About this Guide

This document provides configuration instructions for SAS 9.2 Foundation, which is made up of server-side Base SAS and a variety of server-side SAS products (the exact products vary by customer).

The server-side configuration instructions contained in this document are for the configuration of a generic SAS server. For information about configuring OLAP, workspace and stored process servers, please see *SAS 9.2 Intelligence Platform: Installation and Configuration Guide: Introduction to Installing the SAS Intelligence Platform*. This material can be found at

<http://sww.sas.com/dept/pub/doc/902s/gpp/prods/biig/win/biig.hlp/index.htm>.

Chapter 1: Post-Installation Setup for the Metabase Facility

In Version 7 of the SAS System, the SAS/EIS Metabase facility was converted to the V7 Common Metadata Repository. The Common Metadata Repository is a general-purpose metadata management facility that provides common metadata services to various metadata-driven applications.

Using the Common Metadata Repository requires a one-time setup of the system the repository manager. If the repository manager was set up in a previous release it may not need to be set up again. The steps in the following sections should be completed before you attempt to use the Metabase Facility. For Metabase Facility users who were using a release prior to Version 7, using the Common Metadata Repository requires a conversion. For more information, see the Version 8 OLAP Server Topic “Converting Legacy Metabases.”

Setting Up the System Repository Manager Files

Complete the following steps to set up the necessary system repository manager files. You must have write access to SASHELP in order to specify the system repository manager.

Note: *This process sets the default location for the repository manager for your site. Individual users may specify their own repository manager location by following the steps below and not selecting the Write values to system registry check box.*

1. Create a directory that will be dedicated exclusively to the storage of repository manager files, for example: !SASROOT\RPOSMGR.

This directory should not be used to store other SAS files.

2. At a SAS command line, type REPOSMGR and then select **Setup Repository Manager**.
3. In the Repository Manager Setup window, Library will default to RPOSMGR. For Path, specify the path from Step 1, above, and then select the **Write values to system registry** check box. Then select **OK**.
4. In the resulting dialog window, select **Yes** to generate the necessary repository manager files.

This completes the setup for the System Repository Manager. You can create additional repository managers (a user repository manager, for example) by repeating the steps above and by using a different path.

Registering the SASHELP Repository in the Repository Manager

The SASHELP repository is used in various samples, including the SAS/EIS Report Gallery templates. Before beginning the steps below, a repository manager must be created (see previous section). Complete the following steps to register the SASHELP repository in the Repository Manager:

1. At a SAS command line, type REPOSMGR and then select **Repository Registration**.
2. In the Repository Registration window, select **New**.
3. In the Register Repository (New) window, type SASHELP (in uppercase) in the **Repository** field, and then type the full directory path where the CORE catalog is located in the Path field, for example:

!SASROOT\CORE\SASHELP

4. In the **Description** field, you can type any character string (for example, SASHELP Repository). Select **OK** to close the Register Repository (New) window. Select **Close** to exit the Repository Registration window.

Note: Repositories cannot span multiple directories because the path cannot contain concatenated directories. If you have existing metabases in concatenated directories, you should copy the metabases to a single path that will be referenced as a repository.

Converting Version 6 SAS/EIS Metabases to Version 8 Repositories

For step-by-step instructions on converting Version 6 metabases to Version 8 repositories, please refer to the topic “Converting existing SAS/EIS metabases” in the SAS/EIS online Help.

Chapter 2: Post-Installation Instructions for National Language Support (NLS)

This chapter contains information on post-installation configuration for Asian and European language support.

Important: *To run a localized SAS image, your operating system must be configured to use a Windows for x64 regional setting appropriate to the localized image. You may experience unexpected results if the regional setting and the localized image are not consistent. If multiple SAS localizations have been installed on the system, you may need to change the regional setting for each localized SAS image before invocation. For information on how to change or to use regional settings, refer to your Microsoft Windows for x64 documentation.*

Chinese, Japanese, and Korean DBCS Support

This section explains how to change the default settings for the DBCSLANG and DBCSTYPE system options and how to specify Asian font catalogs.

Note: *The DBCSLANG and DBCSTYPE system options (described in the next section) should be used to set locale for Asian character sets only. The LOCALE and ENCODING system options, described in the SAS Help System, are used to set locale for European languages.*

Changing the Default DBCSLANG and DBCSTYPE Option Settings

When you install SAS 9.2 Foundation and choose to load NLS language translations, the installation automatically sets default values for the DBCSLANG and DBCSTYPE system options based on the language selection and platform. For example, if you install Primary Japanese on Windows 2000, the configuration file (!sasroot\nls\ja\sasv9.cfg) sets DBCSLANG to JAPANESE and DBCSTYPE to PCMS.

Changing the Configuration Files for Unicode Server

There are two configuration files. The first, c:\program files\sas\sas 9.2\sasv9.cfg, points to the second, c:\program files\sas\sas 9.2\nls\ld\sasv9.cfg. To run SAS as a Unicode Server, edit the configuration files for your system with the following changes:

1. DBCS settings are in the second configuration file above. Comment-out the DBCSLANG and the DBCSTYPE options in that file. For example:

```
/* -DBCSTYPE PCMS */
/* -DBCSLANG JAPANESE */
```

2. Add the ENCODING option and set the value to UTF-8 (ENCODING=UTF-8):

```
-ENCODING=UTF-8
```

3. Add the FONT and SYSGUIFont options and set the values to a TrueType font e.g., *Thorndale Duospace*.

For more information, please visit <http://support.sas.com/> and see the white paper *Processing Multilingual Data with the SAS 9.2 Unicode Server*.

Asian Font Catalogs

The default configuration files for Asian language editions already contain font definitions. (However, the configuration file for DBCS extensions does not contain font definitions.) Asian fonts reside in the `SASHELP.FONTS` catalog. In SAS 9.2, **Simplified and Traditional Chinese fonts have been added.**

Asian font catalogs reside in subdirectories (by language) for easy installation. If you want to change the font catalog, you can specify it in either the configuration file or in your SAS session.

Installing Traditional Chinese Fonts

To use Traditional Chinese fonts, you must install the Traditional Chinese localization. You will also need to modify your configuration file, as described in the following section.

Specifying the Font Catalog in the Configuration File for Traditional Chinese Fonts

If you are not running a Traditional Chinese localization but you want to use the Traditional Chinese fonts, you need to modify the configuration file to set `GFONTx` to

```
-set gfontx !SASROOT/nls/zt/font-name
```

In this statement,

- `x` represents a value from 0-9.
- `font-name` represents the name of the font catalog you want to use.

Specifying the Font Catalog in a SAS Session for Traditional Chinese Fonts

To specify the font catalog in a SAS session, submit the following `LIBNAME` statement:

```
-libname gfontx !sasroot\nls\langcode\font-name
```

In this statement,

- `x` represents a value from 0-9.
- `font-name` represents the name of the font catalog you want to use.

European Language Support

Note: The phrase “European Language Support” refers to any language that is not Chinese, Japanese, or Korean.

The following sections explain different methods for configuring your system for locale, describe how to set up your local session to transfer data to a remote session, and provide a list of devmap and keymap values that match the locales on your operating system.

Configuring SAS 9.2 for Locale

If you want to configure your SAS session for a locale other than the default locale, you have two methods from which to choose to achieve that goal. This section explains those methods.

