Using This Book

Audience

The SAS Studio: Developer's Guide is intended for programmers who need to develop custom tasks for their site. This document describes the common task model for SAS Studio and explains the syntax used in this task model.

Prerequisites

For task development, it is recommended that you use the latest version of Google Chrome because of its debugging tools.
For information about the accessibility of this product, see Accessibility Features of SAS Studio 3.1 at support.sas.com.

   Sharing a Task That You Created ................................................ 6

About the SAS Studio Tasks

SAS Studio is shipped with several predefined tasks, which are point-and-click user interfaces that guide the user through an analytical process. For example, tasks enable users to create a bar chart, run a correlation analysis, or rank data. When a user selects a task option, SAS code is generated and run on the SAS server. Any output (such as graphical results or data) is displayed in SAS Studio.

Because of the flexibility of the task framework, you can create tasks for your site. In SAS Studio, all tasks use the same common task model and the Velocity Template Language. No Java programming or ActionScript programming is required to build a task.
The common task model (CTM) defines how the task appears to the SAS Studio user and how to run the task. A task is defined by its input data and the options that are available to the user. (Some tasks might not require an input data source.) In addition, the task has metadata so that it is recognized by SAS Studio.

In SAS Studio, a task is defined by the Task element, which has these children:

Registration
The Registration element identifies the type of task. In this element, you define the task name, icon, and unique identifier.

Metadata
The Metadata element specifies whether an input data source is required to run the task, any role assignments, and the options in the task.

- The UI engine reads the Roles element to determine what types of variables are required by the task. Here is the information that you would specify in this element:
  - type of variable that the user can assign to this role (for example, numeric or character)
  - the minimum or maximum number of variables that you can assign to a role
  - the label or description of the role that appears in the user interface
- The UI engine reads the Options element to determine how to display the options in the user interface.

UI
The UI element describes how to present the user interface to the user. A top-down layout is supported.

Dependencies
The Dependencies element describes any dependencies that options might have on one another. For example, selecting a check box could enable a text box.

Requirements
The Requirements element specifies what conditions must be met in order for code to be generated.
Code Template

The Code Template element determines the output of the task. For most tasks, the output is SAS code. However, you can create any type of text output.

Create a New Task

To create a new task:

1. In the navigation pane, open the Tasks section.
2. Click "Create a New Task".
Chapter 1 / Introduction to the Common Task Model

The sample task definition that is shipped with SAS Studio appears.

3 Edit the sample task definition to create your task. For help with the Velocity Template Language, see *Apache Velocity User’s Guide*.

4 To save the task, click 

5 Enter a unique name for the task. The task is saved with the CTM file extension in your file system.
Validation Steps for the Task

When you run a task, SAS Studio validates the code by determining whether the XML is well formed, whether the Velocity template has any syntax errors, and whether there are any logical XML errors.

Testing a Task

To test your task, click 🖥. (Alternatively, you can press F3.) The user interface for the task appears to the right of your work area.

If you are using Google Chrome, press F12 to view any errors.
Sharing Tasks

About CTM and CTK Files

After creating a task, you might want to share it with other users at your site. Tasks are saved as CTM files. You might also want to share CTK files, which are CTM files with some of the roles and options preselected. For more information about how to create a CTK file, see the “Save a Task and Its Option Settings” topic in SAS Studio: User's Guide.

Accessing a Task Created by Another User

To access this task from SAS Studio:

1. Save the CTM or CTK file to your local computer. (This file could have been sent to you by e-mail.)

2. In SAS Studio, open the Folders section and click . The Upload Files window appears.

3. Specify where you want to upload the files and click Choose Files to select a file.

4. Click Upload.

Sharing a Task That You Created

If you save the CTM or CTK file to a shared network location, other users can create a folder shortcut to access the task from SAS Studio. The advantage to this approach is that you have only one copy of the CTM file.

To create a new folder shortcut, click in the Folders section and select Folder Shortcut. Enter the shortcut name and full path and click Save. The new shortcut is added to the list of folder shortcuts.
About the Registration Element

The Registration element represents a collection of metadata for the task. The hosting application requires this element in order to know the type of task.

Here are the child elements for the Registration element:

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the task. This name is used throughout the application to represent the task.</td>
</tr>
<tr>
<td>Description</td>
<td>A description of the task. This text could appear in the task properties or in tooltips for the task.</td>
</tr>
<tr>
<td>GUID</td>
<td>A unique identifier for the task.</td>
</tr>
<tr>
<td>Procedures</td>
<td>A list of SAS procedures that are used by this task.</td>
</tr>
<tr>
<td>Version</td>
<td>A simple integer value that represents the version of the task.</td>
</tr>
<tr>
<td>Links</td>
<td>A list of hyperlinks to help or resources related to this task.</td>
</tr>
</tbody>
</table>
Example: The Registration Element from the Sample Task Definition

To create a new task, you can use the sample task definition that is shipped with SAS Studio.

Here is the Registration element from the sample task definition:

```xml
<Registration>
  <Name>Task Template</Name>
  <Description>Demonstrates the Common Task Model functionality.</Description>
  <GUID>C6AC34BD-D14A-4CF5-BF2F-A110711BF819</GUID>
  <Procedures>PRINT</Procedures>
  <Version>1.0</Version>
  <Links>
    <Link href="http://www.sas.com">SAS Home page</Link>
  </Links>
</Registration>
```
Working with the Metadata Element

---

**About the Metadata Element**

The *Metadata* element comprises two parts: the *DataSources* element and the *Options* element.

---

**Working with the DataSources Element**

**About the DataSources Element**

The *DataSources* and *DataSource* elements create a simple grouping of the data that is required for the task. If these elements are not specified, then no input data is needed to run the task.
The **DataSource** element is the only child of the **DataSources** element, and the **DataSources** element can have only one **DataSource** child. The **DataSource** element specifies the information about the data set for the task. The only child for the **DataSource** element is the **Roles** element.

### Working with the Roles Element

#### About the Roles Element

The **Roles** element identifies the variables that must be assigned in order to run the task. This element is a way to group the individual role assignments that are needed for a task.

