Overview: TREE Procedure

The TREE procedure reads a data set created by the CLUSTER or VARCLUS procedure and produces a tree diagram (also known as a dendrogram or phenogram), which displays the results of a hierarchical clustering analysis as a tree structure. The TREE procedure uses the data set to produce a diagram of the tree structure in the style of Johnson (1967), with the root at the top. Alternatively, the diagram can be oriented horizontally, with the root at the left. Any numeric variable in the output data set can be used to specify the heights of the clusters. PROC TREE can also create an output data set that contains a variable to indicate the disjoint clusters at a specified level in the tree.

Tree diagrams are discussed in the context of cluster analysis by Duran and Odell (1974); Hartigan (1975); Everitt (1980). Knuth (1973) provides a general treatment of tree diagrams in computer programming.

The literature on tree diagrams contains a mixture of botanical and genealogical terminology. The objects that are clustered are leaves. The cluster that contains all objects is the root. A cluster that contains at least two objects but not all of them is a branch. The general term for leaves, branches, and roots is node. If a cluster A is the union of clusters B and C, then A is the parent of B and C, and B and C are children of A. A leaf is thus a node with no children, and a root is a node with no parent. If every cluster has at most two children, the tree diagram is a binary tree. The CLUSTER procedure always produces binary trees. The VARCLUS procedure can produce tree diagrams with clusters that have many children.

Getting Started: TREE Procedure

The TREE procedure creates tree diagrams from a SAS data set that contains the tree structure. You can create this type of data set with the CLUSTER or VARCLUS procedure. See Chapter 34, “The CLUSTER Procedure,” and Chapter 122, “The VARCLUS Procedure,” for more information.

In the following example, the VARCLUS procedure is used to divide a set of variables into hierarchical clusters and to create the SAS data set that contains the tree structure. The TREE procedure then generates the tree diagrams.

The following data, from Hand et al. (1994), represent the amount of protein consumed from nine food groups for each of 25 European countries. The nine food groups are red meat (RedMeat), white meat (WhiteMeat), eggs (Eggs), milk (Milk), fish (Fish), cereal (Cereal), starch (Starch), nuts (Nuts), and fruits and vegetables (FruVeg).
The following SAS statements create the data set `Protein`:

```sas
data Protein;
  input Country $15. RedMeat WhiteMeat Eggs Milk Fish Cereal Starch Nuts FruVeg;
datalines;
Albania  10.1  1.4  0.5  8.9  0.2  42.3  0.6  5.5  1.7
Austria  8.9  14.0  4.3  19.9  2.1  28.0  3.6  1.3  4.3
Belgium  13.5  9.3  4.1  17.5  4.5  26.6  5.7  2.1  4.0
Bulgaria 7.8  6.0  1.6  8.3  1.2  56.7  1.1  3.7  4.2
Czechoslovakia 9.7  11.4  2.8  12.5  2.0  34.3  5.0  1.1  4.0
Denmark  10.6  10.8  3.7  25.0  9.9  21.9  4.8  0.7  2.4
E Germany 8.4  11.6  3.7  11.1  5.4  24.6  6.5  0.8  3.6
Finland  9.5  4.9  2.7  33.7  5.8  26.3  5.1  1.0  1.4
France 18.0  9.9  3.3  19.5  5.7  28.1  4.8  2.4  6.5
Greece 10.2  3.0  2.8  17.6  5.9  41.7  2.2  7.8  6.5
Hungary 5.3  12.4  2.9  9.7  0.3  40.1  4.0  5.4  4.2
Ireland 13.9  10.0  4.7  25.8  2.2  24.0  6.2  1.6  2.9
Italy  9.0  5.1  2.9  13.7  3.4  36.8  2.1  4.3  6.7
Netherlands 9.5  13.6  3.6  23.4  2.5  22.4  4.2  1.8  3.7
Norway  9.4  4.7  2.7  23.3  9.7  23.0  4.6  1.6  2.7
Poland  6.9  10.2  2.7  19.3  3.0  36.1  5.9  2.0  6.6
Portugal 6.2  3.7  1.1  4.9  14.2  27.0  5.9  4.7  7.9
Romania 6.2  6.3  1.5  11.1  1.0  49.6  3.1  5.3  2.8
Spain  7.1  3.4  3.1  8.6  7.0  29.2  5.7  5.9  7.2
Sweden  9.9  7.8  3.5  4.7  7.5  19.5  3.7  1.4  2.0
Switzerland 13.1  10.1  3.1  23.8  2.3  25.6  2.8  2.4  4.9
UK 17.4  5.7  4.7  20.6  4.3  24.3  4.7  3.4  3.3
USSR  9.3  4.6  2.1  16.6  3.0  43.6  6.4  3.4  2.9
W Germany 11.4  12.5  4.1  18.8  3.4  18.6  5.2  1.5  3.8
Yugoslavia 4.4  5.0  1.2  9.5  0.6  55.9  3.0  5.7  3.2
;```

The data set `Protein` contains the character variable `Country` and the nine numeric variables that represent the food groups. The `$_{15.}` in the INPUT statement specifies that the variable `Country` is a character variable with a length of 15.

The following statements cluster the variables in the data set `Protein`:

```sas
ods graphics on;
proc varclus data=Protein outtree=Tree centroid maxclusters=4
  plots=dendrogram(vertical height=ncl);
  var RedMeat--FruVeg;
run;
```

The OUTTREE= option creates an output data set named `Tree` to contain the tree structure. The CENTROID option specifies the centroid clustering method, and the MAXCLUSTERS= option specifies that the largest number of clusters desired is four. The VAR statement specifies that all numeric variables (RedMeat—FruVeg) are used by the procedure. Since ODS Graphics is enabled, PROC VARCLUS creates a dendrogram, which is displayed in Figure 120.1. The option plots=dendrogram(vertical height=ncl) specifies a vertical dendrogram with the number of clusters on the vertical axis. The default is a horizontal dendrogram with, for this cluster analysis, the proportion of variance explained on the horizontal axis.
The output data set Tree, created by the OUTTREE= option in the previous statements, contains the following variables:

_NAME_  the name of the cluster
_PARENT_  the parent of the cluster
_NCL_  the number of clusters
_VAREXP_  the amount of variance explained by the cluster
_PROPOR_  the proportion of variance explained by the clusters at the current level of the tree diagram
_MINPRO_  the minimum proportion of variance explained by a cluster
_MAXEIGEN_  the maximum second eigenvalue of a cluster
The following statements use PROC TREE to produce a tree diagram of the clusters created by PROC VARCLUS:

```plaintext
proc tree data=tree vaxis=axis1;
    axis1 label=(angle=90);
run;
```

The AXIS1 statement rotates the Y-axis label so that it is displayed in the same way as in the dendrogram from PROC VARCLUS. Figure 120.2 displays the tree diagram.

In each diagram, the name of the cluster is displayed on the horizontal axis and the number of clusters is displayed on the vertical (height) axis.
As you look up from the bottom of either diagram, clusters are progressively joined until a single, all-encompassing cluster is formed at the top (or root) of the tree. Clusters exist at each level of the diagram. For example, at the level where the diagram indicates three clusters, the clusters are as follows:

- Cluster 1: RedMeat WhiteMeat Eggs Milk
- Cluster 2: Fish Starch
- Cluster 3: Cereal Nuts FruVeg

As you proceed up the diagram one level, the number of clusters is two:

- Cluster 1: RedMeat WhiteMeat Eggs Milk Fish Starch
- Cluster 2: Cereal Nuts FruVeg

The following statements illustrate how you can specify the numeric variable that defines the height of each node (cluster) in the tree:

```sas
proc tree data=Tree horizontal haxis=axis1;
  axis1 order=(0 to 1 by 0.2);
  height _PROPOR_;
  label _name_ = 'Variable';
run;
```

The HORIZONTAL option in the PROC TREE statement orients the tree diagram horizontally. The HAXIS= option specifies that the AXIS1 statement be used to customize the appearance of the horizontal axis. The ORDER= option in the AXIS1 statement (see SAS/GRAPH: Reference) specifies the data values in the order in which they are to appear on the axis. The HEIGHT statement specifies the variable _PROPOR_ (the proportion of variance explained) as the height variable. The LABEL statement supplies a short Y-axis label.

The resulting tree diagram is shown in Figure 120.3.
As you look from left to right in the diagram, objects and clusters are progressively joined until a single, all-encompassing cluster is formed at the right (or root) of the tree.

Clusters exist at each level of the diagram, represented by horizontal line segments. Each vertical line segment represents a point where leaves and branches are connected into progressively larger clusters.

For example, three clusters are formed at the leftmost point along the axis where three horizontal line segments exist. At that point, where a vertical line segment connects the Cereal-Nuts and FruVeg clusters, the proportion of variance explained is about 0.6 (_PROPOR_ = 0.6). At the next clustering level the variables Fish and Starch are clustered with variables RedMeat through Milk, resulting in a total of two clusters. The proportion of variance explained is about 0.45 at that point.
Syntax: TREE Procedure

The following statements are available in the TREE procedure:

```
PROC TREE <options>;
    NAME variables ;
    HEIGHT variable ;
    PARENT variables ;
    BY variables ;
    COPY variables ;
    FREQ variable ;
    ID variable ;
```

If the input data set has been created by CLUSTER or VARCLUS, the only statement required is the PROC TREE statement. The BY, COPY, FREQ, HEIGHT, ID, NAME, and PARENT statements are described after the PROC TREE statement.

PROC TREE Statement