Changing the Default LOCALE Option Setting

When you install SAS 9.2 Foundation and you choose to load NLS language translations, the installation automatically sets the LOCALE system option to the default value for the language installed. The LOCALE option is set in the system configuration file for each language installed.

For example, `!SASROOT\nls\fr\sasv9.cfg` sets LOCALE to French_France by default.

If you want to change the default locale setting for SAS, you can set the LOCALE system option to the appropriate language in your system configuration file.

For example, you can edit `!SASROOT\nls\fr\sasv9.cfg` and change `-locale French_France` to `-locale French_Canada`.

Running SAS in a Different Locale

To set the locale for SAS 9.2 at your site, add the LOCALE system option to your configuration file. You can find a list of locale values in the *SAS 9.2 National Language Support (NLS): User's Guide*.

When you read or write a file, SAS 9.2 expects the data in the external files to be in the session encoding. To specify a different encoding, refer to the documentation for the ENCODING system option in the FILENAME, INFILE, or FILE statement in the *SAS 9.2 National Language Support (NLS): User's Guide*.

When LOCALE is set, the ENCODING system option will be set to an encoding that supports the language for the locale. SAS 9.2 expects user data to be in the encoding that matches the ENCODING option. If you prefer an encoding other than the most common encoding for the locale, you can also set the ENCODING system option in the configuration file.

When the ENCODING option is set, the TRANTAB option will always be set to match the ENCODING system option. The transport format trantabs (translation tables), set by the TRANTAB option, are used by the CPORT and CIMPORT procedures to transfer SAS data files. These trantabs are also used by the UPLOAD and DOWNLOAD procedures for transferring files and catalogs, remotely submitting code to the server, and returning logs and listings to the client.

The Output Delivery System (ODS) will create output using the encoding that matches the ENCODING system option. If you would like your output created using a different encoding, please refer to the documentation for the Output Delivery System.

For more information, refer to the *Base SAS 9.2 Procedures Guide* in base SAS software for documentation about PROC CPORT and PROC CIMPORT. Refer to the *SAS/CONNECT 9.2 User's Guide* for documentation on PROC UPLOAD and PROC DOWNLOAD.

Additional Information

Depending on the applications you run, additional setup may be required for your system. Refer to the following sections for more information about configuring your system to run with alternate locales.

Locale Setup on the Remote Server

Note: The %LS() macro was introduced in SAS 9.1. This macro replaced the functionality of the Locale Setup Window that was used in previous releases.

References to "SAS System 9" in the following section refer to all releases of SAS software from SAS System 9 forward.

If you are running SAS System 9 as both your client and server sessions, it is not usually necessary to run the %LS() macro to do any further locale setup. The locale of a server should be compatible with the locale of your client session; otherwise, your data may be corrupted.

If your SAS System 9 client is connecting to a session running a release of SAS prior to SAS System 9, you can use the %LS() macro to set up the remote SAS environment for data transfer. As the Locale Setup Window did in previous releases, the %LS() macro copies the host-to-host translation tables from the LOCALE catalog into SASUSER.PROFILE. The %LS() macro does not set the encoding for the SAS session.

If you use SAS/CONNECT to connect to a remote SAS server, you will need to set up the server session for the locale that the SAS client is using. You must set up the server after signing on to the remote session from the client.

The following examples show how to set locale for remote connections:

Connecting SAS System 9-to-SAS System 9: Use the LOCALE option at startup. The LOCALE option value of the SAS client and server sessions should be the same. For example,

```
sas -locale Spanish_Spain
```

Connecting SAS System 9 and a previous release of SAS:

- SAS System 9 receives the data: Use the LOCALE option on the SAS System 9 side at start up.

Example: `sas -locale Spanish_Mexico`

- Previous release receives the data: Start SAS System 9 with the LOCALE option at start up.

Example: `sas -locale Spanish_Guatemala`

Then use the %LS() macro in SAS System 9 to set up the host-to-host translation tables on the previous release after connection is established. For example, submit the following code from the Program Editor:

```
%ls(locale=Spanish_Guatemala, remote=on);
```

Devmaps and Keymaps for SAS/GRAPH Software

If you are running SAS/GRAPH software and you want to display non-ASCII characters, set the appropriate devmaps and keymaps to match your current encoding. The devmap and keymap entries are located in the SASHELP.FONTS catalog. To get the correct devmaps and keymaps for your encoding, you should use the %LSGRAPH macro.

There are two ways in which the %LSGRAPH macro automatically sets up an environment:

- copies the devmap and keymap entries that match your encoding to the GFONT0.FONTS catalog
- changes the name of the entry to the name DEFAULT so the devmaps and keymaps will be loaded for you.

The following example uses %LSGRAPH to set the correct devmap and keymap (WLT2) for a Polish user on the Windows for x64 platform:

```
libname gfont0 'your-font-library';
%lsgraph(wlt2);
```

Here is a list of the devmaps and keymaps that match the locales on your platform:

Locale	Devmap and Keymap Name
Arabic_Algeria	wara
Arabic_Bahrain	wara
Arabic_Egypt	wara
Arabic_Jordan	wara
Arabic_Kuwait	wara

Chapter 3: Post-Installation Setup for the SAS 9.2 Foundation

If you add {SASHOME}\SASFoundation\9.2 to your system PATH, SAS 9.2 can run from a command console in any folder when you type SAS.

PATH Environment Variable in Windows XP

For Windows XP, The PATH Environment variable can be modified as follows:

1. Go to **Start** -> **Settings** -> **Control Panel**. In the Control Panel “classic view,” double-click the **System** icon.
2. Within the “System Properties” GUI, select the **Advanced** tab. Click the **Environment Variables** button (near the bottom of the GUI).
3. Under “System Variables,” scroll down and select **Path**.
4. Click **Edit**.
5. In the tiny “Variable Value:” window, scroll to the right and add the following to the end of the line:

```
;c:\program files\sas\sasfoundation\9.2\
```

Note: If you have installed your SAS software in a different location, use your actual sas.exe pathname instead.

Be sure to include the semicolon (;) to separate this path from all the other paths.

6. Click **OK**, **OK**, and **OK**.

Now that this folder is in your search PATH, you can easily execute any command in it by typing the name of that command (such as sas.exe) at the DOS command line prompt.

Other Windows Operating Systems

For information about setting the PATH Environment Variable for other versions and editions of the Windows Operating System, refer to Microsoft Windows Help.

Chapter 4: Configuring SAS Analytics Accelerator for Teradata

This chapter describes the use of updates to the SAS 9.2m3 UDF (User Defined Functions) for SAS Stat and SAS Enterprise Miner. These UDF files are used to install SAS functions into the Teradata Data Base. After they are installed, they will enable in-database processing for selected procedures in SAS Stat 9.22 and SAS Enterprise Miner 6.2.

SAS Code Files

The following four SAS code files are included:

- `udftdem.sas` SAS Enterprise Miner functions
- `udftdets.sas` SAS ETS functions
- `udftdins.sas` Installation functions
- `udftdstt.sas` SAS STAT functions

These files can be executed on any SAS 9.2m3 supported platform except ZOS.

