Using This Book .......................................................... vii
What’s New in SAS Studio 3.5 ........................................... ix
Accessibility ................................................................. xix

Chapter 1 • Introduction to SAS Studio ................................ 1
  About SAS Studio ......................................................... 1
  Using SAS Studio ........................................................ 3

Chapter 2 • Working with Programs .................................... 19
  About the Code Editor ................................................... 20
  Opening and Creating Programs ....................................... 20
  Working with Code Snippets ........................................... 37
  Customizing the Code Editor ........................................... 46

Chapter 3 • Working with Queries ...................................... 49
  What Is a Query? ........................................................ 50
  Creating a Query ........................................................ 50
  Understanding Joins ...................................................... 51
  Selecting Data ............................................................ 56
  Filtering Data .............................................................. 61
  Managing Output ......................................................... 64

Chapter 4 • Working with Process Flows .............................. 71
  Understanding Process Flows .......................................... 72
  Add Data to the Process Flow .......................................... 77
  Adding a SAS Program to the Process Flow ....................... 78
  Adding a Query to a Process Flow .................................... 85
  Add a Task to a Process Flow ......................................... 87
  Understanding Subflows ................................................ 89
  Linking Nodes in a Process Flow ..................................... 92
  Running a Process Flow ............................................... 93
  Save a Process Flow .................................................... 93
Chapter 5 • Working with Data ................................................................. 95
  About the Table Viewer ................................................................. 95
  Opening and Viewing Data ......................................................... 98
  Viewing the Code That Is Used to Create a Table ....................... 100
  Filtering and Sorting Data .......................................................... 100
  Importing Data ............................................................................. 105
  Exporting Data ............................................................................. 119

Chapter 6 • Working with Results ....................................................... 121
  Viewing Results .............................................................................. 121
  Default SAS Studio Output ......................................................... 122
  Sending Your Results to Another User ......................................... 125
  About the SAS Output Delivery System ....................................... 126
  About SAS ODS Statistical Graphics .......................................... 127

Chapter 7 • Understanding Tasks in SAS Studio .................................. 133
  What Is a Task? ............................................................................... 133
  How to Run a Task ......................................................................... 134
  Save a Task and Its Option Settings ............................................. 137
  Edit a Predefined Task .................................................................. 138
  Create a New Task ......................................................................... 139
  Customizing the Task Code and the Task Layout in the Workspace 140

Appendix 1 • Customizing SAS Studio .................................................. 143
  About Setting Your Preferences .................................................. 143
  Setting General Preferences ....................................................... 143
  Setting the Editor Preferences .................................................... 146
  Specifying the Result Preferences .............................................. 148
  Setting Task Preferences ........................................................... 149
  Access Repositories in SAS Studio ............................................. 150
  Setting Preferences for Batch Submissions ................................ 151

Appendix 2 • Text Encoding Options and Language Mappings ................. 153
  About the Text Encoding to Language Mappings ....................... 153
  Text Encoding Options and Language Mappings ....................... 153
Audience

This book is designed for all users of SAS Studio. SAS Studio was initially released with the first maintenance release for SAS 9.4. SAS Studio 3.5 is the latest release.
Using This Book
What’s New in SAS Studio 3.5

Overview

SAS Studio 3.5 includes these new features and enhancements:

- a new batch submit feature. For more information, see “About the Batch Submit Feature” on page x.

- the ability to create global settings for all SAS Studio users at your site. For more information, see “Global Settings for SAS Studio” on page x.

- a new Messages window that displays information about the programs, tasks, queries, and process flows that you run. For more information, see “About the Messages Window” on page x.

- enhancements to the table viewer. For more information, see “Table Viewer Enhancements” on page xi.

- new table of contents in results. For more information, see “Table of Contents in Results” on page xi.

- new keyboard shortcuts to add and insert code snippets. For more information, see “New Keyboard Shortcuts for Your Snippets” on page xi.

- new Open button on the SAS Studio toolbar. For more information, see “New Open Button on the SAS Studio Toolbar” on page xii.
What’s New in SAS Studio 3.5

- many new tasks for statistical process control, multivariate analysis, econometric analysis, and power and sample size analysis. For more information, see “SAS Studio Tasks” on page xii.

- documentation enhancements, including several new resources. For more information, see “Documentation Enhancements” on page xviii.

About the Batch Submit Feature

You can run a saved SAS program in batch mode, which means that the program can run while you continue to use SAS Studio. When you run a program in batch mode, you can view the status of programs that have been submitted, and you can cancel programs that are currently running. For more information, see “About the Batch Submit Feature” on page 22.

Global Settings for SAS Studio

You might want to define a list of folder shortcuts for all SAS Studio users at your site. Administrators can now define these options by using global settings. For more information about global folder shortcuts, see SAS Studio: Administrator's Guide.

About the Messages Window

The Messages window displays information, such as notes, warnings, and errors, about the programs, tasks, queries, and process flows that you run in SAS Studio. For more information, see “Using the Messages Window” on page 15.
Table Viewer Enhancements

- You can automatically resize the column widths to fit the current size of the column content in the table viewer.
- You can change the order of the columns.

For more information, see “Opening and Viewing Data” on page 98.

Table of Contents in Results

The Results tab includes a new table of contents that you can use to navigate the different sections in your results. For more information, see “Viewing Default Results” on page 122.

New Keyboard Shortcuts for Your Snippets

You can now use keyboard shortcuts to create a snippet and save it to your My Snippets folder. To create the snippet, select the code in the code editor and press Alt + A (Windows environments) or Command + Alt + A (Macintosh environments).

To insert an existing snippet from your My Snippets folder, press Alt + I (Windows environments) or Command + Alt + I (Macintosh environments).

For a list of the keyboard shortcuts in SAS Studio, see “Keyboard Shortcuts” on page 161.
New Open Button on the SAS Studio Toolbar

You can now open files from your folders and folder shortcuts by clicking on the SAS Studio toolbar.

SAS Studio Tasks

Starting with SAS Studio 3.5, the tasks that are shipped with SAS Studio are now documented in SAS Studio: Task Reference Guide. All of the tasks that are available with SAS Studio are documented. However, the tasks that are available at your site depend on whether you license and install other SAS products.

New Tasks

- Graph tasks: The Mosaic Plot task creates mosaic plots, which display tiles that correspond to the crosstabulation table cells. The areas of the tiles are proportional to the frequencies of the table cells. The column variable is displayed on the X axis, and the tile widths are proportional to the relative frequencies of the column variable levels. The row variable is displayed on the Y axis, and the tile heights are proportional to the relative frequencies of the row levels within column levels. For more information, see “Mosaic Plot” in SAS Studio: Task Reference Guide.

- Statistics tasks:
  - The Mixed Models task fits a variety of mixed linear models to data and enables you to use these fitted models to make inferences about the data. For more information, see “Mixed Models” in SAS Studio: Task Reference Guide.

  - The Partial Least Squares Regression task performs partial least squares analysis. It also performs principal components regression and reduced rank
regression. These techniques combine dimension reduction of the predictors and dependent variables with predictive modeling. For more information, see “Partial Least Squares Regression” in SAS Studio: Task Reference Guide.

- Power and Sample Size tasks: Power and sample size analysis optimizes the resource usage and design of a study, improving chances of conclusive results with maximum efficiency.

These tasks are now available:

- The Pearson Correlation task performs power and sample size analyses for tests of simple and partial Pearson correlation between two variables. Both Fisher’s z transformation and the \( t \) transformation are supported. For more information, see “Pearson Correlation” in SAS Studio: Task Reference Guide.

- The Multiple Regression task calculates the power or sample size for multiple regression. For more information, see “Multiple Regression” in SAS Studio: Task Reference Guide.

- The Confidence Intervals task calculates the power or sample size for these confidence intervals:
  - One-sample means is for confidence interval precision that involves one sample.
  - Paired means is for confidence interval precision that involves paired samples.
  - Two-sample means is for confidence interval precision that involves two independent samples.
  - One proportion is for confidence interval precision for a single binomial proportion.

  For more information, see “Confidence Intervals” in SAS Studio: Task Reference Guide.

- The Tests of Proportions task calculates the power or sample size for tests of one proportion, two correlated proportions, and two independent proportions. For more information, see “Tests of Proportions” in SAS Studio: Task Reference Guide.
The t Tests task calculates the power or sample size for t tests of means and mean ratios. For more information, see “t Tests” in SAS Studio: Task Reference Guide.

The Cox Regression task calculates the power or sample size for the score test of a single scalar predictor in Cox proportional hazards regression for survival data. For more information, see “Cox Regression” in SAS Studio: Task Reference Guide.

Multivariate Analysis tasks:

- The Principal Components Analysis task uses a multivariate technique for examining relationships among several quantitative variables. Use principal component analysis if you are interested in summarizing data and detecting linear relationships. For more information, see “Principal Component Analysis” in SAS Studio: Task Reference Guide.

- The Factor Analysis task performs a factor analysis with a variety of available methods and rotations. For more information, see “Factor Analysis” in SAS Studio: Task Reference Guide.

- The Canonical Correlation task performs canonical correlation, partial canonical correlation, and canonical redundancy analysis. Canonical correlation is a generalization of multiple correlations for analyzing the relationship between two sets of variables. For more information, see “Canonical Correlation” in SAS Studio: Task Reference Guide.

- The Discriminant Analysis task performs discriminant analysis, canonical discriminant analysis, and stepwise discriminant analysis. For more information, see “Discriminant Analysis” in SAS Studio: Task Reference Guide.

- The Correspondence Analysis task performs simple or multiple correspondence analysis of qualitative data. You can specify either raw data or table data for the input data source. For more information, see “Correspondence Analysis” in SAS Studio: Task Reference Guide.

- The Multidimensional Preference Analysis task performs a principal components analysis of rank-ordered data. The principal result is a plot of the scores, which is the objects being rated. In the plot, the scores are represented as points, and the
Econometrics tasks:

- The Causal Models task enables you to use these two techniques: two-stage least squares and Heckman’s two-step selection method. For more information, see “Causal Models” in SAS Studio: Task Reference Guide.

- The Cross-Sectional Data Models task applies econometric techniques to analyze cross-sectional data. Conceptually, the models for this task are similar to the models for the Panel Data Models task. However, in the Cross-Sectional Data Models task, no panel structure (which consists of the cross-sectional ID and the time ID variables) is required. For more information, see “Cross-sectional Data Models” in SAS Studio: Task Reference Guide.

- The Panel Data Models task enables you to run analyses for a variety of model types. You can analyze a class of linear econometric models that commonly arise when time series and cross-sectional data is combined. This type of pooled data on time series cross-sectional bases is often referred to as panel data. Typical examples of panel data include observations over time on households, countries, firms, trade, and so on. For more information, see “Panel Data Models” in SAS Studio: Task Reference Guide.

- The Time Series Analysis task fits models to equally spaced time series data of any frequency, such as monthly, quarterly, or weekly data. You can have a single dependent variable or multiple dependent variables. For more information, see “Time Series Analysis” in SAS Studio: Task Reference Guide.

Statistical Process Control tasks:

- The Control Charts task creates Shewhart control charts for deciding whether a process is in a state of statistical control. For more information, see “Control Charts” in SAS Studio: Task Reference Guide.

- The Capability Analysis task compares the distribution of a process to its specification limits. When you run the Capability Analysis task, the output includes a variety of statistics for summarizing the data distribution of the process variable. Examples of statistics are sample moments, basic statistical measures,
and quantiles. For more information, see “Capability Analysis” in *SAS Studio: Task Reference Guide*.

- The Pareto Analysis task creates Pareto charts that display the frequencies of quality-related problems in a process. The frequencies are represented by bars that are ordered in decreasing magnitude. Thus, you can use a Pareto chart to decide which subset of problems to solve first or which problem areas deserve the most attention. For more information, see “Pareto Analysis” in *SAS Studio: Task Reference Guide*.

- The Analysis of Means task enables you to simultaneously compare treatment means with their overall mean. For more information, see “Analysis of Means” in *SAS Studio: Task Reference Guide*.

### Enhanced Tasks

- For many tasks, you can now create a filter when you select the input data source.
- In the Bin Continuous Data task, you can now compute the weight of evidence and information value. For more information, see “Bin Continuous Data” in *SAS Studio: Task Reference Guide*.
- In the Binary Logistic Regression task, you can now create strata variables. You can also specify whether to label the points in the influence or ROC plots. By default, the points are not labeled. For more information, see “Binary Logistic Regression” in *SAS Studio: Task Reference Guide*.
- In the Filter Data task, you can specify which variables to include in the output data set. For more information, see “Filter Data” in *SAS Studio: Task Reference Guide*.
- In the High-Performance Generalized Linear Model task, the LASSO selection method is now available. For more information, see “High-Performance Generalized Linear Models” in *SAS Studio: Task Reference Guide*.
- In the Predictive Regression Models task, you can specify a random seed to generate the proportion of the validation or test data. For more information, see “Predictive Regression Models” in *SAS Studio: Task Reference Guide*.
The user interface for the Select Random Sample task has been simplified. For more information, see “Select Random Sample” in SAS Studio: Task Reference Guide.

In the Stack/Split Columns task, you can now create multiple stacked or split variables. For more information, see “Stack/Split Columns” in SAS Studio: Task Reference Guide.

The Standardize Data task now includes these standardization methods:

- Maximum absolute value
- Median absolute deviation
- Minkowski
- Art, Gnanadesikan, and Kettenring estimate
- Minimum spacing

For more information, see “Standardize Data” in SAS Studio: Task Reference Guide.

Enhancements to the Common Task Model

- Using multiple DataSource elements, you can now define multiple data sources for a task. In previous releases, a maximum of one data source was allowed. The new where attribute enables users to filter the input data source before using the data in the task.

- The modelbuilder control will be removed in a future release. All SAS Studio tasks that contained the modelbuilder control have been revised to use the mixedeffects control.

For more information about the common task model and writing your own custom tasks for SAS Studio, see SAS Studio 3.5 Developer's Guide for Writing Custom Tasks.
Documentation Enhancements

- The new SAS Studio: Task Reference Guide contains documentation for all the tasks that are shipped with SAS Studio. All of these tasks might not be available at your site. The tasks that are available at your site depend on whether you license and install other SAS products.

- The new SAS Studio: Developer's Guide to Repositories describes how to work with SAS Studio repositories to share tasks and snippets with other users at your site.

- The new SAS Studio: Writing Your First Custom Task guides you step-by-step through creating a custom task for your site.

- The SAS Studio: User's Guide now includes appendixes that list the keyboard shortcuts for SAS Studio and all of the preferences for SAS Studio.

