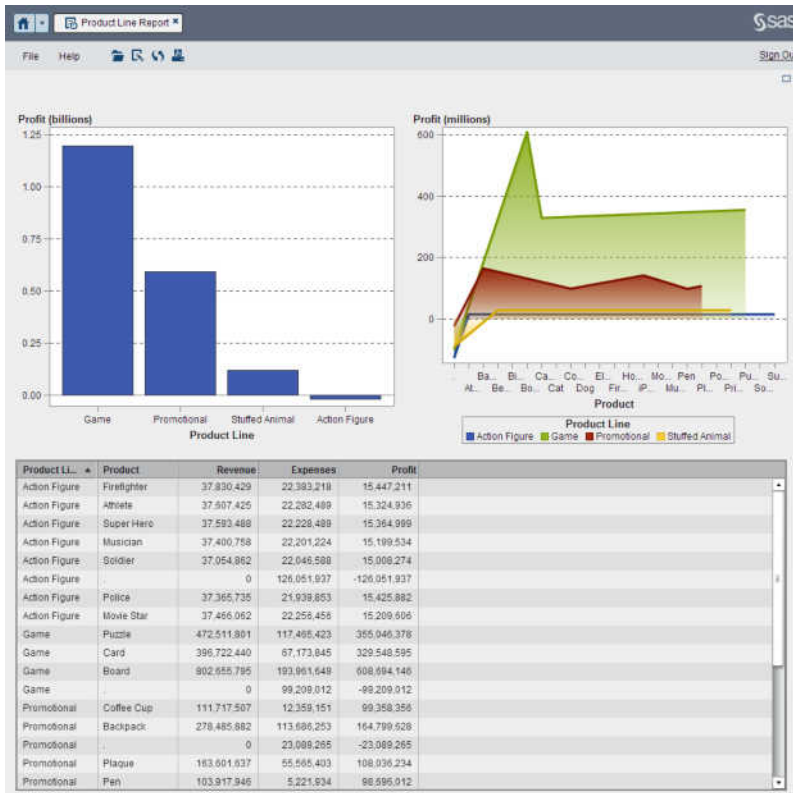

To open a report in the viewer:

- Click on a report on the SAS Visual Analytics home page.
- Use the object inspector on the home page to view details about the report, and then click **View**. For more information about the object inspector, see [“Discover Details Using the Object Inspector on the Home Page” on page 23](#).

The layout of the tiles in the treemap is dependent on the size of the display area. This means that the same treemap might appear slightly different in the viewer than it does in SAS Visual Analytics Designer (the designer) or on a mobile device.

Here is an example of a report in the viewer:

Display 47.1 A Report in the Viewer

If you have the Create Report capability, then you can select **File ► Edit Report** in the current report. The designer is displayed, and then you can edit the report.

You can share reports with other users. For information about sending reports to other users, see [“E-mail a Report” on page 556](#). You can also print reports. For information about prerequisites and conditions for printing, see [“Printing a Report” on page 558](#).

View Report Object Information

You can select a report object to display icons that provide more information about that report object. Depending on which type of report object you select, you might see the following icons:

Icon	Description
	Click to display the title and description of the report object.
	Click to maximize the report object. This icon is displayed only if there is more than one report object being displayed.
	Click to restore the report object to its original size. This icon is displayed only if you previously maximized the report object.
	Click to display incoming filter information for a report object. This icon is displayed only if the data for the report object has been filtered as a result of selecting data in another report object.
	Click to display the prompt dialog box for a stored process. This icon is displayed only for prompted stored processes. You can use the prompt dialog box to change prompt values for a stored process and to re-execute the stored process.

Note: Report authors can disable object selection, so you might not be able to select some report objects.

Add Comments to a Report in the Viewer

If you have the Add Comments capability, then you can add or view comments. Comments can be added to a report or to an object within a report. The comments that you add are automatically saved with the report.

To add a comment to a report or to an object within a report:

- 1 Expand the right pane. Click the **Comments** tab. (If you are adding a comment to a report object, then select the report object.)
- 2 Enter a topic name and a comment.

Here is an example:

Display 47.2 Adding Comments in SAS Visual Analytics Viewer

The screenshot shows a dialog box titled "Comments: Report 1" with three tabs: "Properties", "Comments", and "Alerts". The "Comments" tab is active. Inside the dialog, there is a search bar with the placeholder text "Search within comments". Below the search bar, it says "No comments were found." There are two text input fields: the first contains "2013 Data" and the second contains "When will third quarter data be added?". At the bottom left is a paperclip icon for attaching files. At the bottom right are "Post" and "Cancel" buttons.

- 3 (Optional) Click  to attach a file to your comment.
- 4 Click **Post** to add your comment. Your comment is added to the **Comments** tab in the right pane.

To respond to an existing comment:

- 1 Expand the right pane. Click the **Comments** tab. Select an existing comment, and then enter a reply.
- 2 (Optional) Click  to attach a file to your reply.
- 3 Click **Post**. Your reply is added to the **Comments** tab in the right pane.

Note: To edit another user's comments or to delete comments, you must have the **Comments:Administrator** predefined role.

To search for a comment:

- 1 Expand the right pane. Click the **Comments** tab. Enter the word or phrase that you want to search for in the **Search within comments** field on the **Comments** tab.
- 2 (Optional) To clear the **Search within comments** field, click .

Interacting with Reports in the Viewer

Filter, Brush, and Drill in Reports

Depending on the interactions that were defined by the report designer, you might be able to interact with your report in the following ways:

filter

restricts the data that is returned from a query to a data source. Click on data in the source report object to filter data in the target report object (or objects). Clicking on different data applies the filter based on the new data. To clear the selection, click in the white space that surrounds the source report object.

brush

enables you to show the same data selected simultaneously in two or more tables, graphs, or both. Click on data in the source report object to brush data in the target report object (or objects). To clear the selection, click in the white space that surrounds the source report object.

drill down

enables you to move from summary information to more detailed data. If the data contains hierarchies, you can double-click on the data to drill down the hierarchy into detailed information. When you drill down the hierarchy, breadcrumbs at the top of the report object enable you to drill back up the hierarchy.

View Links in Reports

Report objects can link to other report sections or whole reports. And, they can link to external links. To view a link from a report object, double-click on the report object. If there are multiple links or interactions from a report object, then a list appears that enables you to select a link or interaction. When you are viewing a link, the following buttons are displayed in the top left corner: .

If a report object that you are linking to shares a data source with the current report object, then the target report object is filtered based on the data value that you double-clicked. If you do not want the target report object to be filtered, you can click , and deselect **Apply report link filters**. If the data source is not shared between the two report objects, then no additional filtering takes place in the target report object.

To go back to the original report object, click .

A report object, text, or image can link to an info window within the same report. The info window provides additional information. For example, a list table might provide additional information for a bar chart. Or, there might be additional text about what is displayed in a report object. When you double-click the data (for example, a bar, a bubble, a pie slice, a table row, and so on) in a report object that has an info window link, the info window is displayed as a new window.

Subscribe and Unsubscribe to Alerts

You can subscribe to existing alerts for report objects and receive notifications when the alert criteria is met.

To subscribe or unsubscribe to alerts for a report object:

- 1 Expand the right pane. Click the **Alerts** tab. This tab contains a list of all alert conditions for all report objects within the report.

- 2 Select or deselect the **Subscribe** check box next to an alert to subscribe or unsubscribe to that alert.

TIP You can specify a preference for receiving notifications via e-mail or text message. For more information, see “Specify General Preferences for the Designer” on page 341.

About Guest Access in the Viewer

SAS Visual Analytics system administrators can configure support for guest access. Users with guest access can access only the SAS Visual Analytics home page and the viewer. Guest access uses a shared account, so it does not provide individualized features, such as history, favorites, preferences, or alerts. If guest access is configured, it is available at a special URL such as `http://host/SASVisualAnalyticsViewer/guest.jsp`

Accessing SAS Visual Analytics as a guest is useful if you do not have a metadata identity. This enables you to view reports that are widely available under a generic, shared account. You can also view reports that are available to the public on the Internet.

Note: Some features such as comments and alerts are not available with guest access.

Specify Your Preferences for the Viewer

To specify preferences that are specific to the viewer:

- 1 Select **File ► Preferences** to open the Preferences window.
- 2 Select **SAS Visual Analytics Viewer**.
- 3 If the **SAS High Contrast** theme is selected as a global preference, then you can select the **Override report theme when High Contrast Theme is selected** check

box to ensure that reports are displayed using the SAS High Contrast theme. This overrides any theme settings that are made in the designer.

4 Click **OK** to apply your changes.

To specify your preferences for receiving notifications, see [“Specify General Preferences for the Designer” on page 341](#). To specify general preferences for SAS Visual Analytics, see [“Specify the SAS Visual Analytics General Preferences” on page 28](#). To specify global SAS preferences, see [“Specify Global Preferences” on page 27](#).

Appendix 1

Keyboard Shortcuts for SAS Visual Analytics

The following table contains many of the keyboard shortcuts for SAS Visual Analytics. In SAS Visual Analytics, some shortcuts are displayed within parentheses in tooltips and menu item labels. Some are also displayed in the Keyboard Shortcuts window (press F9 to open that window).

Note: When you use a keyboard shortcut to activate a button, move the focus to the field or section that the button is associated with before you use the keyboard shortcut. For example, if a table has an associated Help button, you must first move the focus to the table before you press Ctrl+?.

Table A1.1 Keyboard Shortcuts

Action	Keyboard Shortcut
Open the Keyboard Shortcuts window.	F9 Note: The Keyboard Shortcuts window might not contain all of the shortcuts for your application.
Open a Help pop-up window from the Help button.	Ctrl+? Note: This shortcut does not work on some keyboards (for example, the Italian keyboard).
Zoom in.	Ctrl+plus sign
Zoom out.	Ctrl+minus sign

Action	Keyboard Shortcut
Reset the zoom state.	Ctrl+0
Maximize view (collapses the category pane and the tile pane and hides the status bar and the application bar, which includes the menu bar). or Exit maximized view (expands the category pane and the tile pane and shows the status bar and the application bar).	Ctrl+Alt+Shift+M
Open a pop-up menu.	Shift+F9 (if a menu is available in that context) Note: If you use Shift+F9 to display the pop-up menu, then it is always displayed in the top left corner of the user interface control that you are using.
Open the Landmarks window.	Ctrl+F6
Temporarily invert or revert application colors (for the current session only). Note: You can set the Invert application colors preference in the Preferences window if you want the color change to persist across sessions.	Ctrl+~
Rename the selected tab.	Make sure that the focus is on the tab. Press F2, and specify the new name. To commit your changes, press Enter. To cancel your changes, press Esc.
Close the selected tab.	Make sure that the focus is on the tab, and then press Delete. Note: Some tabs cannot be closed.
Switch in and out of Edit mode for a table cell.	To enter Edit mode, select a cell, and press F2. To exit Edit mode, press Esc.

