Audience

This book covers tasks that are required after you and your SAS representative have decided what software you need and on what machines you will install the software. At this point, you can begin performing some pre-installation tasks, such as creating operating system user accounts and designating the ports that you will use during installation.

Unless you are deploying a non-distributed SAS LASR Analytic Server, you will also need to refer to the SAS High-Performance Analytics Infrastructure: Installation and Configuration Guide, available at http://support.sas.com/documentation/solutions/hpainfrastructure/.

Documentation Conventions

SAS Installation Directory

The phrase SAS installation directory refers to a host path. (The SAS installation directory is sometimes referred to as SAS Home.) For example, C:\Program Files\SASHome.

SAS Configuration Directory

The phrase SAS configuration directory refers to a host path that includes a configuration name and level. For example, C:\SAS\Config\Lev1.

What’s New in Installation and Configuration for SAS Visual Analytics 7.2

Overview

The SAS Visual Analytics: Installation and Configuration Guide (Distributed SAS LASR) explains how to install and initially configure SAS Visual Analytics. This book contains new information about the following enhancements and changes to SAS Visual Analytics:

- “Enabling SASHDAT Encryption”

Enabling SASHDAT Encryption

To support encryption of SASHDAT, you must apply the SAS Intelligence Platform 9.4m2f and the SAS Visual Analytics 7.2 hot fixes.

After the hot fixes are applied, you must delete and re-add the Hadoop Server and the SAS Data in HDFS Library resource templates in SAS Management Console.

For more information, see “Enable SASHDAT Encryption” on page 150.
Introduction to Deploying SAS Visual Analytics

What Is SAS Visual Analytics?

SAS Visual Analytics is an easy-to-use, web-based product that leverages SAS High-Performance Analytics technologies. SAS Visual Analytics empowers organizations to explore huge volumes of data very quickly to identify patterns and trends and to identify opportunities for further analysis.

SAS Visual Analytics includes the following:

- A non-distributed SAS LASR Analytic Server or a distributed SAS LASR Analytic Server with SAS High-Performance Analytics environment root note and worker nodes.
- One of the following supported co-located data providers:
  - SAS High-Performance Deployment of Hadoop
  - Any supported Hadoop
- A SAS Visual Analytics server tier consisting of the following:
A SAS Visual Analytics middle tier consisting of the following:
- SAS Visual Analytics Hub
- SAS Visual Analytics Explorer
- SAS Visual Statistics
- SAS Visual Analytics Designer
- SAS Visual Data Builder
- SAS Visual Analytics Graph Builder
- SAS Visual Analytics Report Viewer
- SAS Visual Analytics Administrator
- SAS LASR Authorization Service
- SAS Visual Analytics Transport Service
- Search Interface to SAS Content
- SAS Remote Services

When you license SAS Visual Analytics with the non-distributed SAS LASR Analytic Server, the SAS High-Performance Analytics environment and the co-located data provider are not provided.

For more information about SAS Visual Analytics, see the following documents:

- Help and tutorials integrated into SAS Mobile BI
SAS Visual Statistics Installation Instructions

If SAS Visual Statistics is part of your order, then when you perform the steps in this document for installing and configuring SAS Visual Analytics, you are also installing and configuring SAS Visual Statistics.

Where Do I Locate My Analytics Cluster?

Overview of Locating Your Analytics Cluster

If you are planning to use a distributed SAS LASR Analytic Server, then you need to establish an analytics cluster. An analytics cluster is a high-performance environment that is characterized by massively parallel processing (MPP) used to perform analytic tasks on big data residing in a distributed data storage appliance or in a Hadoop cluster.

You have two options for where you locate your SAS analytics cluster.

- It can be co-located with your data store.
- It can be remote from your data store.

When the SAS analytics cluster is separated (remote) from your data store, you have two options for data transfer.

- You can perform a serial data transfer using SAS/ACCESS Interface to Hadoop.
- You can perform a parallel data transfer using SAS/ACCESS Interface to Hadoop with SAS Embedded Process.

The topics in this section contain basic diagrams that describe each option for your analytics cluster location.

- co-located with your data store
  - SAS High-Performance Deployment of Hadoop
  - any supported Hadoop
- remote from your data store
  - SAS High-Performance Deployment of Hadoop (serial connection)
  - any supported Hadoop (serial connection)
  - SAS High-Performance Deployment of Hadoop (parallel connection)
  - any supported Hadoop (parallel connection)

Where you locate your analytics cluster depends on a number of criteria. Your SAS representative knows the latest supported configurations and can help you determine which cluster location works best for your site.
Co-located with Your Data Store

The following figure shows the analytics cluster co-located on your SAS High-Performance Deployment of Hadoop cluster:

Figure 1.1 Analytics Cluster Co-located on Your SAS High-Performance Deployment of Hadoop Cluster
The following figure shows the analytics cluster co-located on a supported Hadoop data store:

**Figure 1.2  Analytics Cluster Co-located on a Supported Hadoop Data Store**

Note: For deployments that access SASHDAT tables exclusively, SAS/ACCESS Interface to Hadoop and SAS Embedded Process are not required.

**Remote from Your Data Store (Serial Connection)**

The following figure shows the analytics cluster running the SAS High-Performance Deployment of Hadoop using a serial connection to your remote data store:

**Figure 1.3** Analytics Cluster (SAS High-Performance Deployment of Hadoop) Remote from Your Data Store (Serial Connection)
The following figure shows the analytics cluster running on a supported Hadoop cluster using a serial connection to your remote data store:

**Figure 1.4 Analytics Cluster (Hadoop) Remote from Your Data Store (Serial Connection)**

Remote from Your Data Store (Parallel Connection)

Together, SAS/ACCESS Interface to Hadoop and SAS Embedded Process provide a high-speed parallel connection that delivers data from your data source to the SAS High-Performance Analytics environment on the analytics cluster. These products are in a deployment package that is specific for your data source. For more information, see the SAS In-Database Products:

The following figure shows the analytics cluster running the SAS High-Performance Deployment of Hadoop using a parallel connection to your remote data store:

**Figure 1.5** Analytics Cluster (SAS High-Performance Deployment of Hadoop) Remote from Your Data Store (Parallel Connection)
The following figure shows the analytics cluster running on a supported Hadoop cluster using a parallel connection to your remote data store:

**Figure 1.6** Analytics Cluster (Hadoop) Remote from Your Data Store (Parallel Connection)
Deploying SAS Visual Analytics

Overview of Deploying SAS Visual Analytics

The following list summarizes the steps required to install and configure SAS Visual Analytics:

1. Create a SAS Software Depot.
2. Check for documentation updates.
3. (Optional) Deploy the SAS High-Performance Analytics infrastructure.
4. Create operating system users and groups and designate ports.
5. (Optional) Set up certificates.
6. Deploy required third-party software.
7. Deploy the servers and middle tier.

The following sections provide a brief description of each of these steps. Subsequent chapters in the guide provide step-by-step instructions.

Step 1: Create a SAS Software Depot

Create a SAS Software Depot, which enables you to install SAS software over your site’s network rather than from the installation media.

Note: If you chose to receive SAS through Electronic Software Delivery, a SAS Software Depot is automatically created for you.

For more information, see Chapter 2, “Pre-Installation: Creating a SAS Software Depot,” on page 13.

Step 2: Check for Documentation Updates

It is very important to check for late-breaking installation information in SAS Notes and to review the system requirements for your SAS software.

- Samples & SAS Notes

Step 3: (Optional) Deploy the SAS High-Performance Analytics Infrastructure

Note: SAS Visual Analytics 7.2 requires that you use SAS High-Performance Analytics environment 2.9 or higher.
The SAS High-Performance Analytics infrastructure consists of the following:

- **SAS High-Performance Analytics environment**
  
is the foundation for SAS LASR Analytic Server. A root node is deployed on the grid host and worker nodes are deployed on each remaining machine in the Hadoop cluster.

- **SAS High-Performance Computing Management Console**
  
is a web application tool that eases the administrative burden on multiple machines in a distributed computing environment.

- **SAS High-Performance Deployment of Hadoop (optional)**
  
is a co-located data provider. SAS High-Performance Deployment of Hadoop is based on Apache and is shipped with SAS. The name node is deployed on the grid host and data nodes are deployed on each remaining machine in the Hadoop cluster.

  **Note:** Use of SAS High-Performance Deployment of Hadoop is optional. Other supported Hadoop clusters can be used.

For information about deploying the SAS High-Performance Analytics infrastructure, see the [SAS High-Performance Analytics Infrastructure documentation website](#).

### Step 4: Create Operating System Users and Groups and Designate Ports

Create a set of operating system users and groups that are required during the installation and configuration of your system. Designate a set of ports to use.

SAS Visual Analytics users must have an operating system account. For distributed environments, users must have passwordless SSH on all machines in the cluster or on blades across the appliance. SAS High-Performance Computing Management Console enables you to perform these two tasks from one location.

For more information, see Chapter 3, “Pre-Installation: Setting Up Users, Groups, and Ports,” on page 53.

### Step 5: (Optional) Set Up Certificates

Decide whether to use certificates to authenticate user and machine identities to secure communication between SAS web applications.

For more information, see Chapter 4, “Pre-Installation: Setting Up Certificates,” on page 69.

### Step 6: Deploy Required Third-Party Software

Install any required third-party products, such as Python. These products are identified in your deployment plan.

For more information, see Chapter 5, “Installing Third-Party Software,” on page 89.
Step 7: Deploy the Servers and Middle Tier

Install and configure your SAS LASR Analytic Server, SAS Visual Analytics server, and SAS Visual Analytics middle-tier software using the SAS Deployment Wizard. The wizard is an installation and configuration tool that is supplied by SAS.

For more information, see Chapter 6, “Deploying the SAS Visual Analytics Server and Middle Tier,” on page 95.
One prerequisite for deploying SAS is to create a special file system of SAS product and order data—a SAS Software Depot—that the SAS Deployment Wizard then uses to install and configure SAS.

Creating a SAS Software Depot is the first of seven steps required to install and configure SAS Visual Analytics.

1. Create a SAS Software Depot.
2. Check for documentation updates.
3. (Optional) Deploy the SAS High-Performance Analytics infrastructure.
4. Create operating system users and groups and designate ports.
5. (Optional) Set up certificates.
6. Deploy required third-party software. on page 89
7. Deploy the servers and middle tier.

About SAS Software Depots

A SAS Software Depot is a file system that consists of SAS installation files that represent one or more orders. The depot is organized in a specific format that is meaningful to the SAS Deployment Wizard, which is the tool installs and initially configures SAS. The depot contains the SAS Deployment Wizard executable, one or more deployment plans, a SAS installation data file per order, order data, and product data.

Figure 2.1  SAS Software Depot File Structure

Before you can install SAS, you must have a SAS Software Depot to install from. During a SAS software download, the SAS Download Manager downloads your order, verifies it, and automatically creates a SAS Software Depot. If you receive your SAS Software Order in the form of physical media, then you must create a depot using the SAS Deployment Wizard.
Benefits of a SAS Software Depot

The main advantage of a SAS Software Depot is realized when it resides on the network at a location that you can share access to. When it is shared, a depot provides a faster and more reliable means of installation compared to traditional removable media (cartridges, CDs, DVDs, and so on).
If you have remote sites running SAS without access to the network on which your depot resides, you can use the SAS Deployment Wizard to create your own SAS media image to write to the removable media of your choice.

Here are some other benefits of using a SAS Software Depot:

- centralizes SAS orders
  The depot enables you to place multiple SAS orders in one location to simplify initial SAS deployment and future maintenance.

- makes applying maintenance and upgrades easier
  You need only to download the changed depot files instead of having to download an entire SAS order.

- saves disk space
  Storing multiple SAS orders in a single depot saves disk space because any content shared between SAS orders is not duplicated, but rather shared, in the depot.

  A single depot in SAS 9.4 can store SAS installation data files for more than one operating system, making the single, multi-system SAS 9.4 depot cumulatively smaller than the multiple, single-system depots in older versions of SAS.

- saves download time
  Because there is a shared copy of common files, the single, multi-system SAS depot requires smaller amounts to download.

- organizes license keys (also known as SAS installation data files)
  The depot enables you to place SAS installation data files in a standard location to better associate license keys with their corresponding SAS orders. (These SAS installation data files are stored in the `sid_files` directory, directly under the depot’s root.)
identifies multiple SAS orders

The depot supports the SAS Deployment Wizard’s feature that enables you to customize order descriptions and enter notes to better identify multiple SAS orders residing in a single depot.

Because depots contain your personal SAS order, it is important to use the following best practices for securing and backing up your depot.

Best Practices for SAS Software Depots

For customers who download SAS, their SAS Software Depot is the only copy of their SAS order. The depot contains the files from which SAS is initially installed. For this reason, it is important to use these best practices when managing your depot:

- Keep your depot.
  - When you keep your SAS 9.4 depot, applying maintenance and upgrades becomes easier because you have to download only the changed depot files instead of downloading an entire SAS order.

- Locate in an empty directory.
  - Create or download your depot into an empty directory that will not be the future location of the SAS installation directory (SASHOME).

- Perform routine backups.
  - As with your SAS production system, it is important to routinely back up your SAS Software Depot and to verify the integrity of these backups.

  Note: Another important reason for securing and backing up your SAS Software Depot is that there are limits on the number of times that you can download your SAS order.

- Secure the depot location.
  - Problems such as data loss, virus infection, and file corruption can compromise your investment in SAS. It is imperative that you have a comprehensive security policy in place to protect your depot.

- Store SAS installation data files with your depot.
  - The SAS installation data file for your order contains information that is integral to successfully deploying SAS. As you get renewal installation data files from SAS—such as the file that contains your permanent SAS license key—it is important that you store them with your depot in the sid_files directory.

  CAUTION! Be careful to use the correct installation data file that contains the SAS products that you are planning to install. Using an incorrect file can cause failure when installing SAS add-on products or other errors later when attempting to run SAS.

- Create a SAS Software Depot administrator.
  - Consider designating one or more users to serve as SAS Software Depot administrators. Users needing to deploy SAS software or to apply maintenance require depot Read and Execute privileges. Depot administration tasks such as initially creating the depot, storing SAS
installation data files, and updating order details require depot Write privileges. Separating depot administration from routine depot usage is a best practice that further protects your SAS Software Depot.

Creating SAS Software Depots

Overview of Creating SAS Software Depots

There are two ways that you can create a SAS Software Depot.

- Download SAS software.
  When you download a SAS order, the SAS Download Manager automatically creates a SAS Software Depot on your system.

- Run the SAS Deployment Wizard.
  Creating a SAS Software Depot is an option on one of the wizard pages.

Before creating a depot, make sure that you have met the necessary requirements described in the following section.

Prerequisites for Creating a SAS Software Depot

Before you start creating a SAS Software Depot, make sure that you have met the following prerequisites:

- Choose a machine that has the following:
  - Internet access
    If you are downloading your SAS order, you need a machine that can access the SAS download website. Ideally, this machine should be networked so that you can perform deployments directly from the machine without having to physically relocate the depot to another machine.
  - Windowing environment
    If you want to run the SAS Download Manager and the SAS Deployment Wizard using a traditional graphical user interface, then on Linux, make sure that a windowing environment such as the Common Desktop Environment or X11 is installed.

  - certain Linux packages and libraries
    - The SAS Download Manager on some 64-bit distributions of Linux might require the compat-libstdc++ RPM.
    - The SAS Download Manager on Red Hat Enterprise Linux 5 or later requires both the 32-bit and 64-bit versions of the library, libXp.so, to be installed.
For more information, see the SAS Download Manager readme file.

- Designate a target directory.

  Decide where you will create the SAS Software Depot. It is helpful if this directory can be shared on a network and accessible to all of the machines on which you will be installing software from the depot.

  **Note:** SAS recommends that you do not copy a depot from one location to another. Choose a permanent location before you create the depot.

- Grant required access permissions.

  The SAS installer user must have Write access on the depot target directory.

  Windows requires that you run the SAS Download Manager installation program using administrator privileges.

- Check disk space requirements.

  Make sure you have enough free disk space available on the target directory.

  Just before creating a depot, the SAS Deployment Wizard and the SAS Download Manager both present you with an estimate for required disk space.

**Create a Depot By Using the SAS Download Manager**

A SAS Software Depot contains one or more deployment plans, a SAS installation data file, order data, and product data. The depot also contains the SAS Deployment Wizard executable—the tool required to install and initially configure SAS.

**Note:** There is no expiration date for downloading your SAS order. However, if the time period for your initial SAS installation data file has expired, you will have to obtain a current SAS installation data file before you can run the SAS Deployment Wizard.

Before you can create a depot by using the SAS Download Manager, you must first download it. So, there are two steps involved.

1. Download and run the SAS Download Manager.
2. Download a SAS order and automatically create a depot using the SAS Download Manager

Although these steps flow one after the other, at the end of each step, you can stop and resume the process later.

Follow these steps to download a SAS order and automatically create a depot using the SAS Download Manager:

1. Locate your software order e-mail sent by SAS. In this e-mail, find the URL for the SAS download website from where you will download the SAS Download Manager.

   **Note:** It is very important that you locate your original software order e-mail to get the correct order and SAS installation key to download the software. You cannot use the renewal order number. The renewal order is a license update and it cannot be used to download software. If you cannot locate your original software order e-mail, contact your SAS Installation Representative or SAS Contracts at the following URLs:
2 Make sure that you have met the necessary requirements described in “Prerequisites for Creating a SAS Software Depot” on page 18.

3 Log on to the machine as a SAS Software Depot administrator or a user with depot Read, Write, and Execute privileges.

   **Note:** Consider designating one or more users to serve as SAS Software Depot administrators. Users needing to deploy SAS software or to apply maintenance require depot Read and Execute privileges. Depot administration tasks such as initially creating the depot, storing SAS installation data files, and updating order details require depot Write privileges. Windows Vista and later requires that you run the SAS Download Manager installation program using administrator privileges.

4 Launch a web browser and navigate to the URL specified in your software order e-mail.

5 In the prompt in the dialog box, select the option that enables you to save the file to disk.

6 Choose a path accessible to the machine to download the SAS Download Manager.

   Your download begins.

7 When your browser has finished downloading the SAS Download Manager, run it. Select the language in which the SAS Download Manager displays messages and prompts.

8 At some sites, you might see a page that prompts for proxy information. If so, provide proxy server settings for the SAS Download Manager to access the Internet. If needed, contact your site’s system administrator for help with these settings.

9 When prompted, enter your order number and SAS installation key.
10 Verify the list of SAS products in your order.

We recommend that you add a description for your SAS order (for example, “TS1M0, Rev. 940_13w26”) to distinguish this from other SAS orders. The SAS Deployment Wizard will display this order information during the SAS installation.

Note: At any time after the download, you can run the SAS Deployment Wizard to add or modify SAS order information. For more information, see “Change Order Information” on page 41.

11 Select **Include complete order contents** if you do not want to subset your order. This selection causes the SAS Download Manager to include all the software in the order. For more information, see “Subsetting SAS Software Orders” on page 31.
Specify a location where you want to download SAS and build the SAS Software Depot.

We recommend that this directory be empty of any content. The exception is if this directory also contains other SAS Software Depots for the same SAS major release as this order.

For more information, see “Prerequisites for Creating a SAS Software Depot” on page 18.

If the directory that you specify does not exist, the wizard prompts you. If you want it to create the directory for you, click Yes.
The SAS Download Manager has finished collecting order input. This is your last opportunity to change any information before downloading the SAS order and writing files to the target directory.

Make one of the following choices:

- Click **Download** to begin downloading the SAS order and writing files to the target directory.
- Click **Back** to navigate to earlier pages to change order information previously entered.
- Click **Cancel** to terminate the SAS Download Manager session. Note that you will lose order the information previously entered.

**Note:** SAS tracks downloads and counts only a *complete* download toward your download limit.

The SAS Download Manager begins downloading, uncompressing, and creating a SAS Software Depot for your SAS order.
When you see a page similar to the following with the progress indicator at 100%, the SAS Download Manager is finished:

15 Click **Next** to go to the final page, which describes post-download instructions.

16 Click **Finish** to close the SAS Download Manager.
To continue with the software installation, proceed to Chapter 5, “Installing Third-Party Software,” on page 89.

After you finish your SAS 9.4 deployment, be sure to keep your SAS Software Depot, because it will make applying maintenance and future upgrades easier.

Create a Depot By Using the SAS Deployment Wizard

You can use the SAS Deployment Wizard to create a copy (or subset) of your SAS Software Depot in another directory. If the new depot location is a remote directory on another machine, the directory must be on a shared network drive accessible from the machine running the wizard.

To create a depot on a machine that does not have shared network storage, you must use another mechanism such as SFTP or SCP to copy the depot. (For more information about these programs, see your operating system documentation.)

To create a SAS Software Depot by using the SAS Deployment Wizard, follow these steps:

1. Make sure that you have met fulfilled the requirements described in “Prerequisites for Creating a SAS Software Depot” on page 18.

2. Log on to the machine that will contain the depot as a SAS Software Depot administrator or a user with depot Read, Write, and Execute privileges.