The **Role** tag, which is the only child of the **Roles** element, describes one type of role assignment for the task.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the name assigned to this role.</td>
</tr>
<tr>
<td>type</td>
<td>Specifies the type of column that can be assigned to this role. Here are the valid values:</td>
</tr>
<tr>
<td></td>
<td>A (All column types are allowed. In the user interface, all columns are identified by the 📊 icon.</td>
</tr>
<tr>
<td></td>
<td>N (Only numeric columns can be assigned to this role. In the user interface, numeric columns are identified by the 📊 icon.)</td>
</tr>
<tr>
<td></td>
<td>C (Only character columns can be assigned to this role. In the user interface, character columns are identified by the 📊 icon.)</td>
</tr>
<tr>
<td>minVars</td>
<td>Specifies the minimum number of columns that must be assigned to this role. If minVars=0, the role is optional. If minVars=1, a column is required to run this task, and a red asterisk appears next to the label in the user interface.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>maxVars</td>
<td>Specifies the maximum number of columns that can be assigned to this role. If <code>maxVars=0</code>, users can assign an unlimited number of columns to this role.</td>
</tr>
<tr>
<td>exclude</td>
<td>Specifies the list of roles that are mutually exclusive to this role. If a column is assigned to a role in this list, the column does not appear in the list of available columns for this role.</td>
</tr>
<tr>
<td>order</td>
<td>Specifies that the user can order the columns that are assigned to this role. Valid values are <code>true</code> and <code>false</code>. If <code>order=true</code>, the user can use the up and down arrows in the user interface to modify the order.</td>
</tr>
</tbody>
</table>

**Example: DataSources and Roles Elements from the Sample Task Definition**

Here is an example of the `DataSources` and `Roles` elements:

```xml
<DataSources>
    <DataSource name="PRIMARYDATA">
        <Roles>
            <Role type="A" maxVars="0" order="true" minVars="1" name="VAR"> Required variable label</Role>
            <Role type="N" maxVars="0" order="true" minVars="0" name="OPTNVAR" exclude="VAR">Numeric variable label</Role>
            <Role type="C" maxVars="3" order="true" minVars="0" name="OPTCVAR">Character variable label</Role>
        </Roles>
    </DataSource>
</DataSources>
```
When you run this code, you get the Data and Roles sections in this example:

A red asterisk appears for the **Required variable label** role because you must assign a column to this role. In the code, this requirement is indicated by `minVars=1`.
Working with the Options Element

About the Options Element

The `<Options>` element identifies the options that are required in order to run the task. The `<Option>` tag, which is the only child of the `<Options>` element, describes the assigned option.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the name assigned to this option.</td>
</tr>
<tr>
<td>defaultValue</td>
<td>Specifies the initial value for the option.</td>
</tr>
<tr>
<td>inputType</td>
<td>Specifies the input control for this option. Here are the valid values:</td>
</tr>
<tr>
<td></td>
<td>‧ checkbox</td>
</tr>
<tr>
<td></td>
<td>‧ color</td>
</tr>
<tr>
<td></td>
<td>‧ combobox</td>
</tr>
<tr>
<td></td>
<td>‧ inputtext</td>
</tr>
<tr>
<td></td>
<td>‧ modelbuilder</td>
</tr>
<tr>
<td></td>
<td>‧ numstepper</td>
</tr>
<tr>
<td></td>
<td>‧ radio</td>
</tr>
<tr>
<td></td>
<td>‧ slider</td>
</tr>
<tr>
<td></td>
<td>‧ string</td>
</tr>
<tr>
<td></td>
<td>‧ validationtext</td>
</tr>
</tbody>
</table>

For more information, see “Supported Input Types” on page 14.
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>indent</td>
<td>Specifies the indentation for this option in the task interface. Here are the valid values:</td>
</tr>
<tr>
<td></td>
<td>1 – minimal indentation (about 17px)</td>
</tr>
<tr>
<td></td>
<td>2 – average indentation (about 34px)</td>
</tr>
<tr>
<td></td>
<td>3 – maximum indentation (about 51px)</td>
</tr>
</tbody>
</table>

**Supported Input Types**

**checkbox**

This input type does not have additional attributes. The valid values for checkbox are 0 (unchecked) and 1 (checked).

The code in the sample task definition creates two check boxes.

```xml
<Option name="GROUP1" inputType="string">CHECK BOXES</Option>
<Option name="chkCheck defaultValue=1" inputType="checkbox">
  Enable another field</Option>
<Option name="chkEXAMPLE defaultValue=0" inputType="checkbox">
  Check box</Option>
```

When you run the code, here is the user interface that is created:

- **CHECK BOXES**
  - [ ] Enable another field
  - [ ] Check box

**color**

This input type does not have additional attributes. Here is an example from the sample task definition:

```xml
<Option name="colorEXAMPLE defaultValue="gray" inputType="color">Choose Color</Option>
```
When you run the code, here is the user interface that is created:

![Choose Color dropdown]

**combobox**

This input type has one attribute.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Specifies the width of the control. This value can be in percent (%), em, or px. By default, SAS Studio sizes the control based on the available width and content.</td>
</tr>
</tbody>
</table>

The code in the sample task definition creates a combination box called **Drop-down list**. This list contains three options: **Value 1**, **Value 2**, and **Value 3**.

```xml
<Option name="comboEXAMPLE" defaultValue="value2" inputType="combobox">
  Drop-down list:
</Option>
<Option name="value1" inputType="string">Value 1</Option>
<Option name="value2" inputType="string">Value 2</Option>
<Option name="value3" inputType="string">Value 3</Option>
```

When you run the code, here is the resulting user interface:

![Choose Color dropdown]

**inputtext**

This input type has these attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>required</td>
<td>Specifies whether any input text is required. Valid values are true and false. The default is false.</td>
</tr>
</tbody>
</table>
Attribute | Description
--- | ---
missingMessage | Specifies the tooltip text that appears when the text box is empty but input text is required. No message is displayed by default.
promptMessage | Specifies the tooltip text that appears when the text box is empty and the user has selected the text box.
width | Specifies the width of the control. This value can be in percent (%), em, or px. By default, SAS Studio sizes the control based on the available width and content.

The code in the sample task definition creates a text box called **Indented field with default value**. The default value for this option is output.xls. If the user removes this text, the message “Enter a filename” appears because a valid filename is required.

```xml
<Option name="txtEXAMPLE" defaultValue="output.xls" inputType="inputtext" width="100%" indent="1" required="true" promptMessage="Enter a filename" missingMessage="Missing filename">Indented field with default value:</Option>
```

When you run the code, here is the user interface that is created:

![Text Input Field](image)

**modelbuilder**

A *model* is an equation that consists of a dependent or response variable and a list of effects. The user creates the list of effects from variables and combinations of variables.

Here are examples of effects:

**main effect**

For variables Gender and Height, the main effects are Gender and Height.
interaction effect

For variables Gender and Height, the interaction is Gender * Height. You can have two-way, three-way, ...n-way interactions.

The order of the variables in the interaction is not important. For example, Gender * Height is the same as Height * Gender.

polynomial effect

You can create polynomial effects with continuous variables. For the continuous variable X, the quadratic polynomial effect is X\*X. You can have second-order, third-order, ...nth-order polynomial effects.