```
PROC TREE <options> ;
```

The PROC TREE statement invokes the TREE procedure.

Table 120.1 summarizes the options available in the PROC TREE statement.

</tbody>
</table>

**CFRAME=**<code>color</code>

specifies a color for the frame, which is the rectangle bounded by the axes.

**DATA=**<code>SAS-data-set</code>

specifies the input data set that defines the tree. If you omit the DATA= option, the most recently created SAS data set is used.

**DESCENDING**

**DES**

reverses the sort order for the SORT option.

**DESCRIPTION=**<code>entry-description</code>

specifies a description for the graph in the GOUT= catalog. The default is “Proc Tree Graph Output.”
DISSIMILAR

DISS

specifies that the values of the HEIGHT variable are dissimilarities; that is, a large height value means that the clusters are very dissimilar or far apart.

If neither the SIMILAR nor the DISSIMILAR option is specified, PROC TREE attempts to infer from the data whether the height values are similarities or dissimilarities. If PROC TREE cannot tell this from the data, it issues an error message and does not display a tree diagram.

DOCK=n

causes observations in the OUT= data set that have a frequency of n or less to be given missing values for the output variables CLUSTER and CLUSNAME. If the NCLUSTERS= option is also specified, DOCK= also prevents clusters with a frequency of n or less from being counted toward the number of clusters requested by the NCLUSTERS= option. By default, DOCK=0.

FILLCHAR=’c’

FC=’c’

specifies the character displayed between leaves that are not joined into a cluster. The character should be enclosed in single quotes. The default is a blank. The LINEPRINTER option must also be specified.

GOUT=< libref. >member-name

specifies the catalog in which the generated graph is stored. The default is Work.Gseg.

HAXIS=AXISn

specifies that the AXISn statement be used to customize the appearance of the horizontal axis.

HEIGHT=name

H=name

specifies certain conventional variables to be used for the height axis of the tree diagram. For many situations, the only option you need is the HEIGHT= option. Valid values for name and their meanings are as follows:

\[ \text{HEIGHT | H} \]

specifies the _HEIGHT_ variable.

\[ \text{LENGTH | L} \]

defines the height of each node as its path length from the root. This can also be interpreted as the number of ancestors of the node.

\[ \text{MODE | M} \]

specifies the _MODE_ variable.

\[ \text{NCL | N} \]

specifies the _NCL_ (number of clusters) variable.

\[ \text{RSQ | R} \]

specifies the _RSQ_ variable.

See also the section “HEIGHT Statement” on page 9889. The HEIGHT statement can specify any variable in the input data set to be used for the height axis. In rare cases, you might need to specify either the DISSIMILAR option or the SIMILAR option.

HORDISPLAY=RIGHT

specifies that the graph be oriented horizontally with the leaf nodes on the right side, when the HORIZONTAL option is also specified. By default, the leaf nodes are on the left side.
HORIZONTAL

HOR displays the tree diagram with the height axis oriented horizontally. The leaf nodes are on the side specified in the HORDisplay= option. If you do not specify the HORIZONTAL option, the height axis is vertical, with the root at the top. When the tree takes up more than one page, horizontal orientation can make the tree diagram considerably easier to read.

HPAGES=n1 specifies that the original graph be enlarged to cover n1 pages. If you also specify the VPAGES=n2 option, the original graph is enlarged to cover n1 \times n2 graphs. For example, if HPAGES=2 and VPAGES=3, then the original graph is generated, followed by 2 \times 3 = 6 more graphs. In these six graphs, the original is enlarged by a factor of 2 in the horizontal direction and by a factor of 3 in the vertical direction. The graphs are generated in left-to-right and top-to-bottom order.

INC=n specifies the increment between tick values on the height axis. If the HEIGHT variable is _NCL_, the default is usually 1, although a different value can be specified for consistency with other options. For any other HEIGHT variable, the default is some power of 10 times 1, 2, 2.5, or 5.

JOINCHAR=c, JC=c specifies the character displayed between leaves that are joined into a cluster. The character should be enclosed in single quotes. The default is ‘X’. The LINEPRINTER option must also be specified.

LEAFCHAR=c, LC=c specifies the character used to represent clusters that have no children. The character should be enclosed in single quotes. The default is a period. The LINEPRINTER option must also be specified.

LEVEL=n specifies the level of the tree that defines disjoint clusters for the OUT= data set. The LEVEL= option also causes only clusters between the root and a height of n to be displayed. The clusters in the output data set are those that exist at a height of n on the tree diagram. For example, if the HEIGHT variable is _NCL_ (number of clusters) and LEVEL=5 is specified, then the OUT= data set contains five disjoint clusters. If the HEIGHT variable is _RSQ_ (R square) and LEVEL=0.9 is specified, then the OUT= data set contains the smallest number of clusters that yields an R square of at least 0.9.