- The SAS Studio: Administrator's Guide now includes an appendix that lists all the configuration properties for SAS Studio.
For information about the accessibility of this product, see Accessibility Features of SAS Studio 3.5.
What’s New in SAS Studio 3.5
About SAS Studio

SAS Studio is a development application for SAS that you access through your web browser. With SAS Studio, you can access your data files, libraries, and existing programs, and you can write new programs. You can also use the predefined tasks in SAS Studio to generate SAS code. When you run a program or task, SAS Studio connects to a SAS server to process the SAS code. The SAS server can be a hosted server in a cloud environment, a server in your local environment, or a copy of SAS on your local machine. After the code is processed, the results are returned to SAS Studio in your browser.
SAS Studio supports multiple web browsers, such as Microsoft Internet Explorer, Apple Safari, Mozilla Firefox, and Google Chrome.

In addition to writing and running your own SAS programs, you can use the predefined tasks that are included with SAS Studio to analyze your data. The tasks are based on SAS System procedures and provide access to some of the most commonly used graph and analytical procedures. You can also use the default task template to write your own tasks.

SAS Studio includes two different perspectives: the SAS Programmer perspective and the Visual Programmer perspective. A perspective is a predetermined set of features that is customized to meet the needs of a specific user type. By selecting a specific perspective, you can narrow the choices that are available in the interface and focus on the features that you need to use regularly. By default, when you open SAS Studio, the SAS Programmer perspective is selected. After you open SAS Studio, you can change the perspective by using the perspectives menu on the toolbar. For more information, see “Understanding Perspectives” on page 16.
Using SAS Studio

About Using SAS Studio

When you sign on to SAS Studio, the main SAS Studio window appears with a blank program window so that you can start programming immediately. You also have access to all five sections of the navigation pane.

Note: To sign out of SAS Studio, click **Sign Out** on the toolbar. Do not use the Back button on your web browser.

The main window of SAS Studio consists of a navigation pane on the left and a work area on the right. The navigation pane provides access to your server files and folder shortcuts, your tasks and snippets, the libraries that you have access to, and your file shortcuts. The **Server Files and Folders** section is displayed by default.
The work area is used to display your data, code, tasks, logs, and results. As you open these items, they are added to the work area as windows in a tabbed interface.

**Using the Navigation Pane**

**About Using the Navigation Pane**

You can expand the sections of the navigation pane by clicking the section that you want to view.

**Working with Server Files and Folders**

The **Server Files and Folders** section of the navigation pane enables you to access files and folders from the following locations:

- your SAS server
- any remote FTP server on which you have an account

  **Note:** SAS Studio supports only FTP servers that use a directory listing similar to UNIX.

The contents of the **Server Files and Folders** section depend on the type of SAS Studio deployment. The default folder shortcuts and root directories can be configured by your SAS administrator. For more information, see *SAS Studio: Administrator’s Guide*.

You can open files that are saved on the SAS server or the FTP server, such as SAS program files or program package files. You can also create a folder shortcut to access your z/OS files, and you can open SAS tables that are saved on the SAS server.

**Note:** You cannot open SAS tables from a remote FTP server.

You can use the **Server Files and Folders** section to create folders and folder shortcuts, download and upload files, and create a new SAS program. From the folders tree, you can expand and collapse folders, copy and move items, and open items in folders by double-clicking them or dragging them to the work area. In addition, you can open files from your folders and folder shortcuts by clicking on the SAS Studio toolbar. You can also view items in a folder as text.
Note: Files and folders that are located on an FTP server and are accessible by using an FTP shortcut cannot contain any of the following characters in their names:

\{ } [ ] , : ; " \ `/ \ | + < > ? @ $ % ^ & ( ) + !

SAS Studio cannot access, move, rename, or delete files and folders on an FTP server whose names contain invalid characters. In addition, you cannot rename or delete any global folder shortcuts.

To create a new folder shortcut:

1. Click Server Files and Folders in the navigation pane. Then click and select Folder Shortcut. The New Folder Shortcut window appears.

2. In the Name box, enter the name of the folder.

3. From the Folder Type drop-down list, specify whether the shortcut refers to a SAS server folder or an FTP folder.

4. If you are creating a shortcut to a SAS server folder, enter the physical path for the directory in the Directory box or click Browse to select a directory. To create a new folder when you are selecting a directory, click .

If you are creating a shortcut to an FTP folder, enter the network address of the FTP host in the Host Name box as well as your user name and password. By default, the directory is the home directory of the FTP user. You can use the Directory box to specify another directory that is relative to the home directory. For example, if the home directory of the FTP user is c:\homedir, and you specify data in the Directory box, then the root directory of the shortcut is c:\homedir\data on the FTP server. You can validate your connection to the FTP server by clicking Test.

Note: If your mid-tier and FTP servers are running different operating systems, you must fully qualify the name of the FTP host in the Host Name box. If this name is not fully qualified, then the connection might fail.
5 Click **Save** to create the folder shortcut. The new shortcut is added to the list of folder shortcuts.

To create a new folder, select the folder in the **Server Files and Folders** section in which you want to create the new folder. Click and select **Folder**. The New Folder window appears. Enter the name of the new folder. The new folder is added to the list of folders.

To create a new XML file, Click and select **XML**. The new file opens in the XML editor in the work area.

To download a file, select the file that you want to download and click . You are prompted to open the file in the default application or save it to your local computer.
To upload one or more files from your local computer, select the folder to which you want to upload the files and click ➔. The Upload Files window appears. Click **Choose Files** to browse for the files that you want to upload.

**Working with Tasks**

The **Tasks and Utilities** section of the navigation pane enables you to access tasks in SAS Studio. Tasks are based on SAS procedures and generate SAS code and formatted results for you. SAS Studio is shipped with several predefined tasks that you can run. You can also edit a copy of these predefined tasks, and you can create your own new tasks.

To create a new task, click ➔ and select **New Task**. SAS Studio creates a template in the work area that you can use to create custom tasks for your site. Custom tasks can be accessed from the My Tasks folder or from the **Server Files and Folders** section of the navigation pane. For more information, see Chapter 7, “Understanding Tasks in SAS Studio,” on page 133.

To edit a task that you have created, select the task from the My Tasks folder and click ➔. The XML code that is used to create the task is opened in the work area. If you want to edit a predefined task, you must first right-click the task and select **Add to My Tasks** or **Add to Folders**. For more information, see “Edit a Predefined Task” on page 138.

**Working with Snippets**

The **Snippets** section of the navigation pane enables you to access your code snippets. **Code snippets** are samples of commonly used SAS code that you can insert into your SAS program. SAS Studio is shipped with several predefined code snippets that you can use. You can also edit a copy of these snippets and create your own custom snippets. Your custom snippets can be accessed from the My Snippets folder. For more information, see Chapter 2, “Working with Programs,” on page 19.

To edit a snippet that you have created, select the snippet from the My Snippets folder and click ➔. If you want to edit a predefined snippet, you must first right-click the snippet and select **Add to My Snippets**.

**Note:** You can edit only the snippets that are in the My Snippets folder.
Working with Libraries

The Libraries section of the navigation pane enables you to access your SAS libraries. SAS tables are stored in SAS libraries. From the Libraries section, you can open SAS tables and add them to your programs. You can use the Libraries section to expand a table and view the columns in that table. The icon in front of the column name indicates the type.

Here are examples of common icons for the column types.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Type of Column</th>
</tr>
</thead>
<tbody>
<tr>
<td>🌟</td>
<td>Character</td>
</tr>
<tr>
<td>🤔</td>
<td>Numeric</td>
</tr>
<tr>
<td>🕒</td>
<td>Date</td>
</tr>
<tr>
<td>⏰️</td>
<td>Datetime</td>
</tr>
</tbody>
</table>

You can drag tables and columns from the Libraries section to a program, and SAS Studio adds code for the dragged items to your program. For more information, see “Opening and Creating Programs” on page 20.

Note: The Sasuser library is read only, as in any SAS server environment. You cannot save content to this library.

You can also create new libraries and assign existing libraries.

To create a new library:

1. Click Libraries in the navigation pane and then click 📦. The New Library window appears.
2 In the **Name** box, enter the libref for the library. The libref must be eight characters or fewer.

3 In the **Path** box, enter the physical path where the library resides or click **Browse** to select a location. To create a new folder when you are selecting a location, click 📦.

4 In the **Options** box, specify any configuration options that you need. For the appropriate options, see the documentation for your operating environment.

5 If you want to access this library each time you use SAS Studio, select **Re-create this library at start-up**.

6 Click **OK** to create the library. The new library is added to the list of libraries in the navigation pane.

In the SAS Studio Mid-Tier (the enterprise edition) deployment, you can assign unassigned metadata libraries by clicking 🍀. The libraries that you can assign must already be defined in your metadata. If you want to access the selected libraries each time you use SAS Studio, select **Assign selected libraries at start-up**. If a library is unassigned, then you cannot access the tables in that library.
Using File Shortcuts

File shortcuts enable you to quickly access files that you specify. You can create a file shortcut to a file on your SAS server, via a URL, or on your FTP server.

Note: You can create a file shortcut to a file on an FTP server only if you have created a folder shortcut to an FTP folder. FTP folders are not available by clicking Browse and using the Select File window, however. You must enter the pathname.

To create a new file shortcut, click . You can define the shortcut by specifying a complete path and filename or by specifying a URL. If you want this shortcut to be available the next time you use SAS Studio, select Re-create this file shortcut at start-up.

You can open a file from a file shortcut by double-clicking it or dragging it to the work area.

Customizing the Navigation Pane

By default, all five sections of the navigation pane are displayed when you open SAS Studio in the SAS Programmer perspective. To customize which sections are displayed, click and select View. Select or clear any sections that you want to add or remove. The navigation pane is updated immediately.

Note: The File Shortcuts section is not displayed by default in the Visual Programmer perspective.

Using the Work Area

About Using the Work Area

The work area is the main portion of the SAS Studio application for accessing programs and tasks and for viewing data. The work area is always displayed and cannot be minimized. When you open a program, task, or table, the windows open as new tabs in the work area. The code, log, and results that are associated with programs and tasks are grouped together under the main tab for the program or task.
Customizing the Work Area

By default, the work area is displayed beside the navigation pane, but you can maximize the work area and hide the navigation pane. You can also close all of the tabs in the work area at once.

To maximize the work area, click 🟢 on the toolbar.

**Note:** To reopen the navigation pane, click 🟢 again.
To close all tabs that are open in the work area, click ✖️ and select Close All Tabs. You are prompted to save any unsaved programs or tasks.

Rearranging the Tabs in the Work Area

In the work area, you can rearrange the tabs by using a drag-and-drop operation to move them to the left or right. You can also dock a tab on the right side or bottom of the work area to view more than one tab at a time.

To rearrange a tab:

1. Select the tab that you want to move.
2. Move the tab icon to the location where you want to view this content. The ✅ icon indicates a valid location.
Note: The Results tab in Program 2 has also been moved to the right side of the program tab.

Searching in SAS Studio

You can use the Search feature to search all of the sections of the navigation pane. The types of items that you can search for depend on what is selected in the navigation pane. For example, if a folder or folder shortcut in the Server Files and Folders section is selected, you can search for folders and files, and you can choose whether to include subfolders in the search. If a task category in the Tasks and Utilities section is
selected, you can search for task names, associated SAS procedures, and task descriptions.

To access the Search feature, click 🕵️‍♂️. The search box appears so that you can enter the text that you want to search for.

You can limit the scope of your search by selecting or clearing any of the Narrow by options. These options vary depending on what is selected in the navigation pane. By default, the search is case sensitive. To search for both uppercase and lowercase text, clear the Match case check box.

The following example shows a search for “class” in the Sashelp library. The search includes all tables and columns in the Sashelp library, and it is not case sensitive.

You can open an item from your results by double-clicking it. To return to your search results list, click 🕵️‍♂️ again.

To clear the search results, click ✗.
Using the Messages Window

The Messages window displays information about the programs, tasks, queries, and process flows that you run in SAS Studio. To open the Messages window, click **Messages** in the lower right corner of your SAS Studio browser window. You can subset the messages that are displayed by clicking the **Filter by** drop-down list and selecting the type of message that you want to view.

If you have run a SAS program in batch mode, you can click **View** to open the Batch Submission Status window. For more information, see “Running a Program in Batch Mode” on page 22. If you have lost your connection to a repository, a message is displayed along with a **Test** button that you can use to test the connection.

![Messages Window Screenshot]

**Note:** If you have selected the **Capture all log events** option, then you can also choose to display debug notifications in the Messages window. For more information, see “Setting General Preferences” on page 143.
Understanding Perspectives

Because SAS Studio can be used by a variety of people and groups within an organization, you can choose to view a specific subset of features, or perspective, that meets your needs best. Perspectives are sets of functionality that are customized to meet the needs of different types of users. SAS Studio includes two perspectives: the SAS Programmer perspective and the Visual Programmer perspective.

The SAS Programmer perspective is for users who intend to use SAS Studio mainly for writing and editing SAS programs. By default, the SAS Programmer perspective opens with a new program window and includes all five sections of the navigation pane so that you can easily manage all of your program files and code snippets.

The Visual Programmer perspective is designed for users who want to work with process flows in a project-based environment. You can use process flows in the Visual Programmer perspective to combine individual processes into one repeatable process flow that you can save, reuse, and share with other users. By default, the Visual Programmer perspective opens with a new process flow window and includes four sections in the navigation pane: Folders, Tasks, Snippets, and Libraries.

**Note:** If you open a process flow while you are using the SAS Programmer perspective, you are prompted to switch to the Visual Programmer perspective.

In both perspectives, you can run the predefined tasks that are shipped with SAS Studio, and you can create and edit tasks. You can also use both perspectives to create and run SAS programs and queries.

The differences between the perspectives can be viewed in the following table:

After you have started SAS Studio and selected a perspective, you can change the perspective that you are using by clicking the perspectives menu on the toolbar and selecting the perspective that you want to use.

You can specify which sections of the navigation pane are displayed in SAS Studio by clicking ☰ and selecting View.

**Editing the Autoexec File**

The autoexec.sas file includes SAS statements that run each time you start SAS Studio and connect to your SAS server. For example, you can use the autoexec.sas file to assign libraries that you want to be available every time you use SAS Studio in both interactive and noninteractive modes.

**Note:** If you create a new library by using the New Library window, you can select the **Re-create this library at start-up** option to automatically add the LIBNAME statement to the autoexec.sas file. For more information, see “Working with Libraries” on page 8.

To edit the autoexec.sas file:

1. Click ☰ and select **Edit Autoexec File**.

2. Enter the code that you want to include in the autoexec.sas file.
3 To validate your syntax, click Run. The Log tab opens so that you can view the log.

4 Click Save to save and close the autoexec file.

Changing Your SAS Workspace Server

If you have access to more than one SAS workspace server, you can change the server that SAS Studio connects to. To change the server, click and select Change SAS Workspace Server. Select the server that you want to use. When you change servers, any libraries and file shortcuts that you created are deleted. For more information, see SAS Studio: Administrator's Guide.