Usage

Follow these steps to install SAS functions into the Teradata Data Base:

Note: *The SAS system and user must have credentials for administrator access to the Teradata 13.0 server.*

1. Copy the four SAS code files to your default SAS user directory on your local SAS system. For example, on most Microsoft Windows 7 systems, the directory is:

```
C:\users\username
```

2. Use SAS language commands to include and run the installation macro, for example:

```
%include 'udftdins.sas' ;  
%udftdins( server=my_teradata_server,  
           user=teradata_admin,  
           password=teradata_admin_password,  
           database=SYSLIB  
);
```

For more information, please refer to *SAS Analytics Accelerator 1.3 for Teradata: Guide* at <http://support.sas.com/documentation/cdl/en/anlytaccltdug/63982/PDF/default/anlytaccltdug.pdf>.

Chapter 5: SAS/ACCESS Interfaces

Configuring SAS/ACCESS Interface to Aster nCluster Software

Registering SAS/ACCESS Interface to Aster nCluster

The following SAS procedure must be run so that the SAS/ACCESS to Aster nCluster product is registered with the SAS system catalog:

```
PROC NICKNAME CAT=sashelp.core engine;  
  add nickname=aster module=sasioast desc="SAS/ACCESS to Aster"  
  preferred eng;  
quit;
```

Installing and Configuring the ODBC Driver and Bulk Loader

Before configuring the ODBC driver, the bulk loader should be installed in `<SASHOME>\SASFoundation\9.2\` or somewhere that is in the PATH environment variable. After they have been installed, you must configure the ODBC data source. SAS recommends (but does not require) that you create a data source name, using the instructions below. If you have more than one user who may use the same workstation to access the Aster nCluster database, you may choose to create it as a system DSN rather than a user DSN.

Complete the following steps to create a data source for Aster nCluster database access:

1. Run **ODBC Administrator** from the Control Panel or **Start** menu.
2. Select the **User DSN** or **System DSN** tab, depending on the number of users, as stated above.
3. Click **Add** and choose *nCluster* from the pop-up window. Click **Finish**.
4. Enter any name in the **Data Source** field.
5. Enter the database name in the **Database** field.
6. Enter the hostname or IP Address in the **Server** field.
7. Enter the user name in the **User Name** field.
8. Enter the password in the **Password** field.
9. Click **Test**. After a message appears that indicates that the test was successful, click **OK**.
10. Click **Save**.

Configuring SAS/ACCESS Interface to Greenplum Software

SAS/ACCESS Interface to Greenplum uses the DataDirect Technologies Greenplum Wire Protocol ODBC driver component, which should be downloaded from SAS. Please see the section entitled "SAS/ACCESS Interface to Greenplum Software" in the System Requirements documentation for information about the download. After you have received the ODBC driver, use the following steps to unzip it and put it in the appropriate location.

1. Use Windows Explorer to navigate to the !SASROOT\access\sasmisc directory where the <platform>gplm60.zip is located and where <platform> is specific to your operating system.
2. Unzip the <platform>gplm60.zip file.
3. Follow the instructions in the Readme.txt file contained in the zip file.

After you download and install the software, configure a Data Source Name (DSN) to access a Greenplum database. You can use the ODBC administrator to add it. If you have more than one user who may use the same workstation to access the Greenplum database, you can create it as a system DSN instead of a user DSN.

Complete the following steps to create a data source for Greenplum database access:

1. Run **ODBC Administrator** from the Control Panel or Start menu.
2. Click the **User DSN** or **System DSN** tab, depending on the number of users, as stated above.
3. Click the **Add** button and choose **SAS ACCESS to Greenplum** from the pop-up window.
4. Enter any name in the **Data Source Name** field. This will be the name that you will use inside of SAS when referencing this database connection.
5. Enter a **Description** for this connection.
6. Enter the **Port Number** that the host is listening on for Greenplum connections. The default is 5432.
7. Enter the **Database Name** of the database on the Greenplum server.
8. Click **Test Connection** and enter your userid and password. A test connection will be initiated.
9. Click **OK** to close the ODBC Administrator and to save your new DSN entry.

Bulkload

SAS/ACCESS can interface with the Greenplum Client Loader interface for loading large volumes of data. To perform bulkloading, the Greenplum Client Loader Package must be present on the system where you installed SAS.

SAS recommends using the “gpfdist” protocol for bulkloading. For this protocol you must set the GPLOAD_HOME environment variable to point to the location where the Greenplum Client Loader is installed. Additional information about how to use the bulkloading feature can be found in the *SAS/ACCESS 9.2 for Relational Databases: Reference* documentation.

Registering SAS/ACCESS Interface to Greenplum

The following SAS procedure can be run so that the SAS/ACCESS Interface to Greenplum product is registered with the SAS system catalog:

```
PROC NICKNAME CAT=sashelp.core engine;
  add nickname=greenplm module=sasiogpl desc="SAS/ACCESS to Greenplum"
  preferred eng;
quit;
```

Configuring SAS/ACCESS Interface to MySQL Software

Before you can use SAS/ACCESS Interface to MySQL software, the following products are required:

- Base SAS software
- SAS/ACCESS Interface to MySQL software

Before you use SAS/ACCESS interface to MySQL software, verify that the MySQL client library has been appended to Path, a system variable. The MySQL client library is often located in C:\mysql\bin.

To locate the Path system variable, follow the instructions for your operating system.

- For Windows NT, right-click **My Computer** and choose **Properties**. Select the **Environment** tab and you will see in your list of system variables.
- For Windows 2000, right-click **My Computer** and choose **Properties**. Select the **Advanced** tab and select the **Environment Variables** button. You will see Path in your list of System Variables.
- For Windows XP, click **Start** then select **Control Panel**. Double-click **System**. Select the **Advanced** tab and select the **Environment Variables** button. You will see Path in your list of System Variables.

If you use MySQL Client version 4.1.0 or later, you will need to make a change because of client incompatibilities. The SASMYL SAS option must be updated so that the SAS/ACCESS Interface to MySQL can identify your version of the MySQL client. This can be done either in the beginning of your SAS program or in your SASV9.cfg file.

If you want to set the SASMYL option in your SAS Program, add the following line at the top of your SAS program:

```
options set=SASMYL MYWIN417
```

The SASV9.cfg file is located in your !SASROOT directory. To set the SASMYL SAS option in your config file, add the following line

```
-set SASMYL MYWIN417
```

For more information about SAS/ACCESS Interface to MySQL, refer to the MySQL chapter in *SAS/ACCESS 9.2 for Relational Databases: Reference*.

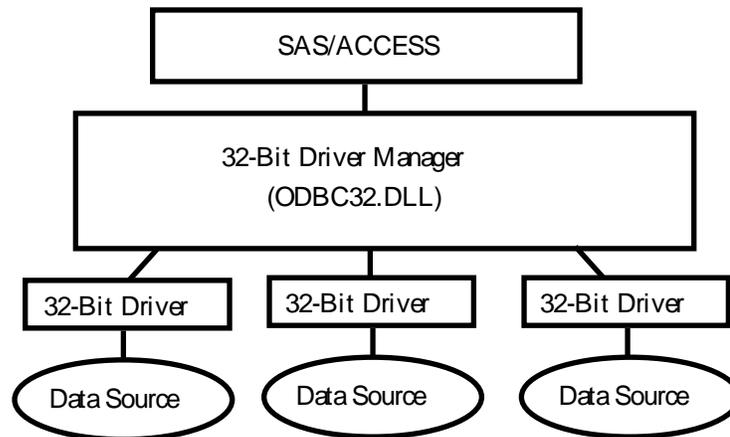

Configuring SAS/ACCESS Interface to ODBC Software

Before you can use SAS/ACCESS Interface to ODBC software, the following products are required:

- Base SAS Software
- SAS/ACCESS Interface to ODBC Software
- A 32-bit ODBC driver for the source from which you want to access data

The ODBC solution allows different technologies to be used by defining a standard interface. SAS/ACCESS Interface to ODBC software with ODBC drivers provides you with access to different databases. An ODBC driver processes ODBC function calls from--and returns results to--SAS/ACCESS software. You can get drivers from Microsoft, your database vendor, or other third party software vendors.