LINEPRINTER specifies that the tree diagram be displayed using line printer graphics.

LINES=( <COLOR=color> <WIDTH=n> <DOTS> ) specifies the color and the thickness of the lines of the tree, and whether a dot is drawn at each leaf node. If the frame and the lines are specified to be the same color, PROC TREE selects a different color for the lines.

LIST lists all the nodes in the tree, displaying the height, parent, and children of each node.
**Chapter 120: The TREE Procedure**

**MAXHEIGHT=n**  
**MAXH=n**  
specifies the maximum value displayed on the height axis.

**MINHEIGHT=n**  
**MINH=n**  
specifies the minimum value displayed on the height axis.

**NAME=name**  
specifies the entry name for the generated graph in the GOUT= catalog. Each time another graph is generated with the same name, the name is modified by appending a number to make it unique.

**NCLUSTERS=n**  
**NCL=n**  
**N=n**  
specifies the number of clusters desired in the OUT= data set. The number of clusters obtained might not equal the number specified if (1) there are fewer than \( n \) leaves in the tree, (2) there are more than \( n \) unconnected trees in the data set, (3) a multiway tree does not contain a level with the specified number of clusters, or (4) the DOCK= option eliminates too many clusters.

The NCLUSTERS= option uses the _NCL_ variable to determine the order in which the clusters are formed. If there is no _NCL_ variable, the height variable (as determined by the HEIGHT statement or HEIGHT= option) is used instead.

**NTICK=n**  
specifies the number of tick intervals on the height axis. The default depends on the values of other options.

**NOPRINT**  
suppresses the display of the tree. Specify the NOPRINT option if you want only to create an OUT= data set.

**OUT=SAS-data-set**  
creates an output data set that contains one observation for each object in the tree or subtree being processed and variables called CLUSTER and CLUSNAME that show cluster membership at any specified level in the tree. If you specify the OUT= option, you must also specify either the NCLUSTERS= or LEVEL= option in order to define the output partition level. If you want to create a SAS data set in a permanent library, you must specify a two-level name. For more information about permanent libraries and SAS data sets, see *SAS Language Reference: Concepts*.

**PAGES=n**  
specifies the number of pages over which the tree diagram (from root to leaves) is to extend. The default is 1. The LINEPRINTER option must also be specified.

**POS=n**  
specifies the number of column positions on the height axis. The default depends on the value of the PAGES= option, the orientation of the tree diagram, and the values specified by the PAGESIZE= and LINESIZE= options. The LINEPRINTER option must also be specified.
**ROOT=’name’**
specifies the value of the NAME statement variable for the root of a subtree to be displayed if you do not want to display the entire tree. If you also specify the OUT= option, the output data set contains only objects that belong to the subtree specified by the ROOT= option.

**SIMILAR**
**SIM**
specifies that the values of the HEIGHT variable represent similarities; that is, a large height value means that the clusters are very similar or close together.

If neither the SIMILAR nor the DISSIMILAR option is specified, PROC TREE attempts to infer from the data whether the height values are similarities or dissimilarities. If PROC TREE cannot tell this from the data, it issues an error message and does not display a tree diagram.

**SORT**
sorts the children of each node by the HEIGHT variable, in the order of cluster formation. See the DESCENDING option for details.

**SPACES=s**
**S=s**
specifies the number of spaces between objects in the output. The default depends on the number of objects, the orientation of the tree diagram, and the values specified by the PAGESIZE= and LINESIZE= options. The LINEPRINTER option must also be specified.

**TICKPOS=n**
specifies the number of column positions per tick interval on the height axis. The default value is usually between 5 and 10, although a different value can be specified for consistency with other options.

**TREECHAR=’c’**
**TC=’c’**
specifies the character used to represent clusters with children. The character should be enclosed in single quotes. The default is ‘X’. The LINEPRINTER option must also be specified.

**VAXIS=AXISn**
specifies that the AXISn statement be used to customize the appearance of the vertical axis.

**VPAGES=n2**
specifies that the original graph be enlarged to cover n2 pages. If you also specify the HPAGES=n1 option, the original graph is enlarged to cover n1 × n2 pages. For example, if HPAGES=2 and VPAGES=3, then the original graph is generated, followed by 2 × 3 = 6 more graphs. In these six graphs, the original is enlarged by a factor of 2 in the horizontal direction and by a factor of 3 in the vertical direction. The graphs are generated in left-to-right and top-to-bottom order.
**Chapter 120: The TREE Procedure**

**BY Statement**