Action	Keyboard Shortcut
Navigate between table headings and table content.	<p>For a two-dimensional table, make sure that the focus is on the table and that you are not in Edit mode. Press Ctrl+F8 to switch the focus between column headings and table cells. Use the arrow keys to navigate from heading to heading.</p> <p>For a multidimensional table, make sure that the focus is on a table cell and that you are not in Edit mode. Press Ctrl+F8 to switch the focus between column headings, row headings, and table cells. Use the arrow keys to navigate from heading to heading.</p>
Navigate the content rows of a table.	<p>When table cells are in Edit mode:</p> <ul style="list-style-type: none"> ■ Press Tab and Shift+Tab to move from cell to cell horizontally across columns. ■ Press Enter and Shift+Enter to move from cell to cell vertically across rows. <p>When table cells are not in Edit mode, use the arrow keys to move from cell to cell.</p>
Sort columns in a table.	<p>To sort a single column, navigate to its column heading (press Ctrl+F8). Press the spacebar to sort the column.</p> <p>To sort additional columns, navigate to the column heading of each additional column that you want to sort. Press Ctrl+spacebar.</p>
Change the width of the current column.	<p>Navigate to the column heading (press Ctrl+F8). Then, press Ctrl+left arrow or Ctrl+right arrow to change the width of the column.</p>
Move the current column.	<p>Navigate to the column heading (press Ctrl+F8). Then, press Shift+left arrow to move one column to the left, and press Shift+right arrow to move one column to the right.</p>
Automatically re-size the current column to fit its contents.	<p>Navigate to the column heading (press Ctrl+F8). Then, press Enter.</p>

Action	Keyboard Shortcut
Open a drop-down list or drop-down menu.	Make sure that the focus is on the control, and press Ctrl+down arrow.
Exit a single application in the SAS Visual Analytics home page.	Tab to the application's button at the top of the browser window, and press Delete.

Tables

List Tables

A *list table* is a two-dimensional representation of data in which the data values are arranged in unlabeled rows and labeled columns. List tables can use any data items from a data source. A list table cannot use a hierarchy or a percentage of subtotals.

Display A2.1 A List Table

Product Line	Revenue	Expenses	Profit ▼	Profit Trend
Game	1,671,890,035	477,809,929	1,194,080,107	
Promotional	813,699,290	223,822,374	589,876,916	
Stuffed Animal	276,990,966	159,548,680	117,442,285	
Action Figure	262,318,761	281,390,254	-19,071,493	

Crosstabs

A *crosstab* (also known as a crosstabulation table) shows an aggregate metric for the intersections of two or more categories. Crosstabs often have two or more categories assigned to both the rows and columns, forming a matrix. Crosstabs can be easier to read than list tables because they often use less space, and they always collapse repeating values for outer category data items into one unique value, which is known as grouping. A crosstab can use a hierarchy.

Display A2.2 A Crosstab

Date by Year ▲			2011	
Product Brand ▲	Product Line ▲	Product ▲	Expenses	Profit
Toy	Action Figure	Novelty	11,364,256	13,791,102
		.	8,891,742	-8,891,742
		Athlete	1,252,738	572,411
		Firefighter	1,246,746	582,670
		Movie Star	1,206,759	593,903
		Musician	1,182,406	563,443
		Police	1,160,948	528,432
		Soldier	1,192,423	536,218
		Super Hero	1,197,047	578,688
	Game		21,023,666	49,058,060
	Stuffed Animal		5,839,582	2,054,767

Graphs, Charts, and Plots

Bar Charts

A *bar chart* consists of vertical or horizontal bars that represent quantitative data. Use bar charts to compare data that is aggregated by the distinct values of a category.

You can apply grouping and create data-driven lattices. You can filter or rank your data based on a specified number of top or bottom values.

Display A2.3 A Bar Chart

Targeted Bar Charts

A *targeted bar chart* is a variation of the bar chart that has target values. A target value is represented as a triangle with a line at the target value that is determined by the target role.

Display A2.4 A Targeted Bar Chart

Waterfall Charts

A *waterfall chart* (also known as a progressive bar chart) shows how the initial value of a measure increases or decreases during a series of operations or transactions. The first bar begins at the initial value, and each subsequent bar begins where the previous bar ends. The length and direction of a bar indicate the magnitude and type (positive or negative, for example) of the operation or transaction. The resulting chart is a stepped bar showing how incremental changes lead to the final value of the measure.

Display A2.5 A Waterfall Chart

Line Charts

A *line chart* shows the relationship of one or more measures over some interval, such as time or a series of ranges. You can measure a single measure (univariate analysis), or you can show the relationships among multiple measures (multivariate analysis), such as the leading or lagging relationship between advertising and sales over time. The category on the X axis of a line chart is discrete; the category on the X axis of a time series plot is continuous.

You can apply grouping and create lattices.

Display A2.6 A Line Chart

Pie Charts

A *pie chart* displays a part-to-whole relationship in a circle divided into multiple slices for each value of a category data item based on a single measure data item. Each slice represents the relative contribution of each part to the whole. In a pie chart, the legend is sorted by contribution.

In SAS Visual Analytics Designer (the designer), a pie chart does not show a slice with a missing or zero response.

Effective pie charts limit the number of slices to 5 or 6. In the designer, you can use a rank to reduce the number of slices in a pie chart. For more information, see [“Add a New Rank” on page 538](#).

Note: The Other slice does not display data tip values. In addition, the Other slice always sums the included values, regardless of the aggregation method selected for the measure. For example, if the aggregation method selected is Count, then the Other slice displays the sum of the individual counts.

Display A2.7 A Pie Chart

Scatter Plots

A *scatter plot* is a two-dimensional plot that shows the relationship of two measure data items. Each marker (represented by a symbol such as a dot, a square, or a plus sign) represents an observation. The marker's position indicates the value for each observation. Use a scatter plot to examine the relationship between numeric data items. You can apply grouping by assigning a category to the **Color** role.

Scatter plots do not use aggregated data.

Display A2.8 A Scatter Plot

Time Series Plots

A *time series plot* shows an ordered sequence of values that are observed at equally spaced time intervals. A time series plot requires a date, datetime, time, or hierarchy data item that is continuous on the X axis.

Display A2.9 A Time Series Plot

Comparative Time Series Plots

Note: This graph object is not displayed in the designer by default. You can select what you want to display using the designer’s Show or Hide Objects window.

A *comparative time series plot* uses line segments to chart two measures on different scales over time. A comparative time series plot requires a date, datetime, time, or hierarchy data item that is continuous on the X axis. The X axis is shared across both plots.

Display A2.10 A Comparative Time Series Plot

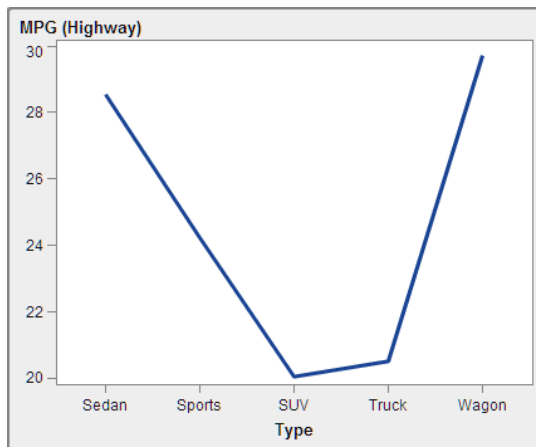

Series Plots

Note: You must create and save this custom graph object in the SAS Visual Analytics Graph Builder (the graph builder) before the object is available for use in reports.

A *series plot* displays a series of line segments that connect observations of input data. A series plot can use numeric or character data on the X axis.

The following example shows MPG averages for different types of vehicles:

Display A2.11 A Series Plot

Numeric Series Plots

Note: This graph object is not displayed in the designer by default. You can select what you want to display using the designer's Show or Hide Objects window.

A *numeric series plot* shows the relationship of one or more measures across a series of numeric values. A numeric series plot requires numeric data on the X axis.

Display A2.12 A Numeric Series Plot

Bubble Plots

A *bubble plot* is a variation of a scatter plot in which the markers are replaced with bubbles. A bubble plot displays the relationships among at least three measures. Two measures are represented by the plot axes, and the third measure is represented by the size of the bubbles. Each bubble represents an observation. A bubble plot is useful for data sets with dozens to hundreds of values. You can add categories to the **Grouping** and **Lattice** roles.

Note: A bubble's size is scaled relative to the minimum and maximum values of the size variable. The minimum and maximum sizes are illustrated in the plot legend. The actual value for each bubble is displayed as a data tip. For example, the legend that is displayed in [Display A2.13 on page 658](#), the minimum size is 1.3 and the maximum size is 8.3.

Display A2.13 A Bubble Plot**Bubble Change Plots**

Note: This graph object is not displayed in the designer by default. You can select what you want to display using the designer's Show or Hide Objects window.

A *bubble change plot* shows changes in two sets of measures using bubbles and directed line segments.

Display A2.14 A Bubble Change Plot

Treemaps

A *treemap* displays your data as a set of rectangles (called tiles). Each tile represents a category node or a hierarchy node. The color of each tile represents the value of the first measure. The size of each tile represents the value of the second measure. (There are two data roles for measures in a treemap—**Size** and **Color**.) For example, a sales data treemap might have tile sizes that represent the number of orders, and it might have tile colors that are derived from color gradients that represent sales.

The layout of the tiles in the treemap is dependent on the size of the display area because it uses a space-filling algorithm to lay the tiles down. This means that the same treemap might appear slightly different in the designer than it does in the viewer or on a mobile device because the aspect ratio and size available in those viewers might be different from what the original report designer sees in the designer.

Note: Treemaps allow only one category data item or hierarchy data item.

Display A2.15 A Treemap

Dual Axis Bar Charts

A *dual axis bar chart* is a variation of the bar chart that has two measures. A measure is on each axis.

Display A2.16 A Dual Axis Bar Chart

Dual Axis Line Charts

A *dual axis line chart* is a variation of the line chart that has two measures. A measure is displayed on both the left and right side of the Y axis. The relationship between two measures can be examined on two different scales in a dual axis line chart.

Display A2.17 A Dual Axis Line Chart

Dual Axis Bar-Line Charts

A *dual axis bar-line chart* is a variation of the bar chart that has two measures. A measure is on each axis, and the bar chart is overlaid by a line chart.

Display A2.18 A Dual Axis Bar-Line Chart

Dual Axis Time Series Plots

A *dual axis time series plot* is a variation of the time series plot that has two measures. A measure is displayed on both the left and right side of the Y axis.

For example, a dual axis time series plot can be useful when you need to display two measures that have the same unit of measurement and different scales, such as quantity ordered and returns, or when you need to display two measures that have different units of measurement, such as sales and quantity ordered.

Display A2.19 A Dual Axis Time Series Plot**Band Plot**

Note: You must create and save this custom graph object in the graph builder before the object is available for use in reports.

A *band plot* draws a horizontal band with two Y values for each X value. Or, it draws a vertical band with two X values for each Y value. A band plot is typically used to show confidence, error, prediction, or control limits. The points on the upper and lower band boundaries can be joined to create two outlines. The area between the boundaries is filled.

Note: A band plot does not support display rules in the designer.

Display A2.20 *A Band Plot***Needle Plot**

Note: This graph object is not displayed in the designer by default. You can select what you want to display using the designer's Show or Hide Objects window.

A *needle plot* is a plot in which data points are connected by a vertical line that connects to a horizontal baseline. The baseline intersects the 0 value or the minimum value on the vertical axis.

The following example shows profits during a particular time period. The example specifies an optional baseline value on the Y axis.

Display A2.21 A Needle Plot

Step Plot

Note: This graph object is not displayed in the designer by default. You can select what you want to display using the designer's Show or Hide Objects window.

A *step plot* consists of a series of horizontal and vertical line segments (giving the appearance of steps) that connect observations of input data.

Note: A step plot does not support display rules in the designer.

The following example shows the price trend during a particular time interval:

Display A2.22 A Step Plot

Schedule Chart

Note: This graph object is not displayed in the designer by default. You can select what you want to display using the designer’s Show or Hide Objects window.