To run SAS/ACCESS software on 32-bit Windows, you need 32-bit drivers. The application calls the 32-bit Driver Manager (ODBC32.DLL), which in turn calls the 32-bit drivers. The following figure illustrates the architecture:

The ODBC Driver Manager and Administrator are Microsoft products that are included with all ODBC drivers. When you install an ODBC driver, the ODBC Driver Manager and Administrator are also installed. The ODBC Administrator should appear as an icon in the control panel. However, it can appear as an icon in the Start menu instead.

After you install the ODBC driver, you can use the ODBC Administrator to define and manage the data sources. A data source associates a particular ODBC driver with the data you want to access through that driver. It can consist of information about the data you want to access and its associated operating system, DBMS, and network platform (if any) used to access the DBMS. For information about how to configure your data sources, refer to the documentation provided with your ODBC drivers.

For more information about SAS/ACCESS to ODBC, refer to the ODBC chapter in *SAS/ACCESS 9.2 for Relational Databases: Reference*. For more information about ODBC, refer to *Microsoft ODBC 3.0 Programmer's Reference and SDK Guide*.

SAS/ACCESS ODBC Conversion Utilities

The SAS/ACCESS ODBC Conversion Utilities are included in the SAS/ACCESS Interface to ODBC software. It helps users of Version 6 SAS/ACCESS Interface to AS/400 and SAS/ACCESS Interface to Microsoft SQL Server move from a native DBMS interface connection to an ODBC interface connection on SAS 9.2.

AS/400 Users

Before you can use the ODBC Conversion Utilities for AS/400 Interface, you need to install IBM's Client Access ODBC Driver (32-bit) V3.00.0004 or above. If your AS/400 Client Access installation loaded a Client Access ODBC Driver prior to this release, you can download Program Temporary Fix (PTF) SF59504 or later from <ftp://ftp.software.ibm.com/> for an update. This service pack for the Client Access product can be found in the `/as400/products/clientaccess/win32/v3r1m2/servicepack/` directory. When this update is applied, Version 3.00.0004 or later of the ODBC driver should be installed.

You are also required to create a data source name. You can use the ODBC administrator to add it. The data source name AS400 is recommended. If you want to use another data source name, set the SAS environment variable AS400DSN, located in your `sasv9.cfg`, to the data source name you assigned. Quotes are required if blanks or special characters are included. You may want to create it as a system DSN instead of a user DSN if you have more than one user who might want to use the same workstation to access the AS/400 database.

Complete the following steps to create a data source for AS/400 database access:

1. Run ODBC Administrator from the Control Panel or Start menu: **Start > Settings > Control Panel > (Admin Tools> on XP) Data Sources (ODBC)**.
2. Click the **User DSN** or **System DSN** tab, depending on the number of users.
3. Click the **Add** button and then choose Client Access ODBC driver (32-bit) from the pop-up windows.
4. Click **Finish**. This brings up the Setup dialog.
5. Click the **General** tab and enter AS400 (or another name) in the Data Source Name field. This name needs to match the value you set for the SAS environment variable AS400DSN.
6. From the pull-down menu, choose an AS/400 system that you want to connect to using this data source.
7. To change the method that this data source will use to connect, click **Connection Options**. Select the appropriate option and click **OK**.
8. Click the **Server** tab. The default library is QGPL. You can change this designation by deleting its name from under the Default Libraries filed and either entering a new library to use or leaving it blank.
9. Click the **Format** tab. Using the Naming Convention pull-down list, select **System naming convention (*SYS)**.
10. Click the **Package(s)** tab. Uncheck the box for Enable Extended Dynamic Support.
11. Click **OK** to close the Setup window.

Microsoft SQL Server Users

An ODBC Conversion Utility is provided that will allow you to read SAS System Version 6 views to access data in Microsoft SQL Server which were created with SAS/ACCESS Interface to Sybase and SQL Server software on Windows. The Conversion Utility helps users migrate to SAS/ACCESS Interface to ODBC software on Windows.

Note: *The Conversion Utility applies only to views that access data in Microsoft SQL Server. It does not apply to Sybase SQL Server.*

The ODBC Conversion Utility requires the Microsoft SQL Server ODBC driver (32-bit) from Microsoft. This driver is installed as part of Microsoft Data Access Components (MDAC).

It is recommended (but not required) to create a data source name. You can use ODBC administrator to add it. You must set the SAS environment variable MSSQLDSN, located in the `sasv9.cfg`, as the data source name you assigned. Quotes are required if blanks or special characters are included. You

can create it as a system DSN instead of a user DSN if you have more than one user who may use the same workstation to access the Microsoft SQL Server database.

Complete the following steps to create a data source for Microsoft SQL Server database access:

1. Run **ODBC Administrator** from the Control Panel or Start menu.
2. Click the **User DSN** or **System DSN** tab, depending on the number of users, as stated above.
3. Click the **Add** button and choose **SQL Server** from the pop-up window.
4. Enter any name in the Name field. This name needs to match the value you set for the SAS environment variable MSSQLDSN.
5. Choose or enter the **Server** field which you defined using SQL Client Configuration Utility.
6. Click **Next**. Select the radio button that describes your login method. If necessary, enter a login ID and password.
7. Click **Next**. A connection will be initiated. If the connection succeeds, please refer to Step 8 below. If the connection fails, an error message will provide a reason for the failure.
8. After a connection succeeds, your default databases may be changed. Click **Next** to leave this screen.
9. After changing your default databases, other options may be selected. Click **Finish** when this screen is correct.
10. Click **Test Data Source**. After a message appears that indicates that the test was successful, click **Okay**. Click **Okay** on the following message as well.

Note: SAS 9.2 will automatically install Microsoft Data Access Components (MDAC) when you install SAS/ACCESS Interface to ODBC software.

Configuring SAS/ACCESS Interface to Oracle Software

Before SAS/ACCESS Interface to Oracle software can be used, the following products are required:

- Base SAS software
- SAS/ACCESS Interface to Oracle software
- Oracle client/server, Release 9i or above

After the Oracle client/server installation process is complete, ensure that the path to the Oracle client libraries is appended to the PATH system variable. The Oracle libraries are usually located in the directory ORACLE_HOME/bin. If the PATH variable does not have ORACLE_HOME/bin, you will see the following error:

```
ERROR: The SAS/ACCESS Interface to ORACLE cannot be loaded.
```

```
ERROR: Image SASORA found but not loadable.
```

For more information about SAS/ACCESS Interface to Oracle, refer to the Oracle chapter in *SAS/ACCESS 9.2 for Relational Databases: Reference*.