The modelbuilder input type has these attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>required</td>
<td>Specifies whether any input text is required. Valid values are true and false. The default is false.</td>
<td></td>
</tr>
<tr>
<td>roleContinuous</td>
<td>Specifies the role that contains the continuous variables. The default value is null.</td>
<td></td>
</tr>
<tr>
<td>roleClassification</td>
<td>Specifies the role that contains the classification variables. The default value is null.</td>
<td></td>
</tr>
<tr>
<td>excludeTools</td>
<td>Specifies the effect and model buttons to exclude from the user interface. Valid values are ADD, CROSS, NEST, TWOFACT, THREEFACT, FULLFACT, NFACTORIAL, POLYEFFECT, POLYMODEL and NFACTPOLY. Separate multiple values with spaces or commas.</td>
<td></td>
</tr>
<tr>
<td>width</td>
<td>Specifies the width of the control. The width value can be specified in percent, em, or px. By default, the control is automatically sized based on the available width and content.</td>
<td></td>
</tr>
</tbody>
</table>

Note: At least one of the role attributes (roleContinuous or roleClassification) is required. If both attributes are set to null, no variables are available to create the model.

Here is some example code for the model builder from the Generalized Linear Model task:
After selecting an input data source and identifying the columns that contain the continuous or classification variables, you can start building your model. This example uses the Sashelp.Cars data set as the input data source. MSRP, EngineSize, Invoice, and Cylinders are the continuous variables.
numstepper
This input type has these attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>decimalPlaces</td>
<td>Specifies the number of decimal places to display. Valid values include a single value or a range. To create a field that allows 0 to 3 decimal places, specify decimalPlaces=&quot;0,3&quot;.</td>
</tr>
</tbody>
</table>
### Attribute Description

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>increment</td>
<td>Specifies the number of values that the option increases or decreases when a user clicks the up or down arrow. The default value is 1.</td>
</tr>
<tr>
<td>maxValue</td>
<td>Specifies the maximum value that is allowed. If the user tries to exceed this value, a message appears. The default value is 9000000000000.</td>
</tr>
<tr>
<td>minValue</td>
<td>Specifies the minimum value that is allowed. If the user specifies a value that is below the minimum value, a message appears.</td>
</tr>
<tr>
<td>required</td>
<td>Specifies whether a value is required. Valid values are true and false. The default value is false.</td>
</tr>
<tr>
<td>width</td>
<td>Specifies the width of the control. This value can be in percent (%), em, or px. By default, SAS Studio sizes the control based on the available width and content.</td>
</tr>
</tbody>
</table>

The first example in the sample task definition creates an option with an assigned default value of 5.

```
<Option name="labelNumStepperEXAMPLE1" inputType="string">
  Numeric stepper with default values:</Option>
<Option name="basicStepperEXAMPLE" defaultValue="5" inputType="numstepper" indent="1">Label:</Option>
```

When you run this code, here is the resulting user interface:

Numeric stepper with default values.

![Label: 5](triangle-up-down.png)

The second example in the sample task definition creates an option with a specified minimum value, maximum value, and increment.

```
<Option name="labelNumStepperEXAMPLE2" inputType="string">
  Numeric stepper with a minimum value of -10, a maximum value of 120, and an increment of 2.</Option>
<Option name="advancedStepperEXAMPLE" defaultValue="80" inputType="numstepper" increment="2"`

```

```
`
When you run the code, here is the resulting user interface:

Numeric stepper with a minimum value of -10, a maximum value of 120, and an increment of 2.

radio

This input type has one attribute:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable</td>
<td>Specifies a variable that contains the name of the currently selected radio button.</td>
</tr>
</tbody>
</table>

The second example in the sample task definition creates an option called **Radio button group label** with the **Radio button 1** button selected by default.

```xml
<Option name="labelEXAMPLE2" inputType="string">Radio button group label:</Option>
<Option name="radioButton1" variable="radioEXAMPLE" defaultValue="radioButton1" inputType="radio">Radio button 1</Option>
<Option name="radioButton2" variable="radioEXAMPLE" inputType="radio">Radio button 2</Option>
<Option name="radioButton3" variable="radioEXAMPLE" inputType="radio">Radio button 3</Option>
```
When you run the code, here is the resulting user interface:

Radio button group label:

- Radio button 1
- Radio button 2
- Radio button 3

**slider**

This input type has these attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>discreteValues</td>
<td>Specifies the number of discrete values in the slider. For example, if discreteValues=3, the slider has three values: a minimum value, a maximum value, and a value in the middle.</td>
</tr>
<tr>
<td>maxValue</td>
<td>Specifies the maximum value for this option.</td>
</tr>
<tr>
<td>minValue</td>
<td>Specifies the minimum value for this option.</td>
</tr>
<tr>
<td>showButtons</td>
<td>Specifies whether to show the increase and decrease buttons for the slide. Valid values are true and false. The default value is true.</td>
</tr>
</tbody>
</table>

The first example in the sample task definition creates a slider option with buttons.

```xml
<Option name="labelSliderEXAMPLE1" inputType="string">
    Slider with buttons.</Option>
<Option name="labelSliderEXAMPLE1" defaultValue="80.00" inputType="slider" discreteValues="14" minValue="-10" maxValue="120">Label</Option>
```
When you run the code, here is the resulting user interface:

Slider with buttons.

The second example in the sample task definition creates a slider option without buttons.

```xml
<Option name="labelSliderEXAMPLE2"
     inputType="string">Slider without buttons.</Option>
<Option name="labelSliderEXAMPLE2" defaultValue="80.00"
     inputType="slider" discreteValues="14" minValue="-10"
     maxValue="120" showButtons="false">Label</Option>
```

When you run the code, here is the resulting user interface:

Slider without buttons.

**string**

This input type has no attributes. The code for the sample task definition contains several examples of the string input type. In the code for the slider option, the explanatory text (**Slider with buttons**) is created by the string input type.