Customizing the Code Editor ............................................... 46
About the Code Editor

SAS Studio includes a color-coded, syntax-checking editor for editing new or existing SAS programs. You can also edit SOURCE entries in SAS catalogs. The editor includes a wide variety of features such as autocompletion, automatic formatting, and pop-up syntax help. With the code editor, you can write, run, and save SAS programs. You can also modify and save the code that is automatically generated when you run a task.

SAS Studio also includes several sample code snippets that you can use to make programming common tasks easier.

Opening and Creating Programs

Opening a Program

You can open SAS programs from the Server Files and Folders section of the navigation pane. To open a program, expand the appropriate folder and double-click the program that you want to open, or drag it into the work area. The program opens in a new tab in the work area.

Creating a New Program

You can create a new SAS program from the Server Files and Folders section of the navigation pane. To create a new program, click and select SAS Program. A program window opens in a new tab in the work area.

Note: You can also click on the main application toolbar and select New SAS Program.
Running a Program

After you have written your program, you can run the entire program or you can select specific lines of code to run. To run the entire program, click 🔄. To run a portion of the program, select the lines of code that you want to run and then click 🔄.

If there are no errors, the results open automatically. If there are errors, the Log tab opens by default. You can expand the Errors, Warnings, and Notes sections to view the messages. When you click on a message, SAS Studio highlights it for you in the log so that you can see exactly where the message occurs in the log.
Note: Because you are working in a server environment, do not include the ENDSAS statement in your SAS programs. If you run a program that contains ENDSAS, reset your SAS session by clicking and selecting Reset SAS Session.

Using the Batch Submit Feature

About the Batch Submit Feature
You can run a saved SAS program in batch mode, which means that the program can run while you continue to use SAS Studio. When you run a program in batch mode, you can view the status of programs that have been submitted, and you can cancel programs that are currently running.

Running a Program in Batch Mode
To run a program in batch mode, right-click the program in the navigation pane and select Batch Submit.

Note: You cannot run a program in batch mode if the program is saved on an FTP server or on a SAS server running on the native z/OS file system. Programs that are saved on a z/OS SAS server running the HFS file system can be run in batch mode.

By default, a notification message is displayed when the program is submitted and again when the program has finished running. If you log off of SAS Studio while the program is running, the program continues to run, but the notification message that indicates when the program is finished is not displayed.

Note: Because batch mode uses a separate workspace server, any libraries that are created by your program do not appear in the Libraries section of the navigation pane in SAS Studio.

To view the status of your batch jobs, click and select Batch Submission Status.
You can use the Batch Submission Status window to perform the following tasks:

1. **Display the batch job properties**, including file pathnames, start time, end time, and status.
2. **Open the program log** in the SAS Studio work area.
3. **Open the program results** in a separate window.
4. **Cancel a running batch job**. Any output that has been created by the job is not deleted.

After the batch job completes, you must refresh the **Server Files and Folders** pane to view any output and log files.

**Customizing Your Batch Submissions**

The Preferences window enables you to customize how to handle batch submissions. To change whether existing log and output files are deleted or overwritten when you rerun a batch job, click and select **Preferences**. Click **Batch**.
For more information about each option, see “Setting Preferences for Batch Submissions” on page 151.

Using the Autocomplete Feature

About the Autocomplete Feature

The autocomplete, or code completion, feature in the code editor can predict the next word that you want to enter before you actually enter it completely. The autocomplete feature can complete keywords that are associated with SAS procedures, statements, macros, functions, CALL routines, formats, informats, macro variables, SAS colors, style elements, style attributes, and statistics keywords, and various SAS statement and procedure options. The autocomplete feature can also complete librefs and table names.

Note: The autocomplete feature is available only for editing SAS programs.

This example shows the keywords and help that appear when you enter `proc a` in the code editor.
In this example, you select **APPEND** from the list of procedures, so that `proc append` appears in the code editor. When you enter a space, the code editor displays a list of options for the APPEND procedure.

![Code Editor Screenshot](image)

**How to Use the Autocomplete Feature**

To use the autocomplete feature:

1. How you open the autocomplete list depends on the keyword that you want to add.
   - If you want to add a global statement, DATA step statement, CALL routine, procedure, macro statement, or automatic macro variable, enter the first one or more letters of the keyword that you want to use.
     
     A window opens with a list of suggested keywords that begin with those letters.
If you want to specify colors, formats, informats, macro functions, SAS functions, statistics keywords, style elements, or style attributes, position your mouse pointer in a comment and press Ctrl+spacebar. To navigate through the list of options backward, press Ctrl+Shift+spacebar.

**Note:** These shortcuts work even if you have deselected the **Enable autocomplete** option in the Preferences window. For more information, see “Customizing the Code Editor” on page 46.

You can navigate to the keyword that you want to use in several ways:
Continue to type until the correct keyword is selected (because the matching improves as you type).

Scroll through the list by using the up and down arrow keys, the Page Up and Page Down keys, or your mouse.

3 You can add the keyword to your program by double-clicking the selected keyword or by pressing the Enter key.

**Using the Syntax Help**

The code editor displays brief SAS syntax documentation as you write and edit your programs. You can display the Help in the following ways:

- Right-click a keyword in your program and select **Syntax Help**.
- Start entering a valid SAS keyword, and then click a suggested keyword in the autocomplete window.
- Position the mouse pointer over a valid SAS keyword in your program. This works only if you have selected the **Enable hint** option in the Editor preferences. For more information, see “Customizing the Code Editor” on page 46.

The SAS Product Documentation provides more comprehensive usage information about the SAS language, but the syntax help in the code editor can get you started with a hint about the syntax or a brief description of the keyword. You can get additional help by clicking links in the syntax help window as follows:

- Click the keyword link at the top of the window to search the support.sas.com website for the keyword.
Click the links at the bottom of the window to search for the keyword in the SAS Product Documentation, Samples and SAS Notes, and SAS Technical Papers.
Adding Table Names and Column Names

From the Libraries section of the navigation pane, you can use a drag-and-drop operation to move table names and column names into the SAS code. For example, you can move the Sashelp.Cars table into the DATA option for the PRINT procedure. When you release the mouse, the fully qualified name for the table appears in your code.
Editing the Code from a Task

You can edit the code that is generated automatically when you run a task and then run it with your modifications. When you edit the code, SAS Studio opens it in a separate program window. The code is no longer associated with the original task.

To edit a program generated by a task:

1. On the appropriate task tab in the work area, click **Code** to display the code that is associated with the task.

   **Note:** In order to edit the code that is associated with a task, you must first display the code with the task. If the task code is not displayed, click and select **Preferences**. Click **Tasks**, and then select **Show Task Code**.

2. On the toolbar, click **Edit**. The code is opened in a new program window.
Creating a SAS Program Package

A SAS Program Package is a file that contains a snapshot of a SAS program along with its log and HTML results. You can create a program package from code that you have written as well as code that is automatically generated when you run a task. When you open a program package in SAS Studio, you can access the code as well as the log and results without running the program again. If you make changes to the code and rerun it, the package is not automatically updated. You must save the package again to keep the changes.

Note: The program package does not include PDF or RTF results. You cannot create a program package if you are running your program in interactive mode.
To create a program package file, open the code that you want to use and click 
. Specify the file location and name, and then select SAS Program Package as the Save as type option.

Note: If you want to save the program or log individually or download the results as an HTML, PDF, or RTF file, you must resubmit the program after you open the program package file.

Creating a Program Summary

You can create a summary page for code that you have written as well as code that is automatically generated when you run a task. The Program Summary page is an HTML file that opens in a separate browser tab and includes information about the program execution, the complete SAS source code, the complete SAS log, and the results. To view the Program Summary page for a program, click .

Note: The Program Summary is available only after you have run the program.

You can also save a Program Summary file to a folder that you specify by clicking and selecting SAS Program Summary as the Save as type option. The Program Summary is saved as an HTML file.

Using Macro Variables

Macro variables can be used to add information that is obtained when a program or task is run, such as the name and version number of the application. You can reference these items within code, titles, or footnotes by preceding them with "&".

For example, you can use macros in a footnote like the following:

Generated with &_CLIENTAPP &_CLIENTAPPVERSION

Note: In addition to the following macro variables, you can use SAS macro functions and variables in your code. For information about SAS macro functions and variables, see SAS Macro Language Reference.
<table>
<thead>
<tr>
<th>Macro Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>_CLIENTAPP</td>
<td>name of the application.</td>
</tr>
<tr>
<td>_CLIENTAPPVERSION</td>
<td>application version number.</td>
</tr>
<tr>
<td>_SASPROGRAMFILE</td>
<td>the full path and filename of the SAS program that is currently being run. This macro variable is available only for SAS program files that are saved on the same server on which your SAS Studio code is running.</td>
</tr>
</tbody>
</table>

**Note:** If you specify `%put _all_` or `%put _global_` in your SAS program, the output does not include any special characters. For example, slashes are not included in directory paths. To view the output with these special characters, you must specify the individual macro variable by name, such as `%put &_sasprogramfile;`.

### Using Your Submission History

SAS Studio maintains a log with entries for each time you run a program or task. You can use this log, or submission history, to access prior versions of your submitted code. To view your submission history, click the **Code** tab in your program or task window. On the toolbar, click 🗄 and select the version that you want to open. The prior version of the program opens in a new window from which you can copy and paste the code as needed.

**Note:** The submission history is cleared when you sign off from SAS Studio.

### Automatically Formatting Your SAS Code

You can use the code editor to make your programs easier to read by automatically formatting your code. When you automatically format your code, line breaks are added, and each line is correctly indented according to its nesting level. To format the code in the code editor, click ⬠.
For example, the following code is difficult to read because it lacks indention and logical line breaks:

```sas
data topn;
  length rank 8; label rank="Rank";
  set topn; by &category descending &measure;
  if first.&category then rank=0; rank+1;
  if rank le &n then output;
run;
```

After you use the automatic code-formatting feature, the program looks like this:

```sas
data topn;
  length rank 8;
  label rank="Rank";
  set topn;
  by &category descending &measure;

  if first.&category then
    rank=0;
    rank+1;

  if rank le &n then
    output;
run;
```

### Working in Interactive Mode

#### What Is Interactive Mode?

Some SAS procedures are interactive, which means they remain active until you submit a QUIT statement, or until you submit a new PROC or DATA step. In SAS Studio, you can use the code editor to run these procedures, as well as other SAS procedures, in interactive mode.

By using interactive mode, you can run selected lines of code from your SAS program and use the results to determine your next steps. For example, the OPTMODEL procedure in SAS/OR enables you to model and solve mathematical programming models. By running this procedure interactively, you can quickly check results for parts of the program and determine whether you need to make any modifications without running the entire program.
Interactive mode is available only if you are running the first maintenance release for SAS 9.4 or later releases.

**Running a Program in Interactive Mode**

To run a program in interactive mode, click on the toolbar. To turn off interactive mode, click again. If you change modes while a program is open, the log and results for that program are cleared. You can also clear the log and results manually by clicking on the appropriate toolbar.

When you run a program in interactive mode, SAS Studio does not add any automatically generated code, such as ODS and %LET statements, to your program. In addition, results are generated only in HTML. In interactive mode, the log and results are appended to the existing log and results. Previously submitted code remains active until you terminate it.

For example, suppose you have the following program:

```sql
proc sql;
  select * from sashelp.cars;

  select * from sashelp.class;
quit;
```

In noninteractive mode, if you select the first two lines of code and submit them, the code runs successfully. If you then select the last two lines of code and submit them, the code fails because the PROC SQL statement is missing.

If you switch to interactive mode and follow the same steps, the last two lines of code run successfully because the PROC SQL statement is still active.

**Note:** For documentation about specific procedures, see the SAS Programmer’s Bookshelf on support.sas.com.

**About Libraries in Interactive Mode**

When you use interactive mode, you are creating a new workspace server session with its own list of libraries that are available only in that session. If you assign a new library when you are in interactive mode, the library might not be available when you turn off interactive mode. In order to share data in a library between interactive mode and
noninteractive mode, the library must be included in your autoexec.sas file so that it is assigned every time you use SAS Studio. For more information, see “Editing the Autoexec File” on page 17.

Webwork is the default output library in interactive mode. If you refer to a table without specifying both the libref and the table name, SAS Studio assumes it is stored in the Webwork library. The Webwork library is shared between interactive mode and noninteractive mode. Any data that you create in the Webwork library in one mode can be accessed in the other mode.

**Note:** If you run a program that creates output data in interactive mode and this data is saved in a library that is available in both interactive and noninteractive mode (such as the Webwork library), you must refresh the **Libraries** section of the navigation pane to view the new data from the user interface.

The Work library is not shared between interactive mode and noninteractive mode. Each workspace server session has its own separate Work library, and data cannot be shared between them. Any data that you save to the Work library in interactive mode cannot be accessed from the Work library in noninteractive mode. In addition, you cannot view data in the Work library from the **Libraries** section of the navigation pane if the data was created in interactive mode. However, you can access that data programmatically in interactive mode.

**Special Considerations When Using Interactive Mode**

The following list summarizes some of the special considerations for using interactive mode:

- If you run a program that creates output data in interactive mode, you must refresh the **Libraries** section of the navigation pane to view the new data.

- You cannot view any data that you create in the Work library in interactive mode in the **Libraries** section of the navigation pane. However, you can access that data programmatically.

- Because each program that is opened in interactive mode creates a new workspace server session, any options, macros and macro variables, and other data that is specific to your workspace server session cannot be shared with other programs in either interactive or noninteractive mode. Programs that are opened in
noninteractive mode use the same workspace server session and can therefore share options, macros and macro variables, and other data.

- When you run a program in interactive mode, results are generated only in HTML.
- You can turn interactive mode on and off for an individual program tab by clicking \( \text{Interactive mode button} \). When interactive mode is turned on, the button appears to be highlighted on the toolbar. If you want to use interactive mode for all program tabs, click \( \text{Preferences} \) and select **Preferences**. Click **General**, and then select **Start new programs in interactive mode**. If you do not select this option, you must turn interactive mode on each time you want to use it.

## Working with Code Snippets

### Why Use Code Snippets?

Code snippets enable you to quickly insert SAS code into your program and customize it to meet your needs. SAS Studio is shipped with several code snippets. You can also create your own snippets and add snippets to your list of favorites.