Configuring SAS/ACCESS Interface to R/3 Software

SAS/ACCESS Interface to R/3 software requires extensive post-installation configuration before it can be used. For detailed information, refer to the *Configuration Instructions for SAS/ACCESS 4.3 Interface to*

R/3 on Install Center

(<http://support.sas.com/documentation/installcenter/92/documents/index.html>).

Configuring SAS/ACCESS Interface to Sybase Software

In SAS 9.2, the administrator or user must install a Sybase-stored procedure on the target server. Two files have been included in the !SASROOT\access\misc directory to assist in the installation:

- `sas-spcp.txt` is a text file containing instructions on how to do the installation.
- `sas-spdf.txt` is the actual stored procedure script. The process utilizes two Sybase facilities, `defncopy` and `isql`.

To complete installation, you must add one of the following options to your `sasv9.cfg` file:

- For Sybase Open Client 15 users: `-set sassyb sywin150`
- For Sybase Open Client 12.5 users: `-set sassyb sywin125`

Configuring SAS/ACCESS to Teradata

Before you use SAS/ACCESS Interface to Teradata software, verify connectivity by logging into your Teradata account with the Teradata BTEQ utility. If BTEQ is unavailable, establish connectivity as documented in the *SAS/ACCESS to Teradata* white paper, available at <http://support.sas.com/resources/papers/teradata.pdf>.

If BTEQ fails to connect to the Teradata server, you may need an entry in the hosts file on your PC to provide the network address of the Teradata server. Typically, this means adding a `dbccop1` entry to your hosts file. For more details about the entry, see your *Teradata Client for Windows Installation Guide*.

FastExporting

For optimal reads of large tables, SAS/ACCESS can perform *FastExporting*. To perform FastExporting, the Teradata FastExport Utility must be present on the system where you install SAS. You must also modify `Path`, a system variable. Append two directory paths to the end of `Path`:

1. The directory where `fexp.exe` (the FastExport Utility) is located. Often this is `C:\Program Files\Teradata\Client\13.0\bin`.
2. The directory where `sasaxsm.dll` is located (`sasaxsm.dll` is usually located in your SAS product tree, in the `!sasroot\access\sasexe` directory.)

The FastExport Utility is not required; SAS/ACCESS reads large tables quite efficiently without it. For further information, see the `DBSLICEPARM` option in your SAS/ACCESS to Teradata documentation. Contact Teradata if you want to obtain the Teradata FastExport Utility.

For more information about SAS/ACCESS Interface to Teradata software, please see the Teradata chapter in *SAS/ACCESS 9.2 for Relational Databases: Reference*, and the *SAS/ACCESS to Teradata* white paper, available on the SAS web site at <http://support.sas.com/resources/papers/teradata.pdf>.

MultiLoad

SAS/ACCESS can load large volumes of data to non-empty tables using MultiLoad. To perform MultiLoading, the Teradata MultiLoad Utility must be present on the system where you install SAS. You must also modify `Path`, a system variable. Append two directory paths to the end of `Path`:

1. The directory where `mload.exe` (the MultiLoad Utility) is located. Often this is `C:\Program Files\Teradata\Client\13.0\bin`.
2. The directory where `sasmlam.dll` and `sasmlne.dll` are located (`sasmlam.dll` and `sasmlne.dll` are usually located in your SAS product tree, in the `!sasroot\access\sasexe` directory.)

The MultiLoad Utility is not required; SAS/ACCESS provides other options for loading tables. For further information, see the `MULTISTMT` option in your *SAS/ACCESS to Teradata* documentation. Contact Teradata if you want to obtain the Teradata MultiLoad Utility.

Teradata Parallel Transporter

SAS/ACCESS supports the Teradata parallel transporter API for loading data using Multiload, Fastload and multi-statement inserts. The API also supports reading data using FastExport.

Note: *The Teradata Parallel Transporter API is not required; SAS/ACCESS provides other options for loading and reading data.*

If you plan to use the Teradata parallel transporter API, the following two requirements must be met:

1. The API must be installed on the system where SAS is installed.
2. The system variable `TKPATHX8664` must be modified. If the variable does not exist already, it must be added.

To modify the variable, append the directory where `sasiotpt.dll` is located. (Usually `sasiotpt.dll` is located in your SAS product tree, in the `!sasroot\access\sasexe` directory.)

To locate the `TKPATHX8664` system variable, follow the instructions for your operating system.

Chapter 6: Post-Installation Setup for SAS/ASSIST Software

This chapter describes how to add an optional master profile to SAS/ASSIST software. You can use a master profile to override the default settings as sent by SAS. This allows you to provide a customized setup for SAS/ASSIST software. With the master profile, you can control the profile options of all SAS/ASSIST users from one central place. For information on the profile options, refer to *SAS/ASSIST Administrator's Guide*.

Adding a Master Profile

Complete the following steps to add a master profile to SAS/ASSIST software:

1. Specify the location of the master profile by creating a new directory that all users of SAS/ASSIST software will have read access to.

All users with write access to this directory will automatically also have write access to the master profile in SAS/ASSIST software. Select a name that conforms to the naming conventions at your installation. The name of this new directory must be stored in an entry in the SASHELP library. This requires that you have write access to the SASHELP library.

On line 1 of the Editor window of the SAS Display Manager System, type the physical pathname of the master profile directory. Execute the Save command to store this in the SASHELP.QASSIST catalog. For example:

```
SAVE SASHELP.QASSIST.PARMS.SOURCE
00001 S:\SAS\ASSIST\PARMS
00002
00003
```

The location of the master profile is now known by SAS/ASSIST software.

2. Create the master profile.

The first time SAS/ASSIST software is started, a master profile is created if SASHELP.QASSIST.PARMS.SOURCE contains the name of an existing physical pathname, and the person who starts SAS/ASSIST software has write access to this physical pathname.

3. Customize the master profile by starting SAS/ASSIST software and selecting **Setup > Profiles > Master/group ...**

If you have write access to the SAS library containing the master profile, you can specify default values for your installation. New users will use these values as they start SAS/ASSIST software.

Note: If you restrict values by typing R in **Status**, users will not be allowed to change the values you define.

You can run SAS/ASSIST software in two different styles - workplace or block menu. The block menu can be new style or old style. You can control this using the profile options below.

Run workplace:

```
SAS/Assist style: Workplace
```

Run block menu new style:

SAS/Assist style:	Block Menu
Save selections on end:	Yes
Menu Style:	New

Run old style:

SAS/Assist style:	Block Menu
Save selections on end:	Yes
Menu Style:	Old

By setting the default values in the master profile, you can control if users should use the new or old style of SAS/ASSIST software. In addition, there are many other profile options. For more information on these options, refer to SAS/ASSIST Administrator's Guide.

4. Create group profiles.

From the master profile, it is possible to create group profiles to allow groups of users to have different setups. The master profile controls group profiles and user profiles when a user is not a member of any group. All users are indirectly controlled by the master profile when option values are set to a restricted (R) status.

From **Setup > Master/Group...**, select **Tools > Create Group Profile**. To add users to a group profile, select **Tools > Update User Group**. By default, the userid is found in the macro variable &SYSJOBID. This value is set in the option Userid in the master profile (option type System Administration). Change the value if your site uses another variable to keep the userid. If the value name starts with &, it is a macro variable; otherwise, it is an environment variable, which is set before the start of SAS 9.2.