```xml
<Option name="labelSliderEXAMPLE1" inputType="string">
   Slider with buttons.</Option>
<Option name="labelSliderEXAMPLE1" defaultValue="80.00"
     inputType="slider" discreteValues="14" minValue="-10"
     maxValue="120">Label</Option>
```

When you run the code, here is the resulting user interface:

Slider with buttons.
validationtext

This input type has these attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>required</td>
<td>Specifies whether any input text is required. Valid values are true and false. The default is false.</td>
</tr>
<tr>
<td>invalidMessage</td>
<td>Specifies the tooltip text to display when the content in the text box is invalid. By default, no message is displayed.</td>
</tr>
<tr>
<td>missingMessage</td>
<td>Specifies the tooltip text that appears when the text box is empty but text is required. By default, no message is displayed.</td>
</tr>
<tr>
<td>promptMessage</td>
<td>Specifies the tooltip text that appears when the text box is empty and the text box is selected. By default, no message is displayed.</td>
</tr>
<tr>
<td>regExp</td>
<td>Specifies the regular expression pattern to use for validation. This syntax comes directly from JavaScript Regular Expressions.</td>
</tr>
<tr>
<td>width</td>
<td>Specifies the width of the control. This value can be in percent (%), em, or px. By default, SAS Studio sizes the control based on the available width and content.</td>
</tr>
</tbody>
</table>

The code for the sample task definition creates a text box called **Label**.

```xml
<Option name="validationTextExample" defaultValue="99999"
inputType="validationtext"
required="true"
width="100%"
promptMsg="A message that tells the user what type of value to enter"
invalidMsg="Invalid value message"
missingMsg="This value is required."
regExp="\d{5}">
Label:
</Option>
```

When you run the code, here is the resulting user interface:

*Label:*

99999
If you remove the default value from this box, the **This value is required** message appears.

When the user begins entering a value, the **message appears**: A message that tells the user what type of value to enter.

If the specified value is invalid, the **Invalid value message** appears.
About the UI Element

This element is read by the UI engine to determine the layout of the user interface. Only linear layouts are supported. The **ui** tag is for grouping purposes only. There are no attributes associated with this tag.

The **ui** element has these children:

<table>
<thead>
<tr>
<th>Child</th>
<th>Description</th>
</tr>
</thead>
</table>
| Container| A tab that contains any options for the task. For example, you might want to display the option for selecting the input data and assigning columns to roles on the same page. The UI engine displays these options sequentially.  
A label is created for the tab. The **container** tag takes only one attribute. The string for this option is the value of the **string** input type in the Metadata element. |
<table>
<thead>
<tr>
<th>Child</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group</td>
<td>A title for a group of options. The UI engine displays these options sequentially. This tag takes these attributes:</td>
</tr>
<tr>
<td></td>
<td>- The option attribute is an option name in the metadata. This string is the same as the string value for the metadata option.</td>
</tr>
<tr>
<td></td>
<td>- The open attribute specifies whether a group is expanded or collapsed. By default, open=false, and the group is collapsed in the user interface. To display the contents of a group by default, specify open=true.</td>
</tr>
<tr>
<td>DataItem</td>
<td>A reference to an input data source. This tag has only one attribute. The string for this option is the value of the string input type in the Metadata element.</td>
</tr>
<tr>
<td>RoleItem</td>
<td>A reference to a role. This tag has only one attribute. The string for this option is the value of the string input type in the Metadata element.</td>
</tr>
<tr>
<td>OptionItem</td>
<td>A reference to an option that has a single state. This type of option is either on or off, or has a single value (such as a series of radio buttons). This tag takes the option attribute only. The option attribute refers to the metadata name attribute for the option. The string for this option is taken from the metadata string value.</td>
</tr>
<tr>
<td>OptionChoice</td>
<td>A reference to an option that has a choice of values. This type of option could be displayed as a combination box. The OptionChoice element uses the OptionItem or OptionValue element to represent the choice of values.</td>
</tr>
<tr>
<td>OptionValue</td>
<td>A value choice. This tag is valid only as a child of the OptionChoice element.</td>
</tr>
</tbody>
</table>
Example: UI Element for the Sample Task Definition

The code for the sample task definition creates a group for each input type. Here is the code for the first three groups:

```xml
<UI>
  <Container option="DATATAB">
    <Group option="DATAGROUP" open="true">
      <DataItem data="DATASOURCE" />
    </Group>
    <Group option="ROLESGROUP" open="true">
      <RoleItem role="VAR"/>
      <RoleItem role="OPTNVAR"/>
      <RoleItem role="OPTCVAR"/>
    </Group>
  </Container>
  
  <Container option="OPTIONSTAB">
    <Group option="GROUP0" open="true">
      <OptionItem option="labelEXAMPLE"/>
    </Group>
    <Group option="GROUP1">
      <OptionItem option="chkCheck"/>
      <OptionItem option="chkEXAMPLE"/>
    </Group>
    <Group option="GROUP2">
      <OptionItem option="labelEXAMPLE2"/>
      <OptionItem option="radioButton1"/>
      <OptionItem option="radioButton2"/>
      <OptionItem option="radioButton3"/>
    </Group>
    ...
  </Container>
</UI>
```

When you run this code, the **Data** and **Options** tabs appear in the interface
The Data tab displays a selector for the input data source and three roles.

The Options tab contains several groups. The example code creates the Groups, Check Boxes, and Radio Buttons groups. The first group is expanded by default.
because the `open` attribute is set to `true`. (The sample task definition includes code to create the remaining groups on the **Options** tab.)
About the Dependencies Element

The Dependencies element specifies how certain options rely on one another in order for the task to work properly. For example, a check box can enable or disable a text box depending on whether the check box is selected. The Dependencies element is a
grouping mechanism for the individual Dependency tags. There are no attributes associated with this element.

The Dependencies element can have multiple Dependency tags. Each Dependency tag has a condition attribute that is resolved to determine the state of the targets.

The Target element has three required attributes.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>option</td>
<td>References the option that will receive the action.</td>
</tr>
<tr>
<td>conditionResult</td>
<td>Specifies when to execute the action. The valid values for this attribute are true and false.</td>
</tr>
<tr>
<td></td>
<td>- If the condition is true and conditionResult=true, the action is executed.</td>
</tr>
<tr>
<td></td>
<td>- If the condition is false and conditionResult=false, the action is executed.</td>
</tr>
<tr>
<td></td>
<td>- If the value of the condition and conditionResult do not match (for example, one is true and one is false), the action is ignored.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| action    | Specifies the action to execute. Here are the valid values:  
  - show  
  - hide  
  - enable  
  - disable  
  - set  

  If the value of the action attribute is set, you must also specify these two attributes:  
  - The property attribute refers to the attribute of an element that was created from the metadata. The option element in the metadata has an inputType attribute that specifies what UI element is created.  
  With a few exceptions, any attribute that is listed for an input type is a valid value for the property attribute of a Target element. The invalid values are required, width, indent, and variable.  
  - The value attribute is the value to use for the target of the property attribute. |

**Notes on Dependencies**

- If action=hide, the associated option is not defined. If action=show, the associated option is defined and appears in the SAS code that is generated by the Velocity script.

- Not all dependencies are evaluated each time the Velocity script runs and produces the SAS code. When the task is first opened, all dependencies are run to establish initial values. After that, only dependencies that are linked to the current interaction in the user interface are evaluated. The value of the condition attribute determines whether a dependency is evaluated.

- Dependencies are evaluated in top-down order.
An option is order independent if the option name appears only in the condition attribute of the Target element.

An option is order dependent if the option name appears in both the condition and option attributes of the Target element.

This example shows a correct and incorrect ordering of dependencies:

```xml
<UI>
  <Container option="options">
    <Group option="basic options">
      <Option name="COMBOBOX"/>
      <Option name="ITEM1"/>
      <Option name="ITEM2"/>
      <Option name="ITEM3"/>
        <OptionItem option="CHECKBOX"/>
        <OptionItem option="INPUTTEXT"/>
      </Group>
    </Container>
  <Dependencies>
1<!-- Correct ordering of the dependencies -->
  <Dependency condition="$COMBOBOX=='ITEM1'">
    <Target conditionResult="true" option="CHECKBOX" action="set"
      property="value" value="1"/>
  </Dependency>
  <Dependency condition="$CHECKBOX=='1'">
    <Target conditionResult="true" option="INPUTTEXT" action="enable"/>
    <Target conditionResult="false" option="INPUTTEXT" action="disable"/>
  </Dependency>

2<!-- Incorrect ordering to the dependencies -->
  <Dependency condition="$CHECKBOX=='1'">
    <Target conditionResult="true" option="INPUTTEXT" action="enable"/>
    <Target conditionResult="false" option="INPUTTEXT" action="disable"/>
  </Dependency>
  <Dependency condition="$COMBOBOX=='ITEM1'">
    <Target conditionResult="true" option="CHECKBOX" action="set"
      property="value" value="1"/>
  </Dependency>
</Dependencies>

1 This first dependency is order independent. COMBOBOX is a name that is used in the condition, but the value of COMBOBOX is not a target in any of the other dependencies.
The second dependency is order dependent. CHECKBOX is used in the condition, and the value of CHECKBOX is also a target for option="CHECKBOX" in the preceding Dependency element. In this case, the state for INPUTTEXT is not evaluated properly because condition="$CHECKBOX=='1'" is evaluated before condition="$COMBOBOX=='ITEM1'".

Example 1: Selecting a Check Box Enables Text Boxes

In this example from the Characterize Data task, the selection of the SAS data sets check box determines whether the Frequency data and Univariate data text boxes are available. (In the Tasks section, the Characterize Data task is in the Data group.)

In this example, SASDATASETS is the name of the check box. FRQDATA and UNIDATA are the names of the input text fields.

```xml
<Dependency condition="$SASDATASETS=='1'"/>
    <Target conditionResult="true" option="FRQDATA" action="enable"/>
    <Target conditionResult="false" option="FRQDATA" action="disable"/>
    <Target conditionResult="true" option="UNIDATA" action="enable"/>
    <Target conditionResult="true" option="UNIDATA" action="enable"/>
</Dependency>
```
By default, the **SAS data sets** check box is selected, so the **Frequency data** and **Univariate data** text boxes are enabled. Here are the results that appear on the **Options** tab:

![SAS data sets]

*Frequency data:
WORK.CharacterizeDataFRQ

*Univariate data:
WORK.CharacterizeDataUNI

If you clear the **SAS data sets** check box, the **Frequency data** and **Univariate data** text boxes are not available. Here are the results that appear on the **Options** tab:

![SAS data sets]

*Frequency data:
WORK.CharacterizeDataFRQ

*Univariate data:
WORK.CharacterizeDataUNI

---

**Example 2: Selecting a Check Box Enables a Combination Box**

In this example from the Summary Statistics task, the **Quantile method** drop-down list is enabled only if the user selects the check box for at least one of the quantile options. (In the **Tasks** section, the Summary Statistics task is in the **Statistics** group.)

In this example, P1, P5, P10, Q1, MEDIAN, Q3, P90, P95, and P99 are the names of the check boxes. QUANTILE is the name of the combination box.

```
<Option name="P1" defaultValue="0" inputType="checkbox">1st</Option>
<Option name="P5" defaultValue="0" inputType="checkbox">5th</Option>
<Option name="P10" defaultValue="0" inputType="checkbox">10th</Option>
<Option name="Q1" defaultValue="0" inputType="checkbox">Lower quartile</Option>
<Option name="MEDIAN" defaultValue="0" inputType="checkbox">Median</Option>
```
By default, no check boxes are selected, so the **Quantile method** drop-down list is not available. Here is the result that appears on the **Options** tab:

- □ 1st
- □ 5th
- □ 10th
- □ Lower quartile
- □ Median
- □ Upper quartile
- □ 90th
- □ 95th
- □ 99th

**Quantile method:**

- □ Order statistics
If you selected one or more of these check boxes, the **Quantile method** drop-down list is available. Here is the result that appears on the **Options** tab:

- 1st
- 5th
- 10th
- Lower quartile
- **Median**
- Upper quartile
- 90th
- 95th
- 99th

**Quantile method:**

Order statistics

---

**Example 3: Selecting a Radio Button Enables a Number Stepper Control**

In this example from the Rank Data task, the selection of the **Group = n (NTILES)** option determines whether the **Number of groups** option is available. (In the **Tasks** section, the Rank Data task is in the **Data** group.)

In this example, RMGN is the name of the radio button, and NUMGRPS is the name of the numstepper variable.

```xml
<Option name="RMGN" inputType="radio" variable="RMGRP">Group = n (NTILES)</Option>
<Option name="NUMGRPS" defaultValue="1" minValue="0" inputType="numstepper" indent="1">Number of groups:</Option>

<Dependency condition="$RMGRP.equalsIgnoreCase('RMGN')"/>
```
By default, the **Group = n (NTILES)** option is not selected, so the **Number of groups** option is not available. Here is the result that appears on the **Options** tab:

When you select the **Group = n (NTILES)** option, the **Number of groups** option is available. Here is the result that appears on the **Options** tab:

---

**Example 4: The Selected Value for a Combination Box Enables the Text Box**

In this example from the Sort Data task, the **Value** text box is available only if you select **B (bytes)**, **KB (kilobytes)**, **MB (megabytes)**, or **GB (gigabytes)** from the **Memory for sorting** drop-down list. (In the **Tasks** section, the Sort Data task is in the **Data** group.)