A *schedule chart* makes it easy to visualize time lines by representing tasks, start dates, durations, and end dates in cascading horizontal bar charts.

Display A2.23 A Schedule Chart

Vector Plots

Note: This graph object is not displayed in the designer by default. You can select what you want to display using the designer's Show or Hide Objects window.

A *vector plot* shows the change in value of a measure using directed line segments, or vectors, to represent both direction and magnitude at each point.

The following example shows the changes in exam scores for different North Carolina school systems from 2012 to 2013:

Display A2.24 A Vector Plot

For an example that shows a vector plot enhanced with bubble plots, see [“Example: Vector Plot”](#) on page 621.

Dot Plots

Note: This graph object is not displayed in the designer by default. You can select what you want to display using the designer's Show or Hide Objects window.

A *dot plot* compares data that is aggregated by the value of a category.

Display A2.25 A Dot Plot

Butterfly Charts

Note: This graph object is not displayed in the designer by default. You can select what you want to display using the designer's Show or Hide Objects window.

A *butterfly chart* compares a measure across two categories of values.

Display A2.26 A Butterfly Chart

Stock High-Low Plots

Note: This graph object is not displayed in the designer by default. You can select what you want to display using the designer's Show or Hide Objects window.

A *stock high-low plot* tracks changes in the price of a tradable asset over time. This plot creates a display of floating vertical lines that represent high and low stock values. The plot also displays stock closing values as markers.

Display A2.27 A Stock High-Low Plot

Stock Volume and Volatility Plots

Note: This graph object is not displayed in the designer by default. You can select what you want to display using the designer's Show or Hide Objects window.

A *stock volume and volatility plot* tracks changes in the price of a tradable asset over time with additional context.

This plot creates a display of floating vertical lines that represent high and low stock values. The plot also displays stock closing values as markers. The plot shows the stock's moving average and Bollinger upper and lower bands.

Display A2.28 A Stock Volume and Volatility Plot

Controls

A control is a report object that filters or narrows the scope of the data that user is viewing. A control enables a report designer to select a category that he or she wants the report viewer to see.

The following controls are available in the designer:

- drop-down lists

Display A2.29 A Drop-down List Control

The screenshot shows a control titled 'Drop-Down List 1'. It features a dropdown menu with the text 'Facility Region' and a downward arrow. Below the dropdown is a 'Clear Filter' button. The control displays a list of regions and their corresponding values:

East	2,695,755
North	11,716,240
South	42,019,795
West	14,301,043

- lists

Other Report Objects

Geo Bubble Maps

A geo bubble map is a bubble plot that is overlaid on a geographic map. Each bubble is located at a geographic location or at the center of a geographical region. The bubbles are automatically colored based on the location. You provide a measure data item that

determines the size of the bubble. A geo bubble map requires a data item that contains geographical information and is assigned to a geography role.

Display A2.34 *Geo Bubble Map*

Geo Coordinate Maps

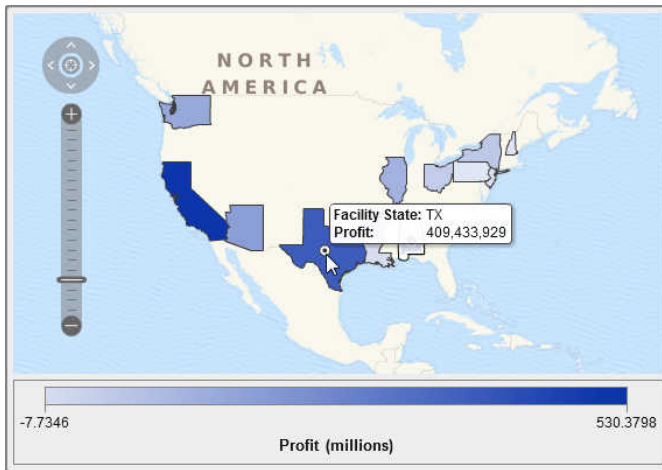

A geo coordinate map is a simple scatter plot that is overlaid on a geographic map. A geo coordinate map is used in place of a geo bubble map when the cardinality is too high and the geo bubble map cannot display the number of points. Each point in a geo coordinate map is located at the center of a geographic region or at the coordinates of a location. A geo coordinate map requires a data item that contains geographical information and is assigned to a geography role.

Geo Region Maps

A geo region map (also known as a choropleth map) is a two-dimensional map that uses color combinations to represent different categories or levels of magnitude. You can fill geographical boundaries (for example, a country or a state) on a map with color, based on measure values that are aggregated to the level defined by a geographical boundary.

Geo region maps do not support ZIP code data.

Display A2.35 *Geo Region Map*

Gauges

Bullet Gauges

A bullet gauge is a dashboard indicator that compares an actual value to a target value and compares them in intervals. The actual value of the primary measure is indicated by an inset horizontal bar.

Note that the scale of a bullet gauge often begins at zero, but it can contain both positive and negative values if both types of values apply to the primary measure, such as profit. The inset horizontal bar should always begin at zero so that comparing multiple bullet graphs is not confusing.

The bullet gauge requires a primary measure and a range display rule, and the target measure is optional. The default orientation is horizontal with an option to display the gauge vertically.

Display A2.36 *A Bullet Gauge*

Slider Gauges

A slider gauge is a dashboard indicator that compares an actual value to a target value and compares them in intervals. The actual value of the primary measure is indicated by a downward-facing arrow. The target value is indicated by a small upward-facing arrow.

Like a bullet gauge, a slider gauge is oriented horizontally by default, but you can change the gauge's orientation to vertical. You should use a slider gauge when the numeric scale does not start at zero.

The slider gauge supports dates (which are continuous) and numeric categories.

Display A2.37 A Slider Gauge

Thermometer Gauges

A thermometer gauge is a dashboard indicator that compares an actual value to a target value and compares them in intervals. The actual value of the primary measure is indicated by a vertical bar. The target value is indicated by a small black line.

The thermometer gauge requires a primary measure value and a range-based display rule. A target measure value is optional. The entire vertical bar is colored conditionally based on one color from the display rule.

The base of a thermometer bar should always start at zero. You can set this by defining your first range display rule to begin at zero. The designer always shows the base of the bar at the bottom of the thermometer.

Display A2.38 A Thermometer Gauge

Dial Gauges

A dial gauge is an arc-shaped dashboard indicator that compares an actual value to a target value and compares them in intervals. The actual value of the primary measure is indicated by an arrow that points outward from the inner circle. The target value is indicated by an arrow that points inward from the outer arc. The color of the center circle is the color associated with the primary measure value's range interval.

The dial gauge requires a primary measure value and a range-based display rule. For more information, see [“Adding Gauge-Level Display Rules” on page 485](#).

A target measure value is optional.

Display A2.39 A Dial Gauge

Speedometer Gauges

A speedometer gauge is a circular dashboard indicator that compares an actual value to a target value and compares them in intervals. The actual value of the primary measure is indicated by the larger pointer. The target value is indicated by a small triangle along the quantitative scale, either pointing inward or outward, depending on the **KPI skin** option for the gauge.

A speedometer gauge requires a primary measure value and a range-based display rule. A target measure value is optional.

Display A2.40 A Speedometer Gauge

Word Clouds

A word cloud displays a set of category values as text, grouped in a cloud-like shape. Depending on the word cloud data roles, the size of the text indicates the frequency of a category value or the value of a measure that corresponds to a category value.

Display A2.41 Word Cloud

Appendix 3

Editing a Data Expression in Text Mode

Overview of Text Mode

In SAS Visual Analytics, you create and edit filters, calculated items, and aggregated items by using an expression editor. The **Text** tab of the expression editor enables you to edit the expression as text.

You can add operators and data items to your expression by dragging and dropping them onto the expression or by entering the names of the operators or data items.

As you enter text, a list of suggestions appears. For example, if you enter `date`, then a drop-down list appears and enables you to select any of the operators and data items whose names begin with “date.”

When you make changes to your expression, it is automatically evaluated to determine whether it is valid. If the expression is not valid, then an error appears on the **Messages** tab, and the **OK** button is disabled. There might be a brief delay as your expression is evaluated.

Specifying Operator Parameters

When you add an operator to the expression, any parameters that are required by the operator are represented between braces `{ }`. For example, if you add the `x – y` operator, then your expression appears as `{Number} — {Number}`.

Each parameter value that you enter should replace the entire string between the braces, including the brace characters. For example, you might replace {Number} with 12 or with a data item such as Expenses.

You can automatically select the next operator in the expression by pressing Ctrl + Shift + spacebar.

Specifying Data Item Names and Global Parameter Names

Data item names and global parameter names can be entered as plain text and are not case sensitive. You can enter names formally by using the format '*data-item-name*'n for a data item, or '*parameter-name*'p for a global parameter. If you switch to the **Visual** tab, then all of your names are converted to the formal format.

Note: If a name contains quotation marks, then you must use the \ character to escape the quotes.

Note: If a name contains spaces, then you must use the formal format.

Note: If a data item or global parameter has the same name as an operator, then you must use the formal format. For example, if you have a category named Year, then enter the name as '*Year*'n to avoid conflict with the **Year** operator.

Using Formatted and Unformatted Values

By default, category values and discrete numeric and date values are evaluated as formatted values. Continuous numeric values are evaluated as unformatted values.

To override this default behavior, you can add [raw] (to use unformatted values) or [formatted] (to use formatted values) to the right of the data item.

For example,

```
'Expenses'n[formatted]
```

specifies that the Expenses measure is evaluated as a formatted value.

Specifying String Values

To enter a string value, you can enter the string between single quotes or double quotes. If your value contains a quotation mark, use the `\` character to escape the quote. If you use double quotes to enclose the string, then you do not need to escape the single quotes. If you use single quotes to enclose the string, then you do not need to escape the double quotes. For example, `"O'Reilly"`, `'O\'Reilly'`, and `'"Hello"'` are all valid.

To enter a string that contains a newline character, use `\r`, `\n`, or both to specify the newline character.

Specifying Date, Time, and Datetime Values

For date, datetime, and time values, specify a formatted value in quotes, followed by the letter “d” for a date value, the letters “dt” for a datetime value, or the letter “t” for a time value.

For time values, a value with a leading underscore is a reference to a specific time of the day.

A time value without a leading underscore specifies a period of elapsed time.

Here are some examples of date, datetime, and time values:

Table A3.1 Example Date, Datetime, and Time Values

Date	'23JUN2013'd
	'JUN2013'd
	'2013'd
	'q32013'd
Datetime	'23JUN2013_5:23:55'dt
	'23JUN2013_5:23'dt
	'23JUN2013'dt

Time	'_12:23:55't
	'_12:23't
Elapsed Time	'44:23:55't
	'00:01:34't

Specifying Aggregated Values

For aggregated values, specify the format, *aggregation-type* [*context*] (*value*), where *context* specifies one of the following aggregation contexts:

ByGroup

calculates the aggregation for each subset of the data item that is used in a visualization. For example, in a bar chart, an aggregated measure with the **ByGroup** context calculates a separate aggregated value for each bar in the chart.

ForAll

calculates the aggregation for the entire data item (after filtering). For example, in a bar chart, an aggregated measure with the **ForAll** context uses the same aggregated value (calculated for the entire data item) for each bar in the chart.

See [“Aggregated \(Simple\) Operators” on page 695](#) for a list of the aggregation types that are available.

For example,

```
sum [bygroup] ('cost'n)
```

aggregates the sum of the measure COST for each BY-group value.

Specifying a Missing Value

Use a period character (.) to specify a missing numeric or date value. Use empty quotes (") to specify a missing string value.