   Note: Consider designating one or more users to serve as SAS Software Depot administrators. Users needing to deploy SAS software or to apply maintenance require depot Read and Execute privileges. Depot administration tasks such as initially creating the depot, storing SAS installation data files, and updating order details require depot Write privileges. Windows Vista and later requires that you run the SAS Download Manager installation program using administrator privileges.
3 Start the SAS Deployment Wizard using one of two methods:
   - If you are starting the wizard from physical media, proceed as follows, depending on your operating system:
     - Windows:
       The `setup.exe` program starts automatically when the media is inserted into the drive.
       **Note:** If the SAS Deployment Wizard does not start automatically, open Windows Explorer, navigate to the media's root directory, and double-click `setup.exe`.
     - Linux:
       Navigate to the media's root directory, and enter `.setup.sh` at a command prompt.
   - If you are starting the wizard from an existing SAS Software Depot, proceed as follows, depending on your operating system:
     - Navigate to the depot's root directory, and do one of the following:
       - Windows:
         Double-click `setup.exe`.
       - Linux:
         Enter `.setup.sh` at a command prompt.

4 Select the language in which the SAS Deployment Wizard displays messages and prompts.

5 Select **Create or Add to a SAS Software Depot**. Do *not* select **Install SAS software**.

6 Verify the list of SAS products in your order.
We recommend that you update the description for your SAS order to distinguish this order from other SAS orders. The SAS Deployment Wizard will display this order information during the SAS installation.

Note: At any time after the download, you can rerun the SAS Deployment Wizard to add or modify SAS order information. For more information, see “Change Order Information” on page 41.

7 If you have multiple orders in your depot, you must select the order for which you want to create a depot. (Creating unique order descriptions helps you select the correct order.)

8 Select **Include complete order contents** if you do not want to subset your order. This selection causes the SAS Deployment Wizard to include all the software in the order. For more information, see “Subsetting SAS Software Orders” on page 31.
Specify a location where you want to download SAS and build the SAS Software Depot. (This location can be shared storage that physically resides on another machine.)

We recommend that this directory be empty of any content. The exception is if this directory also contains other SAS Software Depots for the same SAS major release as this order.

For more information, see “Prerequisites for Creating a SAS Software Depot” on page 18.

If the directory that you specify does not exist, the wizard prompts you. If you want it to create the directory for you, click Yes.
The SAS Deployment Wizard has finished collecting order input. This is your last opportunity to change any information before writing files to the target directory.

Make one of the following choices:

- Click **Start** to begin creating the depot in the target directory.
- Click **Back** to navigate to earlier pages to change order information previously entered.
- Click **Cancel** to terminate the SAS Deployment Wizard session. Note that you will lose the order information previously entered.

If you are running the SAS Deployment Wizard from physical media, the SAS Deployment Wizard prompts you for media. Continue to provide media as prompted.

**Note:** If you are working on a Linux system without an automounter, mount the device. For information about the privileges required to mount a device and the syntax of the `mount` command for your system, see the SAS Deployment Wizard and SAS Deployment Manager User's Guide, available at: [http://support.sas.com/documentation/installcenter/en/ikdeploywizug/66034/PDF/default/user.pdf](http://support.sas.com/documentation/installcenter/en/ikdeploywizug/66034/PDF/default/user.pdf).

The SAS Deployment Wizard begins creating a SAS Software Depot of your SAS order.

When you see a page similar to the following with the progress indicator at 100%, the SAS Deployment Wizard is finished:
14 Click **Next** to go to the final page, which describes post-creation.

15 Click the **depotsummary.html** link on the page to review the SAS QuickStart Guide.

16 Click **Finish** to close the SAS Deployment Wizard.
If you are using physical media on a Linux system with an automounter, use the `eject` command to remove the media. On a Linux system without an automounter, you must unmount the drive using the `umount` command, and then manually open the drive. For information about the `umount` command to unmount a device on your system, see the SAS Deployment Wizard and SAS Deployment Manager User’s Guide, available at http://support.sas.com/documentation/installcenter/en/ikdeploywizug/66034/PDF/default/user.pdf.

To continue with the software installation, proceed to Chapter 5, “Installing Third-Party Software,” on page 89.

After you finish your SAS 9.4 deployment, be sure to keep your SAS Software Depot, because it will make applying maintenance and future upgrades easier.

Subsetting SAS Software Orders

Overview of Subsetting SAS Software Orders

The SAS Deployment Wizard enables you to break up—or subset—your SAS software order. Subsetting your order makes it easier to provision individual SAS clients and conserves download time and disk space.
You have two options for subsetting your order.

- Use a pre-defined *recipe* to determine your order subset.
- Choose products to subset your order manually.

You can use the following characteristics to manually subset your order:

- product operating system
- SAS Foundation products
- product language

In addition, you can choose to subset your order manually by the following products:

- SAS client products that are not configurable (for example, SAS Enterprise Guide and SAS Add-In for Microsoft Office)
- SAS client products that are not configurable and include products from SAS Foundation

The SAS Deployment Wizard also enables you to create a list of the contents of your order subset. For more information, see “List Contents of Subsetted Orders” on page 40.

**Subset an Order Using a Recipe**

The SAS Deployment Wizard enables you to subset your SAS order using a recipe. A *recipe* is an XML file that contains a formula that the wizard uses to assemble a portion of the SAS Software Depot to subset your order. For example, you can subset a particular SAS product or group of products. The recipe has built-in intelligence and is able to determine the various software dependencies that a particular SAS product might have.
Note: Because of its large size, the utilities subdirectory is not included in a depot created using a recipe.

The alternative to subsetting your order with a recipe is to subset manually. For more information, see “Subset an Order Manually” on page 36.

To subset an order using a recipe, follow these steps:

1 Log on to the depot machine as a SAS Software Depot administrator or a user with depot Read, Write, and Execute privileges.
   Note: Consider designating one or more users to serve as SAS Software Depot administrators. Users needing to deploy SAS software or to apply maintenance require depot Read and Execute privileges. Depot administration tasks such as initially creating the depot, storing SAS installation data files, and updating order details require depot Write privileges. Windows Vista and later requires that you run the SAS Download Manager installation program using administrator privileges.

2 Start the SAS Deployment Wizard. Navigate to the depot’s root directory, and do one of the following, depending on your operating system:
   - Windows:
     Double-click setup.exe.
   - Linux:
     Enter ./setup.sh at a command prompt.

3 Select the language in which the SAS Deployment Wizard displays messages and prompts.

4 Select Create or Add to a SAS Software Depot.

5 If you have more than one order, select the order that you want to subset, and then click Next.
6 We recommend that you update the description for your SAS order to distinguish this order from other SAS orders. The SAS Deployment Wizard will display this order information during the SAS installation.

7 When you are finished adding order information, click Next.

8 Select Subset order contents, and click Next.

9 Select Pre-defined Subset Recipes, and click Next.

10 Specify the type of subset recipe that you are using.
   - standard subset recipe
Select **Select from the standard subset recipe files**, and then choose the appropriate recipe in the drop-down list.

- **customized subset recipe**
  
  Select **Specify the full path to a customized subset Recipes File**, and then click **Browse** to navigate to the recipe file (*recipe-name.xml*).

---

11 On the next page, you can refine the subset recipe by operating system and language and include the complete recipe in your subset. Click **Next**.

---

12 Specify a directory where the deployment wizard will create your depot, and click **Next**.
13 Review the Final Review page. If you are satisfied, click Start. Otherwise, click Back, and make changes.

14 After the depot has been created, click Finish to close the SAS Deployment Wizard.

Subset an Order Manually

The SAS Deployment Wizard, enables you to subset you SAS order manually by product operating system, product language, SAS Foundation products, and other characteristics.

The alternative to manually subsetting your order is to use a recipe. For more information, see “Subset an Order Using a Recipe” on page 32.

To subset an order manually, follow these steps:

1 Log on to the depot machine as a SAS Software Depot administrator or a user with depot Read, Write, and Execute privileges.

   Note: Consider designating one or more users to serve as SAS Software Depot administrators. Users needing to deploy SAS software or to apply maintenance require depot Read and Execute privileges. Depot administration tasks such as initially creating the depot, storing SAS installation data files, and updating order details require depot Write privileges. Windows Vista and later requires that you run the SAS Download Manager installation program using administrator privileges.

2 Start the SAS Deployment Wizard. Navigate to the depot’s root directory, and do one of the following, depending on your operating system:

   - Windows:
     Double-click setup.exe.
   - Linux:
Enter ./setup.sh at a command prompt.

3. Select the language in which the SAS Deployment Wizard displays messages and prompts.

4. Select Create or Add to a SAS Software Depot.

5. If you have more than one order, select the order that you want to subset, and then click Next.

6. We recommend that you update the description for your SAS order to distinguish this order from other SAS orders. The SAS Deployment Wizard will display this order information during the SAS installation.
When you are finished adding order information, click **Next**.

Select **Subset order contents**, and click **Next**.

Select **User Selected Subsets**, and refine your order by one of the following characteristics:

- **SAS Foundation Products**
  SAS products that are installed with Base SAS.

- **Client Products**
  SAS products that can be installed on client machines.

- **Non-configurable Products**
  SAS products for which the SAS Deployment Wizard does not prompt for configuration options.

Refine your order, by selecting one or more of the following options:

- **By product platform/operating system**
  Select products based on the operating systems on which they run.

- **By SAS Foundation products** or **By products**
  Select non-configurable SAS products by name. Depending on your previous selection, this list might include SAS Foundation products.

- **By product language**
  Select SAS products by the language in which they will be installed.
11 Depending on how you are subsetting your order, you will see additional wizard pages where you can refine your order even further. Make your selections, and click Next.

In this example, products are subsetted based on the operating systems on which they run.

12 Specify a directory where the deployment wizard will create your depot, and click Next.

13 Review the Final Review page. If you are satisfied, click Start. Otherwise, click Back, and make changes.
After the depot has been created, click **Finish** to close the SAS Deployment Wizard.

## List Contents of Subsetted Orders

It is helpful to know exactly which SAS products are in an order that has been subsetted. The SAS Deployment Wizard enables you to create a list of the contents of your order subset. You generate this list by using submitting a command when you invoke the wizard:

- **Windows**
  
  `setup.exe -listdepot output-pathname`

- **Linux**
  
  `setup.sh -listdepot output-pathname`

For example, a command on Linux might resemble the following:

```
./setup.sh -listdepot /mydata/order_contents.txt
```

The deployment wizard executable resides in your depot's root directory. The list resembles the following:

```
Date: 2013 Dec 12 10:02:56
Depot: /nfs/mymachine/vol/vol7/sas_software_depot

Order: 099SPS
+ Base SAS [base__94ts1m0_mvs_ne_sp0__1]
+ Base SAS [base__94ts1m0_mvs_w0_sp0__1]
+ Base SAS Help and Documentation [basedoc__94110_prt_xx_sp0__1]
+ Base SAS JAR Files [basejars__94110_prt_xx_sp0__1]
<...>

Order: 099SQ2_2011-12-01-12.27.01
+ Advanced Analytics Common Components [aacomp__94110_wx6_en_sp0__1]
+ DATA Step to DS2 Translator [accelmva__94160_wx6_en_sp0__1]
+ Microsoft Office Access Database Engine 2010 [ace__94112_prt_xx_sp0__1]
  - SAS/GRAFH ActiveX Control [activexgraph__94230_win_de_sp0__1]
  + SAS/GRAFH ActiveX Control [activexgraph__94230_win_en_sp0__1]
  + SAS/GRAFH ActiveX Control [activexgraph__94230_win_es_sp0__1]
```

The character at the beginning of a line indicates how to interpret the output.

A line beginning with a:

- **The line with the order number number has Order: at the beginning.**
- **plus sign (+) indicates that the product is in the order.**
- **minus sign (-) indicates that the product is in the depot, but it is not in the specified order.**

Managing SAS Orders

Overview of Managing SAS Orders

Using the SAS Deployment Wizard, you can do the following with your SAS order:

- “Change Order Information” on page 41
- “Delete an Order” on page 43
- “Create a Disc Image of Your Order” on page 45

Change Order Information

Being able to identify a SAS order is important, especially when your SAS Software Depot contains multiple orders. To change the information about a SAS order, follow these steps:

1. Log on to the depot machine as a SAS Software Depot administrator or a user with depot Read, Write, and Execute privileges.

   Note: Consider designating one or more users to serve as SAS Software Depot administrators. Users needing to deploy SAS software or to apply maintenance require depot Read and Execute privileges. Depot administration tasks such as initially creating the depot, storing SAS installation data files, and updating order details require depot Write privileges. Windows Vista and later requires that you run the SAS Download Manager installation program using administrator privileges.

2. Start the SAS Deployment Wizard. Navigate to the SAS Software Depot’s root directory, and do one of the following, depending on your operating system:

   - Windows: Double-click `setup.exe`.
   - Linux: Enter `./setup.sh` at a command prompt.

3. Select the language in which the SAS Deployment Wizard displays messages and prompts.

4. Select Manage this SAS Software Depot.
Select the order for which you want to change information, and then click **Change Details**.

Update the description for your SAS order to distinguish this order from other SAS orders. The SAS Deployment Wizard will display this order information during the SAS installation.
When you are finished adding order information, click **OK**.

Click **Finish** to close the SAS Deployment Wizard.

### Delete an Order

**CAUTION!** It is a best practice to always make sure that you have backed up the SAS Software Depot before deleting an order. Keep in mind that there are limits on the number of times that you can download an order from SAS.

To delete a SAS order, follow these steps:

1. Log on to the depot machine as a SAS Software Depot administrator or a user with depot Read, Write, and Execute privileges.

   **Note:** Consider designating one or more users to serve as SAS Software Depot administrators. Users needing to deploy SAS software or to apply maintenance require depot Read and Execute privileges. Depot administration tasks such as initially creating the depot, storing SAS installation data files, and updating order details require depot Write privileges. Windows Vista and later requires that you run the SAS Download Manager installation program using administrator privileges.

2. Start the SAS Deployment Wizard. Navigate to the depot’s root directory, and do one of the following, depending on your operating system:

   - **Windows:** Double-click **setup.exe**.
   - **Linux:** Enter `/setup.sh` at a command prompt.

3. Select the language in which the SAS Deployment Wizard displays messages and prompts.

4. Select **Manage this SAS Software Depot**.
5 Select the order that you want to delete, and then click **Delete Order**.

6 Confirm that you want to delete the order by clicking **Yes**.
The SAS Deployment Wizard begins to delete your order. When all of the order’s files have been deleted, the Manage SAS Software Depot page appears again, without the deleted order listed.

7 Select Finish to close the SAS Deployment Wizard.

Create a Disc Image of Your Order

If you have SAS running on a remote site that does not have access to the network on which your SAS Software Depot resides, you can use the SAS Deployment Wizard to create an ISO image of your order. Then, using a media creation tool of your choice you can write the ISO image to the physical media format that you specify: either CD or DVD.

You can create an ISO image on a per-order basis only. If your SAS Software Depot has more than one order, then you have to make an ISO image of each order.

To create an ISO image of your SAS order, follow these steps:

1 Log on to the depot machine as a SAS Software Depot administrator or a user with depot Read, Write, and Execute privileges.

   Note: Consider designating one or more users to serve as SAS Software Depot administrators. Users needing to deploy SAS software or to apply maintenance require depot Read and Execute privileges. Depot administration tasks such as initially creating the depot, storing SAS installation data files, and updating order details require depot Write privileges. Windows Vista and later requires that you run the SAS Download Manager installation program using administrator privileges.

2 Start the SAS Deployment Wizard. Navigate to the depot’s root directory, and do one of the following, depending on your operating system:

   - Windows:
     Double-click setup.exe.

   - Linux:
     Enter ./setup.sh at a command prompt.

3 Select the language in which the SAS Deployment Wizard displays messages and prompts.

4 Select Manage this SAS Software Depot.
Select the order for which you want to create an ISO image, and then click Create Media-Ready Image.

Select the type of media (CD or DVD) for which you want to create an image of your order. Provide the target directory where you want the SAS Deployment Wizard to write this image. When you are ready, click Start.
The SAS Deployment Wizard begins writing SAS order files to the target directory.

7 When the progress indicator displays 100%, the image is complete. Click OK.

8 Click Finish to close the SAS Deployment Wizard.

The file system that the SAS Deployment Wizard creates is an ISO image of your SAS order that is logically arranged into directories that map to either CD or DVD media. Each directory contains a summary to enable you to maintain media labels.

9 Using a media creation tool of your choice, you can now write the ISO image of your SAS order to physical media that you specified earlier: either CD or DVD.
Checking Your SAS Software Depot

Overview of Checking Your SAS Software Depot

SAS provides a utility with which you can verify the integrity of your SAS Software Depot. The SAS Software Depot Check Utility goes through your depot and assembles a list of the files contained in the depot. The utility identifies any missing files. For each file that it finds, the utility attempts to validate its size, checksum, and date-and-time stamp.

The utility lists the results of its various validation tests in the output file sas_depot_check.out. The utility attempts to fix any problems that it encounters. Any fixes that it makes are written in a second output file, sas_depot_check.update.

The following is the content of a sas_depot_check.out file when the utility was run on Linux:

SAS Software Depot Check Utility version 4.3

Missing File(s)
No files are missing.

Wrong Size File(s)
All files had the correct size.

Wrong Checksum File(s)
All files had the correct checksum.

Wrong Owner File(s) (Execute /home/sas/sas_depot_check.update for fix)
All files had the correct owner.

Wrong Group File(s) (Execute /home/sas/sas_depot_check.update for fix)
All files had the correct group.

Wrong Permission File(s) (Execute /home/sas/sas_depot_check.update for fix)
/sas_software_depot/order_data/09B9WN/order.xml
/sas_software_depot/cd.id

Missing volsers in cd.id that have been corrected
All volsers were listed in cd.id.

The following is the content of a sas_depot_check.update file when the utility was run on Linux:

chmod 755 "/sas_software_depot/order_data/09B9WN/order.xml"
chmod 755 "/sas_software_depot/cd.id"

You run the utility as a command with options on Windows and Linux systems only. On Windows, a graphical user interface is available.

For more information, see the following:

- "Check Your SAS Software Depot on Windows" on page 49
- "Check Your SAS Software Depot on Linux" on page 50

Check Your SAS Software Depot on Windows

To run the SAS Software Depot Check Utility on Windows, follow these steps:

Note: It is recommended that you use the same Windows user account with which the SAS Software Depot was created to run the SAS Software Depot Check Utility.

1. Locate the utilities\depotchecker directory under your SAS Software Depot directory, and click OK.

2. Double-click SASDepotCheck.exe.

3. In the dialog box that appears, navigate to the top level directory of your depot.

4. In the dialog box that appears, navigate to the directory where you want the utility to write its output, and click Open. (This output will be in the form of one or more text files.)
5 The utility asks whether you want it to continue checking your depot if it finds more than 10 problems. Click Yes.

6 The utility asks whether you want it to list all of the files that it examines in its output file. Click Yes.

The utility begins sweeping your depot. The time required to complete the sweep depends on the size of your depot.

7 When the utility has finished, its output file should automatically open in your default text editor.

If this does not happen, navigate to the output directory that you specified, and open SASDepotCheckResults.txt.

**Check Your SAS Software Depot on Linux**

To run the SAS Software Depot Check Utility on Linux, follow these steps:

Note: It is recommended that you use the same Linux user account with which the SAS Software Depot was created to run the SAS Software Depot Check Utility.

1 Navigate to the utilities/depotchecker directory under your SAS Software Depot directory.

2 Enter the following command:

   ```bash
   ./sas_depot_check.sh -i depot_root_directory -o output_file_path
   ```

   - `depot_root_directory` (required) is the top level directory of your depot.
   - `output_file_path` (required) is the absolute directory path where the utility writes its output (one or more text files).

   You can also specify these options:
-t
  (Optional) Causes the utility to stop checking your depot if it finds more than 10 problems.

-v
  (Optional) Writes all of the found depot files in the output file.
Deployment Process Overview: Step Four

Before you begin installing and configuring your software, you must create a set of required users and groups at the operating-system level, and you must designate a set of TCP/IP ports for the servers to use. This is the fourth of seven tasks required to install and configure SAS Visual Analytics.

1. Create a SAS Software Depot.
2. Check for documentation updates.
3. (Optional) Deploy the SAS High-Performance Analytics infrastructure.
4. Create operating system users and groups and designate ports.
5. (Optional) Set up certificates.
6. Deploy required third-party software. on page 89
Defining User Accounts

Overview of Defining User Accounts

There are two types of user accounts to understand when deploying SAS:

- **Internal user accounts** are accounts known only to SAS and are created and authenticated internally in SAS metadata rather than externally.
- **External user accounts** are accounts created outside of SAS metadata. These accounts are local to a machine or are defined in a network directory service of which the machine is a member, such as LDAP.

The following sections describe the user accounts that SAS and third-party software require. They help you answer these questions:

- What are internal and external user accounts?
- What user rights does each account have and to what groups must each account be assigned?
- Should I create local or network directory service accounts?
- What password policies should I enforce?

Controlling User Access to Hosts

SAS Visual Analytics uses passwordless secure shell (SSH) for access to the machines in the analytics cluster. The following list identifies some of the requirements for configuring passwordless SSH to enable access:

- Data administrators must configure their user accounts for passwordless SSH to start and stop SAS LASR Analytic Server instances. Passwordless SSH is also needed to load and unload tables to server instances. For more information, see SAS High-Performance Analytics Infrastructure: Installation and Configuration Guide, available at http://support.sas.com/documentation/solutions/hpainfrastructure/.

- User accounts that are used as shared logins for group access to data must be configured for passwordless SSH. For more information, see SAS High-Performance Analytics Infrastructure: Installation and Configuration Guide, available at http://support.sas.com/documentation/solutions/hpainfrastructure/.