In this example, **MEMSORT** is the name of the drop-down list that is created by the **combobox** variable. The **MEMSORT** option has these values: **MSSD** (Server default), **MSMA** (Maximum allowed), **MSB** (B (bytes)), **MSKB** (KB (kilobytes)), **MSMB** (MB (megabytes)), and **MSGB** (GB (gigabytes)). **MEMAMT** is the name of the validation text box.

```xml
<Option name="MEMSORT" defaultValue="MSSD" inputType="combobox"/>
```
Memory for sorting:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server default</td>
<td>Server default</td>
</tr>
<tr>
<td>Maximum available</td>
<td>Maximum available</td>
</tr>
<tr>
<td>B (bytes)</td>
<td>B (bytes)</td>
</tr>
<tr>
<td>KB (kilobytes)</td>
<td>KB (kilobytes)</td>
</tr>
<tr>
<td>MB (megabytes)</td>
<td>MB (megabytes)</td>
</tr>
<tr>
<td>GB (gigabytes)</td>
<td>GB (gigabytes)</td>
</tr>
<tr>
<td>MEMAMT</td>
<td>Value:</td>
</tr>
</tbody>
</table>

By default, the **Server default** option is selected, so the **Value** option is not available. Here is the result that appears on the **Options** tab:

If you select the **B (bytes)** option, the **Value** option is available. Here is the result that appears on the **Options** tab:
Example 5: Selecting a Check Box Enables Multiple Types of Options

In this example from the Table Attributes task, selecting the Enhanced report check box enables the Sort variables by drop-down list and the Ascending and Descending radio buttons. (In the Tasks section, the Table Attributes task is in the Data group.)

In this example, ENHANCEDRPT is the name of the check box. SORTROWS, ASCENDING, and DESCENDING are the names of the Sort variables by, Ascending, and Descending options, respectively.

```xml
<Option name="ENHANCEDRPT" defaultValue="1" inputType="checkbox">
  Enhanced report</Option>
<Option name="SORTROWS" defaultValue="SRVN" inputType="combobox" width="100%">
  In the data variable table, sort rows by:
  <Option name="SRVN" inputType="string">Variable name</Option>
  <Option name="SRVO" inputType="string">Variable order in table</Option>
  <Option name="SRVT" inputType="string">Variable type</Option>
  <Option name="SRVF" inputType="string">Variable format</Option>
  <Option name="SRVL" inputType="string">Variable label</Option>
</Option>
<Option name="ORDERSEQ" inputType="string">Order sequence:</Option>
<Option name="ASCENDING" variable="ORDERRADIO" inputType="radio" indent="1" defaultValue="1">Ascending</Option>
<Option name="DESCENDING" variable="ORDERRADIO" inputType="radio" indent="1">Descending</Option>

<Dependency condition="$ENHANCEDRPT=='1'"/>
  <Target conditionResult="true" option="SORTROWS" action="enable"/>
  <Target conditionResult="true" option="ASCENDING" action="enable"/>
  <Target conditionResult="true" option="DESCENDING" action="enable"/>
  <Target conditionResult="false" option="SORTROWS" action="disable"/>
  <Target conditionResult="false" option="ASCENDING" action="disable"/>
  <Target conditionResult="false" option="DESCENDING" action="disable"/>
</Dependency>
```
By default, the Enhanced report check box is selected, so all options are available. Here is the result that appears on the Options tab:

- **Enhanced report**
- **Sort variables by:**
  - **Variable name**
- **Order sequence:**
  - **Ascending**
  - **Descending**

If you clear the Enhanced report check box, the **Sort variables by**, **Ascending**, and **Descending** options are not available. Here is the result that appears on the Options tab:

- **Enhanced report**
- **Sort variables by:**
  - **Variable name**
- **Order sequence:**
  - **Ascending**
  - **Descending**

---

**Example 6: Compound Condition Using AND and OR Logic**

In this example from the One-Way Frequencies task, the **Maximum time (seconds)** option is available only if you select the **Exact test** check box (for Binomial proportion or Chi-square goodness of fit) and the **Limit computation time** check box. (In the Tasks section, the One-Way Frequencies task is in the Statistics group.)
In this example, SECONDS is the name of the number stepper control. chkEXACTP is the name of the Exact test check box for binomial proportions. chkCHIEXACTP is the name of the Exact test check box for chi-square goodness of fit. chkLIMIT is the name of the Limit computation time check box.

By default, neither of the Exact test check boxes is selected, so the Maximum time (seconds) option is not available. Here is the result that appears on the Options tab:

Example 6: Compound Condition Using AND and OR Logic

By default, neither of the Exact test check boxes is selected, so the Maximum time (seconds) option is not available. Here is the result that appears on the Options tab:
When you select either of the **Exact test** check boxes and the **Limit computation time** check box, the **Maximum time (seconds)** option is available. Here is the result that appears on the **Options** tab:

- **Binomial proportion**
  - Asymptotic test
    - Test proportion: 0.5
    - undefined 95%
  - Exact test

- **Chi-square goodness-of-fit**
  - Asymptotic test
    - Exact test
    - Use Monte Carlo estimation
      - Confidence level: 95%

**Note:** For some large problems, computation of exact tests might require a large amount of time and memory. Consider using asymptotic tests for such problems. Alternatively, when asymptotic methods might not be sufficient for such large problems, consider using Monte Carlo estimation of exact p-values.

- **Exact Computation Methods**
  - Limit computation time
    - Maximum time (seconds): 300
About the Requirements Element

The Requirements element specifies a list of conditions that must be met in order for the task to run. If the condition is true, SAS code can be generated. If the condition is false, no code is generated. When defining a requirement, you can specify the message to display when the requirement is not met.

The Requirements element can have multiple Requirement tags. Each Requirement tag has a condition attribute, which is a conditional expression that is used to evaluate whether the requirement is met. The conditional expression that is used is identical to the conditional expression in Apache Velocity.

Each Requirement tag also has a Message element, which has no attributes. The value of this element is the message that is displayed if the condition is not satisfied.

Because dependencies can affect the state of the user interface as well as the state of the Velocity variables, the Requirements element is evaluated after the Dependencies element. As a result, any changes due to dependencies are made before determining whether the requirements are satisfied.
Example: Using a Requirements Element for Roles

In this example, the code refers to three roles: AVAR, BYVAR, and FVAR. The user must assign a variable to at least one of these roles in order for the task to run. If no variables are assigned to any of these roles, the SAS code cannot be generated, and the task will not run.

```
<Metadata>
  <Roles>
    <Role maxVars="0" minVars="1" name="AVAR" nlsKey="AVARKey"
          order="true" type="A">Analysis variables</Role>
    <Role maxVars="0" minVars="1" name="BYVAR" nlsKey="BYVARKey"
          order="true" type="A">Group analysis by</Role>
    <Role maxVars="0" minVars="1" name="FVAR" nlsKey="FVARKey"
          order="true" type="N">Frequency count</Role>
  </Roles>
...
</Metadata>

<Requirements>
  <Requirement condition="$AVAR.size() &gt; 0 || $BYVAR.size() &gt; 0
                   || $FVAR.size() &gt; 0">
    <Message>At least one variable must be assigned to the Analysis variables role, the Group analysis by role, or the Frequency count role.</Message>
  </Requirement>
</Requirements>
```
Understanding the Code Template

About the Code Template                                      49
Predefined Variables                                         50

  string                                                      57
  modelbuilder                                                57

About the Code Template

The code template creates the string output of the task. For most tasks, this output is SAS code. The only contents in the Code Template element is a CDATA block of the
Apache Velocity scripting language. The string output is produced using this scripting language.