```
BY variables;
```

You can specify a BY statement with PROC TREE to obtain separate analyses of observations in groups that are defined by the BY variables. When a BY statement appears, the procedure expects the input data set to be sorted in order of the BY variables. If you specify more than one BY statement, only the last one specified is used.

If your input data set is not sorted in ascending order, use one of the following alternatives:

- Sort the data by using the SORT procedure with a similar BY statement.
- Specify the NOTSORTED or DESCENDING option in the BY statement for the TREE procedure. The NOTSORTED option does not mean that the data are unsorted but rather that the data are arranged in groups (according to values of the BY variables) and that these groups are not necessarily in alphabetical or increasing numeric order.
- Create an index on the BY variables by using the DATASETS procedure (in Base SAS software).

For more information about BY-group processing, see the discussion in *SAS Language Reference: Concepts*. For more information about the DATASETS procedure, see the discussion in the *Base SAS Procedures Guide*.

**COPY Statement**

```
COPY variables;
```

The COPY statement specifies one or more character or numeric variables to be copied to the OUT= data set.

**FREQ Statement**

```
FREQ variable;
```

The FREQ statement specifies one numeric variable that tells how many clustering observations belong to the cluster. If the FREQ statement is omitted, PROC TREE uses the variable _FREQ_ to specify the number of observations per cluster. If neither the FREQ statement nor the _FREQ_ variable is present, each leaf is assumed to represent one clustering observation, and the frequency for each internal node is found by summing the frequencies of its children.
**HEIGHT Statement**

```
HEIGHT variable;
```

The HEIGHT statement specifies the name of a numeric variable to define the height of each node (cluster) in the tree. The height variable can also be specified by the HEIGHT= option in the PROC TREE statement. If both the HEIGHT statement and the HEIGHT= option are omitted, PROC TREE uses the variable _HEIGHT_. If the data set does not contain _HEIGHT_, PROC TREE uses the variable _NCL_. If _NCL_ is not present either, the height of each node is defined to be its path length from the root.

**ID Statement**

```
ID variable;
```

The ID variable is used to identify the objects (leaves) in the tree on the output. The ID variable can be a character or numeric variable of any length. If the ID statement is omitted, the variable in the NAME statement is used instead. If both the ID and NAME statements are omitted, PROC TREE uses the variable _NAME_. If the _NAME_ variable is not found in the data set, PROC TREE issues an error message and stops. The ID variable is copied to the OUT= data set.

**NAME Statement**

```
NAME variable;
```

The NAME statement specifies a character or numeric variable that identifies the node represented by each observation. The NAME statement variable and the PARENT statement variable jointly define the tree structure. If the NAME statement is omitted, PROC TREE uses the variable _NAME_. If the _NAME_ variable is not found in the data set, PROC TREE issues an error message and stops.

**PARENT Statement**

```
PARENT variable;
```

The PARENT statement specifies a character or numeric variable that identifies the node in the tree that is the parent of each observation. The PARENT statement variable must have the same formatted length as the NAME statement variable. If the PARENT statement is omitted, PROC TREE uses the variable _PARENT_. If the _PARENT_ variable is not found in the data set, PROC TREE issues an error message and stops.
Details: TREE Procedure

Missing Values
An observation with a missing value for the NAME statement variable is omitted from processing. If the
PARENT statement variable has a missing value but the NAME statement variable is present, the observation
is treated as the root of a tree. A data set can contain several roots and, hence, several trees.

Missing values of the HEIGHT variable are set to upper or lower bounds determined from the nonmissing
values under the assumption that the heights are monotonic with respect to the tree structure.

Missing values of the FREQ variable are inferred from nonmissing values where possible; otherwise, they
are treated as zero.

Output Data Set
The OUT= data set contains one observation for each leaf in the tree or subtree being processed. The variables
are as follows:

- the BY variables, if any
- the ID variable, or the NAME statement variable if the ID statement is not used
- the COPY variables
- a numeric variable CLUSTER that takes values from 1 to c, where c is the number of disjoint clusters.
  The cluster to which the first observation belongs is given the number 1, the cluster to which the next
  observation belongs that does not belong to cluster 1 is given the number 2, and so on.
- a character variable CLUSNAME that gives the value of the NAME statement variable of the cluster to
  which the observation belongs

The CLUSTER and CLUSNAME variables are missing if the corresponding leaf has a nonpositive frequency.
Displayed Output

The displayed output from the TREE procedure includes the following:

- the names of the objects in the tree
- the height axis
- the tree diagram.

The leaves of the tree diagram are displayed at the bottom of the graph. Horizontal lines connect the leaves into branches, while the topmost horizontal line indicates the root.

If the LINEPRINTER option is specified, the root (the cluster that contains all the objects) is indicated by a solid line of the character specified by the TREECHAR= option (the default character is ‘X’). At each level of the tree, clusters are shown by unbroken lines of the TREECHAR= symbol with the FILLCHAR= symbol (the default is a blank) separating the clusters. The LEAFCHAR= symbol (the default character is a period) represents single-member clusters.

By default, the tree diagram is oriented with the height axis vertical and the object names at the top of the diagram. If the HORIZONTAL option is specified, then the height axis is horizontal and the object names are on the left.

ODS Table Names

PROC TREE assigns a name to each table it creates. You can use table names to refer to tables when using the Output Delivery System (ODS) to select tables and create output data sets. The name of PROC TREE’s only table is listed in Table 120.2. For more information about ODS, see Chapter 20, “Using the Output Delivery System.”

Examples: TREE Procedure

Example 120.1: Mammals' Teeth

The following statements produce a data set that contains the numbers of different kinds of teeth for a variety of mammals:

```r
data teeth;
  title 'Mammals' Teeth';
  input mammal & $16. v1-v8 @@;
  label v1='Right Top Incisors'
       v2='Right Bottom Incisors'
       v3='Right Top Canines'
       v4='Right Bottom Canines'
       v5='Right Top Premolars'
       v6='Right Bottom Premolars'
       v7='Right Top Molars'
       v8='Right Bottom Molars';
datalines;
  Brown Bat 2 3 1 1 3 3 3 3 Mole 3 2 1 0 3 3 3 3
  Silver Hair Bat 2 3 1 1 2 3 3 3 Pigmy Bat 2 3 1 1 2 3 3 3
  House Bat 2 3 1 1 2 3 3 3 Red Bat 1 3 1 1 2 3 3 3
  Pika 2 1 0 0 2 3 3 3 Rabbit 2 1 0 0 3 2 3 3
  Beaver 1 1 0 0 2 3 3 3 Groundhog 1 1 0 0 2 3 3 3
  Gray Squirrel 1 1 0 0 3 3 3 3 House Mouse 1 1 0 0 3 3 3 3
  Porcupine 1 1 0 0 3 3 3 3 Wolf 3 3 1 1 4 3 2 3
  Bear 3 3 1 1 3 3 3 3 Raccoon 3 3 1 1 4 3 2 3
  Marten 3 3 1 1 4 3 3 3 Weasel 3 3 1 1 3 3 1 2
  Wolverine 3 3 1 1 4 3 3 3 Badger 3 3 1 1 3 3 1 2
  River Otter 3 3 1 1 4 3 3 3 Sea Otter 3 3 1 1 3 3 1 2
  Jaguar 3 3 1 1 3 3 3 3 Cougar 3 3 1 1 3 2 1 1
  Fur Seal 3 2 1 1 4 3 1 1 Sea Lion 3 2 1 1 4 3 1 1
  Grey Seal 3 2 1 1 3 3 2 2 Elephant Seal 2 1 1 1 4 4 1 1
  Reindeer 0 4 1 0 3 3 3 3 Elk 0 4 1 0 3 3 3 3
  Deer 0 4 0 0 3 3 3 3 Moose 0 4 0 0 3 3 3 3;
```

The following statements use the CLUSTER procedure to cluster the mammals by average linkage and use ODS Graphics and the TREE procedure to produce a horizontal tree diagram that uses the average-linkage distance as its height axis:

```r
ods graphics on;

proc cluster method=average std pseudo noeigen outtree=tree;
  id mammal;
  var v1-v8;
run;