Appendix 4

Aggregations for Measures

The aggregation that is assigned to a measure determines how its values are summarized in a visualization or report object.

For example, in a bar chart of Sales by Quarter, each bar represents the aggregated values of the Sales measure for a specific quarter. If the aggregation for Sales is **Sum**, then the bars represent the sum (total) of sales for each quarter. If the aggregation for Sales is **Average**, then the bars represent the average sales for each quarter.

Note: Some aggregation types can override the data format that is used to display values in a visualization or report object. For example, if a measure has the Currency format with zero decimal places of precision, and you apply the **Variance** aggregation, then the values are displayed using the Comma format with two decimal places of precision instead.

You can specify the following aggregations for your measures:

Sum

calculates the sum (total) of the values of a measure.

Average

calculates the average (mean) value of a measure.

Standard Deviation

calculates the standard deviation of a measure.

Standard Error

calculates the standard error of the mean of a measure.

Variance

calculates the variance of a measure.

Count

calculates the total number of nonmissing values of a measure.

Number Missing

calculates the number of missing values in a measure.

Minimum

calculates the smallest value of a measure.

First Quartile

calculates the first quartile of a measure.

Median

calculates the median value of a measure.

Third Quartile

calculates the third quartile of a measure.

Maximum

calculates the largest value of a measure.

Skewness

calculates the skewness of a measure. Skewness indicates the distribution of values. A positive value indicates that the distribution is heavier for values greater than the mean. A negative value indicates that the distribution is heavier for values less than the mean.

Kurtosis

calculates the kurtosis of a measure. The kurtosis value indicates how peaked the distribution is. A larger value indicates a more sharply peaked distribution. A smaller value indicates a flatter distribution.

Coefficient of Variation

calculates the coefficient of variation of a measure. The coefficient of variation is the ratio of the standard deviation to the mean.

Uncorrected Sum of Squares

calculates the uncorrected sum of squares of a measure. The uncorrected sum of squares is the sum of the squared values.

Corrected Sum of Squares

calculates the corrected sum of squares of a measure. The corrected sum of squares is the sum of the squared deviations from the mean.

T-statistic (for Average = 0)

calculates the Student's t statistic for a measure, assuming a mean value of zero.

P-value (for T-statistic)

calculates the probability of observing the t statistic value or a more extreme value. A small value indicates that the mean is likely not equal to zero.

<i>Calculating Compound Annual Growth Rate</i>	714

Overview of Operators for Data Expressions

In the explorer and the designer, you can calculate data items and create filters by using expressions that contain operators.

Numeric (Simple) Operators

$-x$

returns a value with the opposite sign of the input value.

For example, $--1$ returns 1 and -1 returns -1.

$x - y$

subtracts the second value from the first value.

For example, $2 - 1$ returns 1.

$x * y$

multiplies the first and second values together.

For example, $2 * 3$ returns 6.

x / y

divides the first value by the second value.

For example, $6 / 2$ returns 3.

$x + y$

adds the first and second values together.

For example, $1 + 2$ returns 3.

Comparison Operators

BetweenExclusive

returns true if the first value is within the range defined by the second and third values (excluding the bounding values).

For example, `X BetweenExclusive(50, 100)` returns true if X is greater than 50 and less than 100.

BetweenInclusive

returns true if the first value is within the range defined by the second and third values (including the bounding values).

For example, `X BetweenInclusive(50, 100)` returns true if X is greater than or equal to 50 and less than or equal to 100.

In

returns true if the first value is in the list specified by the second parameter. Select your list by choosing the values from the drop-down list or the selector window.

For example, `X In ('A', 'B', 'C')` returns true when the value of X is either A, B, or C.

Note: This operator cannot be used to compare measures.

Missing

returns true if the value is a missing value.

For example, `X Missing` returns true if the value of X is missing.

NotBetweenExclusive

returns true if the first value is outside the range defined by the second and third values (excluding the bounding values).

For example, `X NotBetweenExclusive(50, 100)` returns true if X is less than 50 or greater than 100.

NotBetweenInclusive

returns true if the first value is outside the range defined by the second and third values (including the bounding values).

For example, `X NotBetweenInclusive(50, 100)` returns true if X is less than or equal to 50 or greater than or equal to 100.

NotIn

returns true if the first value is not in the list specified by the second parameter. Select your list by choosing the values from the drop-down list or the selector window.

For example, `X NotIn ('A', 'B', 'C')` returns true when the value of X is not A, B, or C.

Note: This operator cannot be used to compare measures.

NotMissing

returns true if the value is not a missing value.

For example, `X NotMissing` returns true if the value of X is not missing.

x < y

returns true if the first value is less than the second value.

x <= y

returns true if the first value is less than or equal to the second value.

x <> y

returns true if the first value is not equal to the second value.

x = y

returns true if the first value is equal to the second value.

x > y

returns true if the first value is greater than the second value.

x >= y

returns true if the first value is greater than or equal to the second value.

Boolean Operators

AND

joins two conditions and returns true if both conditions are true.

For example,

```
(1 = 1) AND (2 = 2)
```

returns true, and

```
(1 = 1) AND (2 = 1)
```

returns false.

IF... ELSE

returns different values, depending on whether the condition is true. The first parameter specifies the condition. The second parameter specifies the value to return if the condition is true. The third parameter specifies the value to return if the condition is false.

For example,

```
if (X > Y) return X else Y
```

returns the value of X if X is greater than Y, but returns the value of Y otherwise.

Note: Starting in the 7.1 release, the IF... ELSE operator can also be used in report filters in the designer.

NOT

returns true if the condition is false.

For example, `not (1 = 2)` returns true.

OR

joins two conditions and returns true if either condition is true.

For example,

```
(1 = 1) OR (2 = 2)
```

returns true, and

`(1 = 1) OR (2 = 1)`

returns true.

Numeric (Advanced) Operators

Abs

returns the absolute value of the input value.

For example, `Abs (-3)` returns 3.

Ceil

rounds the input value up to the nearest integer.

For example, `Ceil (4.2)` returns 5 and `Ceil (-4.8)` returns -4.

Exp

raises the constant *e* to the power specified by the input value.

For example, `Exp (5)` returns *e* to the 5th power (148.41).

Floor

rounds the input value down to the nearest integer.

For example, `Floor (4.8)` returns 4 and `Floor (-4.2)` returns -5.

Ln

returns the natural logarithm (base *e*) of the input value.

For example, `Ln (10)` returns the *e*th root of 10 (2.30...).

Log

returns the logarithm of the first value, where the second value specifies the base.

For example, `64 Log 8` returns the base 8 logarithm of 64 (2).

Mod

returns the remainder after dividing the first value by the second value.

For example, `5 Mod 2` returns 1.

Power

raises the first value to the power of the second value.

For example, `5 Power 2` returns 5 to the 2nd power (25).

Root

returns the n th root of the first value, where the second value specifies n (the base of the root).

For example, `27 Root 3` returns the 3rd (cube) root of 27 (3).

Round

rounds the first value to the number of decimal places that is specified by the second value. Select the second value from the drop-down list.

For example, `7.354 Round 2` returns 7.35.

Note: If you select 0 decimal places, then the values are rounded to the nearest integer.

TreatAs

allows a numeric, date, or datetime value to be used as a different data type within other operators. Select one of the following:

`_Date_`

allows the value to be used as a date.

`_Datetime_`

allows the value to be used as a datetime value.

`_Number_`

allows the value to be used as a number.

`_Time_`

allows the value to be used as a time value.

The value is treated as a raw value instead of being converted. Date values are the number of days since 01JAN1960. Datetime values are the number of seconds since 01JAN1960. Time values are the number of seconds since midnight.

For example, `TreatAs(_Date_, 19600)` returns 30AUG2013 as a date value.

Note: The `TreatAs` operator is useful for calculating elapsed time between two datetime values. For example, `(TreatAs(_Number_, '23OCT2013'd) – TreatAs(_Number_, '15JAN2013'd))` calculates the number of days between 15JAN and 23OCT, which is 281.

Trunc

truncates the input value to an integer.

For example, `Trunc(8.9)` returns 8 and `Trunc(-8.9)` returns -8.

Date and Time Operators

Note: Date and time operators are not supported for aggregated items.

DateFromMDY

creates a date value from separate month, day, and year values. The first value specifies the month as a number from 1–12. The second value specifies the day as a number from 1–31. The third value specifies the year as a four-digit number.

For example, `DateFromMDY(1, 15, 2013)` returns 15JAN2013.

DateFromYQ

creates a date value from separate year and quarter values. The first value specifies the year as a four-digit number. The second value specifies the quarter as a number from 1–4.

For example, `DateFromYQ(2013, 1)` returns 01JAN2013.

Note: The date is generated using the first day of each quarter.

DatePart

converts a datetime value to a date value.

For example, `DatePart('15JAN2013_17:15'dt)` returns 15JAN2013.

`DateTimeFromDateHMS`

creates a datetime value from a date value and separate hour, minute, and second values. The first value specifies the date. The second value specifies the hour as a number from 0–23. The third value specifies the minute as a number from 0–59. The fourth value specifies the second as a number from 0–59.

For example, `DateTimeFromDateHMS('15JAN2013'd, 17, 15, 23)` returns January 15, 2013 05:15:23 PM

`DateTimeFromTimeMDY`

creates a datetime value from a time value and separate month, day, and year values. The first value specifies the time. The second value specifies the month as a number from 1–12. The third value specifies the day as a number from 1–31. The fourth value specifies the year as a four-digit number.

For example, `DateTimeFromTimeMDY('_17:15:23'dt, 1, 15, 2013)` returns January 15, 2013 05:15:23 PM.

`DayOfMonth`

returns the day of the month from a date value as a number from 1–31.

For example, `DayOfMonth('15JAN2013'd)` returns 15.

`DayOfWeek`

returns the day of the week from a date value as a number from 1–7 (1 is Sunday).

For example, `DayOfWeek('15JAN2013'd)` returns 3 (Tuesday).

`DayOfYear`

returns the day of the year from a date value as a number from 1–366.

For example, `DayOfYear('15FEB2013'd)` returns 46.

`Hour`

returns the hour from a time or datetime value as a number from 0–23.

For example, `Hour('17:15:23't)` returns 17.

`Minute`

returns the minute from a time or datetime value as a number from 0–59.

For example, `Minute('17:15:23't)` returns 15.

Month

returns the month from a date value as a number from 1–12.

For example, `Month('15JAN2013'd)` returns 1.

Now

creates a datetime value from the current date and time.

For example, `Now()` returns the current date and time.

Quarter

returns the quarter from a date value as a number from 1–4.

For example, `Quarter('15AUG2013'd)` returns 3.

Second

returns the second from a time or datetime value as a number from 0–59.

For example, `Second('17:15:23't)` returns 23.

TimeFromHMS

creates a time value from separate hour, minute, and second values. The first value specifies the hour as a number from 0–23. The second value specifies the minute as a number from 0–59. The third value specifies the second as a number from 0–59.

For example, `TimeFromHMS(17, 15, 23)` returns 05:15:23 PM.

TimePart

converts a datetime value to a time value.

For example, `TimePart('15JAN2013_17:15:23'dt)` returns 05:15:23 PM.

WeekNumber

returns the week of the year as a number from 0–53, where week 1 begins on the first Sunday of the year. Dates before the first Sunday of the year return 0.

For example, `WeekNumber('04AUG2013'd)` returns 31.

Year

returns the year from a date value as a four-digit number.

For example, `Year('15JAN2013'd)` returns 2013.