To reduce the number of operating system (external user) accounts, use the SAS Installer account for running SAS LASR Analytic Server monitor. Although not required, it is useful to create a SAS First User (sasdemo) account to do a simple validation of your deployment after installation and initial configuration.

Internal User Accounts

SAS identifies internal user accounts by appending a special string to the user ID. This string begins with an at sign (@) and contains saspw (for example, @saspw). For two of the required user accounts, the SAS Administrator and the
SAS Trusted User, the SAS Deployment Wizard prompts you by default to create *internal* user accounts.

The following table shows the default internal user accounts required by SAS. (SAS internal user accounts are authenticated on the SAS Metadata Server.)

**Table 3.1 SAS Internal User Accounts**

<table>
<thead>
<tr>
<th>Description</th>
<th>User ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS Administrator</td>
<td>sasadm@saspw</td>
</tr>
<tr>
<td>The user account that has privileges associated</td>
<td></td>

</tr>
</tbody>
</table>
For more information about SAS internal user accounts and their purposes, see Chapter 2, “Understanding the State of Your System,” in SAS Intelligence Platform: System Administration Guide.

Here are some benefits of internal user accounts:

- less maintenance

  The account is defined only once in SAS. You do not define this account externally using the authentication provider.

- isolation from the host machine security policy

  The SAS Administrator and the SAS Trusted User credentials are referenced in many locations within SAS. For example, forcing a recurring password change (a common security policy) might make unnecessary work for the person administering SAS.

- independence from IT

  You can create additional SAS unrestricted user and administrative user accounts for metadata management without involvement from your IT department.

- reduced “headless” external user accounts

  The SAS Trusted User is an account used for SAS inter-process communication. It will not be mistaken for a human user.

- minimal security exposure to your enterprise

  The SAS Administrator and the SAS Trusted User are highly privileged accounts and only provide access to SAS—not to operating system resources.

### Required External User Accounts for SAS

SAS requires certain external user accounts for two purposes: installing and running certain SAS server processes.
During installation and configuration, the SAS Deployment Wizard must run under an external user account with the necessary privileges on the target machine to write SAS program and log files. To run servers such as the SAS Stored Process Server and the SAS Pooled Workspace Server, SAS requires an external user account to be the server process owner. For more information about SAS external user accounts and their purposes, see “About the Initial User Accounts” in Chapter 2 of SAS Intelligence Platform: System Administration Guide, available at http://support.sas.com/documentation/solutions/hpainfrastructure/.

Although it is not required, you might find it useful to create a SAS First User account. You can use this account to test a typical user’s ability to access various SAS applications and to validate your deployment. (A SAS First User account is sometimes referred to as the sasdemo account.) The SAS Deployment Wizard asks you if you want to create a SAS First User account in SAS metadata, and you must have an external operating system account available for this purpose. After the wizard finishes, remember that you must add this SAS user to the Visual Analytics Data Administrators Group. For more information, see “Create SAS Users and Groups” on page 159.

As you set up external user accounts, remember to use different external accounts for the SAS First User and the SAS Spawned Servers accounts. Otherwise, your configuration will generate errors and the SAS Pooled Workspace Server will not be functional.

As you create these external user accounts, record information about them in the “Pre-installation Checklist for External User Accounts for SAS Visual Analytics” on page 59. You will need this information when you run the SAS Deployment Wizard later.

The following table shows the external user accounts required by SAS, the recommended user ID, and the machines on which they are authenticated.

<table>
<thead>
<tr>
<th>Description</th>
<th>Recommended User ID</th>
<th>Machine Where Authenticated</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS Installer</td>
<td>sas</td>
<td>Every machine</td>
</tr>
<tr>
<td>This user account installs SAS and</td>
<td></td>
<td></td>

<td></td>
<td>SAS Pooled Workspace Server</td>
</tr>
<tr>
<td>owner for SAS Stored Process</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Servers and SAS Pooled Workspace</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Servers.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note:

- For information about the user rights that each external account requires, see “Rights Required by SAS External User Accounts” on page 58.
The SAS Installer generally overrides the default configuration directory with the site’s preferred location (for example, /opt/sas/config). The SAS Installer must have Write permission on this path.

Do not use root for the SAS Installer user ID.

**TIP** To understand the user accounts required by the SAS analytics cluster, see “Preparing Your System to Deploy the SAS High-Performance Analytics Infrastructure” in *SAS High-Performance Analytics Infrastructure: Installation and Configuration Guide*, available at http://support.sas.com/documentation/solutions/hpainfrastructure/.

### Rights Required by SAS External User Accounts

Operating systems require that you assign certain rights to the external user accounts used to deploy and to run SAS.

The following table describes the user rights required:

**Table 3.4  Rights Required by External User Accounts for SAS**

<table>
<thead>
<tr>
<th>External User Account</th>
<th>User Rights Needed</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS Installer</td>
<td>The group that you designate as the primary group for the SAS Installer must contain the SAS Spawned Servers account.</td>
</tr>
<tr>
<td>SAS Spawned Servers</td>
<td>Member of a group that is the primary group for the SAS Installer.</td>
</tr>
<tr>
<td></td>
<td>(This group does not have to be the primary group for the SAS Spawned Servers account.)</td>
</tr>
</tbody>
</table>

### Password Policies

**Note:** This section addresses the passwords for the external user accounts that SAS requires, not the passwords for regular users of the system.

When you set up passwords for your SAS external user accounts, we *highly recommend* that these passwords do not have to be reset when a user first logs on. If, for some reason, it is required that you create passwords that have to be reset, you will have to log on using each account and change the password before you install and configure your software. And, of course, you will need to know the changed password for each account.

By default, passwords for internal user accounts are set not to expire. When passwords for user accounts change, you must use SAS Deployment Manager to update a set of configuration files and some metadata objects. SAS provides instructions for updating these files and metadata objects.

Pre-installation Checklist for External User Accounts for SAS Visual Analytics

Use the following pre-installation checklist to create the necessary external user accounts to deploy and run SAS Visual Analytics.

**Note:** This checklist is superseded by a more complete and up-to-date checklist that can be found at [http://support.sas.com/installcenter/plans](http://support.sas.com/installcenter/plans). This website also contains a corresponding deployment plan and an architectural diagram.

**Table 3.5** Pre-installation Checklist for External User Accounts for SAS Visual Analytics

<table>
<thead>
<tr>
<th>Account</th>
<th>Recommended User ID</th>
<th>Actual User ID You Are Using</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS Installer</td>
<td>sas</td>
<td></td>
</tr>
<tr>
<td>SAS Spawned Servers</td>
<td>sassrv</td>
<td></td>
</tr>
</tbody>
</table>

**CAUTION!** Do not use root as the installer account.

Note these important items:

- For information about the user rights that each external account requires, see “Rights Required by SAS External User Accounts” on page 58.

- The SAS Deployment Wizard prompts you for SAS Installer account and SAS Spawned Servers account information. You cannot complete the installation without providing it.

- Prior to configuration, the SAS Deployment Wizard prompts you for the root (or sudo) password. Certain SAS products and features use functionality that requires SAS to check user ID authentication and file access authorization. This, in turn, necessitates that certain files within your SAS installation have setuid permissions and be owned by root.

- If your system uses an authentication method other than `/etc/passwd` or `/etc/shadow`, then you must configure authentication before you begin your SAS software deployment or SAS Visual Analytics will not function properly. For more information, see the *Configuration Guide for SAS 9.4 Foundation for UNIX Environments*, available at [http://support.sas.com/documentation/installcenter/en/ikfdtnunxcg/66380/PDF/default/config.pdf](http://support.sas.com/documentation/installcenter/en/ikfdtnunxcg/66380/PDF/default/config.pdf).

---

### Defining Groups

#### Define the sas Group

To deploy SAS Visual Analytics, you should create an operating system group called sas and make it the primary group for the SAS Installer user. The SAS Spawned Servers account should be made a member of the sas group. (Members of the sas group are given access to certain directories and files created by the SAS Deployment Wizard.)
For information about creating groups and adding user accounts, see your Linux documentation.

Pre-installation Checklist for Groups for SAS Visual Analytics

Use the following pre-installation checklist to make sure that you have created the necessary groups to deploy and run SAS Visual Analytics.

Note: This checklist is superseded by a more complete and up-to-date checklist that can be found at http://support.sas.com/installcenter/plans. This website also contains a corresponding deployment plan and an architectural diagram.

Table 3.6 Pre-installation Checklist for Groups for SAS Visual Analytics

<table>
<thead>
<tr>
<th>Recommended Group Name</th>

</tr>
</tbody>
</table>
Configuring Machine Access

For the SAS LASR Analytic Server Monitor process to be able to show the tables that are in-memory on a server instance, network name resolution might need to be modified on the machine that runs the SAS Visual Analytics middle-tier machine.

For deployments that use SAS High-Performance Deployment of Hadoop as a co-located data provider, the middle-tier machine typically has network name resolution without additional modification. However, if the machines in the cluster use multiple network interfaces, then make sure that network name resolution works. For /etc/hosts on the SAS middle-tier machine, make sure that your machine names resolve. For example:

```
255.255.255.255  gridhost01  gridhost01.example.com  hdfs0
# hdfs0 is not normally public
```

Designating Ports and Multicast Addresses

About Ports and Multicast Addresses

While you are creating operating system user accounts and groups, you need to review the set of ports that the SAS servers, third-party servers, and spawners in your system will use by default. If any of these ports are unavailable, select an alternate port and record the new port on the following ports pre-installation checklist “Pre-installation Checklist for Ports for SAS” on page 63.

You need to plan for designating IP multicast addresses for all of the machines in your SAS deployment. Multicasting simplifies the ongoing management and deployment of SAS web applications by providing the flexibility to customize the SAS middle tier and to distribute SAS web components to implement load balancing.

Multicast Address Considerations

The SAS Deployment Wizard prompts you to supply a multicast address for inter-machine communication. The wizard provides you with a default multicast address that it generates based on the machine's IP address and the admin-local scope that is recommended in RFC 3171 (IPv4) or RFC 4291 (IPv6).

A multicast group communication protocol is used to communicate among middle-tier SAS applications in a single SAS deployment (the SAS applications connected to the same SAS Metadata Server). The combination of multicast IP address and multicast UDP port should be different for each SAS deployment and different from those used by other multicast applications at your site.

The IP multicast address must be valid for IP multicasting and should be in the range 224.0.0.0 to 239.255.255.255 for IPv4 or have the prefix ff00::/8 for IPv6. Typically, the chosen IP multicast address is in the admin-local scope block, which corresponds to 239/8 for IPv4 and ff14::/8 for IPv6. The sample address provided during configuration by the SAS Deployment Wizard conforms to these
standards. The address should be unique to SAS applications for the subnet that they are installed on.

The IP multicast UDP port should be open and usable on any machine on which a middle-tier application is to be installed. This is a UDP port and does not conflict with any previous TCP port definitions such as the SAS Metadata Server. The multicast group communication is intended to be used only within your data center environment. Many sites keep their data center network separated from users via a firewall that will automatically isolate the multicast protocol. Alternatively, the time to live (TTL) parameter can be used to restrict the scope of multicast communication. Your network administrator can suggest a TTL setting to limit the scope of multicast. The TTL option and the authentication token option both have security implications.

The multicast TTL parameter (default = 1, range = 0–255) affects the number of network hops a multicast packet can take before being dropped. This TTL value must be greater than or equal to the highest number of hops between any two servers containing SAS products. In addition, some network router documentation recommends that multicast datagrams with initial TTL=0 are restricted to the same host, multicast datagrams with initial TTL=1 are restricted to the same subnet, and multicast datagrams with initial TTL=32 are restricted to the same site. Consult your network router documentation or your network administrator to determine the correct values for your environment.

**Note:** Make sure that all of the machines in your SAS 9.4 deployment are members of the same subnet or be sure to set the default TTL value to a number higher than 1. The deployment wizard lets you set the TTL value during SAS 9.4 deployment. For information about how to change this option after deployment, see Appendix 2, “Administering Multicast Options,” in SAS Intelligence Platform: Middle-Tier Administration Guide.

Because the multicast protocol conveys credentials, it is protected via encryption. By default, the multicast group communication is protected only with a fixed encryption key that is built into the software. If your middle tier is running in an environment that is not well-isolated from user access, then you might want better protection against eavesdroppers and unauthorized group participants. In this case, choose an authentication token known only to your SAS middle-tier administrative users. The authentication token is a password-like string needed to connect to the multicast group and create a site-specific encryption key.

The deployment wizard default simplifies configuration by using the authentication token that is built into the software. This option is best used in development and other low-security environments. It might also be appropriate in higher-security environments where the multicast group communication is isolated from the user community, either via a firewall or TTL option, and where all data center administrative users and operational users have sufficient security approval.

If your multicast group communication is not within a well-isolated data center environment, or if the security procedures at your site require protection for administrative users and operational users in various roles, you should specify an authentication token that is known only to the administrators of the SAS environment. The same token string must be supplied on each tier in the configuration.

By default, there is a code-level authentication token shared between all SAS middle-tier applications to prevent access to the multicast group from
unauthorized listeners. If you choose to use a customized authentication token, use the deployment wizard to enter an authentication token value that meets your organization's security guidelines. The authentication token can be any password-like string. In a multi-tier configuration, a prompt appears on each tier that has an application participating in the SAS multicast group. You must provide the same authentication token string to each tier in the same SAS deployment (that is, each tier associated with the same SAS Metadata Server).

Pre-installation Checklist for Ports for SAS

Use the following pre-installation checklist to see what ports are used for SAS by default and to record the port numbers that you are actually using.

**Note:** The SAS Deployment Wizard prompts you for this information. You cannot complete the installation without providing it.

The last digit of the default port number reflects the configuration level that you select in the SAS Deployment Wizard. For example, if you select **Lev1**, the default port for the SAS Metadata Server is 8561. If you select another level, such as **Lev2**, the wizard changes the default port to 8562.

**Note:** This checklist is superseded by a more complete and up-to-date checklist that can be found at [http://support.sas.com/installcenter/plans](http://support.sas.com/installcenter/plans). This website also contains a corresponding deployment plan and an architectural diagram. Consult the pre-installation checklist provided by your SAS representative for a complete list of ports that you must designate.

* If the default port is set to zero, the operating system selects an available port. Each process on a machine must have its own TCP port. Some operating systems restrict the range of ports usable by non-privileged users, and using restricted port numbers can cause run-time errors in GemFire start-up.

** The range of ephemeral ports available for unicast UDP messaging and for TCP failure detection in the peer-to-peer distributed system. These ephemeral ports are created from available ports in a system.
When deploying SAS Visual Analytics, you must decide whether to use certificates. If you choose to secure communication between SAS web applications, then setting up certificates is the fifth of seven tasks required to install and configure SAS Visual Analytics.

1. Create a SAS Software Depot.
2. Check for documentation updates.
3. (Optional) Deploy the SAS High-Performance Analytics infrastructure.
4. Create operating system users and groups and designate ports.
5. (Optional) Set up certificates.
6. Deploy required third-party software. on page 89
7. Deploy the servers and middle tier.

What Are Certificates?

Transport Layer Security (TLS) and its predecessor, Secure Sockets Layer (SSL), are cryptographic protocols that are designed to provide communication security over the Internet. TLS and SSL are protocols that provide network data privacy, data integrity, and authentication.

Note: All discussion of TLS is also applicable to the predecessor protocol, SSL.

TLS uses X.509 digital certificates and asymmetric cryptography to authenticate entities—whether that entity is a server process or a human user.

When messages are exchanged between entities, there is a risk that a message can be intercepted and that a process or a user can become impersonated. Certificate authorities (CAs) are trusted parties that provide confidence that a public key truly belongs to an entity.

You request that the CA issue a certificate that contains your public key. The entity that receives your message acknowledges that your certificate is issued by a CA that it recognizes and is able to substantiate your identity.

Authenticating entities is accomplished through certificates issued by three types of CAs:

- third-party-signed
  You go to a commercial third-party CA, such as VeriSign, to purchase a certificate.
- site-signed
  You go to the IT department at your site to obtain a certificate.
- self-signed
  You serve as your own CA and obtain a certificate using the certificate management tool on your machine.

Some SAS Entities That Use Certificates

These SAS entities can be secured with TLS certificates:

- SAS Deployment Agent
  The SAS Deployment Agent and its remote client perform configuration management operations for clustering and backups. There is one SAS Deployment Agent and its remote client per machine in the deployment.

  During installation, the SAS Deployment Wizard can automatically create self-signed certificates for you. However, you can specify your own site-signed or third-party-signed certificates instead.
For more information, see “How SAS Deployment Agent Uses Certificates” on page 71.

- SAS Environment Manager Server and Agent

SAS Environment Manager is an operational monitoring and management system for SAS deployments. SAS Environment Manager incorporates Hyperic technology from VMware to offer enterprise-class operational features.

During installation, the SAS Deployment Wizard can automatically create a self-signed certificate for you. However, you can specify your own site-signed or third-party-signed certificate instead.

Proceed to the topic “Overview of Implementing Certificates”

- SAS Information Retrieval Studio

SAS Information Retrieval Studio combines several key technologies to provide a comprehensive solution for data collection, indexing, searching, and so on. These technologies are bundled into one customizable product.

To secure SAS Information Retrieval Studio, there is a setup task and a post-deployment task that you must complete.

Proceed to the topic “Overview of Implementing Certificates”

- SAS Web Server

SAS Web Server is an HTTP server based on Pivotal Web Server.

A native application built with OpenSSL, the SAS Web Server does not use Java Keystores. The SAS Web Server requires the following:

- an RSA private key, not protected with a passphrase
- an X.509-signed certificate containing the public key in PEM-encoded format

Proceed to the topic “Overview of Implementing Certificates”
By default, the wizard generates a self-signed certificate to secure both the deployment agent and its remote client. We recommend that users unfamiliar with security setup use the default self-signed certificates. If your site requires a site-signed or third-party-signed certificate, then you must supply paths to both the deployment agent and remote client keystore and truststore locations and their respective passwords when prompted by the wizard. For more information, see “Certificates for SAS Deployment Agent” on page 73.

If you want to use site-signed or third-party-signed certificates, but you are not ready to deploy them, you can initially configure the deployment agent with no security, and then go back and add the certificates later with the SAS Deployment Manager.

You might want to use the same certificate (cacerts) for the deployment agent that the SAS Web Server uses. In this case, configure the deployment agent with no security, and then after you finish deploying SAS, use the SAS Deployment Manager to configure the deployment agent to use cacerts, the default private JRE truststore.

For more information about configuring the deployment agent later, see the SAS Deployment Wizard and SAS Deployment Manager: User’s Guide.

Proceed to the topic “Overview of Implementing Certificates”

---

**Overview of Implementing Certificates**

This topic describes the overall process for implementing certificates in SAS 9.4.

**Note:** For SAS Deployment Agent and SAS Environment Manager server and agent, the SAS Deployment Wizard can automatically create a self-signed certificate for you. In this case, you do not need to perform the steps in this topic. However, if you want to use site-signed or third-party-signed certificates for these products, perform the steps that follow:

1. Decide which type of CA authority to use at your site:
   - site-signed
   - third-party-signed

2. If you are using site-signed or self-signed certificates, be aware of the special deployment process required for SAS web applications. For more information, see “Configure Clients to Trust SAS Web Server with Site-Signed and Self-Signed Certificates”.

3. Create a certificate signing request and submit it to the CA.

   For more information, go to the link appropriate for your operating system.

   - On Windows, see “TLS on Windows: Setting Up Digital Certificates” in Chapter 8 of *Encryption in SAS*, available at [http://support.sas.com/documentation/cdl/en/secref/67436/HTML/default/viewer.htm#p1g2v5c010q6gy1f8f17r7pdi3.htm](http://support.sas.com/documentation/cdl/en/secref/67436/HTML/default/viewer.htm#p1g2v5c010q6gy1f8f17r7pdi3.htm).

Follow the steps in “Implementing Certificates” on page 73.

Perform the post-deployment tasks described in “Post-Deployment Steps for Certificates” on page 83.

Implementing Certificates

Certificates for SAS Deployment Agent

Overview of Certificates for SAS Deployment Agent

The SAS Deployment Wizard configures communication between the SAS Deployment Agent and its remote client using two-way client authentication. Therefore, the deployment agent and its remote client each has to have access to a keystore and truststore. When multiple machines are involved, having a single keystore and truststore is necessary so that all of the remote clients can communicate with all of the deployment agents.

By default, during installation, the deployment wizard generates a self-signed certificate to secure communication between the SAS Deployment Agent and its remote clients. There is one SAS Deployment Agent and its remote client per machine in the deployment. We recommend that users unfamiliar with security setup use the default self-signed certificates.

Make one of the following choices:

- If you choose to use the default self-signed certificates, then no preparation is required before running the deployment wizard.

  When you are finished, proceed to the topic, “Implement Certificates for SAS Deployment Agent” on page 74.

- If your site requires the use of pre-existing self-signed, site-signed, or third-party-signed certificates, then you must supply paths to both the deployment agent and remote client keystore and truststore locations and their respective passwords when prompted by the deployment wizard.

  Proceed to the topic “Pre-installation Checklist for Certificates for SAS Deployment Agent”

Pre-installation Checklist for Certificates for SAS Deployment Agent

If you need to use a pre-existing self-signed, site-signed, or third-party-signed certificate, record their keystore and truststore locations and passwords in the following table.

Your keystores and truststores must be in either JKS or PKCS12 format. The SAS Deployment Wizard encodes the passwords that you supply into SAS proprietary (SAS002) format.