<table>
<thead>
<tr>
<th>Snippet Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Catalogs</td>
<td></td>
</tr>
<tr>
<td>Edit a SOURCE Entry</td>
<td>enables you to specify the content for the SOURCE entry type in a catalog. The SOURCE entry can contain the same code as SAS programs.</td>
</tr>
<tr>
<td>List Catalogs</td>
<td>lists in a SAS table all of the catalogs in the specified library. By default, this table is saved in the Work library and with catalogs as the filename.</td>
</tr>
<tr>
<td>List Catalog Entries</td>
<td>lists all the catalog types in the specified catalog.</td>
</tr>
<tr>
<td>Print GRSEG Entry</td>
<td>prints the GRSEG entry to the open destinations specified by the SAS Output Delivery System (ODS output).</td>
</tr>
<tr>
<td>Snippet Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Data</td>
<td>DS2 Code: provides a template for a DS2 program. DS2 is a SAS programming language that is appropriate for advanced data manipulation. DS2 is included with Base SAS and shares core features with the SAS DATA step. DS2 exceeds the DATA step by adding variable scoping, user-defined methods, ANSI SQL data types, and user-defined packages. The DS2 SET statement accepts embedded FedSQL syntax, and the run-time-generated queries can exchange data interactively between DS2 and any supported database. This allows SQL preprocessing of input tables, which effectively combines the power of the two languages. For more information, see <em>SAS DS2 Language Reference</em>.</td>
</tr>
<tr>
<td></td>
<td>DS2 Package: provides a template for a DS2 package. A package is similar to a DS2 program. The package body consists of a set of global declarations and a list of methods. The main syntactical differences are the PACKAGE and ENDPACKAGE statements. These statements define a block with global scope. For more information, see <em>SAS DS2 Language Reference</em>.</td>
</tr>
<tr>
<td></td>
<td>DS2 Thread: provides a template for a DS2 threaded program. Typically, DS2 code runs sequentially. That is, one process runs to completion before the next process begins. It is possible to run more than one process concurrently, using threaded processing. In threaded processing, each concurrently executing section of code is said to be running in a thread. For more information, see <em>SAS DS2 Language Reference</em>.</td>
</tr>
<tr>
<td></td>
<td>Generate CSV File: enables you to export SAS data as a comma-separated text file.</td>
</tr>
<tr>
<td></td>
<td>Generate PowerPoint Slide: enables you to stream Microsoft PowerPoint output to your web browser.</td>
</tr>
<tr>
<td></td>
<td>Generate XML File: enables you to export SAS data as an XML file that you can view in your web browser.</td>
</tr>
<tr>
<td></td>
<td>Import CSV File: enables you to import a comma-separated file and write the output to a SAS data set.</td>
</tr>
<tr>
<td>Snippet Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Import XLSX File</td>
<td>enables you to import a Microsoft XLSX file and write the output to a SAS data set.</td>
</tr>
<tr>
<td>Simulate Linear Regression Data</td>
<td>creates an input data source that you can use for linear regression analysis. Linear regression analysis tries to assign a linear function to your data by using the least squares method.</td>
</tr>
<tr>
<td>Simulate One-Way ANOVA Data</td>
<td>creates an input data source that considers one treatment factor with three treatment levels. When you analyze this data by using the One-Way ANOVA task, the goal is to test for differences among the means of the levels and to quantify these differences.</td>
</tr>
<tr>
<td>Descriptive</td>
<td></td>
</tr>
<tr>
<td>Custom ODS Output</td>
<td>provides a template for creating HTML, PDF, and RTF output by using the SAS Output Delivery System. For more information, see <em>SAS Output Delivery System: User’s Guide</em>.</td>
</tr>
<tr>
<td>PROC SQL</td>
<td>provides a template for writing SQL queries. For more information, see <em>SAS SQL Procedure User’s Guide</em>.</td>
</tr>
<tr>
<td>Graph</td>
<td></td>
</tr>
<tr>
<td>Note:</td>
<td>For more information about the SGPLOT, SGPANEL, and SGSCATTER procedures, see <em>SAS ODS Graphics: Procedures Guide</em>.</td>
</tr>
<tr>
<td>Bar Panel</td>
<td>uses the VBAR statement in the SGPANEL procedure and enables you to create multiple bar charts.</td>
</tr>
<tr>
<td>Box Panel</td>
<td>uses the VBOX statement in the SGPANEL procedure and enables you to create multiple box plots.</td>
</tr>
<tr>
<td>Comparative Scatter Plot</td>
<td>uses the COMPARE statement in the SGSCATTER procedure. This code snippet creates a comparative panel of scatter plots with shared axes.</td>
</tr>
<tr>
<td>Dot Plot</td>
<td>uses the DOT statement in the SGPLOT procedure. Dot plots summarize horizontally the values of a category variable. By default, each dot represents the frequency for each value of the category variable.</td>
</tr>
<tr>
<td>Snippet Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Fit Plot</td>
<td>uses the REG statement in the SGPLOT procedure. This code snippet produces a regression plot with a quadratic fit and includes confidence limits.</td>
</tr>
<tr>
<td>HBar Plot</td>
<td>uses the HBAR statement in the SGPLOT procedure. This code snippet creates a horizontal bar chart that summarizes the values of a category variable.</td>
</tr>
<tr>
<td>HighLow Plot</td>
<td>uses the HIGHLOW statement in the SGPLOT procedure. High-low charts show how several values of one variable relate to one value of another variable. Typically, each variable value on the horizontal axis has several corresponding values on the vertical axis.</td>
</tr>
<tr>
<td>Histogram Plot</td>
<td>uses the HISTOGRAM statement in the SGPLOT procedure. This code snippet produces a histogram with two density plots. In this snippet, one density plot uses a normal density estimate and the other density plot uses a kernel density estimate.</td>
</tr>
<tr>
<td>Scatter Plot Matrix</td>
<td>uses the MATRIX statement in the SGSCATTER procedure. This code snippet creates a scatter plot matrix.</td>
</tr>
<tr>
<td>VBox Plot</td>
<td>uses the VBOX statement in the SGPLOT procedure. A box plot summarizes the data and indicates the median, upper and lower quartiles, and minimum and maximum values. The plot provides a quick visual summary that easily shows center, spread, range, and any outliers. The SGPLOT and the SGPANEL procedures have separate statements for creating horizontal and vertical box plots.</td>
</tr>
</tbody>
</table>

Macro

Note: For more information about SAS macros, see SAS Macro Language: Reference.
<table>
<thead>
<tr>
<th>Snippet Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS Macro Char Functions</td>
<td>provides several examples of these SAS macros that work with character values:</td>
</tr>
<tr>
<td></td>
<td>- The %EVAL function evaluates arithmetic and logical expressions by using integer arithmetic. This function operates by converting its argument from a character value to a numeric or logical expression. After the expression is evaluated, the result is converted back to a character value.</td>
</tr>
<tr>
<td></td>
<td>This function is useful because the SAS Macro Facility is basically a text generator. As a result, an arithmetic expression is first converted to a numeric expression. After this numeric expression is evaluated, it is converted back to an arithmetic expression.</td>
</tr>
<tr>
<td></td>
<td>- The %INDEX function returns the position of the first character of a string.</td>
</tr>
<tr>
<td></td>
<td>- The %LENGTH function returns the length of a string.</td>
</tr>
<tr>
<td></td>
<td>- The %SCAN function searches for a word that is specified by its position in a string.</td>
</tr>
<tr>
<td></td>
<td>- The %SUBSTR function produces a substring of a character string.</td>
</tr>
<tr>
<td></td>
<td>- The %UPCASE function converts values to uppercase.</td>
</tr>
<tr>
<td>SAS Macro Do Statement</td>
<td>designates the beginning of a section of a macro definition that is treated as a unit until a matching %END statement is encountered. This macro section is called a %DO group.</td>
</tr>
<tr>
<td></td>
<td>A simple %DO statement often appears in conjunction with %IF-%THEN-%ELSE statements to designate a section of the macro to be processed depending on whether the %IF condition is true or false.</td>
</tr>
<tr>
<td></td>
<td>Note: SAS also provides a %DO iterative statement, which is different from the code that is generated by this snippet. For more information, see <em>SAS Macro Language: Reference</em>.</td>
</tr>
<tr>
<td>SAS Macro If Statement</td>
<td>conditionally processes a portion of a macro. The expression that is the condition for the %IF-%THEN-%ELSE statement can contain only operands that are constant text or text expressions that generate text.</td>
</tr>
<tr>
<td>Snippet Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SAS Macro Parameters</td>
<td>names one or more local macro variables whose values you specify when you invoke the macro. There are two types of macro variables: positional and keyword. Parameters are local to the macro that defines them. You must supply each parameter name. You cannot use a text expression to generate it. A parameter list can contain any number of macro parameters separated by commas. The macro variables in the parameter list are usually referenced in the macro.</td>
</tr>
<tr>
<td>SAS Macro</td>
<td>provides a basic template for working with SAS macros. Macros enable you to perform many tasks, including substituting text in a program. A SAS program can contain any number of macros, and you can invoke a macro multiple times in a single program. For more information, see <em>SAS Macro Language: Reference</em>.</td>
</tr>
<tr>
<td>Snippet Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SAS Macro Quoting</td>
<td>provides examples of macro functions that tell the macro processor to interpret special characters and mnemonics as text rather than as part of the macro language.</td>
</tr>
<tr>
<td></td>
<td>- The %STR function masks special characters and mnemonic operators in constant text at macro compilation. This function masks these special characters and mnemonic operators:</td>
</tr>
<tr>
<td></td>
<td>+ - * / &lt; &gt; = ¬ ^ ~ ; , # blank AND OR NOT EQ NE LE LT GE GT IN</td>
</tr>
<tr>
<td></td>
<td>This function also masks these characters when they occur in pairs and when they are not matched and are marked by a preceding %:</td>
</tr>
<tr>
<td></td>
<td>' &quot; ()</td>
</tr>
<tr>
<td></td>
<td>- The %NRSTR function masks special characters and mnemonic operators in constant text at macro compilation. This function masks all of the special characters and mnemonic operators listed for the %STR function. In addition, the %NRSTR function masks these characters:</td>
</tr>
<tr>
<td></td>
<td>&amp; %</td>
</tr>
<tr>
<td></td>
<td>- The %BQUOTE function masks special characters and mnemonic operators in a resolved value at macro execution. This function masks these special characters and mnemonic operators:</td>
</tr>
<tr>
<td></td>
<td>' &quot; () + - * / &lt; &gt; = ¬ ^ ~ ; , # blank AND OR NOT EQ NE LE LT GE GT IN</td>
</tr>
</tbody>
</table>
### SAS Macro Quoting (continued)

- The `%SUPERQ` function masks all special characters and mnemonic operators at macro execution but prevents further resolution of the value. This function masks these special characters and mnemonic operators:

  ```
  & % ' " () + - * / < > = ¬ ^ ~ ; , # blank
  AND OR NOT EQ NE LE LT GE GT IN
  ```

- The `%QSCAN` function searches for a word and masks special characters and mnemonic operators.

- The `%QSUBSTR` function produces a substring and masks special characters and mnemonic operators.

- The `%QUPCASE` function converts a value to uppercase and returns a result that masks special characters and mnemonic operators.

- The `%UNQUOTE` function unmasks a value during macro execution so that any special characters and mnemonic operators are interpreted as macro language elements instead of text.

For more information about macro compilation and macro execution, see [*SAS Macro Language: Reference*](#).

### SAS Macro Variables

Provides examples of how to create user-defined global and local macro variables. Macro variables are tools that enable you to dynamically modify the text in a SAS program through symbolic substitution. You can assign large or small amounts of text to macro variables. Then you can use that text by simply referencing the variable that contains the text.

Macro variables that are defined by the macro programmer are called user-defined macro variables. Macro variables that are defined by the macro processor are called automatic macro variables. You can define and use macro variables anywhere in SAS programs, except within data lines.

### IML

**Note:** These snippets are available only if your site licenses SAS/IML.
<table>
<thead>
<tr>
<th>Snippet Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Find Roots of Nonlinear Equation</td>
<td>enables you to find the roots of a function of one variable. Finding the root (or zero) of a function enables you to solve nonlinear equations.</td>
</tr>
<tr>
<td>Fit by using Maximum Likelihood</td>
<td>uses maximum likelihood estimation to estimate parameters for the normal density estimate.</td>
</tr>
<tr>
<td>Generate a Bootstrap Distribution</td>
<td>uses the IML procedure to create and analyze a bootstrap distribution of the sample mean.</td>
</tr>
<tr>
<td>Integrate a Function</td>
<td>enables you to numerically integrate a one-dimensional function by using the QUAD subroutine in SAS/IML software. Use the QUAD subroutine to numerically find the definite integral of a function on a finite, semi-infinite, or infinite domain.</td>
</tr>
<tr>
<td>Simulate Multivariate Normal Data</td>
<td>simulates data from a multivariate normal distribution with a specified mean and covariance.</td>
</tr>
</tbody>
</table>

**Create a Code Snippet**

To create your own snippet:

1. Open your .sas file in SAS Studio and select the code that you want to save as a snippet.

2. On the Code tab, click ![Add to My Snippets]. The Add to My Snippets dialog box appears.

   **Note:** You can also create a snippet by right-clicking the selected code and selecting **Add to My Snippets**.

3. Enter a name for the snippet and click Save.

This snippet is now available from the My Snippets folder.
How to Insert a Code Snippet

To include a code snippet in your program:

1. Click the location in your program where you want to insert the snippet.

2. In the navigation pane, open the **Snippets** section.

3. You can add the snippet to your program in these ways:
   - use a drag-and-drop operation to move the snippet.
   - double-click the name of the snippet.
   - right-click the name of the snippet and select **Insert**. To select multiple snippets, use the Ctrl key. Then right-click and select **Insert**.

The following example shows the Import XLSX File snippet inserted into a program.

![Example Code Snippet]

Customizing the Code Editor

The Preferences window enables you to change several options that affect the features in the code editor, including autocompletion and color coding.
To access the editor options, click and select **Preferences**. Click **Editor**.

For more information, see “Setting the Editor Preferences” on page 146.

What Is a Query?

A query enables you to extract data from one or more tables according to criteria that you specify. You can create a query that is based on only one table, or you can join tables together. When you create a query, SAS Studio generates Structured Query Language (SQL) code, which you can view. You can create queries in both the SAS Programmer and the Visual Programmer perspectives.

Creating a Query

Creating a New Query

On the main SAS Studio toolbar, click and select **New Query**. A query window opens on a new tab in the work area.
Adding Tables to a Query

On the **Tables** tab in the query window, click + and select **Table**. From the Choose a Table window, expand the appropriate library and select the table that you want to use. The table is added to the query.

**Note:** You can also add tables to the query by using the **Libraries** of the navigation pane. Click **Libraries** and expand the appropriate library. Drag the table that you want to use to the **Tables** tab of the query window.

Understanding Joins

Joining Tables

When you create a query, you can join multiple tables together. SAS Studio can automatically join the tables together for you, or you can manually create the join. SAS Studio attempts to join tables by columns that have the same name and type. If no matches for column name and type are found, then you can specify the join criteria.

**Note:** If you have more than one table in your query and you do not specify join criteria, then your output data includes the Cartesian product, or every possible combination, of the data values.

Creating a Join

To add a table and automatically create a join:

From the **Libraries** of the navigation pane, drag the table that you want to add to the query to the **Tables** tab. Next, drop that table on top of the first table in the query to join the two.
The Join window displays the join criteria. In the following example, the Classfit table is automatically joined to the Class table by using the Name column in both tables.
If a join cannot be created automatically, you can specify the join condition manually.