Chapter 7: Post-Installation Setup for SAS/CONNECT Software

TCP/IP is the access method supported for SAS 9.2 on Windows for x64. For information about the access methods supported by other systems, refer to *Communications Access Methods for SAS/CONNECT 9.2 and SAS/SHARE 9.2*. This document can be found at <http://support.sas.com/documentation/onlinedoc/>.

Note: *The APPC access method is not supported for the Windows for x64 operating system.*

Storing and Locating SAS/CONNECT Script Files

Several sample script files are shipped with SAS/CONNECT software. SAS/CONNECT software uses these script files to establish a connection to a remote SAS session.

The SASSCRIPT configuration option points to the location of the SAS/CONNECT script files. The SASSCRIPT option is used by SAS/ASSIST software and can be used by user-written SCL applications.

Under Windows for x64, the script files are installed into the !SASROOT\CONNECT\SASLINK directory by default. The following line is added to the SASV9 .CFG file when SAS/CONNECT software is installed:

```
-SASSCRIPT !SASROOT\CONNECT\SASLINK
```

If you want to move the script files to another directory, you must edit the SASV9 .CFG file and update the SASSCRIPT option with the new directory location. This option can also be specified from the **Tools/Options/System/Communications/Networking and encryption** selection in DMSEXP mode.

TCP/IP

TCP/IP is the access method supported for SAS 9.2 on Windows for x64. SAS/CONNECT software supports Microsoft's TCP/IP System Driver, which is provided with Windows for x64.

Configuring the SAS Windows Spawner Program

The SAS Windows Spawner is stored in the !SASROOT directory and can be executed manually from the !SASROOT directory at any time. You can run the SAS Windows Spawner as a service by executing SPAWNER .EXE with the -install option. By default, the SAS Windows Spawner will be installed to run with security. For complete documentation on the Windows Spawner and the supported options, see *Communications Access Methods for SAS/CONNECT 9.2 and SAS/SHARE 9.2*.

Note: *If you are upgrading to SAS 9.2 and you run a spawner from a previous release as a service, you should stop and delete the existing spawner service. The SAS 9.2 CONNECT spawner can then be installed as a Windows service.*

By default, when the SAS Windows Spawner is installed as a Windows service, it runs under the LocalSystem userid that has all required User Rights for running the SAS Windows Spawner. If you do not install the SAS Windows Spawner as a Windows service (run it from your system prompt), the Windows userid used to start the SAS Windows Spawner must be the local Administrator of the machine and must have the following User Rights:

- act as part of the operating system

- bypass traverse checking (the default is everyone)
- increase quotas
- replace a process level token
- log on locally (the default is everyone)

The Windows userid specified at signon needs only the User Right “log on as a batch job.”

Chapter 8: Post-Installation Configuration for SAS/IntrNet Software

This chapter has information for your SAS/IntrNet installation. It will help you install, configure, and test your SAS/IntrNet components.

The procedures for installing SAS software using the SAS Deployment Wizard are described in other documentation and are not available in this chapter. In addition, the installation of a Web server is not described in SAS documentation because it is the administrator’s responsibility.

When SAS/IntrNet software has been installed, configured and tested using the procedures described in this chapter, review the latest version of the SAS/IntrNet product documentation online at <http://support.sas.com/documentation/onlinedoc/IntrNet/index.html>. The “What’s New” page at this Web site lists any recent changes to the product or documentation.

Overview

All SAS/IntrNet installations are made up of two components:

1. The SAS/IntrNet server (also referred to as *the Application Server*). This is where SAS Foundation is installed.
2. CGI Tools (also referred to as *the Broker*). This is where the `broker.cfg` file and its supporting files are installed.

When you install SAS/IntrNet, choose between these two installation configurations:

- Type A - The SAS/IntrNet server and CGI Tools components are both installed on the same system machine. The Web server must be installed before starting the SAS installation.
- Type B -The SAS/IntrNet server component is installed on one system machine and the CGI Tools component is installed on a different system machine. The Web server must be installed on the CGI Tools system machine prior to installing CGI Tools.

Type A and Type B require different installation steps:

Type A Installation Steps	Type B Installation Steps
Confirm that the Web server software (IIS, Apache etc.) is on the same system machine as your SAS/IntrNet software.	Confirm that the Web server software (IIS, Apache, etc.) is on the system machine where you will install CGI Tools.
Install your SAS products. Check “CGI Tools for the Web Server” in the “Select Products to Install” menu.	On your application server system machine, start your SAS installation. Uncheck “CGI Tools for the Web Server” in the “Select Products to Install” menu.
	On your Web server system machine, start your SAS installation. Uncheck all products except “CGI Tools for the Web Server” in the “Select Products to Install” menu. You can optionally check the IntrNet

Type A Installation Steps	Type B Installation Steps
	Monitor or Connect Drivers.
Test the Broker	
Configure a Socket Service	
Start the Socket Service	
Test the Socket Service	

Refer to your Web server’s documentation for its installation procedures.

Installing and Configuring SAS/IntrNet Software

Install Your Web Server Software

Refer to your Web server’s documentation for its installation procedures.

Install Your SAS Software

Refer to your *QuickStart Guide* for a description of how to start your SAS software installation.

If you are performing a Type A installation (as described in the “Overview” above), perform the following steps:

1. Confirm that your Web server software is installed before starting your SAS software installation.
2. Check “CGI Tools for the Web Server” in the **Select Products to Install** dialog.

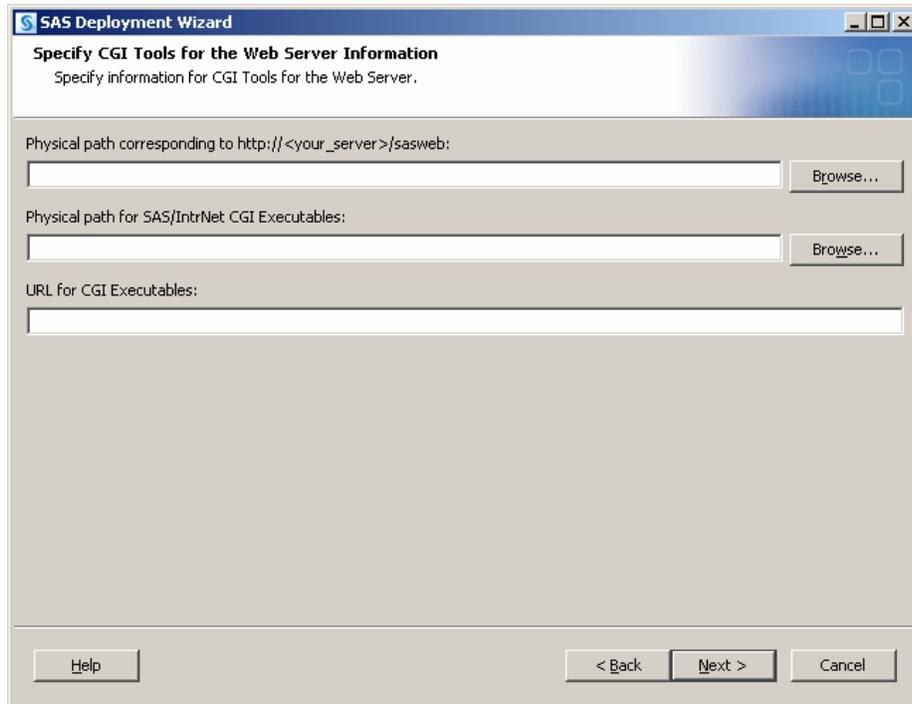

If you are performing a Type B installation (as described in the “Overview” above), do **both** of the following:

1. Install the SAS software on the SAS System side, unchecking “CGI Tools for the Web Server” in the **Select Products to Install** dialog.
2. Start the SAS software install on the Web server and check “CGI Tools for the Web Server” in the **Select Products to Install** dialog. SAS/IntrNet Monitor and SAS/CONNECT Driver for Java are optional selections. Uncheck everything else.