proc tree horizontal;
  label _name_ = 'Animal';
run;
```
Output 120.1.1 displays the information about how the clusters are joined. For example, the cluster history shows that the mammals ‘Wolf’ and ‘Bear’ form cluster 29, which is merged with ‘Raccoon’ to form cluster 11.

</table>
Output 120.1.2 shows the tree diagram produced by PROC CLUSTER.

Output 120.1.2  Dendrogram from PROC CLUSTER
Output 120.1.3 shows the corresponding tree diagram produced by PROC TREE.

Output 120.1.3  Tree Diagram of Mammal Teeth Clusters

As you view the diagram in Output 120.1.3 from left to right, objects and clusters are progressively joined until a single, all-encompassing cluster is formed at the right (or root) of the tree. Clusters exist at each level of the diagram, and every vertical line connects leaves and branches into progressively larger clusters. For example, the five bats form a cluster at the 0.6 level, while the next cluster consists only of the mole. The mammals ‘Reindeer’, ‘Elk’, ‘Deer’, and ‘Moose’ form the next cluster at the 0.6 level, the mammals ‘Pika’ through ‘House Mouse’ are in the fourth cluster, the mammals ‘Wolf’, ‘Bear’, and ‘Raccoon’ form the fifth cluster, and the last cluster contains the mammals ‘Marten’ through ‘Elephant Seal’.

The following statements create the same tree with line printer graphics in a vertical orientation:

```
options ps=40;
proc tree lineprinter;
run;
```

The line printer plot is not displayed.
The next statements sort the clusters at each branch in order of formation and use the number of clusters as the height axis:

```
proc tree sort height=n horizontal;
  label _name_ = 'Animal';
run;
```

The resulting tree is displayed in Output 120.1.4.

Output 120.1.4  PROC TREE with SORT and HEIGHT= Options

Because the CLUSTER procedure always produces binary trees, the number of internal (root and branch) nodes in the tree is one less than the number of leaves. Therefore 31 clusters are formed from the 32 mammals in the input data set. These are represented by the 31 vertical line segments in the tree diagram, each at a different value along the horizontal axis.

As you examine the tree from left to right, the first vertical line segment is where ‘Beaver’ and ‘Groundhog’ are clustered and the number of clusters is 31. The next cluster is formed from ‘Gray Squirrel’ and ‘Porcupine’. The third contains ‘Wolf’ and ‘Bear’. Note how the tree graphically displays the clustering order information that was presented in tabular form by the CLUSTER procedure in Output 120.1.1.

The same clusters as in Output 120.1.3 can be seen at the six-cluster level of the tree diagram in Output 120.1.4, although the SORT and HEIGHT= options make them appear in a different order.
The following statements create these six clusters and save the result in the output data set *part*:

```plaintext
proc tree noprint out=part nclusters=6;
   id mammal;
   copy v1-v8;
run;

proc sort;
   by cluster;
run;
```

PROC TREE with the NOPRINT option displays no output but creates an output data set that indicates the cluster to which each observation belongs at the six-cluster level in the tree. The following statements print the data set part, with the results shown in **Output 120.1.5**:

```plaintext
proc print label uniform;
   id mammal;
   var v1-v8;
   format v1-v8 1.;
   by cluster;
run;
```

**Output 120.1.5**  PROC TREE OUT= Data Set

Example 120.2: Iris Data

Fisher (1936)’s iris data give sepal and petal dimensions for three different species of iris. The data, which are available in the Sashelp library, are clustered by kth-nearest-neighbor density linkage by using the CLUSTER procedure with K=8. Observations are identified by species (‘Setosa’, ‘Versicolor’, or ‘Virginica’) in the tree diagram, which is oriented with the height axis horizontal.

The following statements produce the results shown in Output 120.2.1:

```sas
title 'Fisher (1936) Iris Data';
ods graphics on;

proc cluster data=sashelp.iris method=twostage print=10
   outtree=tree k=8 noeigen;
   var SepalLength SepalWidth PetalLength PetalWidth;
   copy Species;
run;

proc tree data=tree horizontal lineprinter pages=1 maxh=10;
   id species;
run;
```

The PAGES=1 option specifies that the tree diagram extend over one page from tree to root. Since the HORIZONTAL option is also specified, the horizontal extent of the diagram is one page. The number of vertical pages required for the diagram is dictated by the number of leaves in the tree.

The MAXH=10 limits the values displayed on the height axis to a maximum of 10. This prunes the tree diagram so that only the portion from the leaves to level 10 is produced. The line printer plot is not displayed.