To manually create a join:

1. On the **Tables** tab of the query window, make sure that you can view the tables that you want to join.

2. Click **+** on the toolbar and select **Join**. The New Join window opens.

3. From the **Left table** drop-down list, select the table for the left side of the join.

4. From the **Join type** drop-down list, select the type of join that you want to use. The default join type is Inner join.

5. From the **Right table** drop-down list, select the table for the right side of the join.

6. Click **Save**. A join is created between the tables. If the tables include columns with matching names and data types, then a join condition is automatically created. If the tables do not include columns with matching names and data types, then you can select the columns for the join condition from the column drop-down lists.
To add another join condition to the join, click + and select the columns that you want to use from the column drop-down lists.

**Understanding the Types of Joins**

SAS Studio supports four different types of joins. You can select the type of join you want by modifying an existing join.

You can select the join option that you want to use in the Join window.
### SAS Studio Join Type

<table>
<thead>
<tr>
<th>SAS Studio Join Type</th>
<th>Join Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inner Join</td>
<td><img src="image" alt="Inner Join Icon" /></td>
<td>The output rows include those for which the column in the first table matches the joining criterion of the column in the second table. Joins are inner joins by default.</td>
</tr>
<tr>
<td>Left Join</td>
<td><img src="image" alt="Left Join Icon" /></td>
<td>The output rows include all rows from the first table and the rows from the second table in which the joining criterion is met.</td>
</tr>
<tr>
<td>Right Join</td>
<td><img src="image" alt="Right Join Icon" /></td>
<td>The output rows include all rows from the second table and the rows from the first table in which the joining criterion is met.</td>
</tr>
<tr>
<td>Full Join</td>
<td><img src="image" alt="Full Join Icon" /></td>
<td>The output rows include all matching and nonmatching rows from both tables.</td>
</tr>
</tbody>
</table>

### Modifying an Existing Join

You can modify an existing join by selecting a different type of join or by changing the columns that are used in the join condition. You can also add and remove join conditions or remove the entire join.

To modify a join:

1. On the Tables tab of the query window, click the join indicator that you want to modify. The join is displayed in the Join area.

2. To change the type of join, select a new type from the Join type drop-down list.

3. To add a new join condition, click + and specify the columns to use in the join. To remove a join condition, click - next to the appropriate condition.
To delete the entire join, right-click the join indicator and select **Delete**.

---

**Selecting Data**

**Specifying Columns in the Output**

By default, no columns are included in the output. You must specify the columns that you want to appear in the output table. You can also specify an alias to use in place of the column name in the output table.

The order in which the columns are listed on the **Select** is the order in which they appear in the output table.

To select columns for the output table:

1. In the query window, click the **Columns** tab to view the list of columns from the tables in the query.

2. You can add one or more columns to the output data by dragging them from the columns list to the **Select** tab. You can also click **+** on the **Select** tab toolbar and select one or more columns from the Choose Column window.
To specify an alias for a column:

- On the Select tab, enter the alias that you want to use for each column. The alias is used as the column heading for the output data.
Using Summary Functions

You can perform summary functions on any of the columns in your query. To perform a summary function, select the column on which you want to perform a summary function. Use the drop-down list in the Summary column to select the function that you want to use. By default, the query generates an output data set. The following example shows you how to find the average age of all of the students:
PROC SQL;
CREATE TABLE WORK.QUERY1 AS
SELECT AVG(CLASS.Age) AS Age
FROM SASHELP.CLASS CLASS
INNER JOIN SASHELP.CLASSFIT CLASSFIT
ON

By default, the query displays the results in the **Output Data** tab and generates an output table in the Work library:

By default, when you summarize a column, your output is grouped by all of the columns without summaries. For more information, see “Grouping Your Output” on page 66.
Filtering Data

Creating a Filter

When you query data, you might want to retrieve only rows that meet certain criteria, based on values of columns in the data. The process of telling SAS Studio which rows to retrieve is called setting a filter and is done on the Filter tab. This corresponds to using a WHERE clause in an SQL query.

1. In the query window, click the Columns tab to view the list of columns from the tables in the query.

2. You can add one or more columns to the filter by dragging them from the columns list to the Filter tab. You can also click + on the Filter tab toolbar and select one or more columns from the Choose Column window.

3. Select a comparison operator from the Operator drop-down list. The default value is Equals.
4 If the operator that you have selected requires a value, click \( \text{input} \) to enter or select a value in the Select Value window. To choose from a list of values, click \( \text{expand} \) to expand the Value list. Select the values that you want to use and click Add.

**Note:** If you are selecting values for a character column, and you want the values to be enclosed in single quotation marks, select the Enclose values in quotes option. This option is selected by default. If you are using a macro variable or other value that is evaluated when the filter is run, you should clear this option.

If you want to choose from a list of columns, click \( \text{expand} \) to expand the Column list. Select the column that you want to use.
5 Click **OK** to add the values to the filter.

### Changing the Relationship between Filters

You can use only one column in a filter, or you can use multiple columns to create several comparison expressions. If you create more than one comparison expression in your filter, then the default relationship between these filter elements is AND. You can change the relationship between filter elements from AND to OR, and you can group elements together.

To change the relationship between filters:

- On the Filter tab, click the relationship value and select a new value.
Managing Output

Sorting Your Output

You can sort the output from your query by one or more columns from the tables that are used in the query.

Note: It is possible to sort the output table by columns that are not selected for the output.

To sort your output:
1 In the query window, click the **Sort** tab.

2 You can add one or more columns to the **Sort** tab by dragging them from the columns list to the **Sort** tab. You can also click **+** on the **Sort** tab toolbar and select one or more columns from the Choose Column window.

3 Click the **Sort** box for the column on which you want to sort the data. From the drop-down list, select **Ascending** or **Descending**. The default sort direction is **Ascending**.

4 If you are sorting by multiple columns, the output table is sorted first by the column that is listed first. Within each level of the first column, the rows are sorted by the second column in the list, and so on. You can change the sort order by selecting a column and clicking **⬆** and **⬇** to move the column up and down the list.
Eliminating Duplicate Rows in Output

Some types of queries output multiple, identical rows. Because these duplicate rows are generally not useful, SAS Studio enables you to keep only one of the identical rows and eliminate the duplicates.

To eliminate duplicate rows, click the Select tab and select the Select distinct rows only check box.

Grouping Your Output

If you have created a summarized column, you can choose to classify your data into groups based on the values in a column. This is equivalent to using the GROUP BY clause in an SQL query. For example, if you are calculating the average height of a group of students, you might want to group the results by age so that you can see the average height for each age group.

By default, the Automatically select groups option is selected on the Group tab. When this option is selected and you have performed a summary function on a column, your query is automatically grouped by all columns without summary functions. You can choose to edit the list of columns that the query is grouped by.

To group your output:

1. In the query window, click the Group tab.

2. You can add one or more columns to the Group tab by dragging them from the columns list to the Group tab. You can also click + on the Group tab toolbar and select one or more columns from the Choose Column window.

   **Note:** To remove all of the automatically selected columns from the Group tab, clear the Automatically select groups option.
To change the order in which the columns are used to group the data, select the column that you want to move and click ↑ and ↓.

The following example shows you how to find the average weight of students in each age group. First, add the Age and Weight columns to the Select tab, and then select the AVG summary function for the Weight column:
To see the average weight of students by age, the query is grouped by the Age column. The results show the average weight for each age group:
Note: By default, the query generates a table of the result. To generate a report of the results (which is displayed in Results tab), you must specify report as the output type for the query. For more information, see “Saving Your Results” on page 69.

Saving Your Results

You can choose to generate your results in any one of three formats: data table, data view, or report.

If you save your results as a data table or data view, you can specify the library and filename that you want to use. If you don’t specify the library and filename, the results are saved in the Work library.
To specify the results format:

1. In the query window, click the **Settings** tab.
2. Click the **Properties** tab. In the Results area, select the format that you want to use from the **Output type** drop-down list.

   **Report**
   saves the query results as a report that you can download as an HTML, PDF, or RTF file. Query results in this format are not updated until you rerun the query. You cannot run SAS tasks against query results in this format.

   **Table**
   saves the query results as a static data table against which you can run SAS tasks. Query results in this format are not updated until you rerun the query. By default, the data table is stored in the Work library.

   **View**
   saves the query results as a dynamic data view against which you can run SAS tasks. Each time you open query results in the data view format, the results are updated with any changes to the data that is used in the query. By default, the data view is stored in the Work library.

To save your results to a specific location:

1. In the query window, click the **Settings** tab.
2. Click the **Properties** tab. In the Results area, enter the name of the library in which you want to save your results in the **Output location** box.
3. To specify a name for the results, enter the name that you want to use in the **Output name** box.

**Running a Query**

After you specify all the criteria for your query, you can generate your results by clicking **Play** on the query window toolbar. The output data opens in the workspace on a separate tab.

Understanding Process Flows

What Is a Process Flow?

You must be working in the Visual Programming perspective to work with process flows. For more information about the Visual Programming perspective, see “Understanding Perspectives” on page 16.

A process flow consists of one or more objects. Each object is represented by a node in the process flow. The process flow shows the relationship between two or more objects, such as a SAS program, a task, a query, and so on.

This sample process flow contains three branches.

- In the first branch, a query is created for the Sashelp.Classfit data set. As a result of this query, only observations where Sex=M are included in the output data set (called Work.Query). The Rank Data task ranks the Height and Weight values by Age.

- In the second branch, you write a SAS program that generates an output data set. After this program runs, a subflow that contains more program and task nodes runs. Then, SAS Studio tries to run the Bar Chart node. However, this task generates a warning.

- In the third branch, the SAS program generates an error. The information for the List Table Attributes node is incomplete. SAS Studio cannot run the process flow until you provide the required data.
Creating Process Flows

In SAS Studio, you can have multiple process flows. These process flows run independently of each other. To create a new process flow, click and select **New Process Flow**. A new Process Flow tab appears in the interface.

What Are Ports?

In a process flow, you can have two types of ports:

- **control ports**
  
  In the process flow, these types of ports appear as . You use these ports to specify the order in which nodes run in the process flow. For more information, see “Linking Nodes in a Process Flow” on page 92.

- **data ports**
  
  In the process flow, these types of ports appear as .
When you run a task, you must specify an input data source. You specify the input data source in the task interface. From the process flow, you can determine the name of the input data source by positioning your mouse pointer over the input data port. To view the data source on a separate tab, double-click 🔄.

In this example, the input data source for the Rank Data task is Work.Query.

Some nodes, such as queries, might have an output data source. You can use the output data port to determine the name of the output data source. To view the data source, double-click 🔄.

In this example, the output data source for the query node is Work.Query.

By default, ports are displayed in the process flow. To turn off the ports, click Show Ports.

**Understanding the Status of Each Node**

When you run a process flow, some nodes might run successfully, and others might not. To see the status of each node, how long it took to run the node, and whether any output data was created, click the Results tab.
Here are the contents of the **Results** tab for the previous process flow.

You can use these icons to determine the status of each node in the process flow:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Icon" /></td>
<td>specifies that more information is needed before SAS Studio can run the node. For example, if you see this icon on a task node, you must specify values for the required options in the task. This icon can also appear on an empty subflow node after SAS Studio tries to run it.</td>
</tr>
<tr>
<td><img src="image2.png" alt="Icon" /></td>
<td>specifies that the node is in the queue to run.</td>
</tr>
<tr>
<td><img src="image3.png" alt="Icon" /></td>
<td>specifies that the code for the node was submitted successfully. No warnings or errors were returned.</td>
</tr>
</tbody>
</table>
specifies that the code for the node generated a warning. Review the log for that node for more information.

specifies that the code for the node generated an error. Review the log for that node for more information.

Customizing a Process Flow

You can customize your process flow in these ways.

- To specify a color for a node or a group of nodes, select the nodes and click **Color**. From the drop-down list, select the color that you want to use.

- By default, you can arrange objects in the process flow any way you like. However, your process flow might become confusing if it contains many objects. Click for SAS Studio to arrange the objects in your process flow. When arranging the nodes, SAS Studio considers any dependencies and the order in which the nodes were added to the process flow.

Viewing the Properties of a Process Flow

To view the properties of the current process flow, click the **Properties** tab. From the properties, you can specify the priority of execution of the nodes. The process flow runs the nodes in the order in which the nodes are added to the process flow. If node 1 is dependent on another node 2, node 2 must run completely before node 1 will run. You can also run the nodes in parallel, which means that multiple workspace servers are used to run the nodes. As a result, the nodes might not share a common Work library.
Add Data to the Process Flow

To add data to a process flow from an existing library:

1. In the navigation pane, click the Libraries section.

2. Expand the library that contains the data set that you want to add. Select the data set and drag it to the process flow.

   In this example, the Sashelp.Air data set is now available from the process flow. You can now use this data set as the input data for a task.
Adding a SAS Program to the Process Flow

Create a New SAS Program

To add a new SAS program to a process flow:

1. Click \( \text{+} \) and select **SAS program**. A node for the SAS program is added to the process flow.

2. Select the node and click \( \text{edit} \). (You can also select the node and press Enter.) The code editor appears.

3. Enter the code for your program.

4. To name the program, to provide a brief description for the program, and to include any notes, click the **Node** tab.
The SAS program node in the process flow now contains the name and description that you specified on the Node tab.
Add an Existing SAS Program

You might have already written a SAS program that you want to include in the process flow. To add this program:

1. In the navigation pane, click the **Server Files and Folders** section.

2. Expand the folders in the **Server Files and Folders** section until you find the program that you want to add.

3. Select the program that you want to add, and then drag it to the process flow. (A green check mark indicates that you can add this file to the process flow.)
In this example, you are adding the existing TopNCategories.sas file to the process flow in SAS Studio.

Add a Snippet

You can use snippets as the starting point for your SAS programs.

To add a snippet to a process flow:

1. In the navigation pane, select Snippets.

2. In the Snippets section, select the snippet that you want to add, and then drag it to the process flow.
In this example, the Import XLSX file snippet is added to the process flow.

3 To view the code for the snippet, select the snippet node and click 📝. (You can also select the node and press Enter.) Edit the code to meet your needs.
Here is the code for the Import XLSX file snippet. In this example, specify in the code the location of the XLSX file that you want to import.

```sql
1 /** Import an XLSX file. */
2
3 PROC IMPORT DATAFILE="<Your XLSX File>"
   OUT=WORK.MYEXCEL
   DBMS=XLSX
   REPLACE;
4
5 RUN;
6 /** Print the results. */
7
8 PROC PRINT DATA=WORK.MYEXCEL; RUN;
```

4 To name the program that you created, to provide a brief description for the program, and to include any notes, click the **Node** tab.
The Import XLSX File node in the process flow now includes the description that you provided.
Adding a Query to a Process Flow

Create a New Query

To create a new query:

1. Click + and select Query. A node for the query is added to the process flow.

2. Select the node and click 📝. The Query Builder appears.

3. Use the Query Builder to define your query. For more information, see “Creating a New Query” on page 50.
4 To define the type of results for the query, use the Properties tab. For more information, see “Saving Your Results” on page 69.