Aggregated (Simple) Operators

Avg

calculates the average (mean) value of a measure.

Count

calculates the total number of nonmissing values of a measure.

Distinct

calculates the number of distinct values in a category.

Max

calculates the largest value of a measure.

Median

calculates the median value of a measure.

Min

calculates the smallest value of a measure.

NumMiss

calculates the number of missing values in a data item.

Q1

calculates the first quartile of a measure.

Q3

calculates the third quartile of a measure.

StdDev

calculates the standard deviation of a measure.

StdErr

calculates the standard error of the mean of a measure.

Sum

calculates the sum (total) of the values of a measure.

Var

calculates the variance of a measure.

Aggregated (Advanced) Operators

CoefVar

calculates the coefficient of variation of a measure. The coefficient of variation is the ratio of the standard deviation to the mean.

CSS

calculates the corrected sum of squares of a measure. The corrected sum of squares is the sum of the squared deviations from the mean.

First

calculates the first value of a measure based on chronological order. The first parameter specifies the measure. The second parameter specifies the sequence data item that is used to determine the chronological order. The sequence data item can be either a date or time data item or a numeric data item. The third parameter specifies whether missing values are included. Select `_IncludeMissing_` to include missing values or select `_ExcludeMissing_` to exclude missing values.

Note: If there are multiple measure values for the first value of the sequence data item, then the minimum measure value is selected.

Note: The First aggregation always calculates measure values by using the sequence data item that you specify. If your visualization or report object uses a different date or time data item, then the results might be misleading to viewers who do not know the expression for the aggregated data item.

Kurtosis

calculates the kurtosis of a measure. The kurtosis value indicates how peaked the distribution is. A larger value indicates a more sharply peaked distribution. A smaller value indicates a flatter distribution.

Last

calculates the last value of a measure based on chronological order. The first parameter specifies the measure. The second parameter specifies the sequence data item that is used to determine the chronological order. The sequence data item can be either a date or time data item or a numeric data item. The third parameter specifies whether missing values are included. Select `_IncludeMissing_` to include missing values or select `_ExcludeMissing_` to exclude missing values.

Note: If there are multiple measure values for the last value of the sequence data item, then the minimum measure value is selected.

Note: The Last aggregation always calculates measure values by using the sequence data item that you specify. If your visualization or report object uses a different date or time data item, then the results might be misleading to viewers who do not know the expression for the aggregated data item.

Percentile

calculates the specified percentile of a measure. Specify a number between 0 and 100. For example, 85 specifies the 85th percentile, the value for which 85% of the values are lower.

PvalT

calculates the probability of observing the t statistic value or a more extreme value. A small value indicates that the mean is likely not equal to zero.

Skewness

calculates the skewness of a measure. Skewness indicates the distribution of values. A positive value indicates that the distribution is heavier for values greater than the mean. A negative value indicates that the distribution is heavier for values less than the mean.

TStat

calculates the Student's t statistic for a measure, assuming a mean value of zero.

USS

calculates the uncorrected sum of squares of a measure. The uncorrected sum of squares is the sum of the squared values.

Periodic Operators

About Periodic Operators

Periodic operators aggregate values over a period of time.

If you assign a periodic aggregated item to a visualization or report object that contains dates, the aggregated item displays the aggregated values for each time period in the visualization or report object.

In a visualization or report object that does not contain dates, the aggregated item displays values that use today's date as a reference. If the date data item for the operator does not contain data for the interval that contains today's date, then the operator returns missing values.

Periodic operators are evaluated using time intervals. Intervals specify whether the aggregation is applied on a monthly basis, a quarterly basis, and so on. You can specify a specific interval, or you can specify that the interval is inferred. For an inferred interval, the aggregation is evaluated based on its context in the visualization or report object. For example, if your visualization contains a bar chart of sales by month, then the inferred interval is monthly.

Note: Periodic operators return a missing value in the following scenarios:

- Data does not exist for the specified time period.
- The date data item for the period calculation does not match the date data item in the visualization or report object. You must use the same date data item or a duplicate data item that is based on the same data item.
- The interval for the operator is smaller than the interval of the date format in the visualization or report object (for example, if your interval is by month, but the date format is Year).
- For operators that use inner and outer intervals, the inner interval is larger than the outer interval.

- The inferred interval is by week of the year or by an interval smaller than a day.
- The inferred interval is by day for any operator that has an offset other than 0.

For the explorer, the `ParallelPeriod` and `RelativePeriod` operators always return a missing value when the inferred interval is by day.

CumulativePeriod

The `CumulativePeriod` operator returns aggregated values for a period of time, including the previous periods within a larger period of time (for example, the year-to-date total).

Specify the following parameters:

Figure A5.1 Parameters for the `CumulativePeriod` Operator

The screenshot displays the configuration interface for the `CumulativePeriod` operator. It consists of eight numbered parameters arranged vertically:

- 1**: A dropdown menu for aggregation, currently set to `_Sum_`.
- 2**: A text field for the measure, currently containing `Measure`.
- 3**: A dropdown menu for the periodic item, currently set to `Choose periodic item`.
- 4**: A dropdown menu for the inner interval, currently set to `_Inferred_`.
- 5**: A dropdown menu for the outer interval, currently set to `_Inferred_`.
- 6**: A spin box for the offset, currently set to `0`.
- 7**: A dropdown menu for the full period, currently set to `_Full_`.
- 8**: A text field for the end date, accompanied by a calendar icon.

- 1** The aggregation that is applied to the measure.
- 2** The measure to aggregate over time.
- 3** The date data item for the period calculation. Only data items whose formats specify year are available.
- 4** The inner interval for which the values are aggregated. For example, specify `_ByMonth_` as the inner interval and `_ByYear_` as the outer interval to aggregate the year-to-date values for each month.

Select one of the following:

`_Inferred_`

specifies that the interval is determined automatically from the visualization or report object that displays the aggregated item.

`_ByMonth_`

specifies a monthly interval.

`_ByQuarter_`

specifies a quarterly interval.

`_ByYear_`

specifies a yearly interval.

- 5** The outer interval that provides the context for the cumulative aggregation. For example, specify `_ByMonth_` as the inner interval and `_ByYear_` as the outer interval to aggregate the year-to-date values for each month.

Select one of the following:

`_Inferred_`

specifies that the interval is determined automatically from the visualization or report object that displays the aggregated item.

`_ByMonth_`

specifies a monthly interval.

`_ByQuarter_`

specifies a quarterly interval.

`_ByYear_`

specifies a yearly interval.

- 6** The number of outer intervals to offset from the current period. 0 specifies that the period from the current outer interval is used. A negative value indicates a previous interval.

For example, if your inner interval is by month and your outer interval is by year, then -1 specifies the year-to-date monthly values for the previous year.

- 7** The scope for the period. The scope specifies how much of each period is aggregated.

Select one of the following:

`_Full_`

aggregates the values for the entire period.

`_ToDate_`

aggregates only the values up to a specific day of the outer interval.

`_ToToday_`

aggregates only the values up to the equivalent of today's position in the current interval. For example, if today is the 40th day of the quarter, and the outer interval is by quarter, then only the values up to the 40th day of each quarter are used.

The value for today is evaluated dynamically whenever the aggregated item is viewed in a visualization or report object.

- 8** If you select `_ToDate_` as the scope, then select the date that is used to subset each period.

For example, if you select 09NOV2013, and the outer interval is by year, then only the values up to November 9 of each year are used in the aggregation.

For example,

```
CumulativePeriod(_Sum_, 'Expenses'n, 'Date'n, _ByMonth_, _ByYear_, 0, _Full_)
```

aggregates the sum of year-to-date monthly values for the Expenses measure using date values from the Date data item.

ParallelPeriod

The ParallelPeriod operator returns aggregated values for a period of time that is parallel to the current period (for example, the same month of the previous year).

Specify the following parameters:

Figure A5.2 Parameters for the ParallelPeriod Operator

The image shows the configuration interface for the ParallelPeriod operator. It consists of eight numbered parameters arranged vertically:

- 1**: A dropdown menu showing "_Sum_" with a downward arrow.
- 2**: A text input field containing the word "Measure".
- 3**: A dropdown menu showing "Choose periodic item" with a downward arrow.
- 4**: A dropdown menu showing "_Inferred_" with a downward arrow.
- 5**: A dropdown menu showing "_Inferred_" with a downward arrow.
- 6**: A spinbox control showing the value "0" with up and down arrows.
- 7**: A dropdown menu showing "_Full_" with a downward arrow.
- 8**: A text input field with a calendar icon to its right.

- 1** The aggregation that is applied to the measure.
- 2** The measure to aggregate over time.
- 3** The date data item for the period calculation. Only data items whose formats specify year are available.
- 4** The inner interval for which the values are aggregated. For example, specify `_ByMonth_` as the inner interval to aggregate the values for each month.

Select one of the following:

`_Inferred_`

specifies that the interval is determined automatically from the visualization or report object that displays the aggregated item.

`_ByMonth_`

specifies a monthly interval.

`_ByQuarter_`

specifies a quarterly interval.

`_ByYear_`

specifies a yearly interval.

- 5** The outer interval that provides the context for the parallel period aggregation. For example, specify `_ByMonth_` as the inner interval and `_ByYear_` as the outer interval to aggregate the monthly values for a different year.

Select one of the following:

`_Inferred_`

specifies that the interval is determined automatically from the visualization or report object that displays the aggregated item.

`_ByMonth_`

specifies a monthly interval.

`_ByQuarter_`

specifies a quarterly interval.

`_ByYear_`

specifies a yearly interval.

- 6** The number of outer intervals to offset from the current period. 0 specifies that the period from the current outer interval is used. A negative value indicates a previous interval.

For example, if your inner interval is by month and your outer interval is by year, then -1 specifies the monthly values for the previous year.

- 7** The scope for the period. The scope specifies how much of each period is aggregated.

Select one of the following:

`_Full_`

aggregates the values for the entire period.

`_ToDate_`

aggregates only the values up to a specific day of the outer interval.

`_ToToday_`

aggregates only the values up to the equivalent of today's position in the current interval. For example, if today is the 40th day of the quarter, and the outer

interval is by quarter, then only the values up to the 40th day of each quarter are used.

The value for today is evaluated dynamically whenever the aggregated item is viewed in a visualization or report object.

- 8** If you select `_ToDate_` as the scope, then select the date that is used to subset each period.

For example, if you select 09NOV2013, and the outer interval is by year, then only the values up to November 9 of each year are used in the aggregation.

For example,

```
ParallelPeriod(_Sum_, 'Expenses'n, 'Date'n, _ByMonth_, _ByYear_, -1, _Full_)
```

aggregates the sum of monthly values for the Expenses measure for the previous year using date values from the Date data item.

Period

The Period operator returns aggregated values for a period of time (for example, the current month).

Specify the following parameters:

Figure A5.3 Parameters for the Period Operator

- 1** The aggregation that is applied to the measure.
- 2** The measure to aggregate over time.
- 3** The date data item for the period calculation. Only data items whose formats specify year are available.

- 4** The interval for which the values are aggregated. For example, specify `_ByMonth_` as the interval to aggregate the values for each month.

Select one of the following:

`_Inferred_`

specifies that the interval is determined automatically from the visualization or report object that displays the aggregated item.

`_ByMonth_`

specifies a monthly interval.

`_ByQuarter_`

specifies a quarterly interval.

`_ByYear_`

specifies a yearly interval.