The SAS Deployment Wizard prompts you for this information during SAS installation and configuration.

When you are finished, proceed to the topic, “Implement Certificates for SAS Deployment Agent” on page 74.

Implement Certificates for SAS Deployment Agent

During installation, the SAS Deployment Wizard gives you two options for configuring secure communication between the SAS Deployment Agent and its remote clients:

- The deployment wizard generates self-signed certificates for you.
- You provide pre-existing self-signed, site-signed, or third-party-signed certificates.

If you want the deployment wizard to generate self-signed certificates for you, then when you are prompted, select **Generate credentials to secure the connection**.
If you are providing pre-existing self-signed, site-signed, or third-party-signed certificates, then select **Specify existing credentials to secure the connection**.

Click **Next**. The deployment wizard prompts you for the SAS Deployment Agent keystore location and password.
Click **Next**. The deployment wizard prompts you for the SAS Deployment Agent truststore location and password.

*Figure 4.3 SAS Deployment Agent Truststore Credentials*

Because the deployment wizard configures communication between the SAS Deployment Agent and its remote client using two-way client authentication, the wizard prompts you for the path to the remote client keystore location and password.

*Figure 4.4 SAS Remote Deployment Agent Client Keystore Credentials*
Click **Next**. The deployment wizard prompts you for the remote client truststore location and password.

**Figure 4.5** SAS Remote Deployment Agent Client Truststore Credentials

Proceed to the topic "Certificates for SAS Environment Manager"

**Certificates for SAS Environment Manager**

**Overview of Certificates for SAS Environment Manager**

By default, during installation, the deployment wizard generates a self-signed certificate to secure communication between the SAS Environment Manager server and its agent. Site-signed or third-party-signed certificates enable secure communication for SAS Environment Manager users who connect using a web browser. We recommend that users unfamiliar with security setup use the default self-signed certificates.

Make one of the following choices:

- If you choose to use the default self-signed certificates, then no preparation is required before running the deployment wizard.

  Proceed to the topic “Implement Certificates for SAS Environment Manager” on page 78.

- If your site requires the use of a pre-existing self-signed or site-signed, or third-party-signed certificate, then you must supply paths to both the server and agent keystore locations and their respective passwords when prompted by the deployment wizard.

  Proceed to the topic, “Pre-installation Checklist for Certificates for SAS Environment Manager”.
Pre-installation Checklist for Certificates for SAS Environment Manager

If you need to use a pre-existing self-signed, site-signed, or third-party-signed certificate, record thekeystorelocations and their respective passwords. The SAS Deployment Wizard prompts you for keystore andtruststoreinformation during SAS installation and configuration.

When you are finished, proceed to the topic, “Implement Certificates for SAS Environment Manager” on page 78.

Table 4.2  Pre-installation Checklist for Keystore Information

<table>
<thead>
<tr>
<th>Keystore Properties</th>
<th>Actual Value You Are Using</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS Environment Manager Server keystore path</td>
<td></td>
</tr>
<tr>
<td>SAS Environment Manager Server keystore password*</td>
<td></td>
</tr>
<tr>
<td>SAS Environment Manager alias*</td>
<td></td>
</tr>
<tr>
<td>SAS Environment Manager Agent keystore path</td>
<td></td>
</tr>
<tr>
<td>SAS Environment Manager Agent keystore password</td>
<td></td>
</tr>
</tbody>
</table>

* SAS Environment Manager requires that the keystore alias and its password be identical.

Implement Certificates for SAS Environment Manager

During installation, the SAS Deployment Wizard gives you two options for configuring a secure communication between the SAS Environment Manager server and its agent:

- The deployment wizard generates a self-signed certificate for you.
- You provide a pre-existing self-signed, site-signed, or third-party-signed certificate.

If you want the deployment wizard to generate a self-signed certificate for you, then when you are prompted, select Use the default JKS format keystore from SAS Environment Manager.
If you are providing a pre-existing self-signed certificate or a site-signed or third-party-signed certificate, then select **Use a customer-supplied JKS format keystore**.

If you selected **Use a customer-supplied JKS format keystore**, the deployment wizard prompts you for the keystore locations and their respective password.

**Note:** SAS Environment Manager requires that the keystore password and private key password be identical. For more information, see [http://pubs.vmware.com/vfabric5/index.jsp?topic=/com.vmware.vfabric.hyperic.4.6/Configure_SSL_Options.html](http://pubs.vmware.com/vfabric5/index.jsp?topic=/com.vmware.vfabric.hyperic.4.6/Configure_SSL_Options.html).
Certificates for SAS Information Retrieval Studio

During installation, there are no security-related prompts to respond to when deploying SAS Information Retrieval Studio. However, you must perform the following task, based on your operating system:
On Linux, create a trust list.

For more information, see “TLS on UNIX: Setting Up Digital Certificates” in Chapter 7 of *Encryption in SAS*, available at http://support.sas.com/documentation/cdl/en/secref/67436/HTML/default/viewer.htm#p0gy97oedcx0fin1n83srxczpqzk.htm.

On Windows, make sure that all the CAs are members of the Trusted Root Certification Authorities (TRCA) store.

- You can use your web browser to see whether a CA is a member of the TRCA store. Point it to your secure SAS Web Server and view the certificate. For more information, see your web browser documentation.

- If the CA is not a member of the TRCA store, add it. For more information, see “TLS on Windows: Setting Up Digital Certificates” in Chapter 8 of *Encryption in SAS*, available at http://support.sas.com/documentation/cdl/en/secref/67436/HTML/default/viewer.htm#p1g2v5c010q6gyn1fi8f17r7pdi3.htm.

After you deploy SAS Information Retrieval Studio, there is a second task that you must perform. For more information, see “Post-Deployment Step for SAS Information Retrieval Studio” on page 84.

Proceed to the topic, “Certificates for SAS Web Server”.

### Certificates for SAS Web Server

#### Overview of Certificates for SAS Web Server

During installation, the deployment wizard enables you to secure communication between the SAS Web Server and its SAS Java clients. The SAS Web Server is a native application built with OpenSSL. It does not use Java Keystores. The SAS Web Server requires the following:

- an RSA private key, not protected with a passphrase
- an X.509-signed certificate containing the public key in PEM-encoded format

For more information, see “Providers of Encryption” in Chapter 1 of *Encryption in SAS*, available at http://support.sas.com/documentation/cdl/en/secref/67436/HTML/default/viewer.htm#n0gzdro5ac3enzn18qbrmaq4li3.htm.

When you have your RSA private key and your certificate, proceed to the topic, “Pre-installation Checklist for Certificates for SAS Web Server”.

#### Pre-installation Checklist for Certificates for SAS Web Server

If you need to secure communication between the SAS Web Server and its SAS Java clients, record the RSA private key and certificate location. The SAS Deployment Wizard prompts you for this information during SAS installation and configuration.

When you are finished, proceed to the topic, “Implement Certificates for SAS Web Server” on page 82.
Table 4.3  Pre-installation Checklist for RSA Private Key and Certificate Information

<table>
<thead>
<tr>
<th>Key and Certificate Properties</th>
<th>Actual Value You Are Using</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS Web Server X.509 certificate path</td>
<td></td>
</tr>
<tr>
<td>SAS Web Server RSA private key path</td>
<td></td>
</tr>
</tbody>
</table>

Implement Certificates for SAS Web Server

During installation, the SAS Deployment Wizard enables you to secure communication between the SAS Web Server communication with its SAS Java clients. Select **HTTP Protocol using Secure Sockets**.

Figure 4.9  SAS Web Server Communication Configuration

If you selected **HTTP Protocol using Secure Sockets**, the deployment wizard prompts you for the following information:

- In the X509 certificate field, enter the path to the valid X.509 certificate with the DNS name of the machine as the Common Name (CN).
- In the RSA private key field, enter the path to the RSA private key that is not protected by a passphrase.

Note: The SAS Web Server does not use a passphrase so that it can start without having to prompt the administrator for a passphrase.
Post-Deployment Steps for Certificates

Post-Deployment Server Tier Setting for Certificates

In SAS 9.4, when you have implemented certificates for the SAS Web Server, perform the following action based on the type of certificate used:

- **Self-signed certificates**
  
  The self-signed certificate must be available on the client.
  
  - For the SAS server tier on Linux:
    
    Provide the location of the server’s self-signed certificate to SAS using the SSLCALISTLOC system option. The option specifies the path to the server’s self-signed certificate (in PEM-encoded format).
    
    For more information, see "More about SSLCALISTLOC System Option" on page 84.
  
  - For the SAS server tier on Windows:
    
    The site-signed or third-party-signed certificate must be in the Windows System truststore (not in the private JRE truststore discussed in earlier topics).
    
    - Set paths for SAS Information Retrieval Studio on page 84.

- **Site-signed and third-party-signed certificates**
For the SAS server tier on Linux:

Certificates can be in one of two locations:

- All certificates must be in one file in PEM-encoded format that is referenced by the SSLCALISTLOC option.

- All certificates must be in an OpenSSL CA certificates directory pointed to by the SSL_CERT_DIR or SSLCACERTDIR environment variable.

SSL_CERT_DIR is the OpenSSL environment variable and SSLCACERTDIR is the SAS environment variable. The layout of the OpenSSL CA certificates directory is specified by OpenSSL, where the certificates are in PEM-encoded format and referenced by their hash values.

For more information, see "More about SSLCALISTLOC System Option" on page 84.

For the SAS server tier on Windows:

The self-signed certificate must be in the Windows System truststore (not in the private JRE truststore discussed in earlier topics). Many certificates are already pre-populated on Windows machines.

Perform these post-deployment steps:

- Set paths for SAS Information Retrieval Studio on page 84.
- Disable HTTP for the SAS Environment Manager server on page 85.
- Change security callback URLs for the SAS Environment Manager server on page 86.

More about SSLCALISTLOC System Option

On Linux systems, in the SAS Web Application Server sasv9.cfg file, SAS sets the SSLCALISTLOC system option by default to SAS-configuration-directory/certs/cacert.pem.

If certificates are not used, SAS ignores SSLCALISTLOC.

If certificates are used, one of the following occurs:

- If cacert.pem does not exist, and the SSL_CERT_DIR and SSLCACERTDIR environment variables are not set, SAS outputs an error.
- If cacert.pem does not exist, but the certificates are in the directory defined by SSL_CERT_DIR or SSLCACERTDIR, then SAS ignores SSLCALISTLOC.
- If cacert.pem exists and the SSL_CERT_DIR and SSLCACERTDIR environment variables are set, SAS checks cacert.pem first before it searches the directory.

Post-Deployment Step for SAS Information Retrieval Studio

After running the SAS Deployment Wizard to install and configure SAS Visual Analytics, you must add the path to SAS Foundation for SAS Information...
Retrieval Studio. On Linux, in addition to the path to SAS Foundation, you must add the path to the SAS Authentication Server certificate file.

To add the SAS Foundation path to SAS Information Retrieval Studio, follow these steps:

1. Sign on to the SAS Visual Analytics server and middle-tier machine as the SAS Installer user.

2. Using a text editor, open the following:
   
   ```
   SAS-installation-directory/
   SASInformationRetrievalStudioforSAS/1.53/Static/work/
   information-retrieval-studio.conf
   ```

3. Add the following paths to information-retrieval-studio.conf based on your operating system:

   - **Linux:**
     ```
     tpath=/sas-installation-directory/SASFoundation/9.4/sase:
     /sas-installation-directory/SASFoundation/9.4/utilities/bin/
     auth-server-certificates-path=certificate-file.pem
     ```
   
   - **Windows:**
     ```
     tpath=sas-installation-directory\SASFoundation\9.4\core\sasext
     ```

4. After you make your changes to information-retrieval-studio.conf, restart SAS Information Retrieval Studio.

---

**Disable HTTP for the SAS Environment Manager Server**

By default, the SAS Environment Manager server listens on both HTTP (7080) and HTTPS (7443) ports. When implementing site-signed and third-party-signed certificates, you should disable HTTP.

**Note:** Once you have disabled the HTTP connector, the SAS Environment Manager agents will not be able to monitor and collect metrics for the Apache Tomcat instance hosting the SAS Environment Manager server.

To disable HTTP on the SAS Environment Manager server, follow these steps:

1. Using a text editor, open server.xml, located at the following:
   ```
   SAS-configuration-directoryWeb/SASEnvironmentManager/
   server-5.0.0-EE/hq-engine/hq-server/conf
   ```

2. Locate the HTTP connector, and surround it with comment tags:

   ```
   <!--
   <Connector port="${server.webapp.port}" executor="tomcatThreadPool"
   maxHttpHeaderSize="8192"
   emptySessionPath="true" protocol="HTTP/1.1"
   enableLookups="false" redirectPort="${server.webapp.secure.port}"
   acceptCount="100"
   connectionTimeout="20000" disableUploadTimeout="true" compression="on"
   compressableMimeType="text/html,text/xml,text/plain,text/css,text/
   javascript" URIEncoding="UTF-8"/>
   -->
   ```
3  Save and close server.xml.

4  Proceed to the topic “Change Security Callback URLs”

Change Security Callback URLs
To change the security callback URLs for the SAS Environment Manager server, follow these steps:

1  Using a text editor, open security-web-context.xml, located at the following:

   SAS-configuration-directory/Web/SASEnvironmentManager/
   server-5.0.0-EE/hq-engine/hq-server/webapps/ROOT/WEB-INF/
   spring

   Note: One of the occurrences is encoded. After you make the change, it should resemble the following:

   https://myserver.example.com:443/SASLogon/
   logout?sas_svcs_logon_LogonUrl=
   https%3A%2F%2Fdmyserver.example.com%3A7443%2F

   CAUTION! Be careful not to change the SASLogon URLs.

3  Save and close security-web-context.xml.

Configure Clients to Trust SAS Web Server with Site-Signed and Self-Signed Certificates
Web applications running on the SAS Web Application Server act as clients of other web applications, directing requests to web applications on other instances of SAS Web Application Server. These requests are directed through the SAS Web Server. Thus, each SAS Web Application Server instance must trust the SAS Web Server. This trust is achieved by adding site-signed and self-signed certificates to the SAS private JRE truststore.

   Note: If you are using a site-signed or self-signed certificate, and you do not import the certificate into the default SAS private JRE truststore, the SAS Deployment Wizard fails to load content to the SAS Content Server. (This failure is not immediate. It occurs after the SAS Content Server starts.) This failure occurs because the wizard’s load content step acts as a client sending requests through SAS Web Server. SAS Web Server uses the SAS private JRE truststore and has no trust of the site-signed or self-signed certificate.

   Because SAS web applications use the default SAS private JRE truststore—cacerts—a special deployment process is required when you install and configure SAS Web Server using site-signed or self-signed certificates.

1  Know the location of your self-signed or site-signed certificate.

2  Run the SAS Deployment Wizard in install mode only to install SAS Web Server.
3 Import your self-signed or site-signed certificate into the default SAS private JRE truststore, cacerts.

Importing a certificate into a keystore is accomplished with the Java keytool -importcert command. The location of cacerts is the following:

SAS-installation-directory/SASHome/
SASPrivateJavaRuntimeEnvironment/9.4/jre/lib/security

For example, on Windows, the command that you run is similar to this:

```plaintext
cd C:\Program Files\SASHome\SASPrivateJavaRuntimeEnvironment\9.4\jre\lib\security
..\..\bin\keytool -importcert -keystore cacerts -file mycert.crt
```

**TIP** The default password for cacerts is changeit. It is publicly documented on the Oracle website.

For more information, see your Java documentation at [http://docs.oracle.com/javase/7/docs/technotes/tools/solaris/keytool.html](http://docs.oracle.com/javase/7/docs/technotes/tools/solaris/keytool.html).

4 Run the SAS Deployment Wizard in configure mode only to configure SAS Web Server.
Figure 4.12  SAS Deployment Wizard in Configure Mode

Perform a Planned Deployment

Perform a planned deployment of SAS software using a sample deployment plan or a customized deployment plan created specifically for your site. A planned deployment consists of installing and configuring the software on each machine in the deployment plan. You may choose to perform these steps independently by unselecting a step below.

- Configure SAS Software

Install SAS Foundation and Related Software

Express path for installing SAS Foundation and related software. A plan file is not used for this type of deployment.

Install Additional Software

Perform individual installs of SAS software by selecting from a list of available software. This option is recommended only when you want to add software to an existing deployment, and do not need to perform configuration.
Installing Third-Party Software

Deployment Process Overview: Step Six

Installing third-party software is the sixth of seven tasks required to install and configure SAS Visual Analytics.

1. Create a SAS Software Depot.
2. Check for documentation updates.
3. (Optional) Deploy the SAS High-Performance Analytics infrastructure.
4. Create operating system users and groups and designate ports.
5. (Optional) Set up certificates.
6. Deploy required third-party software.
7. Deploy the servers and middle tier.

About Installing Third-Party Products

SAS Visual Analytics requires the following third-party products:
As you install third-party products, print and fill out the appropriate third-party software checklists found in “Pre-installation Checklists for Third-Party Products” on page 92.

Note: You must have the necessary third-party software installed on the current machine, or the utility that you use to deploy SAS, the SAS Deployment Wizard, will not let you complete your SAS deployment.

Obtaining Third-Party Software

Overview of Obtaining Third-Party Software

SAS provides you with two ways to obtain required third-party software:

- SAS Software Depot
- SAS third-party software website

SAS Software Depot: third_party Directory

Some third-party products are shipped with SAS 9.4. These products' installation files and documentation are located in the SAS Software Depot under the third_party directory.
Platform Suite for SAS is an example of one third-party application that you install in this way. To determine whether any of your third-party software is distributed with your order, refer to your SAS Software Summary that resides in your SAS Software Depot in your order_number directory under install_doc. For example:

C:\SAS Software Depot\install_doc\order_number\ordersummary.html

Some third-party software can be obtained from the website that SAS maintains. For more information, see “SAS Third-Party Software Website”.

SAS Third-Party Software Website

SAS maintains a third-party software website to help you do the following:

- determine what version of the product to install
- obtain the product, if you do not already have it
- find installation instructions
- learn about any patches required

The SAS third-party website is located at http://support.sas.com/resources/thirdpartysupport/.

About the Java Runtime Environment

SAS Java applications require the Java Runtime Environment (JRE), which includes a Java Virtual Machine (JVM) that executes the application and a set of standard Java class libraries. On Windows, UNIX, and Linux, the SAS Deployment Wizard installs the default version of the 32-bit JRE with which SAS has been tested.
If a different supported version of the JRE is required, it can be obtained from
the appropriate vendor’s website. Links to the appropriate JRE vendor’s website
can be found on the SAS 9.4 third-party support site located at http://
support.sas.com/resources/thirdpartysupport/v94.

Pre-installation Checklists for Third-Party Products

Overview of Pre-installation Checklists for Third-Party Products

As you install third-party products, print and fill out the appropriate third-party
software checklists.

Note: You must have the necessary third-party software installed on the current
machine, or the utility that you use to deploy SAS, the SAS Deployment Wizard,
will not let you complete your SAS deployment.

This section contains checklists for the following third-party products:

- PowerShell
- Python
- JUnit
- Java Access Bridge (optional)
- Platform Suite for SAS (optional)

PowerShell

Microsoft Windows PowerShell is a .NET-based configuration management
framework that is required to deploy the SAS middle tier on Windows. The SAS
Deployment Wizard uses PowerShell to run configuration scripts that modify
path information. During installation, the deployment wizard prompts you to
specify the PowerShell installation location.

For more information about PowerShell version requirements and a download
link, go to http://support.sas.com/resources/thirdpartysupport/v94/othersw.html.

<table>
<thead>
<tr>
<th>Description</th>
<th>Default Values</th>
<th>Actual Values</th>

</thead>
<tbody>
<tr>
<td>PowerShell location</td>
<td>\Windows\System32\WindowsPowerShell\v1.0</td>
<td></td>
</tr>
<tr>
<td>Product version</td>
<td>2.2</td>
<td></td>
</tr>
</tbody>
</table>
Python

Python is an open-source, high-level general purpose programming language required for SAS Information Retrieval Studio on the Visual Analytics middle tier. During installation, the deployment wizard prompts you to specify the Python installation location.

For more information about Python version requirements and a download link, go to http://support.sas.com/resources/thirdpartysupport/v94/othersw.html.

<table>
<thead>
<tr>
<th>Description</th>
<th>Default Values</th>
<th>Actual Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Python location</td>
<td>/Python26</td>
<td></td>
</tr>
<tr>
<td>Product version</td>
<td>2.6</td>
<td></td>
</tr>
</tbody>
</table>

JUnit

JUnit is an open-source software testing framework for Java, and the de facto standard for writing unit and regression tests. Some of the validation tests shipped with SAS products run under the SAS Deployment Tester framework and require JUnit. During SAS installation, the SAS Deployment Wizard prompts you to specify the location of the JUnit JAR file.

For more information about JUnit version requirements and a download link, go to http://support.sas.com/resources/thirdpartysupport/v94/othersw.html.

<table>
<thead>
<tr>
<th>Description</th>
<th>Default Values</th>
<th>Actual Values</th>

<tr>
<td>Product version</td>
<td>4.8.1</td>
<td></td>
</tr>
</tbody>
</table>

Java Access Bridge

The Java Access Bridge (JAB) is a prerequisite for JAWS, the Windows accessibility solution. JAB is shipped with SAS 9.4. For more information, see http://support.sas.com/resources/thirdpartysupport/v94/othersw.html.