5 To name the query node, to provide a brief description for the query, and to include any notes, click the Node tab.

To return to the view of the process flow, select the name of the process flow in the breadcrumbs. The query node in the process flow now contains the name and description that you specified on the Node tab.

Add an Existing Query to a Process Flow

You might have already written a query that you want to include in the process flow. To add this query:

1 In the navigation pane, click the Server Files and Folders section.

2 Expand the folders in the Server Files and Folders section until you find the query that you want to add.

3 Select the query that you want to add, and then drag it to the process flow. (A green check mark indicates that you can add this file to the process flow.)
In this example, you are adding the existing Query_CLASSFIT file to the process flow in SAS Studio.

Add a Task to a Process Flow

You can add custom tasks and tasks that shipped with SAS Studio to your process flow.

1. In the navigation pane, click the **Tasks and Utilities** section.

2. Select the task that you want to add, and then drag it to the process flow.
Here is an example of a process flow that contains the Sort Data task.

3 Select the task node and click 📁. To run the task, you must specify values for any required options.
Here is the user interface for the Sort Data task.

When you run the task, SAS Studio uses the values that you specified for the task options.

Understanding Subflows

What Is a Subflow?

Within a process flow, you could have subflows. These subflows contain one or more objects. The advantage to creating a subflow is that you can easily run the nodes within a subflow without running the entire process flow. If the subflow links to another node in the entire process flow, the subflow must run to completion before SAS Studio runs the subsequent node.
In this example, there are three nodes: a node for a subflow, a query node called CLASS=F, and a programming node called PROC PRINT. All of the nodes in the subflow node must run before SAS Studio runs the PROC PRINT node. By default, the node for a subflow is white.

Note: SAS Studio cannot run a process flow that contains an empty subflow. An error message appears instead.

Create a New Subflow

To add a subflow to a process flow:

1. Click + and select Sub-Flow. A node for the subflow appears in the process flow.

2. Select the subflow node and click . Use the breadcrumbs to verify that you are working in the subflow.
3 Add the content for the subflow. A subflow can contain other subflows.

4 To name the subflow node, to provide a brief description for the subflow, and to include any notes, click the Node tab.

After you enter this information, the subflow node in the process flow contains the name and description that you specified on the Node tab.

Create a Subflow from an Existing Process Flow

You might want to add an existing process flow as a subflow to another process flow.

To add an existing process flow as a subflow:

1 In the navigation pane, click the Server Files and Folders section.
2 Expand the folders in the **Server Files and Folders** section until you find the program that you want to add.

3 Select the subflow that you want to add, and then drag it to the process flow. (A green check mark indicates that you can add this file to the process flow.) In this example, you are adding the existing Subflow_CLASSFIT.cpf file to the process flow in SAS Studio.

---

**Linking Nodes in a Process Flow**

In a process flow, you can specify the order in which each node runs. Generally, each node has an input port and an output port. To view the ports for the nodes in your process flow, click **Show Ports**.
To link nodes in the process flow:

1. Select the node that you want to link from.

2. Click + and select Link. The Add Link window appears.

3. Select the nodes that you want to link to and click OK.

   If a link is allowed between the two nodes, the two nodes are connected by a dotted line in the process flow.

---

**Running a Process Flow**

To run all the nodes in the process flow, click ▶ Run.

To run a select group of nodes, use the mouse to draw a box around the nodes that you want to run. Right-click your selection. From the pop-up menu, select Run Selected.

---

**Save a Process Flow**

To save the current process flow, click 📄. The process flow is saved as a CPF file.
About the Table Viewer

When you open a table in SAS Studio, you use the table viewer.
Note: The table viewer displays the first 100 rows of the table. If the structure or data values of the table change while the table is open, you must refresh the table viewer to see the changes. If the structure of the table changes and you do not refresh the table, the columns that are listed in the Libraries section of the navigation pane might be different from the columns that are displayed in the table viewer.

You can view the properties of the table and its columns by clicking on the toolbar.
The extended attributes tabs enable you to associate additional user-defined characteristics with the table and columns in the table. For example, you could create extended attributes that contain a URL with information about your table or the formula that is used to create a column. For more information about creating extended attributes, see *Base SAS 9.4 Procedures Guide*.

**Note:** You can add extended attributes only to SAS tables that were created on a SAS 9.4 (or later) server.
Opening and Viewing Data

You can open files in SAS Studio in several ways:

- You can double-click a file in the Server Files and Folders and Libraries sections.
- You can drag a file from the Server Files and Folders and Libraries sections to the work area.
- You can search for a file and open it from the search results. You can open the file by double-clicking it or by dragging it to the work area.
- You can open a file by using a file shortcut in the File Shortcuts section. You can open the file by double-clicking it or by dragging it to the work area.

Note: SAS Studio provides native file support for z/OS. For more information about SAS in z/OS environments, see SAS Companion for z/OS.

When you open a table, all of the columns in the table are displayed. You can use the Columns area to specify which columns you want to include in the table viewer. By default, the column names are displayed, but you can choose to display the column labels by selecting Column labels from the View drop-down list.

Note: By default, the table viewer displays the total number of rows in the table and the total number of filtered rows, if you have filtered the data. However, if SAS Studio is
unable to determine the row counts without affecting performance, then the row counts are listed as “Unavailable.”

You can automatically resize the column widths to fit the current size of the column content. To resize the column widths, right-click any column heading and select Size grid columns to content. To set the columns back to their default widths, right-click any column heading and select Restore original column widths. You can choose to always resize the column widths when you open data by selecting Size grid columns to content in the General preferences. For more information, see “Setting General Preferences” on page 143.

**Note:** The column widths might need to be recalculated when the column content changes due to filtering, sorting, or paging through the data and can affect performance.

You can change the order of the columns in the table viewer by dragging a column to a new position in the table viewer or in the Columns area.
Viewing the Code That Is Used to Create a Table

While you select options and customize the table to look the way you want it to, SAS Studio is generating SAS code that you can use. To view the code, click on the toolbar. A new program window appears with the code that was used to create the view of the table in the table viewer. The program is a copy of the code and is no longer associated with the original code. Editing the code does not affect the data that is displayed in the table viewer, and modifying the table viewer does not affect the contents of the code.

Filtering and Sorting Data

In the table viewer, you can right-click a column heading to filter and sort the data by that column. You can sort the data in ascending or descending alphabetical order or display the columns in the order in which they appear in the data table.
You can also filter the data in order to display only rows that meet certain criteria, based on values in the data. The filter options vary depending on the type of column that you have selected and the number of distinct values that a column has.

The Add Filter window for a numeric column enables you to specify one or two filter criteria for each column. To add a second filter criterion, click $+$.
The Add Filter window for a character column is case sensitive and searches for values that contain the text that you enter.

When a numeric column has 10 or fewer distinct values or a character column has 30 or fewer distinct values, the Add Filter window displays a list of values to choose from. The list of values includes both the unformatted and formatted values. If no format has been applied to the data, then the unformatted and formatted values are the same.
Note: SAS Studio always uses the unformatted values in the filter expression.

When you create a filter on a numeric column by selecting values from a list, SAS Studio filters the data differently depending on whether any of the values in the column have a fractional component.

If the values are all integers, then SAS Studio creates the filter by using the equality operator. For example, suppose your data includes integer values between 12 and 17,
and you want to create a filter for all values equal to 15. SAS Studio creates the following filter expression:

\[ \text{column-name} = 15 \]

If any of the values include a fractional component, then SAS Studio creates the filter by using a range of values to ensure that there are no rounding errors that might exclude the selected value. For example, suppose your data includes a value of 123.45678. If you select that value to use in a filter, SAS Studio creates the following filter expression:

\[ (\text{column-name} \geq 123.456775 \text{ and } \text{column-name} < 123.456785) \]

**Note:** Generating a list of values for a filter can take a long time for large tables and Hadoop tables and can affect performance. If you are creating a filter on a very large table or on a Hadoop table, you cannot select the filter values. You must enter them in the value box. By default, if a table has more than 50,000 rows or the total number of rows is unknown, then you must enter filter values for it. The default value is controlled by a setting in the config.properties file. For more information, see *SAS Studio: Administrator’s Guide*.

The Add Filter window for a date column enables you to select a date value from a pop-up calendar.
When you create a filter on your data, the filter criteria are displayed at the top of the workspace. You can click 🏷️ to edit the filter and ❌ to delete the filter. SAS Studio remembers any filters that you create each time you open the data.

---

**Importing Data**

**About Importing Data to SAS Studio**

You can import these types of data files into SAS Studio:

- Microsoft Access database files. To import these files, you must use the SAS LIBNAME statement.
- delimited files, such as files with comma-separated values.
dBASE 5.0, IV, III+, and III.

Stata files.

Microsoft Excel files. To import XLSB and XLSM files, you must use the SAS LIBNAME statement.

JMP files.

Paradox DB files.

SPSS files.

Lotus 1-2-3 files from Releases 2, 3, 4, or 5.

If you are using the SAS Studio Enterprise Edition or the SAS Studio Basic Edition, your data file might be saved to your local computer. In this case, you must upload the file to SAS Studio before you can import it.

Whether data from another locale imports correctly depends on whether the SAS server supports the locale of the data that is being imported. If you are importing data that contains characters that are different from the current locale, use a Unicode (UTF–8) server to import your data. If you do not use a UTF–8 server and the locale of the data is not supported, unsupported values might appear as question marks (?) in your imported data. For more information about how to set the Default text encoding option, see “Setting General Preferences” on page 143.

Note: You cannot import remote files (files that are available through FTP file shortcuts).

Import an Excel Worksheet

To import an Excel worksheet:

1. Click Server Files and Folders in the navigation pane and browse to find the file that you want to import.

2. Right-click the file that you want to import and select Import Data. The top of the Import Data tab shows the name and location of this Excel file. It also shows several options that you can customize.
This example shows importing the as_products.xls file.

FILE INFORMATION

SOURCE FILE

File name: as_products.xls
Source location: C:/Users
Worksheet name: First worksheet

OUTPUT DATA

SAS server: User Root
Data set name: IMPORT1
Library: WORK

OPTIONS

File type:

CODE

/* Generated Code (IMPORT) */
/* Source File: as_products.xls */
/* Source Path: C:/Users */
/* Code generated on: Friday, April 10, 2015 4:27:18 PM */

&web_drop_table(WORK.IMPORT1);

FILENAME REFFILE "C:/Users/user-id/Documents/as_products.xls";

PROC IMPORT DATAFILE=REFFILE
  DBMS=XLS
  OUT=IMPORT1;
3 To import the data from a specific worksheet, enter the name of that worksheet in the **Worksheet name** box. By default, SAS Studio imports the data from the first worksheet.

4 To specify the location to save the output data set, click **Change**. By default, the output data set is saved to the Work library, which is a temporary location. The contents in this library are deleted when you exit SAS Studio.

5 To generate SAS variable names from the data values in the first row of the worksheet, select **Generate SAS variable names**. If a data value in the first row in the input file is read and it contains special characters that are not valid in a SAS name, such as a blank, then SAS converts the character to an underscore.

6 To import the Excel worksheet, click 🏫.
The **Results** tab shows the attributes of the new SAS data set.

<table>
<thead>
<tr>
<th>Data Set Name</th>
<th>WORK.IMPORT1</th>
<th>Observations</th>
<th>60</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

**Engine/Host Dependent Information**

<table>
<thead>
<tr>
<th>Data Set Page Size</th>
<th>65536</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of Data Set Pages</td>
<td>1</td>
</tr>
<tr>
<td>First Data Page</td>
<td>1</td>
</tr>
<tr>
<td>Max Obs per Page</td>
<td>817</td>
</tr>
<tr>
<td>Obs in First Data Page</td>
<td>60</td>
</tr>
<tr>
<td>Number of Data Set Repairs</td>
<td>0</td>
</tr>
<tr>
<td>ExtendObsCounter</td>
<td>YES</td>
</tr>
<tr>
<td>Filename</td>
<td>C:\Users\admin\Desktop\newSAS\Import\Temp\File1, T055288, WEEFUTC31, IP32</td>
</tr>
</tbody>
</table>
The **Output Data** tab shows the contents of the new data set. If this data set is in the Work library (as shown in this example), you might want to save it to a more permanent location. Data in the Work library is temporary and is deleted when you exit SAS Studio.

**Import a Delimited File**

**Note:** For some delimited files (such as files with a .dat extension), the Import Tool might not be available. To import these delimited files, save the file as a text file. Then you can use the Import Tool.
To import a delimited file:

1. Click **Server Files and Folders** in the navigation pane and browse to find the file that you want to import.

2. To determine the delimiter for the file, right-click the filename and select **View File as Text**. The contents of the file open in a text editor. Note the delimiter that is used between values and whether the first row of the data includes headings.

3. After determining the delimiter of this file, click and select **New Import Data**. The **Import Data** tab opens in the SAS Studio workspace.

4. Drag the selected text file from **Server Files and Folders** in the navigation pane to the **Import Data** tab. The top of the **Import Data** tab now shows the properties of the file (such as the filename and location of the saved file), the name of the imported data source, and any options that you can specify. The bottom of the **Import Data** tab shows the SAS code that has been generated.
This example shows importing a text file called CommaSep.txt.

To specify the location to save the output data set, click Change. By default, the output data set is saved to the Work library, which is a temporary location. The contents in this library are deleted when you exit SAS Studio.
6 To generate SAS variable names from the data values in the first row in the text file, select **Generate SAS variable names**. If a data value in the first row in the input file is read and it contains special characters that are not valid in a SAS name (such as a blank), SAS converts the character to an underscore.

7 In the **Delimiter** box, enter the delimiter for the values in the file. The default delimiter is a space. Examples of delimiters are comma (,) and Tab.

   **Note:** If you use a hexadecimal value to specify the delimiter, you do not need to select the **Quote delimiter** check box.

8 (Optional) To start reading data from a specified row in the delimited text file, enter the starting row in the **Start reading data at row** box. You might want to use this option if you have comments at the top of the text file or the first row of the file is column headings.

9 (Optional) For SAS Studio to determine the appropriate data type and length of the variables, enter a value in the **Guessing rows** box. The task scans the input data file from row 1 to the number that you specified. By default, the first 20 rows are scanned.

10 To import the data, click **Importing Data**.
Click the **Results** tab to see the attributes of the imported data set.

### The CONTENTS Procedure

<td>0</td>
</tr>
<tr>
<td>ExtendObsCounter</td>
<td>YES</td>
</tr>
</tbody>
</table>
Click the **Output Data** tab to view the new SAS data set. If this data set is in the Work library (as shown in this example), you might want to save it to a more permanent location. Data in the Work library is temporary and is deleted when you exit SAS Studio.

### Import a DBMS File

When you import a file from a database management system (DBMS), the available options depend on the file type. For a list of the supported file types, see “About Importing Data to SAS Studio” on page 105.