For example,

```
Period(_Sum_, 'Expenses'n, 'Date'n, _ByMonth_)
```

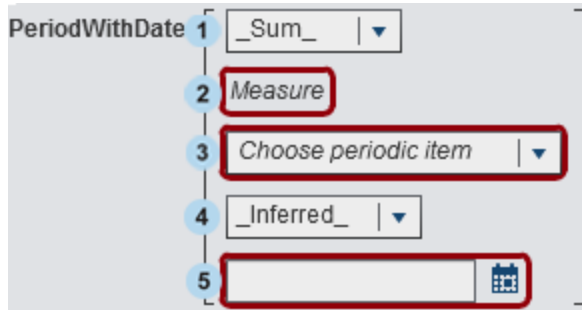

aggregates the sum of monthly values for the Expenses measure using date values from the Date data item.

PeriodWithDate

The `PeriodWithDate` operator returns aggregated values for a specific, constant period of time (for example, the month that includes 15OCT2013).

Specify the following parameters:

Figure A5.4 Parameters for the *PeriodWithDate* Operator

- 1** The aggregation that is applied to the measure.
- 2** The measure to aggregate over time.
- 3** The date data item for the period calculation. Only data items whose formats specify year are available.
- 4** The interval for which the values are aggregated. For example, specify `_ByMonth_` as the interval to aggregate the values for each month.

Select one of the following:

`_Inferred_`

specifies that the interval is determined automatically from the visualization or report object that displays the aggregated item.

`_ByMonth_`

specifies a monthly interval.

`_ByQuarter_`

specifies a quarterly interval.

`_ByYear_`

specifies a yearly interval.

- 5** The reference date for the period aggregation.

For example,

```
PeriodWithDate(_Sum_, 'Expenses'n, 'Date'n, _ByMonth_, '15OCT2013'd)
```

aggregates the sum of monthly values for the Expenses measure using date values from the Date data item.

RelativePeriod

The RelativePeriod operator returns aggregated values for a period of time that is relative to the current period (for example, the previous month of the same year).

Specify the following parameters:

Figure A5.5 Parameters for the RelativePeriod Operator

RelativePeriod

- 1
- 2
- 3
- 4
- 5
- 6
- 7

- 1 The aggregation that is applied to the measure.
- 2 The measure to aggregate over time.
- 3 The date data item for the period calculation. Only data items whose formats specify year are available.
- 4 The interval for which the values are aggregated. For example, specify `_ByMonth_` as the interval to aggregate the year-to-date values for each month.

Select one of the following:

`_Inferred_`

specifies that the interval is determined automatically from the visualization or report object that displays the aggregated item.

ByMonth
specifies a monthly interval.

ByQuarter
specifies a quarterly interval.

ByYear
specifies a yearly interval.

- 5** The number of intervals to offset from the current period. 0 specifies that the period from the current interval is used. A negative value indicates a previous interval.

For example, if your interval is by month, then -1 specifies the monthly values for the previous month.

- 6** The scope for the period. The scope specifies how much of each period is aggregated.

Select one of the following:

Full
aggregates the values for the entire period.

ToDate
aggregates only the values up to a specific day of the interval.

ToToday
aggregates only the values up to the equivalent of today's position in the current interval. For example, if today is the 40th day of the quarter, and the outer interval is by quarter, then only the values up to the 40th day of each quarter are used.

The value for today is evaluated dynamically whenever the aggregated item is viewed in a visualization or report object.

- 7** If you select **_ToDate_** as the scope, then select the date that is used to subset each period.

For example, if you select 09NOV2013 and the outer interval is by quarter, then only the values up to the 40th day of each quarter are used in the aggregation.

For example,

```
RelativePeriod(_Sum_, 'Expenses'n, 'Date'n, _ByMonth_, -1, _Full_)
```

aggregates the sum of monthly values for the Expenses measure for the previous month using date values from the Date data item.

Text (Simple) Operators

Note: All text operators are case sensitive.

Note: Text operators are not supported for aggregated items.

Concatenate

appends the second input string to the first input string.

For example, `Concatenate('A', 'B')` returns **AB**.

Contains

specifies that a matching value must contain the specified string.

For example, `'Catcher' Contains 'Cat'` returns true.

EndsWith

specifies that a matching value must contain the specified string at the end of the value.

For example, `'Catcher' EndsWith 'her'` returns true.

Format

applies a SAS format to the input value. Click the format field to select the format that you want to apply. The output from the Format operator is a string.

For example, `Format(1015.35, 'DOLLAR6.2')` returns **\$1,015.35** as a string value.

Note: Standard date formats in SAS Visual Analytics display date and datetime values in the locale of your browser. You can display date and datetime values in the locale of the data source by using national language formats. The names of national language formats begin with “NL.” For example, the NLDATE format displays date values by using the locale of the data source.

LowerCase

changes all of the characters in a text string to lowercase.

For example, `LowerCase('SAS INSTITUTE')` returns **sas institute**.

NotContains

specifies that a matching value must not contain the specified string.

For example, `'Catcher' NotContains 'Dog'` returns true.

Parse

interprets a numeric or datetime value from the input string. Click the format field to select the format that is used to interpret the string. The output from the Parse operator is either a number or a datetime value, depending on the format that you select.

For example, `Parse('15JAN2013', 'DATE9.')` returns 15JAN2013 as a date value.

StartsWith

specifies that a matching value must contain the specified string at the start of the value.

For example, `'Catcher' StartsWith 'Cat'` returns true.

UpCase

changes all of the characters in the text string to uppercase.

For example, `UpCase('sas institute')` returns **SAS INSTITUTE**.

Text (Advanced) Operators

Note: All text operators are case sensitive.

Note: Text operators are not supported for aggregated items.

FindChar

finds the position of a character or any of a set of characters within a text string. The position of the first match is returned as a numeric value. If no matches are found,

then 0 is returned. The first input string specifies the value to search within. The second input string specifies the list of characters to search for.

For example, `FindChar('mystring', 'sz')` returns 3.

FindString

finds the position of a string within another string. The position of the first match is returned as a numeric value. If no matches are found, then 0 is returned. The first input string specifies the value to search within. The second input string specifies the string to search for.

For example, `FindString('mystring', 'st')` returns 3.

GetLength

returns the length of an input string as a numeric value.

For example, `GetLength('mystring')` returns 8.

GetWord

returns a word from an input string where the words are separated by spaces, periods, or other special characters. The first parameter specifies the input string. The second parameter specifies the number of the word to return where 1 is the first word.

For example, `GetWord('my test string', 2)` returns **test**.

RemoveBlanks

removes space characters from the input string. The first parameter specifies the input string. The second parameter specifies which space characters to remove. Select one of the following:

`_All_`

removes all spaces from the string.

`_Leading_`

removes spaces at the beginning of the string.

`_LeadingAndTrailing_`

removes spaces at the beginning and end of the string.

`_Trailing_`

removes spaces at the end of the string.

For example, `RemoveBlanks('my test string', '_ALL_')` returns **myteststring**.

`RemoveChars`

removes all instances of a set of characters from the input string. The first parameter specifies the input string. The second parameter specifies the list of characters to remove.

For example, `RemoveChars('my_test_string', '_')` returns **myteststring**.

`RemoveWord`

removes a word from an input string where the words are separated by spaces, periods, or other special characters. The first parameter specifies the input string. The second parameter specifies the number of the word to remove where 1 is the first word.

For example, `RemoveWord('my test string', 2)` returns **my string**.

`Replace`

replaces a substring within the input string with a replacement string. The first parameter specifies the input string. The second parameter specifies the substring to replace. The third parameter specifies the replacement string. The fourth parameter specifies which instances of the substring to replace. Select one of the following:

`_ALL_`

replaces every instance.

`_FIRST_`

replaces the first instance only.

`_LAST_`

replaces the last instance only.

For example, `Replace('my test string test', 'test', 'new', '_ALL_')` returns **my new string new**.

ReplaceWord

replaces a word from an input string where the words are separated by spaces, periods, or other special characters. The first parameter specifies the input string. The second parameter specifies the number of the word to replace where 1 is the first word. The third parameter specifies the replacement string.

For example, `ReplaceWord('my test string', 2, 'new')` returns **my new string**.

Reverse

reverses the order of the characters in the input string.

For example, `Reverse('A B C')` returns **C B A**.

Substring

returns a substring from the input string based on the position of the characters. The first parameter specifies the input string. The second parameter specifies the position of the first character to return. The third parameter specifies the number of characters to return.

For example, `Substring('my test string', 4, 3)` returns **tes**.

Update

replaces a substring from the input string based on the position of the characters. The first parameter specifies the input string. The second parameter specifies the position of the first character to replace. The third parameter specifies the number of characters to replace. The fourth parameter specifies the replacement string.

For example, `Update('my test string', 4, 3, 'nex')` returns **my next string**.

URLDecode

removes URL encoding from the input string. URL encoding replaces some characters with a % character followed by a two-digit hexadecimal code.

For example, `URLDecode('support.sas.com%2Fmy%20string')` returns **support.sas.com/my string**.

URLEncode

applies URL encoding to the input string. URL encoding replaces some characters with a % character followed by a two-digit hexadecimal code.

For example, `URLEncode('support.sas.com/my string')` returns `support.sas.com%2Fmy%20string`.

Calculating Compound Annual Growth Rate

Compound annual growth rate (CAGR) is an investing and business term for the effective constant year-over-year rate of return that produces a target result value at the end of multiple years, assuming that the CAGR is compounded at the end of each year. For example, you might use CAGR to compare trends over multiple years in revenue or in the number of units sold. For SAS Visual Analytics, you can calculate the yearly CAGR using the expression builder.

This example compares trends in the growth rate for yearly sales amounts between different product types or regions.

The basic data items are:

sales

This is a numeric measure with a currency format and a default aggregation of Sum.

ProductType

This is a string category data item.

RegionName

This is a string category data item.

TransactionDate

This is a date data item with a format of Month, Day, Year (MMDDYYYY).

The duplicate data item is:

TransactionDateYear

This data item is a duplicate of the `TransactionDate` data item, but with the `Year` format.

The calculated data items are:

BeginningYearNum

This data item should be a numeric type with a `Float4.0` format and an aggregation of `Minimum`.

```
BeginningYearNum = Year('31DEC2010'd)
```

EndingYearNum

This data item should be a numeric type with a `Float4.0` format and an aggregation of `Minimum`.

```
EndingYearNum = Year('transactionDate'n)
```

The aggregated measure data items are:

NumYears

This data item has a `Float4.0` format.

```
NumYears = Min [_ByGroup_] ('EndingYearNum'n) - Min
[_ByGroup_] ('BeginningYearNum'n)
```

BeginningValue

This data item needs to be set to the same currency format as the `sales` data item.

```
BeginningValue = PeriodWithDate(_Sum_, 'sales'n,
'transactionDate'n, _ByYear_, '31DEC2010'd)
```

EndingValue

This data item needs to be set to the same currency format as the `sales` data item.

```
EndingValue = Period(_Sum_, 'sales'n, 'transactionDate'n,
_ByYear_)
```

NormalizedRatio

This data item has a `Float12.2` format.

```
NormalizedRatio = 'EndingValue'n / 'BeginningValue'n
```

CAGR

This data item has a Percent format.

$$\text{CAGR} = (\text{'NormalizedRatio'}^n \text{ Power } (1 / \text{'NumYears'}^n)) - 1$$

To use the CAGR, you should add TransactionDateYear, CAGR, and any other categories of interest (for example, RegionName, ProductType, and so on) to a list table, a crosstab, or a graph.