**Predefined Variables**

To access option variables, a Velocity variable is defined for each option. The names of these variables correlate to the option name attribute. For example, to access a check box with a name attribute of `cbx1`, a Velocity variable of `$cbx1` is defined.

Here are the predefined Velocity variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>$SASLIBRARY</code></td>
<td>The name of the library that contains the input data source. The <code>$SASLIBRARY</code> variable is defined only if you have a <code>DataSource</code> element in the task.</td>
</tr>
<tr>
<td><code>$SASTABLE</code></td>
<td>The table name of the input data source. The <code>$SASTABLE</code> variable is defined only if you have a <code>DataSource</code> element in the task.</td>
</tr>
</tbody>
</table>

**Predefined SAS Macros**

If you need to generate SAS code, SAS Studio has these predefined macros:

<table>
<thead>
<tr>
<th>SAS Macro</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>%web_drop_table(table-name1, table-name2, ... table-name_n)</code></td>
<td>Drops the specified tables</td>
</tr>
<tr>
<td><code>%web_open_table(table-name)</code></td>
<td>Opens the specified table</td>
</tr>
<tr>
<td><code>%web_open_file(filename, type)</code></td>
<td>Opens the specified file with the specified MIME type</td>
</tr>
</tbody>
</table>
Data Source

For the input data source, a Velocity variable is used to access information about the data. This variable is the same as the name attribute for the `DataSource` tag.

In this example, the input data source is given the name of `DATASOURCE`. As a result, the Velocity variable, `$DATASOURCE`, is created. When this script is run, the `$DATASOURCE` variable is checked to see whether an input data source has been assigned.

```xml
<DataSource name="DATASOURCE">
  
  ...  

  <CodeTemplate>
    <![CDATA[
      %put DATASET=$DATASOURCE;
      %put SASLIBRARY=$SASLIBRARY;
      %put SASTABLE=$SASTABLE;
    
    ...  

    %web_open_table($DATASOURCE);

    ]]>  
  </CodeTemplate>
</DataSource>
```
Roles

For each role, a Velocity variable is used to access the role information. This variable is the same as the role’s name attribute.

In this example, the **Analysis Group** role is given the name of BY. As a result, the Velocity variable, $BY, is created. When this script is run, the $BY variable is checked to see whether any columns are assigned. If the user has assigned any columns to the **Analysis Group** role, the generated SAS code sorts on these columns.

```
<Roles>
  <Role type="A" maxVars="0" order="true" minVars="0"
    name="VAR">Columns</Role>
  <Role type="A" maxVars="0" order="true" minVars="0"
    name="BY">Analysis group</Role>
  <Role type="N" maxVars="0" order="true" minVars="0"
    name="SUM">Total of</Role>
  <Role type="A" maxVars="0" order="true" minVars="0"
    name="ID">Identifying label</Role>
</Roles>
<CodeTemplate>
  <![CDATA[
    #if( $BY )/* Sort $DATASET for BY group processing. */
    PROC SORT DATA=$DATASET OUT=WORK.SORTTEMP;
    BY #foreach($item in $BY ) $item#end;
    #end
    RUN;]]>
</CodeTemplate>
```

Options

**Checkbox**

The checkbox variable holds the state information for the check box option. If the check box is selected, the variable is set to 1. If the check box is not selected, the variable is set to 0.
In this example, the code outputs the character N if the **Print row numbers** check box is selected.

```xml
<Options>
  <Option name="PRINTNUMROWS" defaultValue="1"
    inputType="checkbox">Print row numbers</Option>
</Options>
<Code Template>
  <![CDATA[
  #if ($PRINTNUMROWS == '1')
    N
  #end]]>
</CodeTemplate>
```

**color**

The **color** variable holds the specified color.

In this example, the code template is printed as **colorEXAMPLE=specified-color**.

```xml
<Options>
  <Option name="colorEXAMPLE" defaultValue="white"
    inputType="color">Select a color</Option>
</Options>
<CodeTemplate>
  <![CDATA[
  %put colorEXAMPLE=$colorEXAMPLE;
  #end]]>
</CodeTemplate>
```

**combobox**

The **combobox** variable holds the name of the selected option. If no option is selected, the variable is null.

This example outputs the string **HEADING=option-name**, where **option-name** is the value selected from the **Direction of heading** drop-down list. If the user selects **Horizontal** from the **Direction of heading** drop-down list, the output is **HEADING="horizontal"**.

```xml
<Options>
  <Option name="HEADING" defaultValue="default"
    inputType="list">Direction of heading</Option>
</Options>
```
inputtext

The `inputtext` variable holds the string that was specified in the text box.

This example outputs the string `OBS=` and the text specified in the `Column` text box. If the user enters `Student Number` into the `Column` text box, the output is `OBS="Student Number"`.

```xml
<Options>
  <Option name="OBSHEADING" indent="1" defaultValue="Row number"
    inputType="inputtext">Column label:</Option>
</Options>
<CodeTemplate>
  <![CDATA[
    #if ($OBSHEADING && ($OBSHEADING !="default"))
      OBS=$OBSHEADING
    #end
  ]]> 
</CodeTemplate>
```

numstepper

The `numstepper` variable holds the string specified in the number control box.
This example outputs the string `GROUPS=` and the value in the **Number of groups** box. If the user enters 2 into the **Number of groups** text box, the string output is `GROUPS="2"`.

```xml
<Options>
  <Option name="NUMGRPS" defaultValue="1" minValue="0"
    inputType="numstepper" indent="1">Number of groups:</Option>
</Options>
<CodeTemplate>
  <![CDATA[
    GROUPS="$NUMGRPS"
  ]]>
</CodeTemplate>
```

**radio**

The radio button options are grouped together with the same variable attribute. It is this attribute that defines the Velocity scripting variable. The Velocity scripting variable holds the name of the selected radio button. If no radio button is selected, the variable is null.

In this example, there are four radio buttons.