Platform Suite for SAS

If you will use products from Platform Computing Incorporated either for scheduling or for grid computing, you must install several of the products from
the Platform Suite for SAS offering. Platform Suite for SAS includes three products:

- **Platform Process Manager**
  provides scheduling capabilities. Process Manager submits jobs to Platform LSF and manages dependencies between jobs. (When you install Platform Process Manager, Platform LSF is also installed.)

- **Platform LSF (Load Sharing Facility)**
  manages resource requirements and provides for load balancing.

- **Platform Grid Management Service**
  includes a monitoring daemon that enables administrators to monitor the load on machines running Platform LSF.

  If you are using the Platform Suite for SAS for grid computing, you must install Platform LSF and the Platform Grid Management Service. If you want to schedule jobs to run on the grid, you must also install Platform Process Manager.

For more information about where to install each of these products, see “SAS Grid Topology” in Chapter 1 of *Grid Computing in SAS*.

Platform Suite for SAS is distributed with SAS in the depot `third_party` directory, where you will find the installation programs and instructions.

You can also find the Platform Suite for SAS installation instructions on the SAS Scalability and Performance focus area on the web at [http://support.sas.com/rnd/scalability/platform/index.html](http://support.sas.com/rnd/scalability/platform/index.html).

**Table 5.4 Platform Suite for SAS**

Deployment Process Overview: Step Seven

Installing and configuring SAS Visual Analytics is the seventh and final task required to install and configure SAS Visual Analytics.
1. Create a SAS Software Depot.
2. Check for documentation updates.
3. (Optional) Deploy the SAS High-Performance Analytics infrastructure.
4. Create operating system users and groups and designate ports.
5. (Optional) Set up certificates.
6. Deploy required third-party software. on page 89
   ▶ 7. Deploy the servers and middle tier.

Components of SAS Visual Analytics

Deploying the SAS Visual Analytics server tier consists of installing and configuring the following components on the server-tier machine:

- SAS LASR Analytic Server Monitor
- SAS Workspace Servers
- SAS Pooled Workspace Servers
- SAS Stored Process Servers

Deploying the SAS Visual Analytics middle tier consists of installing and configuring the following components on the middle-tier machine:

- SAS Visual Analytics Home Page
- SAS Visual Analytics Explorer
- SAS Visual Statistics
- SAS Visual Analytics Designer
- SAS Visual Data Builder
- SAS Visual Analytics Viewer
- SAS Visual Analytics Administrator
- SAS LASR Authorization Service
- Visual Analytics Transport Service
- Search Interface to SAS Content
- SAS Remote Services

Preparing to Deploy SAS Visual Analytics

Which SAS LASR Analytic Server Mode?

SAS LASR Analytic Server was originally developed to operate in a distributed computing environment and to perform analytic tasks on data that is loaded in memory. This is referred to as running the server in distributed mode.

The server can also run on a single machine or in non-distributed mode.
SAS allows you to license SAS LASR Analytic Server to run in distributed mode, non-distributed mode, or both modes. The mode that you deploy and run is driven by the license that accompanies your order. For more information, consult with your SAS representative.

**Deploy the SAS High-Performance Analytics Environment**

**SAS Deployment Wizard Options**

The SAS Deployment Wizard is a cross-platform utility that installs and configures many SAS products. Using a SAS installation data file and a deployment plan for its initial input, the wizard is designed to prompt the user for the remaining input at the start of the session so that the user does not have to monitor the entire deployment.

**About Deployment Plans**

A deployment plan describes what software should be installed and configured on each machine in a SAS deployment. A deployment plan is an XML file that is used as input to the SAS Deployment Wizard. A deployment plan for SAS Visual Analytics is created by a SAS representative specifically for a site.

- A SAS representative has created a custom deployment plan for you (an XML file or a ZIP file containing an XML file). It has been e-mailed to your site.
- Your deployment plan must be a valid SAS 9.4 deployment plan. The SAS Deployment Wizard does not accept plans from earlier SAS releases.

At the end of the SAS deployment, the SAS Deployment Wizard makes a copy of the deployment plan that it used. The deployment plan can be helpful when you want to add a SAS product or change your SAS configuration. The wizard stores a copy of the deployment plan in the SAS configuration directory in the Utilities directory, and it appends a date and time stamp to the deployment plan filename. Here is an example:

```
/opt/SAS/config/Lev1/Utilities/plan.2015-04-23-13.10.xml
```

**SAS Visual Analytics Configuration Options**

To provide values specific to installing and configuring SAS Visual Analytics, choose the wizard’s *Typical* or *Custom* prompting level.
The following table lists SAS Deployment Wizard pages that are specific to SAS Visual Analytics and the prompting level under which you can find them. For a list of the other configuration options associated with the SAS Intelligence Platform, see “Configuration Options by Prompt Level” on page 180.

In addition, there are JVM settings that are recommended for SAS Web Application Server and SAS Remote Services. For more information, see “SAS Remote Services Application: JVM” on page 129.

* An asterisk (*) next to a configuration option indicates that more information is available in this document. See the SAS Deployment Wizard online Help for information about all options.

### SAS Deployment Agents

The SAS Deployment Agent and its remote clients are required for deployments that run remote processes. SAS uses the agent to copy content and to perform configuration management operations associated with creating new servers and clustering. It is also used for server administration tasks such as deployment backups.

For more information, see “How SAS Deployment Agent Uses Certificates” on page 71.
SAS Metadata Server Clustering

A metadata server cluster is a group of three or more host machines (nodes) that have been configured as identical metadata servers. Each node runs its own server process and has its own server configuration information, journal file, and copy of the repository data sets. In addition, each node maintains a complete in-memory copy of the metadata repository. The nodes work together as if they were a single metadata server.

Note: If you are configuring metadata server clustering, and if your server tier or middle tier includes one or more Windows hosts, then the SAS Deployment Wizard should prompt you for the SAS Deployment Backup and Recovery Tool: User Account. This external account, also referred to as the backup user, will be used to run the Deployment Backup and Recovery tool. The account must meet the requirements that are specified in “What is a Backup User?” in Chapter 29 of SAS Intelligence Platform: System Administration Guide available at http://support.sas.com/documentation/cdl/en/bisag/67481/HTML/default/viewer.htm#p1ugntmt9ufvtpn1tux6i272hwzl.htm. If this prompt does not appear, then you must configure the user manually after the deployment process is complete. For instructions, see “Specifying a Backup User Manually” in Chapter 29 of SAS Intelligence Platform: System Administration Guide available at http://support.sas.com/documentation/cdl/en/bisag/67481/HTML/default/viewer.htm#p1ugntmt9ufvtpn1tux6i272hwzl.htm.

Clustering provides redundancy and high availability of the metadata server. Client applications and users interact with the cluster in the same way that they would interact with a metadata server that is not clustered. A load balancing process automatically distributes work among the nodes. If a node ceases to operate, the server continues to be available using the remaining nodes.

On Windows you need an external, Windows domain-based user account that will start all of the nodes. The suggested user ID for this service login is myWindowsDomain\sassvlgn. On Linux, the nodes are started by the SAS Installer account. For more information, see “Prerequisites for Cluster Configuration” in Chapter 17 of SAS Intelligence Platform: System Administration Guide available at http://support.sas.com/documentation/cdl/en/bisag/67481/HTML/default/viewer.htm#n1odroiqzm0fkhn16sakutai9qr5.htm.

All of the nodes in the cluster must have the same operating system.

You deploy your metadata cluster by installing an initial metadata server, and then moving to another machine and running the deployment wizard to deploy a metadata server node. You indicate which type of metadata server you want to deploy by choosing the appropriate step on the deployment wizard Select Deployment Step and Products to Install page.

Server and Middle Tier Topology Constraint Removed in Release 7.1

Starting with SAS Visual Analytics 7.1, if the server tier and middle tier are deployed on separate machines, these machines no longer must use operating systems in the same operating system family. (For example, Red Hat Enterprise Linux 6.1, x86, 64-bit, and SUSE Linux Enterprise 11 Service Pack 1, x86, 64-bit, are both in the same operating system family.) The SAS Visual Analytics 7.1 server tier and middle tier—like the SAS Metadata Server and SAS Web Infrastructure Platform—can be deployed on machines that use different operating system families.

For example, the SAS Visual Analytics server tier can reside on a Windows machine and the SAS Visual Analytics middle tier can reside on a Linux x86 machine.

SAS Web Application Servers

SAS supports multiple SAS Web Application Servers on the middle-tier machine.

SAS Web Application Server Clustering

Server clustering provides redundancy and high availability and enhances performance. In SAS 9.4, the deployment model has been enhanced to better support clustering of SAS Web Application Servers. You can easily configure
vertical cluster members (additional server instances on the same machine) and horizontal cluster members (servers on additional machines). Combining vertical and horizontal clustering is also supported and can be configured easily.

### Installation Rules for Multiple-Machine Deployments

Be aware that if you are deploying SAS on a multiple-machine distributed system, you must install software on your machines in a particular order.

1. Always install SAS software on the metadata server machine first.
2. If you are implementing metadata server clusters, install the metadata server nodes next.
3. Install the SAS application servers (such as the SAS Workspace Server or SAS Stored Process Server) on machines other than the metadata server machine.
4. If your deployment plan separates SAS Web Server from SAS Web Application Server, install SAS Web Server first.
5. Install the middle tier.
6. For SAS deployments where the metadata server and middle tier reside on the same machine, remember that the SAS server tier (the compute tier) must be configured after the metadata server and before the middle tier.
7. If you are implementing SAS Web Application Server clusters, install the SAS Web Application Server nodes next.
8. Install software on machines that will host only clients last.

### SAS Metadata Server Recommendation

You should deploy the metadata server on a dedicated server machine. A machine running only the metadata server greatly simplifies tuning, management, and diagnostics.

For more recommendations, see information about the SAS Metadata Server in the system requirements for your SAS product.

### SAS Metadata Repository Considerations

Your SAS Metadata Repositories should reside either on a local file system or on a high-performance, high-availability network file system. For more information about metadata repositories, see “About SAS Metadata Repositories” in Chapter 18 of SAS Intelligence Platform: System Administration Guide available at http://support.sas.com/documentation/cdl/en/bisag/67481/HTML/default/viewer.htm#p1b7gxgkbu04zbn1dhnh3pb8c6zs.htm.
Locale and Encoding Considerations

Locale and Encoding Preparation

Before you invoke the SAS Deployment Wizard, your operating system must match the locale and encoding that you plan to select on the Select Regional Settings page of the Deployment Wizard.

Figure 6.3 Select Regional Settings Page

On Windows, the Windows System Locale must match your choice on the Select Regional Settings page. For more information, refer to your Windows documentation.

On UNIX and Linux, the LANG environment variable setting must match the locale and encoding you plan to choose for SASFoundation and SAS Metadata. Additionally, if you plan to select Configure as a Unicode Server, you must use UTF8 as your operating system encoding.

For example, on Linux, if you plan to choose the locale Japanese (Japan) and the default encoding, you would enter the following command:

```
$ LANG=ja_JP.eucjp; export LANG
```

On UNIX and Linux, there are differences in the spelling and case of language-encoding pairs. For this reason, we suggest that you run the `locale` command to check the current locale and to verify the spelling of locale values. A misspelling causes the LANG environment variable to be improperly set, and interferes with propagation to other locale-related environment variables. For example, consider the case and spelling differences across Linux and UNIX for US English, UTF8:

- On Linux and Solaris:
On AIX:

en_US.UTF-8

On HP-UX:

nen_US.utf8

Locale and Encoding Settings in the SAS Deployment Wizard

The SAS Deployment Wizard enables you to select the default locale and languages for the SAS Deployment Wizard and for SAS 9.4. (A separate tool, the SAS Deployment Manager, enables you to configure the locale of SAS Java clients. For more information, see Appendix 4, “Change Locale for SAS,” in SAS Intelligence Platform: Installation and Configuration Guide available at http://support.sas.com/documentation/cdl/en/biig/63852/HTML/default/viewer.htm#n09019intelplatform00install.htm.)

One of the first dialog boxes in the deployment wizard is the Choose Language dialog box.

*Figure 6.4  Choose Language Dialog Box*

The language that you select in the Choose Language dialog box indicates the language that the deployment wizard uses to display text.

Further into the deployment wizard, you have an opportunity to set the language that your SAS 9.4 products support.
And finally, the deployment wizard prompts you for your locale settings.

The locale (or regional) setting controls how SAS 9.4 displays the following:

- Text
numbers
currencies
dates
times
data (sorting)

The locale (or regional) setting also specifies the language that the SAS Metadata Server uses to store objects in its repository.

On Windows and Linux machines, you can choose to configure SAS 9.4 as a Unicode server. Unicode can be particularly useful when your SAS deployment supports multiple languages. Choosing to make SAS a Unicode server means that SAS reads and writes all of its data sets, catalogs, and text files in UTF-8 encoding. UTF-8 encoding supports characters from all of the world’s languages, including characters found in both single- and double-byte character sets. However, UTF-8 can make data sharing with SAS sites that use default encodings problematic.

If configuring SAS as a Unicode server is not a viable option for your deployment, you can implement a more advanced deployment that requires adding an additional server configuration to support a separate encoding. This separate configuration can be used by the SAS Customer Intelligence system only. For more information, see Adding Additional SAS Workspace Servers to Support Multiple Encodings available at http://support.sas.com/resources/papers/AddingAdditionalSASWorkspaceServerstoSupportMultipleEncodings.pdf.

CAUTION! The SAS automated deployment tools do not support changing locale after SAS is initially deployed. For example, you cannot initially deploy SAS as English (US), and then reconfigure SAS with the SAS Deployment Manager and change the locale to French.

For single-byte character set languages, the chosen locale is set in the configuration file that matches the default language and also in the English configuration file. For example, if you choose fr_FR, this value is added to both the French and English configuration files.

For double-byte character set languages, the chosen locale is set in the configuration file that matches the default language and English (US) is set as the default locale for English (SBCS), with some exceptions.

When a locale is set, a default encoding is used for that locale and the operating system.

A Note about Host Names

The SAS Deployment Wizard follows the Internet Host Table Specification and does not allow the underscore character (_) in host names. For more information about what constitutes a valid host name, see RFC 952 at http://www.rfc-base.org/txt/rfc-952.txt.
How the SAS Deployment Wizard Names SAS Web Application Servers

The deployment wizard creates multiple SAS Web Application Servers as needed based on the products in your SAS order. By default, each SAS Web Application Server is assigned to a specific server for deployment. This distribution helps balance the load on each server and defines a recommended number of servers based on the products in each configuration.

Most of the time, the deployment wizard numbers these servers sequentially (for example, SASserver1, SASserver2, and SASserver3). However, depending on your particular SAS product order, the default names for the SAS Web Application Servers might not be sequential.

If you use the default names (for example, SASservern) in your configuration, then you should maintain the default numbering scheme.

Reviewing Third-Party Database Requirements

The SAS 9.4 middle-tier software and certain SAS solutions software use the SAS Web Infrastructure Platform Data Server to store transactions. The data server relies on PostgreSQL 9.1.9 and is configured specifically to support SAS 9.4 software.

Note: The database used by SAS Environment Manager, the SAS Deployment Backup and Recovery tool, and certain SAS solutions, such as SAS Visual Analytics, will be PostgreSQL regardless of the database you choose for the SAS Web Infrastructure Platform.

SAS enables you to use a database management system other than the SAS Web Infrastructure Platform Data Server for storing transactional data for the SAS middle tier and certain SAS solution software. (The SAS Deployment Wizard gives you this option when you choose the Custom prompting level.) In SAS 9.4, the following third-party databases are supported:

- DB2
- MySQL
- Oracle
- PostgreSQL
- SQLServer

Third-party databases often have particular requirements that you need to know about, such as database name limits, minimum tablespace sizes, and so on. If you have not already done so, make sure that you review Appendix 5, “Configuring an Alternate Database for SAS Web Infrastructure Platform Services,” in SAS Intelligence Platform: Installation and Configuration Guide available at http://support.sas.com/documentation/cdl/en/biig/63852/HTML/default/viewer.htm#p14intellplatform00installgd.htm.

If you want to use a third-party database, you must deselect Use SAS Web Infrastructure Platform Data Server on the SAS Web Infrastructure Platform Database: Data Server page during SAS installation and configuration.
On the SAS Web Infrastructure Platform: Database Type page, you choose the database management system type for the database that you plan to use.

Later, the SAS Deployment Wizard prompts you for additional information about your database, including a database user ID and password. The user ID that you specify must have the ability insert, update, and delete database records.
Deploying SAS Visual Analytics Interactively

Installing and configuring SAS Visual Analytics interactively with the deployment wizard consists of two main phases:

- Providing installation information such as the following:
  - deployment type (planned or unplanned)
  - deployment plan location (if planned)
  - machine type (single machine, server machine, and so on)
  - SAS components to be installed on the machine
  - valid paths to any required, pre-installed, third-party software

- Providing configuration information such as the following:
  - prompting level (Express, Typical, or Custom)
  - SAS components to be configured on the machine
  - configuration directory name
  - single sign-on preference (Windows only)
  - required user account credentials
  - server port numbers

This section describes the installation pages and some of the more important configuration pages that you encounter during the configuration phase of a SAS Visual Analytics deployment. The type and number of configuration pages that you get depend on the prompting level and the contents of your SAS Visual Analytics custom order. "Configuration Options by Prompt Level" on page 180 lists which configuration options are available for each prompting level. For information about all deployment wizard prompts, see the online Help.

To install and configure SAS Visual Analytics interactively, complete these steps:

1. Make sure that you have reviewed all of the documents listed in "Step 2: Check for Documentation Updates" on page 10.

2. Verify that you have performed the previous required steps outlined in "Preparing to Deploy SAS Visual Analytics" on page 96.

   Note: A few pages into the SAS installation, the deployment wizard prompts you for paths to the required third-party software. The required third-party software must be installed on the current machine or the deployment wizard will not let you continue with the installation. In this situation, you need to end the deployment wizard session and install the required third-party software before you can continue.

3. If you are adding on SAS Visual Analytics or SAS Visual Analytics Administration and Reporting to an existing SAS 9.4 deployment, make sure
that you first review “Add on SAS Visual Analytics Administration and Reporting” on page 191.

4 If you are deploying SAS LASR Analytic Server in non-distributed mode, you get fewer configuration prompts. You do not see any prompts about data providers and SAS High-Performance Computing Management Console. For a list of the prompts that you get, see Table 6.1 on page 98.

5 If you use any garbage execution scripts, temporarily suspend these scripts during deployment wizard. If any wizard temporary files are deleted during wizard execution, configuration failures can occur.

6 Review information about where to source certain SAS content repositories described in “SAS Metadata Repository Considerations” on page 103.

7 Review information about deployment wizard configuration prompting levels described in Appendix 3, “Configuration Options by Prompt Level,” on page 179.

8 Log on to the machine on which you plan to install the SAS Visual Analytics server tier and middle tier (blade 0). Do not use root.

9 Start the deployment wizard from the highest-level directory in your SAS Software Depot using this command: setup.sh -record -deploy
   Note: Using the -record -deploy options causes the wizard to create a response file that records your inputs. This can be helpful when you want to repeat the deployment on other machines or when you are troubleshooting a deployment issue.
   By default, the wizard creates the response file in the following location: ~sdwresponse.properties
   You should see a welcome page similar to the following:

10 Choose Language
    Select the language for the SAS Deployment Wizard, and click OK.
    - From the drop-down list, select the language that you want the SAS Deployment Wizard to use when it displays text.
    For more information, see “Locale and Encoding Considerations” on page 104.

11 If you have more than one SAS software order in your depot, the wizard prompts you to select the order in which you want to deploy. When you are finished, click Next.
12 Select Deployment Task

Choose the deployment task that you want to perform, and click **Next**.

- Select **Install SAS Software**.

13 Specify SAS Home

Specify the location where you want to install SAS, and click **Next**.

- If you want to specify a different location where SAS is installed other than the default, enter this path in **SAS Home**.

Although your SAS installation directory (which the wizard refers to as SAS Home) and SAS configuration directories can share the same parent directory, one directory cannot reside inside another. Also, the SAS installation directory should not be a directory within your SAS Software Depot.

**CAUTION!** There should be one SAS installation directory (SAS Home) per SAS deployment. Therefore, when deploying multiple tiers on the same host, the SAS installation directory location should always be shared. By contrast, when deploying different versions of SAS on the same machine, there should be a unique SAS installation directory for each SAS version.

**Note:** On Windows, the deployment wizard prompts you for the SAS installation directory (which it refers to as SAS Home) the first time you run the wizard. On any subsequent sessions on this machine, the wizard uses the previously specified location for the SAS installation directory.

14 Select Deployment Type

Specify the type of deployment that you want to perform, and click **Next**.

- Confirm that **Perform a Planned Deployment**, **Install SAS Software**, and **Configure SAS Software** are all selected.

15 Specify Deployment Plan
Specify the type of deployment plan that you are using, and click Next.

- customized deployment plan
  Select Specify the full path to a customized deployment plan, and then click Browse to navigate to the plan file (plan.xml).

- standard deployment plan
  Select Select a standard deployment plan, and then choose the appropriate plan in the drop-down list.
  For more information, see "About Deployment Plans" on page 97.

16 Select Deployment Step and Products to Install

Select the machine on which you are installing software, and select the SAS products that you want to install. When you are finished, click Next.

- Select the machine on which you are installing software from the Deployment Step drop-down list.

  Note: If you are deploying SAS on multiple machines, make sure that you are following the process described in “Installation Order Rules for Multiple Machine Deployments” in Chapter 6 of SAS Intelligence Platform: Installation and Configuration Guide.