CGI Tools Installation Dialogs

The following windows appear for CGI Tools for the Web Server for all installations. For information about the fields, click **Help** on any dialog.

Customary entries are documented following each screen shown below. Customize the entries according to your environment.

The following are examples of common entries for popular Web servers. Customize your entries according to your own Web server environment. These fields will tell SAS where your Web server software is located.

Physical path corresponding to `http://<your_server>/sasweb`:

- IIS: `C:\Inetpub\wwwroot\sasweb`
- Apache (Windows): `C:\program files\Apache Software Foundation\Apache2.2\htdocs\sasweb`
- Apache (UNIX): `/usr/local/apache2/htdocs/sasweb`

Physical path for SAS/IntrNet CGI Executables:

- IIS: `C:\Inetpub\scripts`
- Apache (Windows): `C:\program files\Apache Software Foundation\Apache2.2\cgi-bin`
- Apache (UNIX): `/usr/local/apache2/cgi-bin`

URL for CGI Executables:

- IIS: `http://<web_servername>/scripts`
Example: `http://abcserver.comp.com/scripts`
- Apache (Windows): `http:// <web_servername>/cgi-bin`
Example: `http://abcserver.comp.com/cgi-bin`
- Apache (UNIX): `http://<web_servername>/cgi-bin`
Example: `http://abcserver.comp.com/cgi-bin`

SAS Deployment Wizard

Specify CGI Tools for the Web Server Additional Settings
Specify additional settings for CGI Tools for the Web Server.

Name of the Service Administrator:

Email Address of the Service Administrator:

DNS Name or IP Address of Application Server Host:

TCP Port Number for Application Server:

Help < Back Next > Cancel

Note that your entries for this dialog are added to the `broker.cfg` file. The `broker.cfg` file is a text file that can be edited after the installation is complete.

Name of the Service Administrator:

(optional) Enter the name of the administrator (for example, John Doe).

Email Address of the Service Administrator:

(optional) Enter the e-mail address of the administrator (for example, NetAdmin@comp.com).

DNS Name or IP Address of Application Server Host:

Enter the DNS name or IP address of the application server host where SAS Foundation is located.

TCP Port Number for Application Server:

The customary default port number is 5001, but you can use any valid available port on your system between 256 – 65535.

Installing CGI Tools and SAS Foundation on Machines with Different Operating Systems

Your SAS Foundation system's operating system might be different than your CGI Tools system's operating system. For example, your SAS Foundation might be installed on a Windows system and your CGI Tools might be installed on a UNIX system. The CGI Tools installation from the SAS Deployment Wizard will detect the destination operating system and install the appropriate operating system-specific software.

There are two methods to make the SAS Software Depot available to the installer on the destination CGI Tools system. Choose the method that is appropriate for your site's available facilities:

- Launch the set-up from a SAS Software Depot that resides on a remote system. You might need to use a cross-platform file access method such as NFS or SAMBA to connect the two systems.
- Create media from an existing depot using the SAS Deployment Wizard and use that media on the host machine. This process is described more thoroughly in the *SAS Deployment Wizard Users Guide*, available from Install Center (<http://support.sas.com/documentation/installcenter/92/documents/index.html>).

Note: *SAS/IntrNet operation requires TCP/IP connectivity between the SAS Foundation system and the CGI Tools system, regardless of the operating systems on which these components are installed.*

Test the Web Server

To determine if the Web server is running, launch the Web server's browser and enter `http://localhost`. This will return a Web page if the Web server is running.

If you do not receive a Web page, you must debug or reinstall your Web server before continuing.

Internet Information Services (IIS) 6.0+ Post-Install Configuration for Broker

In IIS 6.0 and later, you need to take manual steps in order for IIS to recognize the Broker as an application. For more information, please visit <http://support.sas.com/kb/10/496.html>.

Test the Application Broker

To verify that CGI Tools was installed correctly and can access the `broker.cfg` file, point your Web browser to the following URL:

Windows:

IIS: `http://<web_servername>/scripts/broker.exe`

Apache: `http://<web_servername>/cgi-bin/broker.exe`

Other hosts:

`http://your_webserver/cgi-bin/broker`

Replace *your_webserver* with the name of the Web server. The URL path might also need to be changed if you installed CGI Tools to a different directory. You should see a Web page similar to the following:

```
SAS/IntrNet Application Dispatcher
Application Broker Version 9.2 (Build 1495)
Application Dispatcher Administration
SAS/IntrNet Samples
SAS/IntrNet Documentation - requires Internet access
```

If you do not receive this page, you must debug your Web server installation before continuing. Verify that your Web server is enabled for CGI execution in the directory where you installed the Application Broker (`broker.exe` and `broker.cfg` files). This directory was determined by what was entered for **Physical path for SAS/IntrNet CGI Executables** during the CGI Tools installation above.

Configure a Default Application Dispatcher Service

You must create a default Application Dispatcher service to run any of the sample programs supplied with SAS/IntrNet. You should create the default service with the SAS/IntrNet Configuration Utility `inetcfg`. Services can be created on Windows platforms with a configuration utility that is accessible from the Start menu.

Perform the following steps to create and start the default service:

1. From the Start menu, select **Programs** ➤ **SAS** (or other program group where SAS is installed) ➤ **IntrNet** ➤ **Create a New IntrNet Service**.
2. The IntrNet Config Utility Welcome window appears. Read the information in the Welcome window, and then select **Next** to continue.
3. Select **Create a Socket Service**, then select **Next** to continue.
4. Type *default* as the name of the new service. Select **Next** to continue.
5. Specify the directory where you want the configuration utility to place your service directory and control files. The default location (under your SASROOT directory) is recommended. Select **Next** to continue.
6. Type the TCP/IP port number that you reserved for the default Application Dispatcher service. Select **Next** to continue.
7. A password is not necessary for the default service. You can add an administrator password later if you use this service for production applications. Select **Next** to continue.
8. The Create Service window displays all of the information that you specified for this service. Verify that the information is correct and then select **Next** to create the service.
9. Select **Next** and then **Finish** to complete the setup of the default service.
10. From the Start menu, select **Programs** ➤ **SAS** (or other program group where SAS is installed) ➤ **IntrNet** ➤ **default Service** ➤ **Start Interactively**. Your default Application Server should now be running.

Starting and Stopping the Default Service

As stated above, from the Start menu, select **Programs** ➤ **SAS** (or other program group where SAS is installed) ➤ **IntrNet** ➤ **default Service** ➤ **Start Interactively**. Your default Application Server should now be running.