Appendix 6

Conditions for Filters

In SAS Visual Analytics, filters are based on expressions that contain operators. Conditions enable you to easily add the most common operators to your expression. Depending on the type of data that is used by the filter, you can select from the following categories of filter conditions:

Table A6.1 Conditions for Character Data

=	Specifies that a matching value must match one of the filter values exactly.
Contains	Specifies that a matching value must contain the filter value.
EndsWith	Specifies that a matching value must contain the filter value at the end of the value.
In	Specifies that a matching value is in the list that you select. To select your list, choose the values from the drop-down list.
Missing	Specifies that a missing value matches the filter.
NotContains	Specifies that a matching value must not contain the filter value.
NotIn	Specifies that a matching value is not in the list that you select. To select your list, choose the values from the drop-down list.
NotMissing	Specifies that a nonmissing value matches the filter.
StartsWith	Specifies that a matching value must contain the filter value at the start of the value.

Table A6.2 Conditions for Numeric Data and Date and Time Data

<>	Specifies that a matching value must not be equal to the filter value.
=	Specifies that a matching value must be equal to the filter value.
<	Specifies that a matching value must be less than the filter value.
<=	Specifies that a matching value must be less than or equal to the filter value.
>	Specifies that a matching value must be greater than the filter value.
>=	Specifies that a matching value must be greater than or equal to the filter value.
Between [exclusive]	Specifies that a matching value must be greater than the first filter value and less than the second filter value.
Between [inclusive]	Specifies that a matching value must be greater than or equal to the first filter value and less than or equal to the second filter value.
In	<p>Specifies that a matching value is in the list that you select. To select your list, choose the values from the drop-down list.</p> <p>Note: This condition is not available for continuous numeric data.</p>
Missing	Specifies that a missing value matches the filter.
NotBetween [exclusive]	Specifies that a matching value must be less than the first filter value or greater than the second filter value.
NotBetween [inclusive]	Specifies that a matching value must be less than or equal to the first filter value or less than or equal to the second filter value.
NotIn	<p>Specifies that a matching value is not in the list that you select. To select your list, choose the values from the drop-down list.</p> <p>Note: This condition is not available for continuous numeric data.</p>

NotMissing

Specifies that a nonmissing value matches the filter.

Data Limits for SAS Visual Analytics Explorer 721

High-Cardinality Thresholds for Report Objects	726
---	------------

Some of the visualizations in SAS Visual Analytics Explorer (the explorer) have limits to the number of data values that they can display. The limit values are affected by the **Visualization data threshold** setting in the Preferences window. For more information about the Preferences window, see [“Specify Your Preferences for the Explorer” on page 159](#).

The following table displays the data limits for visualizations in the explorer:

Table A7.1 *Data Limits for the Explorer*

Visualization Type	Variation	Behavior when Limit Is Exceeded	Default Threshold	Minimum Threshold	Maximum Threshold
Table	—	Paging is applied to the table.	10,000	1,000	100,000

Visualization Type	Variation	Behavior when Limit Is Exceeded	Default Threshold	Minimum Threshold	Maximum Threshold
Crosstab	—	An error message appears.	21,000,000 cells	1,000,000 cells	26,000,000 cells
Bar Chart	Not grouped or latticed.	The bar chart shows a subset that contains the first or last ranked values.	3,000	810	3,625
	Grouped or latticed.	An error message appears.	3,000	810	3,625
Line Chart	Single numeric or datetime category in the Category role.	The line chart shows a subset that contains the first or last ranked value.	10,000	5,630	11,250
	Single string category in the Category role.		4,000	1,380	4,750
	No string categories in the Category role, grouped or latticed.	An error message appears.	10,000	5,630	11,250
	One or more string categories in the Category role, grouped or latticed.		4,000	1,380	4,750

Visualization Type	Variation	Behavior when Limit Is Exceeded	Default Threshold	Minimum Threshold	Maximum Threshold
Scatter Plot	Two measures, not grouped.	The scatter plot is converted to a heat map.	40,000	9,375	48,750
	Two measures, grouped.	An error message appears.	40,000	9,375	48,750
	Three or more measures, not grouped.	The scatter plot is converted to a correlation matrix.	80,000 / number of measures	18,750 / number of measures	97,500 / number of measures
	Three or more measures, grouped.	An error message appears.	80,000 / number of measures	18,750 / number of measures	97,500 / number of measures
Bubble Plot	No categories.	The bubble plot is converted to a heat map.	25,000	7,500	30,000
	Grouped.	The bubble plot shows the top or bottom value by size.	500	150	600
	Latticed.	An error message appears.	1,050	4,900	50,000
	Grouped and latticed.		500	150	600
	Animated.		50,000	15,000	60,000
Network Plot	—	An error message appears	8000	100	10000
			1,000 nodes, 1,000 links		
Sankey Diagram	—	An error message appears	3,000 links	500 links	3625 links
			8,020 rows	1,000 rows	10,000 rows
Histogram	—	—	None	None	None

Visualization Type	Variation	Behavior when Limit Is Exceeded	Default Threshold	Minimum Threshold	Maximum Threshold
Box Plot	—	An error message appears.	2,900 boxes	800 boxes	3,500 boxes
Heat Map	No categories.	—	None	None	None
	One or more categories.	An error message appears.	3,000	1,250	3,500
Geo Map	Bubble overlay	The bubble overlay is converted to a coordinate overlay.	5,000	1,500	6,000
	Region overlay	The bubble overlay is converted to a coordinate overlay.	5,000	1,500	6,000
	Coordinate overlay	An error message appears.	82,000	10,000	100,000
Treemap	No additional levels.	The treemap shows a subset that contains the first or last ranked value.	4,900	1,050	6,000
	One or more additional levels.	The number of additional levels is reduced to 0. If the threshold is still exceeded, then the treemap shows a subset that contains the first or last ranked value.	4,900	1,050	6,000

Visualization Type	Variation	Behavior when Limit Is Exceeded	Default Threshold	Minimum Threshold	Maximum Threshold
Correlation Matrix	—		60 measures		
Decision Tree	Number of nodes.	An error message appears.	180	75	200
	Number of target values.	The decision tree displays truncated data.	50	30	50
	Number of predictor values.	An error message appears.	4300	1500	5000
Word Cloud	—	The word cloud displays the top words by frequency, by measure value, or by topic weight.	100	100	100

In addition to the data thresholds that are set by the Preferences window, there are server data limits that can be set by the system administrator. For information about the server data limits, see the topic “Manage High-Cardinality Data” in the *SAS Visual Analytics: Administration Guide*.

High-Cardinality Thresholds for Report Objects

Client-side thresholds for report objects are documented in the following table. These thresholds affect the designer and all of the viewers. The second column indicates the maximum number of unique values.

Table A7.2 Client-Side Thresholds for Report Objects

Report Object	Rows
Gauges (bullets, sliders, thermometers, dials, and speedometers)	10
Word cloud	100
Bubble plots	1,500
Bar charts (regular, targeted, dual axis, and dual axis bar-line)	3,000
Waterfall charts	3,000
Scatter plots	3,000
Line charts (regular and dual axis line)	4,000
Geo maps (bubble, coordinate, and region)	5,000
Step plots	10,000
Time series plots (regular and dual axis)	10,000
Treemaps	25,000
Pie charts	40,000
Tables (list tables and crosstabs)	40,000

Here are some key points about high-cardinality thresholds in report objects:

- In general, requests that exceed a client-side report object threshold cause an error message to be displayed. An exception is that for detail data, excess rows are truncated.
- Scatter plots always show detail data. List tables show details if the user selects the **Show detail data** check box. Bubble plots show details unless a category is assigned to the Group role.
- If a data source contains more than a million records, queries are blocked for data items whose cardinality is greater than 10,000 unique items in any particular category.

Appendix 8

Troubleshooting in SAS Visual Analytics Designer

<i>Repairing Reports</i>	729
<i>Displaying Alert Notifications</i>	730
<i>Exporting Data from Report Objects to Microsoft Excel 2007</i>	731

Repairing Reports

Issue: The Repair Report window is displayed.

Resolution:

When you open a report in the designer, you might be prompted to repair the report. For example, this can happen when one or more columns have been removed from the data source. You might be prompted to repair the report when you refresh a report or change a data source. You might be prompted to repair a report if your system administrator is still deciding which data items should be in a table.

To repair a report:

- 1 Decide whether you want to fix individual data items or all of the data items in the report.

Fixes can be made at the individual data item level. For example, if two data items are removed from a report, then the Repair Report window displays separate entries

for each data item. The report objects that are impacted by each data item appear below each of the data items.

Here is an example of the **Repair Report** window that is displayed when a missing column affects two report objects:

- 2 Click **Fix** or **Fix All**. For example, if there is a column missing in the data source and you click **Fix**, then the missing column is removed from the report.

Click **Close** in the confirmation message that is displayed.

Note: If you click **Open Report**, then all of the data is removed from the report objects.

Displaying Alert Notifications

Issue: An expected alert notification has not been received.

Resolution:

There are many factors that can affect alert notifications. For example, system administrators for SAS Visual Analytics can set a property for how frequently the system checks to see whether the alert condition has been met. And, alert notifications are not sent if a server is down.

The timing of when alert notifications are sent can vary depending on when the alert condition is met. For example, suppose that you specify that alert notifications are sent every five days. The alert condition is met for the first time at 10:00am on September 2.

After that, the system continues to check for the alert condition based on the hour or minute value that you specified for the **Query the system every** field. Because the frequency is set to five days, no alert notifications will be sent between 10:01am on September 2 and 9:59am on September 7. This is the case, no matter how many times the alert condition is met during that timeframe. At 10:00am on September 7, if the alert condition is met, then another alert notification is sent, and the five-day countdown starts again. On the other hand, if the alert condition has not been met at 10:00am on September 7, then no alert notification is sent. However, now that five days have passed, an alert notification is sent as soon as the alert condition is met again. Suppose that an alert notification is sent at 2:00pm on September 10. After the alert notification is sent, the five-day countdown starts again, and the earliest the next alert notification can be sent is 2:00pm on September 15. If you modify the notification frequency, then the notification history is reset.

You might not receive an alert notification as soon as the alert condition is met because of the hour or minute value that is set in the **Query the system every** field in the designer. For example, suppose that you set the value in the **Query the system every** field to **1 day**. If the alert condition is met one hour after the system check is done, then it will be another 23 hours before the system checks for the alert condition again and sends an alert notification.

Contact your system administrator for additional assistance.

Exporting Data from Report Objects to Microsoft Excel 2007

Issue: An error occurs when data from a report object is exported using the **Export to: Excel 2007 Workbook (*.xlsx)** option or when there are character codes displayed in the exported Excel file.

Resolutions:

- If an error occurs during exporting, then in the Export or Save As window, select either the **Save as: Tab-Separated Values (*.tsv)** or the **Save as: Comma-Separated Values (*.csv)** option to create a data file.

- If you see character codes displayed in a file that has been exported to Excel, then re-open the exported file in Excel, and save it without any changes. The character codes are removed from the file.

Appendix 9

Using URL Parameters to View a Report

If guest access is configured for the SAS Visual Analytics Viewer, you can use this URL: `http://host/SASVisualAnalyticsViewer/VisualAnalyticsViewer/guest.jsp`. However, to log on and display a single report using guest access, you can use a URL such as this one (which has parameters to specify the name and location of the report): `http://host/SASVisualAnalyticsViewer/VisualAnalyticsViewer_guest.jsp?reportName=My+Report&reportPath=/Shared+Data/VA+Reports/&appSwitcherDisabled=true`. This second URL is useful for tasks such as using an `<iframe>` tag to incorporate a single report within another web application because the SAS Visual Analytics application bar, menu bar, and toolbar are not included.