  Note: When a machine has multiple deployment steps, the deployment wizard attempts to default to the correct step. However, in some cases this can be difficult for the wizard to determine. Therefore, always be careful to choose the correct step and avoid merely choosing the default step.

Starting with SAS Visual Analytics 7.1, if the server tier and middle tier are deployed on separate machines, these machines are no longer required to use operating systems in the same operating system family (for example, Red Hat Enterprise Linux 6.1, x86, 64-bit, and SUSE Linux Enterprise System 11 SP1, x86, 64-bit are both in the same family). The SAS Visual Analytics 7.1 server and middle tiers—like the SAS Metadata Server and the SAS Web Infrastructure Platform—can be located on machines that use a different operating system family. For example, the SAS Visual Analytics server tier could reside on a Windows machine, and the SAS Visual Analytics middle tier could reside on a Linux x86 machine.

By default, all products that are displayed will be installed. Deselect any products that you do not want to install.

Note: If you are deploying a middle-tier node machine, make sure that SAS Web Application Server Node Configuration is selected.

### 17 Specify SAS Installation Data File

Specify the path to your SAS installation data file and, click Next.

- Click Browse and locate your SAS installation data file.

The SAS installation data file that contains information about the software that you have licensed for the current machine.

**CAUTION!** Be careful to use the correct installation data file that contains the SAS products that you are planning to install. Using an incorrect file can cause installation failure for SAS add-on products or other errors later when attempting to run SAS. For multi-machine deployments during the clients step, choose the SID file for the server machine that is associated with the clients being installed.

### 18 Select Language Support

Select the languages for your SAS software to support, and click Next.

- Click Clear All. (English remains selected as the default language.)
Add any additional languages that you want SAS to support.

By default, SAS attempts to support all languages that your machine’s operating system is configured for.

19 Select Regional Settings

Select the language, region, and locale setting that affect how SAS displays text, numbers, currencies, dates, and times and how SAS sorts data. Then, click Next.

- Accept the default value of English (United States), or select a different language, region, locale, in Language (Region) [Locale].
- Select Configure as a Unicode server if you want to configure SAS as a Unicode server.

For more information, see “Locale and Encoding Considerations” on page 104.

20 Select Authentication Type

(Linux only) Specify the type of authentication for this machine, and click Next.

- Select Use PAM Authentication if your system uses Pluggable Authentication Modules (PAM).

If you are uncertain that this system uses PAM for authentication, contact your system administrator.

Note: Do not select the PAM option if you know that your system uses /etc/password or /etc/shadow authentication.

21 Specify Remote Communication Configuration

Specify the configuration for communication with the SAS Deployment Agent, and click Next.

- If you want to change the default port (5660) for communication with the SAS Deployment Agent, enter the new port in Port.

For more information, see “SAS Deployment Agents” on page 100.

- In Specify how to secure the remote connection, make one of the following selections:
  - Select Generate credentials to secure the connection if you want the deployment wizard to create a self-signed certificate, generate a keystore, and import the certificate into the keystore.
  - Select Specify existing credentials to secure the connection if you already have implemented CA-signed, site-signed, or self-signed certificates. On the next page, the wizard prompts you for the keystore location and password.
  - Select Do not secure the connection if you do not want to secure SAS Deployment Agent communication or have not yet implemented certificates.
You can set up certificates later on your own or by using the SAS Deployment Manager. Do not start the SAS Deployment Agent until you have completed the manual security configuration.

For more information, see "How SAS Deployment Agent Uses Certificates" on page 71.

22 Specify SAS Deployment Agent Keystore Credentials

Specify the location and credentials for the keystore used to verify credentials for outgoing communications from your SAS Deployment Agent machine, and click Next.

- In **Agent Keystore Location**, enter your SAS Deployment Agent keystore file location (path and filename).
- In **Agent Keystore Password**, enter the password that you used when you created the keystore using the Java `keytool` command.
- In **Confirm Agent Keystore Password**, re-enter the password.

For more information, see “Pre-installation Checklist for Certificates for SAS Deployment Agent” on page 73.

23 Specify SAS Deployment Agent Truststore Credentials

Specify the location and credentials for the truststore used to verify credentials for incoming communications to your machine, and click Next.

- In **Agent Truststore Location**, enter your agent truststore file location (path and filename).
- In **Agent Truststore Password**, enter the password that you used when you created the truststore using the Java `keytool` command.
- In **Confirm Agent Keystore Password**, re-enter the password.

For more information, see “Pre-installation Checklist for Certificates for SAS Deployment Agent” on page 73.

24 Specify SAS Remote Deployment Agent Client Keystore Credentials

Specify the location and credentials for the keystore used to verify credentials for outgoing communications from your remote SAS Deployment Agent client machine, and click Next.

- In **Remote Client Keystore Location**, enter your remote SAS Deployment Agent client keystore file location (path and filename).
- In **Remote Client Keystore Password**, enter the password that you used when you created the keystore using the Java `keytool` command.
- In **Confirm Remote Client Keystore Password**, re-enter the password.

For more information, see “Pre-installation Checklist for Certificates for SAS Deployment Agent” on page 73.

25 Specify SAS Remote Deployment Agent Client Truststore Credentials

Specify the location and credentials for the truststore used to verify credentials for incoming communications to your remote SAS Deployment Agent client machine, and click Next.

- In **Remote Client Truststore Location**, enter your remote SAS Deployment Agent client truststore file location (path and filename).
In **Remote Client Truststore Password**, enter the password that you used when you created the truststore using the Java `keytool` command.

In **Confirm Remote Client Truststore Password**, re-enter the password.

For more information, see “Pre-installation Checklist for Certificates for SAS Deployment Agent” on page 73.

26 The deployment wizard scans your machine to determine whether any pre-existing SAS files are locked or do not have Write permission. If no action is required, click **Next**.

If the wizard lists any files in the text box, then while the wizard is running, quit SAS and add Write permission to the files listed.

27 If you use a third-party database, and SAS/ACCESS is a part of your order, select the software version for the third-party database.

The wizard uses your selection to configure SAS/ACCESS for the correct version of the third-party database.

Make sure that you perform any additional configuration on your system, such as installing the third-party database client and configuring the system environment for access to the native client libraries. For more information about the correct environment variables, go to SAS Install Center Documentation at [http://support.sas.com/documentation/installcenter/94](http://support.sas.com/documentation/installcenter/94). Select an operating system and SAS version to locate the appropriate SAS Foundation configuration guide.

28 Review Required Software

Review the list of third-party software that is required for the SAS software that you are installing on the current machine, and click **Next**. (The list of
third-party software depends on the SAS software that you are installing on the current machine.)

- In the pages that immediately follow, be prepared to provide paths to these third-party applications. The number of wizard pages varies depending on the SAS software that you are deploying on the current machine.

**Note:** You must provide valid paths to the requested third-party software or the SAS Deployment Wizard will not let you continue with the installation.

The *Third-Party Software for SAS 9.4* website is available at [http://support.sas.com/resources/thirdpartysupport/v94/index.html](http://support.sas.com/resources/thirdpartysupport/v94/index.html).

29 **Specify Software Location**

Specify the installation directory for the required software, and click **Next**.

- In the field, enter the installation directory for the required third-party software.

30 **Select Configuration Prompting Level**

Specify the amount of information to provide the SAS Deployment Wizard for configuring the SAS software that you are installing on the current machine. Select one of the three prompting levels, and click **Next**:

- **Express**
  
  displays the minimum number of wizard pages needed to complete the SAS configuration.

  **Note:** When deploying the SAS middle tier, by default, the SAS Deployment Wizard automatically configures your SAS Web Application Server. To disable this feature, run the wizard using either the Typical or Custom prompting levels. Manually configuring your SAS middle tier is an advanced procedure and requires using other documents such as your Instructions.html file.

- **Typical**

  displays the basic set of wizard pages needed to complete the SAS configuration.

- **Custom**

  displays all the wizard pages needed to complete the SAS configuration.

Refer to Appendix 3, *Configuration Options by Prompt Level,* on page 179 for more information about the SAS Deployment Wizard prompting levels.

31 **Provide the remaining configuration information as the wizard prompts you for it.**
Note: This topic describes some of the more important pages that you encounter during the configuration phase of a SAS Visual Analytics deployment. The options for which the deployment wizard prompts you depend on which SAS products are identified in your deployment plan. In addition, in multiple-machine deployments, the options depend on which machine you are currently deploying. "Configuration Options by Prompt Level" on page 180 lists which configuration options are available for each prompting level. For information about all deployment wizard prompts, see the online Help.

Specify Configuration Information
Select the path where the SAS Deployment Wizard will write SAS configuration files and logs and the level that you want to deploy (for example, Lev1 = production). Then, click Next.

- In Configuration Directory, enter the path for SAS configuration files and logs.
- In Configuration Level, enter the level that you want to deploy (for example, Lev1 = production).

In Linux environments, the SAS Installer generally overrides the default configuration directory with the site’s preferred location (for example, /opt/sas/config). The installer must have Write permission on this path.

Note: The last digit of the default port number reflects the configuration level that you select in the SAS Deployment Wizard. For example, when you select Lev1, the default port for the metadata server is 8561. If you choose another level, such as Lev2, the wizard changes the default port to 8562.

Note: Although your SAS installation directory and SAS configuration directories can share the same parent directory, one directory should not reside inside another. Defining the configuration directory under the SAS installation directory, or vice versa, can lead to file permission issues arising from the need to manage installed files differently from site-specific configurations.

Local Machine Name
Identify the local machine in various ways, and click Next.

- In Fully-qualified Local Host Name, enter the complete name of the local host.

The fully qualified local host name typically takes the form of the local host name plus the domain name server (for example, MyMachine.example.com).

**TIP** If you do not know the domain name used at your site, check with your system administrator.

- In Short Local Host Name, enter a short host name.
The short local host name is the abbreviated, more common method of referring to the host, usually only a single word (for example, MyMachine).

Migration Information
Specify the path to the migration package, and click Next.

- Select **Perform Migration** if you are migrating to SAS 9.4.

**Note:** Ignore this page unless you are migrating.

Refer to the instructions in “Overview of Migrating SAS Visual Analytics” on page 167.

- In **SAS Migration Utility Package Directory**, enter an absolute path to your migration package that you created with the SAS Migration Utility.

  This path should be to the top level directory of the migration package (for example: C:\SMU\93_Deployment). (This path should match the value of the SMU.Output.Dir property.)

**Note:** During installations for the additional metadata server nodes, the SAS Deployment Wizard prompts for a migration. Ignore this prompt. Migration is supported only on the primary metadata server node.

**Note:** Migrating via the SAS Deployment Wizard should be performed only once per tier for a deployment. (Also, you cannot selectively choose products to migrate. You must migrate all products targeted for the current machine.) If SAS components are unconfigured for a particular tier, you cannot migrate them a second time by choosing **Perform Migration**. In this situation, you have to perform a standard, non-migrated configuration using the deployment wizard (unless you want to unconfigure the entire SAS deployment).

**CAUTION!** The **Perform Migration** check box should not be selected when running the SAS Deployment Wizard on any middle-tier node machines or client-tier machines. The **Perform Migration** check box should be selected only when there is content available in the SAS Migration Utility package for that machine.

Authentication Domain
Specify the authentication domain SAS uses to authenticate logins to servers, and click Next.

- Accept the default value (DefaultAuth) unless you are planning to use a different SAS authentication domain for servers on this machine. For example, if the SAS Metadata Server is on Windows and the SAS Workspace Server is on Linux, the workspace server might be assigned to a SAS authentication domain named LinuxAuth.

  For more information, see “Manage Authentication Domains” in Chapter 2 of SAS Management Console: Guide to Users and Permissions available at [http://support.sas.com/documentation/cdl/en/mcssecug/64770/HTML/default/viewer.htm#n11xf0voa0jli0n1cl6rfh5idfx.htm](http://support.sas.com/documentation/cdl/en/mcssecug/64770/HTML/default/viewer.htm#n11xf0voa0jli0n1cl6rfh5idfx.htm).

Windows Options (run as server management scripts or Windows services)
Select options available for the Windows operating system, and click Next.

- In **Server Operation Type**, choose how to run your SAS servers, either by using management scripts or running them as Windows services.
If you choose the script option, then the user account that runs the SAS Object Spawner must be the administrator or a member of the Windows Administrator’s group. Or, it must have the following Windows local user rights on the SAS Object Spawner machine:

- Adjust memory quotas for a process
- Replace a process level token

Select Create Windows Shortcuts to create shortcuts to start and stop your SAS servers.

These shortcuts function whether the servers are running as Windows services or are already running from server management scripts.

Integrated Windows Authentication
Indicate whether you are using Integrated Windows Authentication (IWA) for SAS client/server connections, and click Next.

Select Use Integrated Windows authentication (single sign-on) to configure SAS Workspace Servers running on Windows or Linux to use IWA.

IWA uses a single sign-on feature that allows a user’s identity, obtained from authentication to the user’s desktop, to be securely passed from the desktop to other processes such as the SAS Metadata Server and the SAS Workspace Server running on either Windows or Linux. The mechanism used is typically Kerberos, but on Windows, NTLM can be used.

Note: If you choose to use IWA, you cannot also implement token-based authentication.

You will encounter this page when deploying SAS Enterprise Guide and SAS Add-In for Microsoft Office. If you have not chosen IWA for the SAS Workspace Server, then choosing IWA for these clients has no effect.

Token-based authentication
Indicate whether you are using token-based authentication for SAS client/server connections, and click Next.

Choose Use SAS Token authentication to cause clients of this SAS Workspace Server to request a token from the SAS Metadata Server.

SAS client applications obtain a connection to the metadata server and request a SAS token to connect to the workspace server. For the
workspace server to be launched, a launch credential will be defined for the workspace server by the SAS Spawned Servers account.

If token authentication is not selected, SAS uses host authentication and clients provide either an IWA token or a user name and password to authenticate to the workspace server.

Note: If you choose to use token-based authentication, you cannot also implement IWA.

SAS Metadata Server
Specify connection information for the metadata server, and click Next.

- In SAS Metadata Server Logical Name, enter the logical name of the metadata server.

  By default, SAS prefixes the logical server name with the application server name (SASMeta). A logical server is a container for definitions of physical servers. A logical server can have one server component for each SAS server type.

- In SAS Metadata Server Name, enter the logical name of the metadata server.

  By default, SAS prefixes the logical server name with the application server name (SASMeta). A server name is the definition for a physical server. Servers are contained within a logical server (server component) that matches its server type (for example, a metadata server definition is contained in a logical metadata server).

- In Host Name, enter the name of the machine on which the metadata server runs.

- In Port, enter the metadata server listening port. If you choose to not accept the default value, refer to your completed Pre-Installation Checklist for the value that you should enter.

SAS Metadata Server: Override Backup Location
Use this page to indicate a different location for metadata server backups. When you are finished, click Next.

- When you want to change the location of the metadata server backup directory, select Override the default SAS Metadata Server backup directory.

  When configuring a metadata server cluster, you must specify a network file system path accessible to all nodes in the cluster.

SAS Metadata Server: Override Service Login Account
Use this page to indicate a different default service login user account for the metadata server. When you are finished, click Next.

- When you want to change the service login user account for the metadata server, select Specify the service login account for the SAS Metadata Server. The local system account is the default Windows service login account for the metadata server.

- When configuring a metadata server cluster, you must specify a different service login user account.

Deployment Accounts: Type of Accounts
Select which type of user accounts to use for initial deployment SAS identities, and click Next.

- Select Use SAS internal accounts when appropriate for SAS to use accounts known only to SAS.

  SAS creates and authenticates internal accounts in metadata rather than using an operating system account.

  Note: On Windows, whenever the deployment wizard prompts you for an external account, always enter a domain-qualified user account (for example, myDomain\myAccount).

  For more information, see “Internal User Accounts” on page 54.

External Account: Installer
Specify the operating system account (external account) used to initialize the SAS Metadata Server, and click Next.

- In External User ID, enter the user ID for the external account that you are using to install and configure SAS.

  Depending on the operating system, this account should meet the following requirements:

  Windows:

  Use a domain-qualified account that is available in the long term (for future SAS maintenance) and is a member of the Administrators group.

  Linux:

  Use the same account on all machines on which you are deploying SAS. Do not use root.

- In External Password, enter the password for the user ID.

  For more information, see “Defining User Accounts” on page 54.
Automatic Script Execution

(UNIX only) Specify your preference for automatic script execution, and click Next.

- **Run setuid.sh with my ID and password** for the deployment wizard to attempt to run the script with the credentials that you provide.

You see this page on Linux for SAS products that require you run the setuid.sh script with sudo privileges. If you select this option, you will be asked on a subsequent page for the sudo password (if you are deploying a metadata server, you have already provided this information), and as it installs your software, the deployment wizard attempts to run the script with the credentials that you provided.

If you do not select this option, you will have to run setuid.sh manually during installation (and configuration if you have chosen to configure) is complete. Note that setuid.sh must be run as root in order to complete successfully. If you have any concerns with the SAS Deployment Wizard running as root or you do not know the sudo information for the machine that you are installing on, you should not select this option.

**Password for Current ID**

Enter the password for the current account, and click Next.

- **Password for Current ID** enter the password for the current account.

You see this page on Linux when you have indicated on the previous page that you want the SAS Deployment Wizard to run the setuid.sh script via sudo. If you have any concerns with the deployment wizard running as root or you do not know the sudo information for the machine that you are installing on, you should go back and change your earlier selection.

- **Confirm Password** re-enter the password.

**SAS Internal Account: Unrestricted Administrator**

Specify the metadata password for the first Unrestricted Administrator identity, and click Next.

- **New Internal Password** enter a password for the internal account (sasadm@saspw) that the wizard will create to serve as an unrestricted administrator for the purpose of configuring the metadata server.

**Note:** Remember this password as you will need it in the future.

- **Confirm New Internal Password** re-enter the password.

For more information, see “Defining User Accounts” on page 54.

**SAS Internal Account: Trusted User**

Specify the metadata password for the Trusted User identity, and click Next.

- **New Internal Password** enter a password for an internal account (sastrust@saspw) that the wizard will create to enable SAS server and spawner components to communicate securely with each other.

**Note:** Remember this password as you will need it in the future.

- **Confirm New Internal Password** re-enter the password.
For more information, see “Defining User Accounts” on page 54.

SAS BI Web Services: Authentication Method
Select the method by which users of SAS BI Web Services are authenticated, and click Next.

- In Authentication Method, make one of the following selections and click Next:
  - SAS Authentication is managed by the metadata server.
  - Web Authentication is managed by the SAS Web Application Server using container-based authentication or a third-party product.

Selecting Web Authentication has these effects:

- Has no effect on the BI web applications (such as SAS Web Report Studio, SAS Web Information Portal, and so on). You will have to configure web authentication for these BI web applications.
- Prevents you from being offered a chance to set up an anonymous web user (as this is incompatible with web authentication).

Anonymous Web Access
When using SAS authentication, you can select this option to set up a SAS identity for anonymous access to certain web services and web applications that support this feature. When you are finished, click Next.

- Choose Enable anonymous web access to set up a SAS identity for anonymous access to certain web services and web applications that support this feature.

SAS BI Web Services for Java and .NET, the SAS Stored Process Web Application, and SAS Visual Analytics Guest Access are the only components that support this feature.

SAS Internal Account: Anonymous Web User
Specify the metadata password for the anonymous web user identity, and click Next.

- In New Internal Password, enter a password for the internal SAS account to be used to grant clients access to applicable SAS Web Infrastructure Platform applications such as SAS BI Web Services and the SAS Stored Process Web Application.

When SAS authentication is being used and the user has not preemptively specified credentials, the client will be given access to these web applications under the anonymous user account.

For more information, see “Using the SAS Anonymous Web User with SAS Authentication” in Chapter 19 of SAS Intelligence Platform:
Note: Remember this password as you will need it in the future.

- In **Confirm New Internal Password**, re-enter the password.

**SAS Visual Analytics: Allow Guest Access**

Specify whether to allow anonymous access to a subset of SAS Visual Analytics resources and functionality, and click **Next**.

- Select **Guest Access Permitted** to allow guest access for participating SAS Visual Analytics applications.

  Guest access is an optional feature. All users who connect to a guest access URL are authenticated as the same service account (the SAS Anonymous Web User), which functions as the single surrogate identity for all connecting users. Guest access is not compatible with web authentication.

  **TIP** If you are unsure about whether to allow guest access in SAS Visual Analytics, you can create the SAS Anonymous Web User, and then easily add guest access after installation.

**External Account: SAS Spawned Servers Account**

Specify the credentials used to launch back-end stored process and workspace servers, and click **Next**.

- In **External User ID**, enter the user ID to be used to start the SAS Pooled Workspace Server and the SAS Stored Process Servers.

  **Note:** On Windows, enter a domain-qualified user ID.

- In **External Password**, enter the password for the earlier entered user ID.

  **Note:** Remember this password as you will need it in the future.

  For more information, see “Defining User Accounts” on page 54.

**Create Common Directories**

Indicate the common directories that you want the deployment wizard to create. On Windows, in the page that follows, you can specify a data directory, and click **Next**.

- Select the respective check box to create common directories for server and spawner logs, user-specific files, data (SAS libraries for tables and cubes), and temporary work tables and files.

  When you select this option, the deployment wizard creates the specified directory (**Logs**, **Users**, **Data**, and **Temp**) under the SAS configuration directory.

- In **Data Directory** enter a location to contain SAS libraries for tables and cubes.