- If the first radio button is selected, there is no output.
- If the second radio button is selected, the string output is `GROUPS="100"`.
- If the third radio button is selected, the string output is `GROUPS="10"`.
- If the fourth radio button is selected, the string output is `GROUPS="4"`.

```xml
<Options>
  <Option name="RMSL" inputType="radio" variable="RMGRP"
    defaultValue="1">Smallest to largest</Option>
  <Option name="RMPR" inputType="radio" variable="RMGRP">Percentile ranks</Option>
  <Option name="RMDC" inputType="radio" variable="RMGRP">Deciles</Option>
  <Option name="RMQR" inputType="radio" variable="RMGRP">Quartiles</Option>
</Options>
<CodeTemplate>
  <![CDATA[
    #if ($RMGRP.equalsIgnoreCase("RMPR")) GROUP=100 #end
    #if ($RMGRP.equalsIgnoreCase("RMDC")) GROUP=10 #end
    #if ($RMGRP.equalsIgnoreCase("RMQR")) GROUP=4 #end
  ]]>
</CodeTemplate>
slider

The slider variable holds the numeric string that is specified on the slider control.

This example outputs the string `datalabelattrs=(size="n")`, where `n` is the value of the Label Font Size option. If the value of the Label Font Size option is 10, the output is `datalabelattrs=(size=10)`.

   <Options>
   <Option name="labelSIZE" defaultValue="7" inputType="slider"
       discreteValues="16" minValue="5" maxValue="20">Label Font Size</Option>
   </Options>
   <CodeTemplate>
   <![CDATA[
datalabelattrs=(size=$labelSIZE)]]
   </CodeTemplate>

validationtext

The validationtext variable holds the string that was specified in the text box.

The following example outputs the string `OBS=` and the text specified in the Column text box. If the user enters Student Number into the Column text box, the output is `OBS="Student Number"`.

   <Options>
   The inputtext variable holds the string entered into the text field.
   The following example outputs the string "rho0=" and the text in the Null hypothesis correlation option. If the user specifies 0, the string rho0=0 is generated.
   <source lang="xml">
   <Options>
   <Option name="nullRho" indent="1" inputType="validationtext"
       defaultValue="0" required="true"
       promptMessage="Enter a number greater than -1 and less than 1 for the null hypothesis correlation"
       invalidMessage="Enter a number greater than -1 and less than 1 for the null hypothesis correlation"
       missingMessage="Enter a number greater than -1 and less than 1 for the null hypothesis correlation"
       regExp="[-+]?((0\.\d*)|\.\d+)|0">Null hypothesis correlation:</Option>
   </Options>
   </source>
string

This input type cannot be accessed within the Velocity script.

modelbuilder

The Model Effects Builder is a custom component. This example code shows how the Model Effects Builder might be used in the user interface for a task. The Velocity code shows how to process the effects that are generated by the modelbuilder component.

```xml
<Metadata>
  <DataSources>
    <DataSource name="dataset">
      <Roles>
        <Role type="N" maxVars="0" minVar="1" order="true"
          name="CONTVARS">Continuous variables</Role>
        <Role type="A" maxVars="0" minVar="0" order="true"
          name="CLASSVARS">Classification variables</Role>
      </Roles>
    </DataSource>
  </DataSources>
  <Options>
    <Option inputType="string" name="modelGroup">MODEL</Option>
    <Option inputType="string" name="modelTab">MODEL</Option>
    <Option excludeTools="THREEFACT, NFACTPOLY" inputType="modelbuilder"
      name="modelBuilder roleClassification="classVariables"
      roleContinuous="continuousVariables" width="100%">Model</Option>
    <Option inputType="string" name="responseGroup">Response</Option>
  </Options>
</Metadata>

<UI>
  <Container>
    <Container option="modelTab">
      <Group open="true" option="modelGroup">
        <OptionItem option="modelBuilder"/>
      </Group>
    </Container>
  </UI>
```
<CodeTemplate>
<![CDATA[

#macro (ModelEffects)
#if ($modelBuilder)
#foreach ($item in $modelBuilder)
## if first element is 'm', then this is a main effect
#if ($item.get(0) == 'm')
#foreach ($subitem in $item.get(1))$subitem #end
## if first element is 'i', then this is an interaction effect
#elifif ($item.get(0) == 'i')
#foreach ($subitem in $item.get(1))$subitem#if($velocityCount < $item.get(1).size())*#else #end#end
## if first element is 'n', then this is a nested effect
#elseif ($item.get(0) == 'n')
#foreach ($subitem1 in $item.get(1))$subitem1#if($velocityCount < $item.get(1).size())*#end#end(#foreach($subitem2 in $item.get(2))$subitem(2)#if($velocityCount < $item.get(2).size())*#end#end)
#end
#end
#end
#end

Example: Task Definition for List Data Task

Open the List Data Task .................................................. 59
View the XML Code for the List Data Task .................. 60
Understanding the XML Code for the List Data Task ........ 61

Open the List Data Task

To view the user interface for a predefined task:

1 In the navigation pane, open the Tasks section.

2 Expand the Data folder.

3 Right-click List Data and select Open. Alternatively, you can double-click the name of the task to open it.

   The task opens to the right of the work area.
View the XML Code for the List Data Task

You cannot edit the code for a predefined task. However, you can copy the task code and edit the copy.

To view the code for a predefined task:

1. In the navigation pane, open the Tasks section.
2. Expand the Data folder.
3. Right-click List Data and select Add to My Tasks. A copy of the task is added to your My Tasks folder.
4. Open the My Tasks folder and select the copied task.
5. Click . The XML and Velocity code for the task appears.
Understanding the XML Code for the List Data Task

This example shows the task definition for the List Data task and labels each element in the XML code.

```xml
<?xml version="1.0" encoding="UTF-16"?><Task schemaVersion="1.0">
  <Registration>
    <Name>List Data</Name>
    <Description>The List Data task displays the contents of a table as a report.</Description>
    <GUID>3C74D5C3-B845-4926-A749-E56CBA1283E2</GUID>
    <Procedures>PRINT SORT</Procedures>
    <Version>1</Version>

Use this list to identify each section in the preceding code:

1. The Registration element. For more information, see “Working with the Registration Element” on page 7.

2. The Metadata element specifies whether an input data source is required, defines the roles for columns in the input data source and any options that are required for the task to run. For more information, see “Working with the Metadata Element” on page 9.

3. The UI element specifies the layout of the task in the user interface. For more information, see “Working with the UI Element” on page 27.

4. The Dependencies element specifies the options that rely on one another in order for the task to work. For more information, see “Working with the Dependencies Element” on page 33.

5. The Code Template element generates the SAS code for the task. For more information, see “Understanding the Code Template” on page 49.