Testing the Socket Service

1. To make sure that the service was installed and started correctly, point your Web browser to this URL:

Windows:

IIS: `http://<web_servername>/scripts/broker.exe`

Apache: `http://<web_servername>/cgi-bin/broker.exe`

Other hosts:

`http://your_webserver/cgi-bin/broker`

Replace *your_webserver* with the name of the Web server. The URL path might also need to be changed if you installed the Application Broker to a different directory. You should see the following Web page: SAS/IntrNet Application Dispatcher

Application Broker Version 9.2 (Build 1495)

Application Dispatcher Administration

SAS/IntrNet Samples

SAS/IntrNet Documentation - requires Internet access

2. Click on the **Application Dispatcher Administration** link to see if the Application Broker can read the `broker.cfg` file. The Application Dispatcher Services Web page should open.
3. Verify connectivity between the Application Server and the Web server. Click on the **Application Dispatcher Administration** link and then click on the **ping** link under **SocketService default** heading. If the ping is successful, you should see:

```
Ping. The Application Server <hostname>:<port_number> is functioning properly.
```
4. To complete installation testing, type this URL in your browser address line:

Windows:

IIS:

```
http://your_webserver/scripts/broker.exe?_service=default&_program=sample.webhello.sas
```

Apache:

```
http://your_webserver/cgi-bin/broker.exe?_service=default&_program=sample.webhello.sas
```

Other hosts:

```
http://your_webserver/cgi-bin/broker?_service=default&_program=sample.webhello.sas
```

You should see the string "Hello World!" in large bold type in your browser. If you do not, add the debug option to create a log:

Windows:

IIS:

```
http://your_webserver/scripts/broker.exe?_service=default&_program=sample.webhello.sas&_debug=131
```

Apache:

```
http://your_webserver/cgi-bin/broker.exe?_service=default&_program=sample.webhello.sas&_debug=131
```

Other hosts:

```
http://yourWebserver/cgi-bin/broker?_service=default&_program=sample.webhello.sas&_debug=131
```

Save the log screen on the browser for SAS Technical Support.

Configure Additional Services

This chapter describes how to configure only a simple default Application Dispatcher service. There are many reasons you may want to configure additional services, including segregating applications by security or performance requirements and implementing more scalable servers. See the “Using Services” section of the SAS/IntrNet Application Dispatcher documentation at <http://support.sas.com/documentation/onlinedoc/intrnet/index.html> information on configuring additional services, using the Load Manager, and adding pool services.

Chapter 9: Installing SAS/SECURE Software Client Components

SAS/SECURE software includes client components that non-SAS System client applications can use to communicate with a SAS server in a secure environment. To use encryption between a non-SAS System client and a SAS server with SAS/SECURE software licensed, you must install the SAS/SECURE client components on the client machine. When SAS/SECURE software is included in a customer's order, these SAS/SECURE client components can be selected for installation via the SAS Deployment Wizard.

Note: This installation is not necessary if the SAS System is your client. The SAS System installs the components that it needs as part of the SAS System installation process.

SAS/SECURE for Windows Clients

The SAS/SECURE components needed by Windows clients can be installed by running the SAS Deployment Wizard to access the SAS/SECURE Windows Client Components.

SAS/SECURE for Java Clients

The SAS/SECURE components for Java clients provide encryption support for Java applications. You can incorporate this support into applications that are written using the following components:

- SAS/SHARE driver for JDBC
- SAS/CONNECT driver for Java
- IOM Bridge for Java

If the SAS/SECURE Java Component was part of your software order, the SAS/SECURE components needed by Java clients will be installed automatically when you run the SAS Deployment Wizard.

Chapter 10: Post-Installation Setup for SAS/SHARE Software

This chapter discusses the use of the TCP/IP access methods with SAS/SHARE software. TCP/IP is the access method supported for SAS 9.2 on Windows for x64. For information about the access methods supported by other systems, please visit <http://support.sas.com/documentation/onlinedoc/> and refer to *Communications Access Methods for SAS/CONNECT 9.2 and SAS/SHARE 9.2*.

Using the TCP/IP Communications Access Method

Communication between a SAS/SHARE server and user is handled by the TCP/IP communications access method, which is a part of SAS 9.2 that uses underlying communications software to exchange messages and data. The TCP/IP access method requires Microsoft's TCP/IP Network Protocol communications software.

Note: The APPC access method is not supported for the Windows for x64 operating system.

To use the TCP/IP access method, you must have the supporting software on each workstation on which a SAS/SHARE server or user will execute.

System Configuration for the TCP/IP Access Method

SAS/SHARE software supports Microsoft's TCP/IP Network Protocol, which is provided with Windows for x64.

To define server names in the TCP/IP SERVICES file, complete the following steps:

1. Locate the SERVICES file.

This file is located under the \windows or \winnt directory paths depending on the specific Windows operating system and upgrade method. For example, under a machine configured with a Windows 2000 operating system, the directory path is named

```
<drive letter>:\winnt\system32\drivers\etc
```

2. Specify the server names and port assignments.

Each SAS/SHARE server that runs on a network must be defined as a service in the SERVICES file. Each entry in this file associates a service name with the port number and protocol used by that service. An entry for a SAS/SHARE server has the form:

```
<server name> <port number>/<protocol> # <comments>
```

The server name must be 1-8 characters in length. The first character must be a letter or underscore. The remaining seven characters can include letters, digits, underscores, the dollar (\$) sign, or the at (@) sign. The port number must be above 1024, as any port number equal to or less than 1024 is reserved. The protocol must always be TCP.

An entry for a server with the name MKTSERV might look like this:

```
mktserv 5000/tcp # SAS server for Marketing and Sales
```

The server name is specified with the SERVER= option in the PROC SERVER statement in the server's SAS session and in the PROC OPERATE and LIBNAME statements in user and server

administrator programs. If the server name is not defined, you must use `__port#`, for example, `server= __5012`.

For more information about the options used with `PROC SERVER` and `PROC OPERATE` procedures, please refer to the *SAS/SHARE 9.2 User's Guide*.

Client-Side Components

SAS/SHARE software includes client components that are used outside of your SAS installation. These components are available from the SAS 9.2 Software Download site and are described below:

SAS/SHARE Data Provider

The SAS/SHARE data provider enables you to access, update, and manipulate SAS data using OLE DB- and ADO-compliant applications on Windows platforms.

SAS ODBC Driver

The SAS ODBC driver enables you to access, update, and manipulate SAS data from ODBC-compliant applications on Windows platforms.

SAS/SHARE Driver for JDBC

The SAS/SHARE driver for JDBC enables you to write applets, applications, and servlets that access and update SAS data. The Java Tools package that includes the SAS/SHARE driver for JDBC also includes the SAS/CONNECT driver for Java. If you are writing Java programs using these interfaces, you may also want to use the tunnel feature. This optional feature can be used with the Java applets you write to solve some common configuration problems.

SAS/SHARE SQL Library for C

The SAS SQL Library for C provides an application programming interface (API) that enables your applications to send SQL queries and statements through a SAS/SHARE server to data on remote hosts.

NLS Information

Sites that develop or support international applications that use SAS/SHARE software should refer to the chapter Post-Installation Instructions for National Language Support (NLS) on page 4.

THE
POWER
TO KNOW.

support.sas.com

SAS is the world leader in providing software and services that enable customers to transform data from all areas of their business into intelligence. SAS solutions help organizations make better, more informed decisions and maximize customer, supplier, and organizational relationships. For more than 30 years, SAS has been giving customers around the world The Power to Know®. Visit us at www.sas.com.