  This directory is required when configuring SAS BI Dashboard.
Enable FIPS-certified Encryption Algorithms
Indicate whether you want to use AES encryption, and click **Next**.

- Choose the check box to use the Advanced Encryption Standard (AES) algorithm to encrypt communications to and from a SAS Metadata Server. A block cipher that encrypts 128-bit blocks by using a 256-bit key, AES complies with Federal Information Processing Systems (FIPS) standards.

  For more information, see “FIPS 140-2 Standards Compliance” in Chapter 1 of *Encryption in SAS* available at [http://support.sas.com/documentation/cdl/en/secref/68201/HTML/default/viewer.htm#n0pkwquwl0843kn1lroueqj54x45.htm](http://support.sas.com/documentation/cdl/en/secref/68201/HTML/default/viewer.htm#n0pkwquwl0843kn1lroueqj54x45.htm).

Server Encryption
Select the encryption level and algorithm that SAS clients and servers use to connect to the SAS Metadata Server, and click **Next**.

- In **Server Encryption Level**, choose **Credentials** to encrypt only login credentials. Choose **Everything** to encrypt all communication with the metadata server.

  Choosing **Everything** can affect your SAS performance.

- In **Server Encryption Algorithm**, you can specify an encryption algorithm other than SAS Proprietary. The other algorithms are: RC2, RC4, DES, TripleDES, and AES.

Client-side Credentials Policy
Set the policy for client-side storage of credentials, and click **Next**.

- Select **Allow users to save credentials in client-side connection profiles** to allow users to save their user IDs and passwords in client-side connection profiles on the metadata server for desktop applications.

  When set, SAS enables OMA_SASSEC_LOCAL_PW_SAVE in omaconfig.xml.

  For more information, see “Reference Information for omaconfig.xml” in Chapter 32 of SAS *Intelligence Platform: System Administration Guide* available at [http://support.sas.com/documentation/cdl/en/bisag/67481/HTML/default/viewer.htm#n070fn7r6yuz53n19c7180f3hr1g.htm](http://support.sas.com/documentation/cdl/en/bisag/67481/HTML/default/viewer.htm#n070fn7r6yuz53n19c7180f3hr1g.htm).

Estimated System Size
Size your system configuration based on user number, system size, and workload size. Then, click **Next**.

- In **Size Estimate**, make one of the following selections: **Small System**, **Medium System**, or **Large System**.

  The deployment wizard uses your sizing selection as a tuning hint during SAS server configuration. This option appears only during metadata server configuration and applies to all machines configured with this metadata server.
You might have to further refine individual tuning parameters after you have collected and evaluated system usage information.

**E-mail Server**

Specify e-mail server configuration information, and click **Next**.

- In **Host Name**, enter the host name for an SMTP e-mail server at your site. SAS uses this server to send alerts for system-related issues to an administrator (for example, the SAS Metadata Server detects a journaling issue).

  The SAS Deployment Wizard also uses this e-mail server as the default for the SAS Application Server to provide e-mail services to various SAS clients. For example, with SAS Data Integration Studio, you can use a Publish to Email transformation to alert users about various data changes. In order for the SAS BI Dashboard to send alerts by e-mail to dashboard users and administrators, the port and host name must be configured for the e-mail server.

  For more information, see “Pre-installation Checklist for Ports for SAS” on page 63 and “Managing Alert E-mail Options for the SAS Metadata Server” in Chapter 15 of SAS Intelligence Platform: System Administration Guide available at http://support.sas.com/documentation/cdl/en/bisag/67481/HTML/default/viewer.htm#n1gx07b9f1q8dn15shohw31cyl.htm.

- In **Port**, enter the port that the SMTP e-mail server uses.

  For more information, see “Pre-installation Checklist for Ports for SAS” on page 63 and “Managing Alert E-mail Options for the SAS Metadata Server” in Chapter 15 of SAS Intelligence Platform: System Administration Guide available at http://support.sas.com/documentation/cdl/en/bisag/67481/HTML/default/viewer.htm#n1gx07b9f1q8dn15shohw31cyl.htm.

**SAS Application Server: Server Context**

Specify the name of the SAS Application Server context, and click **Next**.

- In **SAS Application Server Context Name**, accept the default (SASApp) or enter a different name of the server context for the SAS Application Server definition that the wizard will create in metadata.

  A server context is a SAS IOM server concept that describes how SAS Application Servers manage client requests. A SAS Application Server has an awareness (or context) of how it is being used and makes decisions based on that awareness. The server context name is prepended to all server names defined in the server context.

  **Note:** The server context name must be unique.

SAS Pooled Workspace Server
Specify SAS Pooled Workspace Server information, and click Next.

- In Logical SAS Pooled Workspace Server Name, enter the name of the logical pooled workspace server to be stored in SAS metadata.
- In SAS Pooled Workspace Server Name, enter the name of the pooled workspace server to be stored in SAS metadata.
- In Host Name, enter the name of the machine on which the pooled workspace server runs. The machine name should match the name specified to the object spawner.
- In Port, enter the port on which the object spawner will listen for client requests to launch pooled workspace servers.

SAS Web Infrastructure Platform Data Server
Specify information for the SAS Web Infrastructure Platform Data Server, and click Next.

- In Host Name, enter the fully qualified host name of SAS Web Infrastructure Platform Data Server or accept the default value. The default is the host name where the deployment wizard is currently running. In most cases the default is correct. However, a machine can have more than one network interface card (NIC) or host name alias. In such a case, to determine whether the default is correct, refer to your Pre-Installation Checklist.
- In Port, enter the TCP/IP port number on which SAS Web Infrastructure Platform Data Server listens or accept the default value.
- In Data Server Administrator, enter the user ID for administering SAS Web Infrastructure Platform Data Server.
- In Data Server Administrator Password, enter the password for the user ID associated with the SAS Web Infrastructure Platform Data Server administrator.

Note: Remember this password as you will need it in the future.

- In Confirm Password, re-enter the password entered in the earlier field.

For more information, see “Reviewing Third-Party Database Requirements” on page 108.

SAS Remote Services Application: JVM
Specify the desired heap sizes for the SAS Remote Services application using the JVM option format, and click Next.

- In Initial JVM Heap Size, enter the desired initial heap size for the remote services application using the JVM option format.

Note: SAS 9.4 no longer requires SAS Remote Services. However, some custom SAS applications still require SAS Remote Services. The SAS Deployment Wizard deploys SAS Remote Services, but it is not automatically started by default.
In **Max JVM Heap Size**, enter the desired maximum heap size for the remote services application using the JVM option format.

In **Additional JVM Options**, enter any additional Java options that you want the SAS Remote Services JVM to use. For example, you might want to add `-Dmulticast_udp_ip_ttl=1` to restrict multicast traffic to a single subnet based on your network topology.

---

**SAS Web Server: Automated or Manual Configuration Option**

Indicate whether you want the deployment wizard to configure the SAS Web Server automatically, and click **Next**.

If you want to configure the SAS Web Server manually, clear **Configure SAS Web Server automatically**.

Select this option for the deployment wizard to automatically build and configure the SAS web applications as well as configure a sample web application server for use with SAS 9.4. (To use this wizard feature, make sure that your web application server is not running before proceeding.)

It is strongly recommended that you choose to automatically configure the SAS Web Server. If you find that you need to make changes to the SAS Web Server after the automatic configuration, there are tools to help you reconfigure it.

For more information, see “Scripting Tool for SAS Web Application Server” in Chapter 21 of *SAS Intelligence Platform: Middle-Tier Administration Guide* available at [http://support.sas.com/documentation/cdl/en/bimtag/66823/HTML/default/viewer.htm#p0zmlylpg3ejydn1vg8x4tai4uxh.htm](http://support.sas.com/documentation/cdl/en/bimtag/66823/HTML/default/viewer.htm#p0zmlylpg3ejydn1vg8x4tai4uxh.htm).

If you choose not to automatically configure your web application server, you will still be prompted for web application server information, and deployment stages such as Configure Products, Deploy Web Applications, and Start Web Application Servers will execute to create instructions for manual deployment. When configuration is complete, follow these manual instructions on how to configure your server and deploy your web applications.

For more information, go to [http://support.sas.com/resources/thirdpartysupport/v94/appservers/index.html](http://support.sas.com/resources/thirdpartysupport/v94/appservers/index.html) and select the product name of your web application server.

**Note:** Manually configuring your SAS middle tier is an advanced procedure and requires using other documents such as your Instructions.html file.

---

**SAS Web Server: Configuration**

Specify SAS Web Server configuration options, and click **Next**.

- The standard port for HTTP traffic is 80. If you want to change this for SAS Web Server, then specify a new port number in **HTTP Port**.

**Note:** On Linux systems that you must start servers as root if you want servers to listen on ports lower than 1024. We recommend that you install
and configure as a less-privileged user and then start SAS Web Server manually as root.

For more information, see “Pre-installation Checklist for Ports for SAS” on page 63 and “Managing Alert E-mail Options for the SAS Metadata Server” in Chapter 15 of SAS Intelligence Platform: System Administration Guide available at http://support.sas.com/documentation/cdl/en/bisag/67481/HTML/default/viewer.htm#n1gx07b9f1f8dn15shohw31cyl.htm.

- The standard port for Transport Layer Security (TLS) traffic is 443. If you want to change this for SAS Web Server, then specify a new port number in HTTPS Port. (See earlier note.)

- In Configured Protocol, select the communication protocol for SAS Web Server. There are two choices, HTTP (unsecured) and HTTPS (secured).
  
  If you select HTTPS, an X509 certificate and private key are required. The deployment wizard prompts you for the paths to these items on a later page. You will have an opportunity to enter a location for these components or provide information to create them. For more information, see Chapter 4, “Pre-Installation: Setting Up Certificates,” on page 69.

- In Administrator Mail Address, specify an e-mail address for e-mail to be sent to the SAS Web Server administrator.

SAS Web Server: Server Process for Handling

Enter the user name and group name for the HTTPD response processes, and click Next.

- In User Name enter the host system user name for the HTTPD response processes. Do not use the numeric User ID.
  
  On Linux, when the HTTPD listener process is run as root, it forks a set of child processes that will handle the requests and respond to the client. For security reasons, these child processes must run with a more limited user and group ID.

- In Group Name, enter the host system group name for the HTTPD response processes. Do not use the numeric Group ID.

SAS Web Server: Location of X509 Certificate and RSA Private Key

If you already have a private key and a signed certificate, enter the location where these reside. When you are finished, click Next.

- In X509 Certificate, enter the path to the valid X509 certificate with the DNS name of this machine as the Common Name (CN).

- In RSA private key, enter the path to the RSA private key that is not protected by a passphrase.
  
  For more information, see Chapter 4, “Pre-Installation: Setting Up Certificates,” on page 69.

Web Application Server: Configure Internet Proxy Server

On this page and the one that immediately follows, indicate whether to configure an Internet proxy server and specify proxy information, and click Next.

- In Proxy Host, enter the fully qualified host name for the proxy server.
If you are using SAS Information Delivery Portal RSS feeds, then you will have to provide proxy server information.

- In **Proxy Port**, enter the port that your site uses to access the Internet.
- In **NonProxy Hosts**, enter the DNS names of all the machines that should not be accessed through the proxy server. Separate each machine name with a vertical line character (|). Use an asterisk (*) as a wildcard for an entire subnet. For example, *.subnet.com excludes all machines with a DNS name that ends with .subnet.com.

If your site does not allow Internet access on production systems, refer to configuration information available at this SAS website: [http://support.sas.com/resources/thirdpartysupport/v94](http://support.sas.com/resources/thirdpartysupport/v94) and select your web application server.

**Web Application Server: Multiple Servers**

Indicate whether to configure multiple web application servers on which to deploy SAS web applications, and click **Next**.

- Select **Configure multiple servers** to have the deployment wizard automatically configure multiple managed servers for you using SAS best practices for choosing the server to deploy each application to.

In some situations, it might be preferable to split the SAS web applications across multiple managed servers. This is usually done for performance reasons.

If you chose to manually configure your application servers, you will be provided with recommended configuration settings in a generated instructions file (Instructions.html) when the SAS Deployment Wizard completes.

**Web Application Server: Server Configuration**

Specify web application server information, and click **Next**.

- In **Server Name**, enter a logical name for your server. A suffix is automatically added to the name that is provided here in order to distinguish cluster members.

  For example, if the name SASServer1 is selected, the actual name will be SASServer1_1. If the multiplier provided on the next page is greater than one, additional servers will be created with unique suffixes. For example, if the multiplier is 2, then servers named SASServer1_1 and SASServer1_2 will be created.

- In **Additional JVM Options**, enter any additional Java options that you want the server VM to use. These JVM options are tagged onto the end of the server's command line. Options that are hardcoded into the SAS Deployment Wizard default set can be over-ridden in this way.
Web Applications: Automatic Deployment

Indicate whether you want the wizard to automatically deploy SAS web applications to the SAS Web Application Server, and click Next.

- Select **Deploy web applications automatically** for the deployment wizard to automatically deploy SAS web applications to the web application server.

  If you do not choose to deploy web applications automatically, manual deployment instructions will be written to Instructions.html during the web application deployment stage.

**Note:** Manually deploying your SAS web applications is an advanced procedure and requires using other documents such as your Instructions.html file.

Regardless of whether you choose to automatically deploy your SAS web applications, when building web applications, the wizard also automatically explodes web application archive files (EAR files).

For more information, see “Overview” in Chapter 10 of SAS Intelligence Platform: Middle-Tier Administration Guide.

**IP Multicast Version**

(UNIX only) Specify the IP version to use for the IP multicast address, and click Next.

- In **IP Version**, select the Internet Protocol version appropriate for your system.

  The deployment wizard detects that this machine has an IPv4 address and an IPv6 address. If you choose IPv6, you are confirming that all servers containing SAS products are connected to an IPv6 enabled network and have IPv6 enabled network interfaces.

  For more information, see “Multicast Address Considerations” on page 61.

**IP Multicast**

Specify IP multicast information between SAS applications. Accept these IP multicast settings or enter new ones. If you choose to use an authentication token, a wizard page immediately follows in which you enter token information. When you are finished, click Next.

- In **IP Multicast Address**, enter a new multicast address.

  A multicast group communications protocol is used to communicate among middle-tier SAS applications in a single SAS deployment (the set of applications connected to the same metadata server). The combination of multicast IP address and multicast UDP port should be different for each SAS deployment and also different from those used by other multicast applications at your site. The defaults are most appropriate for deployments in a firewall-isolated data center environment.

  For more information, see “Multicast Address Considerations” on page 61.

- In **IP Multicast UDP Port**, enter a valid UDP port for use on all the machines where a SAS middle-tier application is installed.

- In **IP Multicast UDP TTL**, enter a valid multicast TTL property (default = 1, range = 0–255). This property affects the number of network hops
a multicast packet will take before being dropped. This TTL value must be greater than or equal to the largest number of hops between any two servers containing SAS products.

- Choose **Use an authentication token to connect** to prevent access to the multicast group from unauthorized listeners. The authentication token can be any password-like string. You must provide the same authentication token string to each tier in the same SAS deployment (that is, each tier associated with the same metadata server).

SAS Web Infrastructure Platform Database: Data Server

Indicate whether to use a third-party database for the SAS Web Infrastructure Platform database, and click **Next**.

- Clear **Use SAS Web Infrastructure Platform Data Server** to use a different database to store SAS Web Infrastructure Platform data.

  In SAS 9.4, the following third-party database management systems are supported: DB2, MySQL, Oracle, PostgreSQL, and SQLServer.

SAS Content Server: Repository Directory

Specify content server repository options, and click **Next**.

- In **Repository Directory**, enter the location on the disk for the content server indexes and repository configuration file. You can also click **Browse** to search for this location.

  For more information, see Chapter 10, “Administering the SAS Content Server,” in *SAS Intelligence Platform: Middle-Tier Administration Guide* available at [http://support.sas.com/documentation/cdl/en/bimtag/66823/HTML/default/viewer.htm#p0q09sqnbzpnm0n1c0v7q6fqxn5d.htm](http://support.sas.com/documentation/cdl/en/bimtag/66823/HTML/default/viewer.htm#p0q09sqnbzpnm0n1c0v7q6fqxn5d.htm).

- Select **Start initial node as clustered**, when this machine is (or might be) part of a clustered deployment.

**CAUTION!** If you enable this option, you must also establish a central backup vault for the SAS Deployment Backup and Recovery Tool. Starting in the second maintenance release for SAS 9.4, a vault is no longer required for clustered content servers.

  Deselect **Start initial node as clustered** when you are not deploying the SAS middle tier on a machine cluster. (This setting enables journaling and the necessary cluster synchronization processes.)

  If you redeploy the middle tier on a machine cluster in the future, you can manually set the Java system property `-Dcom.sas.server.isclustered=true` and restart the initial application server node. For more information, see “Adding a Horizontal Cluster Member” in Chapter 16 of *SAS Intelligence Platform: Middle-Tier Administration Guide*.

SAS Web Infrastructure Platform: Database Type

Specify the alternate database that you want to use for the SAS Web Infrastructure Platform, and click **Next**.

- In **Database Type**, select one of the following supported databases: DB2, MySQL, Oracle, PostgreSQL, or SQLServer.

  **Note:** The database used by SAS Environment Manager, the SAS Deployment Backup and Recovery tool, and certain SAS solutions, such as SAS Visual Analytics, will be PostgreSQL regardless of the database that you choose for the SAS Web Infrastructure Platform.
For more information, see “Reviewing Third-Party Database Requirements” on page 108.

SAS Web Infrastructure Platform Database: JDBC Properties
If you selected a database server other than the SAS Web Infrastructure Data Server, then the following fields are editable. If you are using the SAS Web Infrastructure Database Server, the database name and user ID is ReadOnly. When you are finished, click Next.

- In **Database Name**, specify the name of the database that contains the SAS Web Infrastructure Database tables.
- In **User ID**, specify the user ID for accessing the database used with your SAS Web Infrastructure Database tables. This user ID must have the ability to insert, update, and delete records.
- In **Password**, specify a valid password for the user ID associated with the database server account. The deployment wizard will use this password to create the database server account.

*Note:* Remember this password as you will need it in the future.

- In **Confirm Password**, re-enter the password that you specified in **Password**.

SAS Environment Manager: Administration Database Configuration
Specify administrator credentials for the SAS Environment Manager database, and click Next.

- In **User ID**, specify the user ID for accessing the database used with your SAS Web Infrastructure Platform Database tables. This user ID must have the ability to insert, update, and delete records.

By default, the SAS Environment Manager uses the Administration database on the SAS Web Infrastructure Data Server. If you are using the SAS Web Infrastructure Platform Database Server, the user ID is ReadOnly.

- In **Password**, enter the password for the user ID.

*Note:* Remember this password as you will need it in the future.

- In **Confirm Password**, re-enter the password.

SAS Internal Account: SAS Environment Manager Service Account
Specify the metadata password for the SAS Environment Manager service, and click Next.

- In **SAS Environment Manager Service Account Password**, enter a password for the SAS Environment Manager service account (sasevs@saspw).

The password must contain at least six characters. Make sure that you supply the same password that was specified in any previous SAS Environment Manager configuration prompts.

*Note:* Remember this password as you will need it in the future.
This service account is required for the SAS Environment Manager and its agent to communicate while monitoring the processes in your SAS deployment. This internal SAS account has unrestricted administrative access rights to the metadata server.

- In Confirm Password, re-enter the password.

Choose SAS Environment Manager: Keystore

Indicate whether to use the built-in or customized keystore, and click Next.

- By default, the SAS Environment Manager uses the cacerts file shipped with the SAS private JRE.

  If you want to use a different keystore, choose Use a customer-supplied JKS format keystore.

  For more information, see Chapter 4, “Pre-Installation: Setting Up Certificates,” on page 69.

SAS Environment Manager: Database Configuration

Specify SAS Environment Manager database credentials. EVManager is a default Postgres database supplied by SAS that is used to store collected server metrics. When you are finished, click Next.

- In Database User, specify a user ID used for accessing the EVManager database.

- In Database User Password, specify a valid password for the user ID associated with the database server account.

  Note: Remember this password as you will need it in the future.

- In Confirm Password, re-enter the password.

- In Database Encryption Passphrase, specify a valid passphrase key used for encrypting and decrypting the SAS Environment Manager database user password.

  The key must be at least eight characters long and can contain letters and numbers only.

  Note: Remember this passphrase as you will need it in the future.

  In Confirm Database Encryption Passphrase, re-enter the passphrase key. Click Next.

Specify SAS Environment Manager database credentials. EVManager is a default Postgres database supplied by SAS that is used to store collected server metrics. When you are finished, click Next.

- In Database User, specify a user ID used for accessing the EVManager database.

- In Database User Password, specify a valid password for the user ID associated with the database server account.

  Note: Remember this password as you will need it in the future.

- In Confirm Password, re-enter the password.
In **Database Encryption Passphrase**, specify a valid passphrase key used for encrypting and decrypting the SAS Environment Manager database user password.

The key must be at least eight characters long and can contain letters and numbers only.

**Note:** Remember this passphrase as you will need it in the future.

In **Confirm Database Encryption Passphrase**, re-enter the passphrase key. Click **Next**.

**SAS Environment Manager Agent Configuration**

On this page and the one that follows, specify SAS Environment Manager Agent information, and click **Next**.

Select **Establish secure communication** to enable secure communication using Transport Layer Security (TLS) between the SAS Environment Manager and its agents.