The following table lists the parameters that can be included in the second URL:

Parameter	Description
reportName	Specifies the name of the report that you want to view. This parameter is required if you are accessing a specific report through a URL.
reportPath	Specifies the path to the report that you want to view. This parameter is required if you are accessing a specific report through a URL.

Parameter	Description
appSwitcherDisabled	Disables the application bar, which enables you to return to the home page or to access other parts of SAS Visual Analytics and other SAS applications. The default value is false. Note: If you are displaying in an <iframe> tag, you must disable the application bar by specifying <code>appSwitcherDisabled=true</code> .
commentsEnabled	Enables the Comments tab in the right pane. The default value is true. If both <code>propertiesEnabled</code> and <code>commentsEnabled</code> are false, then the right pane is not added to the viewer.
propertiesEnabled	Enables the Properties tab in the right pane. The default value is true. If both <code>propertiesEnabled</code> and <code>commentsEnabled</code> are false, then the right pane is not added to the viewer.
reportViewOnly	Hides the SAS Visual Analytics banner, including all of the menus.

Parameters are specified in the URL as a sequence of name and value pairs using query string syntax. The URL specifies your server, an absolute path to SAS Visual Analytics, and the query string (following the question mark character). Each parameter name in the query string is separated from the next value by an equal sign (=). Multiple name and value pairs are separated by ampersand characters (&). In this example, `reportName=My+Report` is the parameter that specifies the name of the report. The second name and value pair (`reportPath=/Shared+Data/VA+Reports/`) is the parameter that specifies the path to that report. The third name and value pair (`appSwitcherDisabled=true`) disables the application bar. It must be present if you are displaying the report in an <iframe> tag.

There are special rules for formatting name and value pairs in a URL. Special characters (such as most punctuation characters, including spaces) in a value must be URL-encoded. A space can be encoded as a plus sign (+) or %20. Other characters are encoded using the %nn convention, where nn is the hexadecimal representation of the character in the ASCII character set. In the previous example, the value `/Shared+Data/VA+Reports/` actually identifies the report path `/Shared Data/VA Reports/`. The spaces in the names are encoded as plus signs (+).

The `reportName` and `reportPath` parameters must be specified in the URL. The `reportName` parameter specifies the name of the report that you want to view (for example, `My Report`). The `reportPath` parameter specifies the path to that report (for example, `/Shared Data/VA Reports/`).

Note: You can use these parameters with the standard viewer URL that requires login credentials (`http://host/SASVisualAnalyticsViewer/VisualAnalyticsViewer.jsp`). For example, you can use `http://host/SASVisualAnalyticsViewer/VisualAnalyticsViewer.jsp?reportViewOnly=true` to hide the banner.

Appendix 10

Twitter Data Details

The schema for the imported tweets is shown in the following table:

Column Name	Column Type	Length	Description
author	Character	128	The author's screen name.
authordescription	Character	1024	The author's description.
authorfavoritecount	Numeric	8	The number of tweets the author has "favorited."
authorfollowercount	Numeric	8	The number of followers the author had when the tweet was imported from Twitter.
authorfriendcount	Numeric	8	The number of users the author was following when the tweet was imported from Twitter.
authorid	Numeric	8	Twitter's unique ID for the author.
authorimageurl	Character	1024	A link to the author's profile image.

Column Name	Column Type	Length	Description
authorlang	Character	\$2	The BCP 47 code for the author's self-declared user interface language.
authorlocation	Character	128	The author's self-declared location.
authorname	Character	128	The author's self-declared name in the author's profile.
authortimezone	Character	256	The author's self-declared time zone.
authorurl	Character	1024	A URL provided by the author in the author's profile.
body	Character	1024	The body of the tweet.
deviceinfo	Character	1024	The utility that was used to post the tweet. It is represented as an HTML-formatted string.
docid	Numeric	8	Twitter's unique ID for the tweet. You can specify this variable as a unique row identifier when working with text analysis and word could visualizations.

Column Name	Column Type	Length	Description
doclatitude	Numeric	8	The latitude value of the tweet's coordinates (if available). If it is not available, then a missing value is populated.
doclongitude	Numeric	8	The longitude value of the tweet's coordinates (if available). If it is not available, then a missing value is populated.
isretweet	Numeric	8	A value of 1 indicates that the tweet is a retweet. Otherwise, the value is 0.
referenceauthor	Character	128	Screen name of the user to whom this tweet was a reply. If the tweet is not a reply, then this field is empty.
referenceauthorid	Numeric	8	User ID of the user to whom this tweet was a reply. If the tweet is not a reply, then the value for this field is set to -1.
publisheddatetime	Numeric	8	The tweet's published date and time as a SAS datetime value (based on the number of seconds since January 1, 1960).

Column Name	Column Type	Length	Description
<code>publisheddate timestr</code>	Character	32	The tweet's published date and time in string format. Example: October 24, 2013 6:56:25 PM GMT.
<code>tags</code>	Character	128	A semi-colon separated list of hash tags that are mentioned within the tweet.
<code>listoflinks</code>	Character	1024	A semi-colon separated list of URLs that are included in the body of the tweet. Expanded links are used where available.
<code>mentioneduser names</code>	Character	256	A semi-colon separated list of names of twitter users mentioned within the tweet.
<code>mentionedusers</code>	Character	256	A semi-colon separated list of screen names of twitter users mentioned within the tweet.
<code>retweetcount</code>	Numeric	8	The number of times this tweet has been retweeted when the tweet was imported from Twitter.

The schema for tweets is different from the schema that Twitter uses for tweets, users, and entities. The following list provides URLs to the information from Twitter for comparison purposes:

- Tweets: <https://dev.twitter.com/docs/platform-objects/tweets>
- Users: <https://dev.twitter.com/docs/platform-objects/users>
- Entities: <https://dev.twitter.com/docs/platform-objects/entities>

Glossary

Apache Hadoop

a framework that allows for the distributed processing of large data sets across clusters of computers using a simple programming model.

bar chart

a chart that consists of a grid and some vertical or horizontal columns (bars). Each column represents quantitative data.

bar-line chart

a bar chart with an overlaid line graph.

box plot

a graphical display of five statistics (the minimum, lower quartile, median, upper quartile, and maximum) that summarize the distribution of a set of data. The lower quartile (25th percentile) is represented by the lower edge of the box, and the upper quartile (75th percentile) is represented by the upper edge of the box. The median (50th percentile) is represented by a central line that divides the box into sections. The extreme values are represented by whiskers that extend out from the edges of the box.

calculated column

a column that does not exist in any of the tables that are accessed, but which is created as a result of a column expression.

capability

an application feature that is under role-based management. Typically, a capability corresponds to a menu item or button. For example, a Report Creation capability

might correspond to a New Report menu item in a reporting application. Capabilities are assigned to roles.

cell

a distinct rectangular subregion of a graph that can contain plots, text, or legends.

choropleth map

a two-dimensional map that uses color and fill pattern combinations to represent different categories or levels of magnitude.

co-located data provider

a distributed data source, such as SAS Visual Analytics Hadoop or a third-party vendor database, that has SAS High-Performance Analytics software installed on the same machines. The SAS software on each machine processes the data that is local to the machine or that the data source makes available as the result of a query.

crosstab

a two-dimensional table that shows frequency distributions or other aggregate statistics for the intersections of two or more category data items. In a crosstabulation table, categories are displayed on both the columns and rows, and each cell value represents the data result from the intersection of the categories on the specific row and column.

data brushing

a feature that enables you to select data values in a report object or visualization, and to readily see the corresponding data values highlighted in other report objects or visualizations.

data item

an item in a data source that is either a logical view of a data field or a calculation. The author of a report decides which data items to use in a particular section of a report. There are three types of data items: hierarchies, categories, and measures.

data source

a table, view, or file from which you will extract information. Sources can be in any format that SAS can access, on any supported hardware platform. The metadata for a source is typically an input to a job.

dependency

a trigger condition that must be met before a job can run in a scheduled flow.

deployed job

a job that has been saved in a deployment directory and can be scheduled.

deployment directory

the location for generated SAS DATA step programs that will be executed by the batch server as part of a scheduled flow.

file event

a file-related occurrence that is used as a trigger in a scheduled flow. For example, a file event occurs when a scheduling server determines that a specified file exists.

filter

specified criteria that are applied to data in order to identify the subset of data for a subsequent operation, such as continued processing.

flow

a set of jobs and associated dependencies that is scheduled in the Schedule Manager plug-in in SAS Management Console.

heat map

a graphical representation of data where the values taken by a variable in a two-dimensional map are represented as colors.

job

a collection of SAS tasks that can create output.

job event

a job-related occurrence that is used as a trigger in a scheduled flow. For example, a job event occurs when the scheduling server issues a command to determine whether a job ran successfully.

job flow

a group of jobs and their dependencies, including dependencies on other jobs, on files, or on specified dates and times.

join condition

a combination of join keys and a comparison operator.

list table

a two-dimensional representation of data, in which the data values are arranged in rows and columns.

local data

data that is accessible through the file systems on a computer. This includes data on hard drives or available through network file systems.

locale

a setting that reflects the language, local conventions, and culture for a geographic region. Local conventions can include specific formatting rules for paper sizes, dates, times, and numbers, and a currency symbol for the country or region. Some examples of locale values are French_Canada, Portuguese_Brazil, and Chinese_Singapore.

localization

the process of adapting software for a particular geocultural region (locale). Translation of the user interface, system messages, and documentation is a large part of the localization process.

pie chart

a circular chart that is divided into slices by radial lines. Each slice represents the relative contribution of each part to the whole.

query

a set of instructions that requests particular information from one or more data sources.

remote data

data that is not accessible through the file systems available to a computer. To use remote data, you must direct a SAS server to access the data that is available through file systems on the remote machine.

report

output that is generated by running custom SAS code against the data in your project.

role

a set of capabilities within an application that are targeted to a particular group of users.

SAS Management Console

a Java application that provides a single user interface for performing SAS administrative tasks.

SAS Stored Process

a SAS program that is stored on a server and defined in metadata, and which can be executed by client applications. Short form: stored process.

scatter plot

a two- or three-dimensional plot that shows the joint variation of two (or three) variables from a group of table rows. The coordinates of each point in the plot correspond to the data values for a single table row (observation).

scatter plot matrix

a grid of scatter plots showing pairwise combinations of multiple numeric variables.

scheduling server

a server that runs deployed jobs in a scheduled flow. Before running a job, the scheduling server determines when the schedule for the deployed job as well as all of the dependencies for the job have been met.

source

See data source

subquery

a query-expression that is nested as part of another query-expression. Depending on the clause that contains it, a subquery can return a single value or multiple values.

time series

an ordered sequence of values of a variable that are observed at equally spaced time intervals.

Unicode

a 16-bit encoding that is the industry standard for supporting the interchange, processing, and display of characters and symbols from most of the world's writing systems.

user role

See role

UTF-8

a method for converting 16-bit Unicode characters to 8-bit characters. This format supports all of the world's languages, including those that use non-Latin 1 characters.

visual exploration

a metadata object that contains visualizations and data settings that are saved from a session of SAS Visual Analytics Explorer.

visualization

an interactive visual representation of data. A visualization can be a table, a chart, or a geographic map.

waterfall chart

a form of data visualization that is used to understand or explain the cumulative effect on an initial value of sequentially introduced positive or negative values. Usually, the initial and the final values are represented by whole columns, and the intermediate values are denoted by floating columns.