1. Click **Server Files and Folders** in the navigation pane and browse to find the file that you want to import.
2. Right-click the file that you want to import and select **Import Data**. The **Import Data** tab opens. The options that are available on this tab depend on the file type.

3. To specify the location to save the output data set, click **Change**. By default, the output data set is saved to the Work library, which is a temporary location. The contents in this library are deleted when you exit SAS Studio.

4. (Optional) To generate SAS variable names from the data values in the first row of the worksheet, select **Generate SAS variable names**. If a data value in the first row in the input file is read and it contains special characters that are not valid in a SAS name, such as a blank, then SAS converts the character to an underscore.

5. To import the file, click ⌁.

**Importing Data in a Process Flow**

If you are using the SAS Visual Programmer perspective, you can also import data by using the process flow. You might want to add an import node if the file that you want to import is updated frequently.

To create the import node, drag the filename that you want to import into the process flow.
Here is an example of an import node (called Import as_products.xls) in a process flow. The imported data is then used in the Summary Statistics task.

Save the Import Task

You might want to save an instance of the Import Data tool so that you can share these settings for importing a specific file with others at your site. SAS Studio saves these instances as a CTL file. CTL files must be run in the same operating environment where they were created. For example, if you create a CTL file using Windows, this CTL file must be run in Windows.

To save the import task:

1. Click  

2 In the Save As window, specify the name and location, and then click **Save**. The file is saved with a CTL extension.
You can use SAS Studio to export your data as another file type to a folder that you specify.

**Note:** You cannot export your data to an FTP folder.

To export your data:

1. Click **Libraries** in the navigation pane and browse to find the file that you want to export.

2. Right-click the file that you want to export and select **Export**. The Export Table window opens.

3. Select the folder in which you want to save the exported file.

4. In the **Filename** box, enter the name of the exported file.

5. From the **File format** drop-down list, select the format of the exported file.
6 Click Export to export the file.
Viewing Results

When you run a task or a program in SAS Studio, the results are displayed in the work area. Here are ways that you can manage your results:

- Generate HTML5, PDF, and RTF output by default, and view the HTML5 output on the Results tab.
Download your generated output. There is a download button for each of the three default output types.

Change the default output style for each destination by using the Preferences window.

Send results to another user.

---

Default SAS Studio Output

Viewing Default Results

In SAS Studio, by default, output is generated in the HTML5, PDF, and RTF formats.

If you want to change the default output, you can use the Preferences window to disable results in PDF or RTF format. You can also change the default style for your output to any of the ODS styles that are available. For more information, see “Specifying the Result Preferences” on page 148.
By default, the HTML5 results are the only results that are displayed on the Results tab.

The PDF and RTF output is generated but is not displayed.

When you view your results, you can use the table of contents to navigate through the different sections. Click Table of Contents at the top of your results, and then click the section that you want to navigate to.
Downloading Default HTML5, PDF, and RTF Results from SAS Studio

If you want to save results from SAS Studio, you can download your results in the HTML5, PDF, or RTF output formats and save them or open them in the default application for that format:

- HTML5 file
You can send a copy of your results and the associated code and log files to another user through electronic mail. Files that you can send include results in HTML5, RTF, and PDF formats as well as the code and log files that are associated with the results. You can also send a Program Summary file, which includes information about the program execution, the complete SAS source code, the complete SAS log, and the results. The code is sent as a SAS program file, and the log and program summary files are sent as HTML5 files. To send files through email, you need access to an SMTP server. For more information, contact your site administrator.

**Note:** If your SAS Studio email messages are being marked as junk mail, see *SAS Studio: Administrator's Guide* for information about your configuration file.

To send results by email:

1. On the toolbar for your results, click  

The Send Email window appears.
2 Select the items that you want to include as attachments to your email. By default, the HTML results are selected.

3 In the **To** box, enter the email addresses to which you want to send the files. Separate addresses with a semicolon.

4 If you want to send a copy of the email to another address, enter the address in the **Cc** box.

5 In the **Subject** box, enter a subject for the email. You can also add a message to include in the body of the email.

6 Click **Send** to send the message and attachments.

---

**About the SAS Output Delivery System**

The SAS Output Delivery System (ODS) gives you greater flexibility in generating, storing, and reproducing SAS procedure and DATA step output along with a wide range
of formatting options. ODS provides formatting functionality that is not available when using individual procedures or the DATA step without ODS.

SAS Studio uses very specific ODS options and the GOPTIONS statements so that the output is displayed properly in the web environment. To view all of the ODS options in your code, click and select **Preferences**. In the Preferences window, click **General** and select the **Show generated code in the SAS log** option.

**Note:** To ensure that your output is displayed properly, do not change the settings of the ODS options or GOPTIONS statements in the generated code.

---

**About SAS ODS Statistical Graphics**

**About SAS ODS Statistical Graphics**

SAS ODS Statistical Graphics, more commonly referred to as SAS ODS Graphics, is an extension of the SAS Output Delivery System (ODS). ODS manages all output that is created by procedures and enables you to display the output in a variety of forms, including HTML and PDF.

Many SAS analytical procedures use ODS Graphics functionality to produce graphs. ODS Graphics uses the Graph Template Language (GTL) syntax, which provides the power and flexibility to create many complex graphs. The GTL is a comprehensive language for defining statistical graphics.

In SAS Studio, you can use the ODS Graphics Designer to define these statistical graphics without knowing the GTL. After a graph definition is created, you can use that graph definition to create an ODS statistical graph in SAS Studio.

**SAS ODS Graphics Designer**

**What Is the SAS ODS Graphics Designer?**

The SAS ODS Graphics Designer is an interactive graphical application that you can use to create and design custom graphs. The designer creates graphs that are based on the Graph Template Language (GTL), which is the same language that is used by
SAS analytical procedures and SAS ODS Graphics procedures. The ODS Graphics Designer provides a graphical user interface so that you can design graphs easily without knowing the details of templates and the GTL.

Using point-and-click interaction, you can create simple or complex graphical views of data for analysis. The ODS Graphics Designer enables you to design sophisticated graphs by using a wide array of plot types. You can design multi-cell graphs, classification panels, and scatter plot matrices. Your graphs can have titles, footnotes, legends, and other graphics elements. You can save the results as an image for inclusion in a report or as an ODS Graphics Designer file (SGD) that you can later edit.

For more information, see *SAS ODS Graphics Designer: User's Guide*, which is available from support.sas.com.

**How to Install the SAS ODS Graphics Designer**

If you have SAS Foundation installed on your machine, the SAS ODS Graphics Designer is already available. For example, if you are using the single-user edition of SAS Studio, the SAS ODS Graphics Designer is already installed because you are running SAS Foundation and SAS Studio on the same machine.

**Note:** Only the Windows version of the SAS ODS Graphics Designer is supported when you are running SAS Studio. The SAS ODS Graphics Designer must be installed on the same machine as the browser that you are using to access SAS Studio. (SAS Studio might be installed on a different machine.) If multiple users are accessing SAS Studio and these users are on different machines, SAS ODS Graphics Designer must be installed on each user’s machine.

To install the SAS ODS Graphics Designer:

1. Click 📦. Select **Tools ➤ Install ODS Graphics Designer**. The software page for SAS Studio opens.

2. In the right navigation pane under the **Software Downloads** heading, click **SAS ODS Graphics Designer**. The downloads page for SAS ODS Graphics Designer opens.

3. From the table, click the link in the **Request download** column for your operating environment and follow the subsequent installation steps.
Open the SAS ODS Graphics Designer

After the SAS ODS Graphics Designer is installed, you can open it by using a menu option in SAS Studio. To open SAS ODS Graphics Designer, click ![Menu Option]. Then select **Tools > ODS Graphics Designer**.

SAS ODS Graphics Editor

**What Is the SAS ODS Graphics Editor?**

The ODS Graphics Editor enables you to edit the various elements in the output graph while keeping the underlying data unchanged. In addition, you can annotate a graph by
inserting text, lines, arrows, images, and other items in a layer above the graph. You can save the results of your customization as an ODS Graphics Editor (SGE) file and make incremental changes to the file. You can also save the results as a Portable Network Graphics (PNG) image file for inclusion in other documents.

For more information about the SAS ODS Graphics Editor, see *SAS ODS Graphics Editor: User's Guide*, which is available from support.sas.com.

**How to Install the SAS ODS Graphics Editor**

**Note:** If you are running the single-user edition of SAS Studio, then the SAS ODS Graphics Editor is already installed.

To install the SAS ODS Graphics Editor:

1. Click . Then select **Tools ▶️ Install ODS Graphics Editor**. The software page for SAS Studio opens.

2. In the right navigation pane under the **Software Downloads** heading, click **SAS ODS Graphics Editor**. The downloads page for SAS ODS Graphics Editor opens.

3. From the table, click the link in the **Request download** column for your operating environment and follow the subsequent installation steps.

**How to Edit Your Graphics Output**

1. Include this statement in your SAS code so that you can edit your graphics output:

   ```sas
   ods listing sge=on gpath="directory-path";
   ```

   When you run this program, the graphical output is saved as an SGE file in the directory specified by the GPATH= option.

2. In the **Server Files and Folders** section of the navigation pane, double-click the filename (with SGE extension) to open the graph in the SAS ODS Graphics Editor.
For example, here is the SGPanel1.sge file in the SAS ODS Graphics Editor.
What Is a Task?

A task is an XML and Apache Velocity code file that generates SAS code and formats results for you. Tasks include SAS procedures from simple data listings to complex analytical procedures. SAS Studio is shipped with several predefined tasks. The tasks are organized into categories. Some categories and their tasks might not be available at your site because you do not have the required SAS product.
The tasks in the Data, Graph, and Combinatorics and Probability categories are always available. This table lists the task categories and their product dependencies.

<table>
<thead>
<tr>
<th>Task Category in SAS Studio</th>
<th>Required SAS Product</th>
</tr>
</thead>
<tbody>
<tr>
<td>Statistics</td>
<td>SAS/STAT</td>
</tr>
<tr>
<td>High-Performance Statistics</td>
<td>SAS/STAT</td>
</tr>
<tr>
<td>Econometrics</td>
<td>SAS/ETS</td>
</tr>
<tr>
<td>Forecasting</td>
<td>SAS/ETS</td>
</tr>
<tr>
<td>Data Mining</td>
<td>SAS Enterprise Miner</td>
</tr>
</tbody>
</table>

For more information about each of these tasks, see *SAS Studio: Task Reference Guide*.

You can edit a copy of these predefined tasks in order to customize the tasks for your site. You can also build your own tasks.

**How to Run a Task**

To run a predefined task:

1. In the navigation pane, click the **Tasks and Utilities** section.
2. Expand the folder that contains the task.
3. Right-click the task name and select **Open**. Alternatively, you can double-click the task to open it.
   
   The task opens to the right of the work area.
4 If the **Data** tab is available, specify an input data source and select columns for the roles in the data source. A role is a description of a variable’s purpose in the task. To add a column to a role, click \+\+. A list of available columns for that role appears. If only one column can be assigned to the role, you select a column and the list disappears. If multiple columns can be assigned, you can press Ctrl or Shift to select multiple columns from the list and click **OK**.

5 On the remaining tabs, specify any other required options, which are denoted with a red asterisk. As you assign values to the task, the relevant SAS code is generated. For more information about the options available for each task, see *SAS Studio: Task Reference Guide*.

6 To run the task, click \(\text{Run}\).

If the task generates output data, the table opens in the **Output Data** tab.
If the task generates results, the output appears on the **Results** tab.
Save a Task and Its Option Settings

If you use a task frequently, you might want to save the task after you specify the input data source and the option settings. In SAS Studio, you can save a task as a CTK file on the server or in your My Tasks folder. The next time you need to run the task, double-click the task in the navigation pane, and the task appears with all of your previous settings.

Note: Before you can save a task, you must specify an input data set and all the options that are required to run the task.

To save a task:

1. Click 🔄. The Save As window appears.
2 Select the location where you want to save the task file. You can save this file in the **Server Files and Folders** section or in your **My Tasks** folder. Specify a name for this file. For the file type, select **CTK Files (*.CTK)**. Click **Save**.

In this example, the task is now available from the **Server Files and Folders** section.

![Server Files and Folders](image)

**Note:** When you save a task as a CTK file, the task is no longer attached to a corresponding task in the **Tasks and Utilities** section. For example, if you run the Bar Chart task that is available in the **Tasks and Utilities** section, no changes are made to the Bar Chart.ctk file in the **Server Files and Folders** section.

---

**Edit a Predefined Task**

To customize the predefined tasks for your site, you can edit the XML code that is used to create the task.
To edit a predefined task:

1. In the navigation pane, open the **Tasks and Utilities** section.
2. Expand the folder that contains the task.
3. Right-click the name of the task that you want to edit and select **Add to My Tasks**. The **Add to My Tasks** window appears.
4. Specify a name and description for the task. By default, the name and description from the predefined task is used. Using the **Category** drop-down list, you can also specify where to save a copy of this task in the **My Tasks** folder. If you select **(none)**, the task is added directly to the **My Tasks** folder.
   
   Click **Add**.
5. Open the **My Tasks** folder and select the copied task.
6. Click **Edit**. The XML file for the task appears.
7. Edit the XML file and save your changes. To preview your changes, click **Preview**.

---

**Create a New Task**

SAS Studio provides a template that you can use to create custom tasks for your site. For help with writing your first custom task, see *SAS Studio: Writing Your First Custom Task*.

To create a custom task:

1. In the navigation pane, open the **Tasks and Utilities** section.
2. Click **+** and select **New Task**. A blank task template opens.
3  Edit the code in the task template to create your task. To view the user interface for the task template, click . In the user interface for the task template, you can see examples of radio buttons, check boxes, combination boxes, and other types of options. For more information about this file, see SAS Studio: Developer's Guide to Writing Custom Tasks.

4  Click .

Note: The name of the task cannot include these special characters:

[ ] { } , ? / * # % + | < > :

Customizing the Task Code and the Task Layout in the Workspace

The Preferences window enables you to change several options that affect what and how the task code is displayed.
To access these options, click and select Preferences. Click Tasks.

For more information, see “Setting Task Preferences” on page 149.

About Setting Your Preferences

The Preferences window enables you to customize several options in SAS Studio.

To change your preferences, click ☰ and select Preferences.

Setting General Preferences

From the General page, you can set these options.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Show generated code in the SAS log</strong></td>
<td>displays the ODS statements, %LET statements, and any other code that is automatically generated by SAS in the log file. This option applies to both SAS tasks and SAS program files.</td>
</tr>
<tr>
<td><strong>Include a Show Details button in error messages</strong></td>
<td>adds a Show Details button to any error messages that SAS Studio generates.</td>
</tr>
<tr>
<td><strong>Start new programs in interactive mode</strong></td>
<td>opens new programs with the interactive mode on. This option is available only if you are running the first maintenance release for SAS 9.4 or later. For more information, see “Working in Interactive Mode” on page 34.</td>
</tr>
<tr>
<td><strong>Size grid columns to content</strong></td>
<td>Automatically adjusts the width of the columns in the table viewer to fit the size of the column content.</td>
</tr>
<tr>
<td><strong>Time-out interval: (hours)</strong></td>
<td>specifies the amount of time that SAS Studio allows you to be logged on without any activity. The default value is one hour.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>SAS variable name policy</strong></td>
<td>enables you to specify one of the following sets of rules to apply to SAS variable names.</td>
</tr>
<tr>
<td></td>
<td>- <strong>ANY</strong> — specifies that the variable names can begin with or contain any characters, including blanks, must contain at least one character, and cannot contain any null bytes. Variable names can contain mixed-case letters as well as special and multi-byte characters. Names can be up to 32 bytes in length. This option is selected by default. Leading blanks are preserved, but trailing blanks are ignored.</td>
</tr>
<tr>
<td></td>
<td>- <strong>V7</strong> — specifies that the variable names must begin with a letter of the Latin alphabet (A-Z, a-z) or the underscore character. They cannot contain blanks or special characters except for the underscore and cannot be assigned the names of special SAS automatic variables or variable list names. Variable names can contain mixed-case letters and can be up to 32 bytes in length.</td>
</tr>
<tr>
<td><strong>Default text encoding</strong></td>
<td>specifies the character-set encoding that is used when text files are read or written. The default value is UTF-8. This option is not available for SAS servers running on z/OS. For a list of some of the encoding options and the languages that they are associated with, see Appendix 2, “Text Encoding Options and Language Mappings,” on page 153.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can also specify the text encoding when you open a single file by holding down the Alt key and double-clicking the file. The Choose Text Encoding window appears and you can select the encoding. This option applies to SAS program files (<em>.SAS), text files (</em>.txt), comma-separated values files, (<em>.csv), and log (</em>.log) file types.</td>
</tr>
</tbody>
</table>
### Display a message on arrival
Displays a message when batch jobs are started and when they are complete. You can adjust the number of seconds that the message is displayed. The range of time that a message can be displayed is between 3 seconds and 30 seconds. The default value is 5 seconds.

### Capture all log events
Records all diagnostic messages each time you run a program, task, or query. You can view the diagnostic messages by clicking **Messages** in the lower right corner of your SAS Studio browser window. In the Messages window, click the **Filter by** dropdown list and select **Debug**. The debug messages are available in the Messages window only when you have selected this option.

---

## Setting the Editor Preferences

From the **Editor** page, you can specify these options for the code editor.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable autocomplete</td>
<td>turns on the autocomplete feature of the code editor. This feature can predict the next keyword that you want to type before you actually type it completely. For more information, see “Using the Autocomplete Feature” on page 24.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Enable hint</td>
<td>displays the syntax help window when you position the mouse pointer over a valid SAS keyword in your program. If this option is not selected, then you can view the syntax help by right-clicking a keyword and selecting <strong>Syntax Help</strong>. This option is not selected by default.</td>
</tr>
</tbody>
</table>
| Tab width                  | displays the number of spaces that are inserted into your text when you insert a tab character. The default value is four spaces for each tab character.  
**Note:** In Microsoft Internet Explorer and Apple Safari, spaces are used instead of Tab characters. If you are using those browsers, you must select the **Substitute spaces for tabs** check box in order for the value of the tab width to be used. |
<p>| Substitute spaces for tabs | inserts the number of spaces listed in the Tab width box instead of a single tab character. This option applies to both text that you type in the code editor and text that you paste into the code editor. |
| Enable color coding        | displays the text in the code editor in different colors to help you identify different elements in the syntax.                                                                                           |
| Show line numbers          | displays line numbers in the leftmost column of the program and log windows.                                                                                                                                |
| Font size                  | specifies the font size of the text in the code editor and log window.                                                                                                                                     |</p>
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable autosave</td>
<td>automatically creates auto-saved copies of each previously saved program file that you are editing so that you can recover the files if your browser closes unexpectedly. New program files are not auto-saved until you save them first. The files are saved at the interval specified in the <strong>Autosave Interval</strong> option. The default interval is 30 seconds.</td>
</tr>
</tbody>
</table>

### Specifying the Result Preferences

From the **Results** page, you can specify these options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Display warning if results are larger than ( n ) MB</strong></td>
<td>displays a warning message when you attempt to open a results file that is larger than ( n ) megabytes (MB). The default value is 4 MB.</td>
</tr>
<tr>
<td><strong>HTML output style</strong></td>
<td>displays the style that is applied to results in HTML. To change the style that is applied to the results, select another style from the drop-down list.</td>
</tr>
<tr>
<td><strong>Produce PDF output</strong></td>
<td>generates results in PDF format. This option is selected by default.</td>
</tr>
<tr>
<td><strong>PDF output style</strong></td>
<td>displays the style that is applied to results in PDF. To change the style that is applied to the results, select another style from the drop-down list.</td>
</tr>
<tr>
<td><strong>Generate the default table of contents</strong></td>
<td>automatically creates a table of contents in the PDF file.</td>
</tr>
</tbody>
</table>
Option | Description
--- | ---
Produce RTF output | generates results in RTF format. This option is selected by default.
RTF output style | displays the style that is applied to results in RTF. To change the style that is applied to the results, select another style from the drop-down list.
Automatically open generated output data | automatically displays the output data that is created when you run a task or submit code.

**Note:** If you want to use a custom style, you must customize the SAS Studio output environment. For more information, see Appendix 3, “Customized Output Environment,” on page 155.

### Setting Task Preferences

From the **Tasks** page, you can set the options for the generated SAS code and the task layout in the SAS Studio workspace.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trim all leading and trailing blank spaces in generated code</td>
<td>removes any blank spaces that appear before or after the generated code.</td>
</tr>
<tr>
<td>Generate header comments for task code</td>
<td>adds comments before the generated code for a SAS task.</td>
</tr>
<tr>
<td>Automatically format generated code</td>
<td>automatically formats any code that is generated by a task and displayed in the code editor.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>View</strong></td>
<td>specifies how to lay out the task options, task code, and task results in your workspace. You can choose from these options:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Split</strong> — displays the task settings, the code, and the results for the task.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Settings</strong> — displays only the options for the task in the workspace.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Code/Results</strong> — displays the SAS code, the log, and any results in the workspace.</td>
</tr>
<tr>
<td><strong>Show task code</strong></td>
<td>specifies whether to display the SAS code for the task when you select the <strong>Split</strong> view or the <strong>Code/Results</strong> view.</td>
</tr>
<tr>
<td><strong>Show task log</strong></td>
<td>specifies whether to display the log that is generated when you run the task. This option is available only if you select the <strong>Split</strong> view or the <strong>Code/Results</strong> view.</td>
</tr>
<tr>
<td><strong>Display task settings on right</strong></td>
<td>displays the task option to the right of the SAS Studio workspace. By default, the task options are displayed to the left.</td>
</tr>
</tbody>
</table>

### Access Repositories in SAS Studio

Administrators can create global repositories. These repositories are available to everyone at your site. Global repositories are automatically available from the **Tasks and Utilities** and **Snippets** sections when you first open SAS Studio.

If your administrator allows it, you can also set your preferences to access additional repositories. For more information about repositories, see *SAS Studio: Developer's Guide to Repositories*.
## Setting Preferences for Batch Submissions

From the **Batch** page, you can set preferences for batch submissions.

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete existing log and output</td>
<td>Automatically deletes the existing log and output files and replaces them with the new files.</td>
</tr>
<tr>
<td>Fail batch submission</td>
<td>Cancels the batch submission. You must delete the existing log and output files and resubmit the program.</td>
</tr>
<tr>
<td>Prompt for fail or overwrite</td>
<td>Displays a message window to confirm that you want to delete or rename the existing log and output files before submitting the batch job. If you select <strong>No</strong>, then the batch submission is canceled. This is the default value.</td>
</tr>
</tbody>
</table>

You can change the length of time that the batch notification messages are displayed by using the **Display a message on arrival** option on the **General** page of the Preferences window. For more information, see “Setting General Preferences” on page 143.
Appendix 2

Text Encoding Options and Language Mappings

About the Text Encoding to Language Mappings

The following table lists some of the text encoding options and the languages they are associated with. For more information about specifying a text encoding option, see “Setting General Preferences” on page 143.

Text Encoding Options and Language Mappings

Customized Output Environment

Overview .......................... 155
Generate Output for Other Output Destinations .................. 157
Send Your Results to Another Location .................. 157
Use a Custom Style for Your Output .......................... 158
Use an Image Format Other Than the Default .................. 158
Create a Drill-down Graph ...................................... 159
Create an Animated GIF or SVG Image .................. 159

Overview

You must customize the SAS Studio output environment to perform any of these tasks:

- generate output for other output destinations
- send your results to another location
- use a custom style for your output
- use an image format other than the default
- create a drill-down graph
- create an animated GIF or SVG image
To customize the SAS Studio output environment, first disable the default output environment in order to conserve system resources. Next, establish your own output environment, and then execute the SAS statements that are required to generate your output. Use ODS statements, ODS procedures, or ODS options in your SAS program to define the environment that you need.

As a best practice, if your SAS program requires a customized output environment in SAS Studio, your program should always perform these steps:

1. Create a file reference for your ODS output. You can use the &_SASWS_ macro variable that is defined in SAS Studio to reference your home directory as shown in the following statement:

   filename odsout "&_SASWS_/charts";

   If you want to store your image files in a separate directory, create a second file reference for your image files as shown in the following statement:

   filename ods1out "&_SASWS_/charts/images";

   **Note:** The directories that you specify must already exist, and you must have Write access to the directories.

2. To conserve system resources, disable the default output environment by using the following statement:

   ods _all_ close;

3. Open the desired ODS destination. Use the PATH= option to specify the file reference that you created for your ODS output. If you created a separate file reference for your image files, use the GPATH= option to specify the image output file reference. Here is an example:

   ods html path=odsout gpath=ods1out file="saleschart.html";

4. Execute the SAS statements that are required to generate your output.

5. Close your ODS destination.
When you disable the default SAS Studio output environment, results are no longer displayed on the **Results** tab for the duration of your program. The results are generated only by the ODS destination that you open.

---

**Generate Output for Other Output Destinations**

If you need to generate output other than the default HTML5, PDF, or RTF output, you must open your own ODS destination. Examples of output destinations include HTML, PowerPoint, and LISTING. After you disable the default output environment, use an ODS statement to open your own output destination. Here is an example:

```sas
filename odsout &_SASWS_/charts;
ods _all_ close;
ods powerpoint path=odsout file="filename";
```

To access the dictionary of ODS statements, see *SAS Output Delivery System: User’s Guide*.

---

**Send Your Results to Another Location**

When you execute a program in SAS Studio, you can download the output from the **Results** tab to your local machine. If you want to send your output directly to another location, you must open your own ODS destination. By default, output files that are generated by the ODS destinations that you open are written to your home directory.

In SAS Studio Single-User deployments, the output is written to your home directory on your local machine.

In SAS Studio Basic and in SAS Studio Mid-Tier deployments, the output is written to your home directory on the remote SAS server. Your home directory appears in the navigation pane under **Files and Folders** or **Server Files and Folders**.

If you want to send the results to a specific location, use a FILENAME statement to define a file reference to the desired location. You can use the &_SASWS_ macro...
variable to reference your home directory. After you create the file reference, use the \texttt{PATH=\textit{file-reference}} option in your ODS statement. Here is an example:

\begin{verbatim}
filename odsout "&_SASWS_/charts";
ods _all_ close;
ods html path=odsout file="sales.htm";
\end{verbatim}

In this case, file sales.htm and any image files that are generated are written to subdirectory \texttt{charts} in your home directory.

### Use a Custom Style for Your Output

When you need to use a custom ODS style such as a corporate style for your results in SAS Studio, you must open your own ODS destination. You cannot specify a custom style for the default results. Use the \texttt{STYLE=} option in your ODS statement to specify your custom style. Here is an example:

\begin{verbatim}
filename odsout ="&_SASWS_/charts";
ods _all_ close;
ods html path=odsout file="filename.htm" style=style-name;
\end{verbatim}

To create a custom style, use the ODS TEMPLATE procedure, CSSStyles, or the \texttt{STYLE=} option. For more information, see \textit{SAS Output Delivery System: User’s Guide}.

### Use an Image Format Other Than the Default

When you need to use an image format other than the default, you must specify the desired output format, and then open your own ODS destination. To specify the image format:

- If you are using SAS/GRAPH to create your graphs, specify the \texttt{DEVICE=} option in an OPTIONS or GOPTIONS statement. For more information, see \textit{SAS/GRAPH: Reference}. 
If you are using ODS Graphics to create your graphs, specify the OUTPUTFMT= option in an ODS GRAPHICS statement. For more information, see *SAS Output Delivery System: User's Guide*.

---

**Create a Drill-down Graph**

When you need to create a drill-down graph in SAS Studio, you must open your own ODS destination. Drill-down graphs provide a convenient means for users to explore complex data. In a drill-down graph, certain elements of the graph contain active links. When a user clicks a linked element, the linked resource appears in a new browser window by default.

For more information, see the following documents:

- If you are using SAS/GRAPH to create the graph, see *SAS/GRAPH: Reference*.
- If you are using the Graph Template Language to create the graph, see *SAS Graph Template Language: User's Guide*.

---

**Create an Animated GIF or SVG Image**

When you need to create an animated graph in SAS Studio, you must open your own ODS destination. An animated graph displays a series of charts automatically when the graph is viewed in a web browser or other viewer that supports animation. The animation plays as a sequence of graphs in a slide-show fashion with a delay between each graph. The sequence can play only one time, loop a fixed number of times and then stop, or loop indefinitely.

For more information, see the following documents:

- If you are using SAS/GRAPH to create the graph, see *SAS/GRAPH: Reference*.
- If you are using the Graph Template Language to create the graph, see *SAS Graph Template Language: User's Guide*. 
The following table contains the keyboard shortcuts for the application. In the user interface, the shortcuts are displayed within parentheses in tooltips and menu labels.

<table>
<thead>
<tr>
<th>Action</th>

## Special Characters

- `_CLIENTAPP` 32
- `_CLIENTAPPVERSION` 32
- `_SASPROGRAMFILE` 32

## A

- autocomplete 24, 146
- autoexec file 17
- autosaving
  - enabling 148

## B

- batch jobs
  - messages 146
- batch submissions
  - canceling 151
  - deleting log and output 151

## C

- changing your SAS workspace
  - server 18
- code
  - editing from a task 30

## D

- data
  - exporting 119
  - extended attributes 95
  - filtering 100
  - importing 105
  - opening 98
  - process flows 77
  - sorting 100
  - table viewer 95

- formatting SAS code 33
- showing in the SAS log 144
- trimming blank spaces 149

## Code Editor

- about 20
- autocomplete 24, 146
- color coding 147
- customizing 46, 146