For more information, see Chapter 5, “Setting Up Certificates for SAS Deployment,” in SVM: Installation and Configuration Guide.

**SAS Environment Manager Enablement Kit Database Credentials**

Specify database connection information, and click **Next**.

Do not change the user ID information that is displayed on this page.

In **User ID**, enter the user ID for accessing the database used with SAS Environment Manager Enablement Kit.

In **Password**, enter the password for the user ID.

**Note:** Remember this password as you will need it in the future.

In **Confirm Password**, re-enter the password.

**SAS Visual Analytics Explorer: Context Root**

Specify the context root, and click **Next**.

In **Context Root for SAS Visual Analytics Explorer**, enter the context root that ties the user to the EAR file that is specified in the **Display Name** field.

The form of the URL for SAS Visual Analytics Explorer is `http://machine:port/SASVisualAnalyticsExplorer`. Although the machine and port are configured elsewhere and they typically apply to the web container as a whole, the `SASVisualAnalyticsExplorer` portion is the context root, and you can change it (within the constraints of URL rules).

**SAS Visual Analytics High-Performance Configuration Properties**

Specify properties to create a libref to reference the directory that contains uploaded and extracted SAS data sets, and click **Next**.

In **Uploaded SAS Dataset Libref Name**, enter the libref name to reference the directory that contains uploaded and extracted SAS data sets. The maximum number of characters for a libref name is eight.
In **SAS Visual Analytics High-Performance Data Provider**, select the data provider to be used with SAS Visual Analytics. The supported values are Hadoop and Non-distributed LASR.

This configuration panel appears only when the SAS order is licensed for both the distributed and the non-distributed SAS LASR Analytic Server.

Several versions of Hadoop are supported such as SAS High-Performance Deployment of Hadoop, Cloudera Hadoop, and Hortonworks Data Platform. For more information, refer to Chapter 4, “Deploying Co-Located Hadoop,” in *SAS High-Performance Analytics Infrastructure: Installation and Configuration Guide* available at [http://support.sas.com/documentation/solutions/hpainfrastructure/](http://support.sas.com/documentation/solutions/hpainfrastructure/).

---

**SAS Visual Analytics High-Performance Configuration Information**

Specify configuration information for the SAS High-Performance Analytics environment, and click **Next**.

- **In SAS High-Performance Analytics Environment Host**, enter the fully qualified machine name in the cluster to which the SAS clients connect.

- **In SAS High-Performance Analytics Environment Port**, enter the port number in the environment through which the SAS clients connect. (By default, the port is 10010.)

  For more information, refer to “Pre-installation Checklist for Ports for SAS” on page 63.

- **In Signature files location**, specify the absolute path where the SAS LASR Analytic Server writes signature files.

  If you are using SAS LASR Analytic Server in distributed mode, specify a path located on the SAS High-Performance Analytics environment root node. If you are using non-distributed mode, specify a path located on the local machine.

  It is important to carefully manage access to the signature files directory. User IDs under which certain activities are performed (for example, starting a server or loading data) must have Write access to the signature files directory. Access to a signature files directory can provide access to loaded data so that the signature files directory should be protected against unauthorized access. For more information, see “Signature Files” in Chapter 3 of *SAS Visual Analytics: Administration Guide*.

- **In Location of the TKGrid or TKGrid_REP Installation on the SAS High-Performance Analytics Environment**, specify the absolute path to the TKGrid directory or the TKGrid_REP directory on the root node host (for example, `/opt/TKGrid`).

  Specify the TKGrid_REP directory when you are feeding your SAS High-Performance Analytics Environment with parallel loads from a remote (not co-located) data provider.
Be sure not to leave any whitespace characters at the end of the path because whitespace characters can cause problems when you attempt to submit SAS LASR Analytic Server jobs later.

- In **SAS High-Performance Computing Management Console URL**, enter the URL used to access SAS High-Performance Computing Management Console. (By default, the URL is http://local_host_name:10020.)
  

- In **Location for the SAS linguistic distributed binaries**, specify the directory on disk that stores the SAS linguistic binary files. These binary files are required to perform text analysis in SAS LASR Analytic Server with SAS Visual Analytics and to run PROC HPTMINE and PROC HPTMSCORE with SAS Text Miner.

  **SAS Visual Analytics Data Provider: Hadoop**

Specify Hadoop configuration information, and click **Next**.

- In **Hadoop NameNode Host**, specify the machine in the HDFS cluster that is the Hadoop NameNode.

- In **Hadoop NameNode Port**, enter a port number for the HDFS NameNode service, which runs only on the NameNode in the HDFS cluster. This value maps to the Hadoop property com.sas.lasr.hadoop.service.namenode.port.

- In **Hadoop NameNode Authentication Domain**, enter the domain to use for identifying logins that access the Hadoop NameNode machine.

  The authentication domain is a metadata construct that pairs each login with the servers for which that login is valid. The authentication domain provides logical groupings for resources and logins in a metadata repository. This ensures that resources use the same authentication process.

  For example, when an application needs to locate credentials that enable a particular user to access a particular server, the application searches the metadata for logins that are associated with the authentication domain in which the particular server is registered.

- In **Library Name**, enter the library name for the Hadoop library.

- In **Libref**, specify the libref for the Hadoop library.
In **Hadoop Path**, enter the path to the database for the Hadoop data server.

**SAS Visual Analytics Public Data Library: Hadoop**
Specify public data library configuration information, and click **Next**.

- In **Library Name**, enter the library name for the public Hadoop library.
- In **Hadoop Path**, enter the database for the public Hadoop data server.
- In **Libref**, enter the libref for the public Hadoop library.

**SAS Visual Analytics Data Provider: Hadoop**
Confirm the various ports used for Hadoop, and click **Next**.

- In **File System Default Port**, enter the port used to access the NameNode default file system.
- In **MapReduce Job Tracker Port**, enter the port used to access the MapReduce server JobTracker process. This value maps to the Hadoop property `mapred.job.tracker`.
- In **Primary NameNode HTTP Port**, enter the port on which the NameNode primary web user interface listens. This value maps to the Hadoop property `dfs.namenode.http-address`.
- In **Secondary NameNode HTTP Port**, enter the port on which the NameNode backup web user interface listens. This value maps to the Hadoop property `dfs.secondary.http-address`.
- In **Job Tracker HTTP Port**, enter the port on which the JobTracker web user interface listens. This value maps to the Hadoop property `mapred.job.tracker.http.address`.

**SAS Visual Analytics Public Data Provider**
Specify a library definition for a public, non-distributed SAS LASR Analytic Server data provider, and click **Next**.

- In **Data Reload Library Name**, specify the name for the Reload library.
- In **Data Reload Libref**, specify the libref for the Reload library.
- In **SAS Visual Analytics Reload Path**, enter the absolute path to the Reload library.

**SAS LASR Analytic Server Monitor Configuration Information**
Specify SAS LASR Analytic Server Monitor configuration information, and click **Next**.

- In **SAS LASR Analytic Server Monitor Host**, enter the SAS LASR Analytic Server Monitor host name.
- In **SAS LASR Analytic Server Monitor RMI Registry Port**, enter the Remote Method Invocation (RMI) port that the SAS LASR Analytic Server Monitor listens on for activity.

For more information, see "Pre-installation Checklist for Ports for SAS" on page 63.
SAS Visual Analytics Public Data Library Information
Confirm the port for the SAS High-Performance Analytics environment to which the SAS clients connect, and click Next.

- In **SAS Visual Analytics Public Data Library Port**, enter the port number for the SAS High-Performance Analytics environment to which the SAS clients connect.
  
  For more information, see “Pre-installation Checklist for Ports for SAS” on page 63.

SAS Visual Analytics AutoLoad Location
Specify the path to the SAS Visual Analytics AutoLoad location, and click Next.

- In **SAS Visual Analytics AutoLoad Location**, enter the absolute path of the host directory in which users place tables for loading to memory.

SAS Visual Analytics: SAS LASR Analytic Server Library
Specify the SAS LASR Analytic Server library name and libref, and click Next. You can modify both of these properties after installation by using SAS Management Console.

- In **Library Name**, enter the name for the SAS LASR Analytic Server library.
- In **Libref**, enter the libref for the SAS LASR Analytic Server library.

SAS Visual Analytics: Public LASR Libraries
Specify the public LASR library name and libref, and click Next. You can modify both of these properties after installation by using SAS Management Console.

- In **Public LASR Library Name**, enter the name for the library that is pre-populated for users when they import data files and create data queries. (This public LASR library provides ease of use rather than data security.)
- In **Public LASR Libref**, enter the libref for the public LASR library.

SAS Visual Analytics Designer: Context Root
Specify the context root, and click Next.

- In **Context Root for SAS Visual Analytics Designer**, enter the context root that ties the user to the EAR file that is specified in the **Display Name** field.
  
  The form of the URL for SAS Visual Analytics Designer is http://machine:port/SASVisualAnalyticsDesigner. Although the machine and port are configured elsewhere and they typically apply to the web container as a whole, the **SASVisualAnalyticsDesigner** portion is the context root, and you can change it (within the constraints of URL rules).

SAS Visual Analytics Hub: Context Root
Specify the context root, and click Next.

- In **Context Root for SAS Visual Analytics Hub**, enter the context root that ties the user to the EAR file that is specified in the **Display Name** field.
  
  The form of the URL for SAS Visual Analytics Hub is http://machine:port/SASVisualAnalyticsHub. Although the machine and port
are configured elsewhere and they typically apply to the web container as a whole, the \texttt{SASVisualAnalyticsHub} portion is the \textit{context root}, and you can change it (within the constraints of URL rules).

\textbf{SAS Visual Analytics Report Viewer: Context Root}
Specify the context root, and click \textbf{Next}.

- In \textit{Context Root for SAS Visual Analytics Report Viewer}, enter the context root that ties the user to the EAR file that is specified in the \texttt{Display Name} field.

The form of the URL for SAS Visual Analytics Report Viewer is \url{http://machine:port/SASVisualAnalyticsReportViewer}. Although the machine and port are configured elsewhere and they typically apply to the web container as a whole, the \texttt{SASVisualAnalyticsReportViewer} portion is the \textit{context root}, and you can change it (within the constraints of URL rules).

\textbf{SAS Visual Analytics Admin: Context Root}
Specify the context root, and click \textbf{Next}.

- In \textit{Context Root for SAS Visual Analytics Admin}, enter the context root that ties the user to the EAR file that is specified in the \texttt{Display Name} field.

The form of the URL for SAS Visual Analytics Administrator is \url{http://machine:port/SASVisualAnalyticsAdministrator}. Although the machine and port are configured elsewhere and they typically apply to the web container as a whole, the \texttt{SASVisualAnalyticsAdministrator} portion is the \textit{context root}, and you can change it (within the constraints of URL rules).

\textbf{SAS Visual Analytics Services Database Credentials}
Specify JDBC connection information for the SAS Visual Analytics Services database, and click \textbf{Next}.

- In \texttt{User ID}, enter the user account that SAS uses to create a JDBC connection to the SAS Visual Analytics Services Database. (The default is \texttt{vatadm}.)

- In \texttt{Password}, enter a password for the user account (\texttt{vatadm}).

\textbf{Note:} Remember this password as you will need it in the future.

- In \texttt{Confirm Password}, re-enter the password.

\textbf{SAS Visual Analytics Transport Service: Whitelist Mobile Devices}
Specify whether to enforce a whitelist for SAS Mobile BI, and click \textbf{Next}.

- Select \textbf{Enforce whitelist for mobile devices} to use a whitelist to control access to SAS Mobile BI.

A deployment enforces either the blacklist or the whitelist. If the whitelist is not selected to be enforced, the blacklist is enforced by default. If the whitelist is enforced, only devices that are on the whitelist can use SAS Mobile BI. If the blacklist is enforced, any device that is not on the blacklist can use SAS Mobile BI. Although only one list is enforced, you can make changes to both lists.

For more information, see “Access from Mobile Devices” in Chapter 3 of \textit{SAS Visual Analytics: Administration Guide} available at \url{http://support.sas.com/documentation/solutions/va}.\texttt{142}
SAS Visual Analytics: Protocol for OpenStreetMap Server
Specify the protocol for how SAS Visual Analytics Explorer communicates with the OpenStreetMap server hosted by SAS, and click **Next**.

- In **SAS-hosted OpenStreetMap Server Communication Protocol**, select a protocol to use for standard web browser communication.
  
  Your options are **HTTP Protocol** (default) and **HTTPS Protocol** (secure).
  
  Using HTTPS can result in performance degradation because of additional communication and encryption.
  

SAS Visual Analytics: Configure ArcGIS Server
Specify whether to configure an Esri ArcGIS server, and click **Next**.

- Select **Configure ArcGIS Server** to configure an ArcGIS server. If this option is not selected, then the wizard skips ArcGIS server configuration.
  

SAS Visual Analytics: ArcGIS Server Details
Specify the URL of the ArcGIS REST Services directory, and click **Next**.

- In **ArcGIS REST Services Directory**, enter the URL used to connect to the ArcGIS REST Services directory.
  
  Use the format `protocol://hostname:port/instance/services/folder`.

SAS Visual Analytics Hyperlink Service: Context Root
Specify the context root, and click **Next**.

- In **Context Root for SAS Visual Analytics Hyperlink Service**, enter the context root that ties the user to the EAR file that is specified in the **Display Name** field.
  
  The form of the URL for SAS Visual Analytics Service Hyperlink Service is `http://machine:port/SASVisualAnalytics`. Although the machine and port are configured elsewhere and typically apply to the web container as a whole, the `SASVisualAnalytics` portion is the **context root**, and you can change it (within the constraints of URL rules).

SAS Visual Data Builder: Context Root
Specify the context root, and click **Next**.

- In **Context Root for SAS Visual Analytics Data Builder**, enter the context root that ties the user to the EAR file that is specified in the **Display Name** field.
  
  The form of the URL for SAS Visual Analytics Data Builder is `http://machine:port/SASVisualAnalyticsDataBuilder`. Although the machine and port are configured elsewhere and typically apply to the web container as a whole, the `SASVisualAnalyticsDataBuilder` portion is the **context root**, and you can change it (within the constraints of URL rules).
SAS Visual Data Builder Database Credentials
Specify JDBC connection information for the SAS Visual Data Builder database, and click Next.

- In User ID, enter the user account that SAS uses to create a JDBC connection to the SAS Visual Data Builder database. (The default is vdbadm.)
- In Password, enter a password for the user account (vdbadm).
  
  Note: Remember this password as you will need it in the future.
- In Confirm Password, re-enter the password.

SAS Information Retrieval Studio
On this page and the next page, confirm the ports used for SAS Information Retrieval Studio, and click Next.

- Review the SAS Information Retrieval Studio ports.
  
  For more information, see “Pre-installation Checklist for Ports for SAS” on page 63.

Search Interface to SAS Content Feeder Configuration
Specify feeder information for Search Interface to SAS Content, and click Next.

- In Index Loader Interval In Minutes, enter the interval to provide SAS content to the server for search indexing.

SAS Internal Account: Search Interface to SAS Content User
Specify a metadata password for the internal user account that permits access to SAS content that is provided to SAS Information Retrieval Studio for indexing. Click Next.

- Display Name contains the SAS Content User display name that is stored in SAS metadata.
- Name contains the SAS Content User account name that is stored in SAS metadata.
- Internal User ID contains the SAS Content User user ID that is stored in SAS metadata.
- In New Internal Password, enter a password for the SAS Content User. SAS stores this password in SAS metadata. The password must contain at least six characters.
  
  Note: Remember this password as you will need it in the future.
- In Confirm New Internal Password, re-enter the password.

SAS Deployment Backup and Recovery Tool: Enable Central Vault
Indicate whether to use a central backup vault for the SAS Deployment Backup and Recovery Tool, and click Next.

- Select Enable central vault storage of backup files, to enable central storage of backup files by specifying a network-accessible vault directory.

  CAUTION! If your SAS deployment is not current with the second maintenance release for SAS 9.4, then a central vault location is required if your middle-tier environment includes a clustered SAS Content Server.
The default value for the shared centralized vault location is kept blank. The feature of storing backup at a centralized location is disabled as default.

To enable this feature, in the two pages that follow, provide a directory shared across all the tiers. The default retention period for a backup is 30 days. If the configuration that you are performing requires a backup at a centralized shared location and you want to change retention period, select this option.

Finally, provide a valid operating system (external) user account and password to be used to execute commands using the SAS Deployment Agent. This user account must have access to and sufficient privileges for each host machine to be included in the backup.

SAS Visual Analytics Graph Builder: Context Root
Specify the context root, and click Next.

- In Context Root for SAS Visual Analytics Graph Builder, enter the context root that ties the user to the EAR file that is specified in the Display Name field.

The form of the URL for SAS Visual Analytics Graph Builder is http://machine:port/SASVisualAnalyticsGraphBuilder. Although the machine and port are configured elsewhere and they typically apply to the web container as a whole, the SASVisualAnalyticsGraphBuilder portion is the context root, and you can change it (within the constraints of URL rules).

SAS Studio Mid-Tier: Context Root
Specify the context root, and click Next.

- In Context Root for SAS Studio Mid-Tier, enter the context root that ties the user to the EAR file that is specified in the Display Name field.

The form of the URL for SAS Studio Mid-Tier is http://machine:port/SASSStudio. Although the machine and port are configured elsewhere and typically apply to the web container as a whole, the SASSStudio portion is the context root, and you can change it (within the constraints of URL rules).

32 Deployment Summary

Review the summary of software that the deployment wizard will install and configure.

- When you see the Deployment Summary page, the deployment wizard has finished collecting installation and configuration input. This is the last opportunity to go back and change any information that you have
provided in previous pages before the wizard begins writing to your system.

Make one of the following choices:

- Click **Start** to begin installing SAS files and writing the configuration to the current machine.
  
  The deployment wizard launches the installation and configuration process and provides an ongoing status update.

- Click **Back** to navigate to earlier wizard pages to change installation and configuration information previously entered.

- Click **Cancel** to terminate the wizard session. Note that you will lose installation and configuration information previously entered.

**CAUTION!** If you encounter a situation in which the deployment wizard reports a configuration failure, leave the error message displayed and do not continue. Consult additional documentation and, if necessary, contact SAS Technical Support. Moving past an error most often results in having to delete your deployment and start over.

On Linux, when you are installing the server tier, you will be instructed to run a script as root. As the message in the installation program explains, certain SAS products and features use functionality that requires SAS to check user ID authentication and file access authorizations. This, in turn, necessitates that certain files within your SAS installation have setuid permissions and be owned by root.

Your credentials are temporarily stored in your Windows registry using the Windows automatic logon functionality. In rare circumstances, it is possible those values will remain in your Windows registry after their use, thus posing a potential security risk.

For more information about this functionality, including any risks, see Microsoft documentation about security and automatic logons. You should weigh the risks of convenience for automatic logon after restart against the security policies in place at your site.
Deployment Complete

The Deployment Complete page displays the configuration results for each SAS product.

- Green check marks next to every item on this page indicate that your deployment completed successfully. Click Next.

Additional Resources
Use the links displayed to review more information about your SAS deployment.

- **Click Finish** to close the SAS Deployment Wizard.

35 Configuration Guidelines and Details

Review Configuration Guidelines and Details for post-deployment steps, and click **Next**.

- To complete your SAS deployment, review Configuration Guidelines and Details and perform the steps listed.

  Configuration Guidelines and Details (Instructions.html) is automatically generated by the deployment wizard and has post-installation steps specific to your SAS order that you must perform.

- The SAS Deployment Wizard writes the Configuration Guidelines and Details (Instructions.html) file to the Documents directory under the SAS configuration path. For example:
  
  - **Linux:**
    
    `/opt/SAS/Lev1/Documents/Instructions.html`
  
  - **Windows:**
    
    `C:\SAS\Config\Lev1\Documents\Instructions.html`
36 Back up your metadata repository and your SAS configuration directory.

- Make a backup copy of your SAS Visual Analytics configuration directories by using your site-approved method. Your SAS configuration directories are all of the child directories under the path that you specified previously on the Specify Configuration Information wizard page.

- Back up your SAS Web Application Server directories.

37 If you opted not to automatically deploy your SAS web applications, then you must manually deploy them. For more information, see SAS Support for Web Application Servers and HTTP Servers.

38 Be sure to restart any servers that you stopped when creating the backup.

40 If you are using encryption for SASHDAT, follow the post-deployment tasks in “Enable SASHDAT Encryption” on page 150.
Adding SAS LASR Analytic Server Monitor as a Windows Service

To add the SAS LASR Analytic Server Monitor as a Windows Service, follow these steps:

1. Log on to the SAS LASR Analytic Server Monitor machine as a user who is a member of the Windows Administrators group.

2. In the Windows taskbar, click Start, in Search programs and files, type services.msc, and then press Enter.

4. On the Log On tab, select This account, and enter the domain and user name (for example, DOMAIN\user_name). Click Apply.

5. Windows automatically grants the Log On As A Service right. Click OK.

6. Click OK.

7. Copy the SSH keys from the SAS High-Performance Analytics environment host to the SAS LASR Analytic Server Monitor machine under disk: \Users \current-user-ID\.ssh.

8. Open LASRMonitor.conf, located at SAS-configuration-directory\Applications\SASVisualAnalytics \HighPerformanceConfiguration\wrapper.

9. Update the set.USERNAME= property with the SAS High-Performance Analytics environment host user ID whose SSH keys match the SSH keys that you copied earlier.

10. Save and close LASRMonitor.conf.

11. Start the SAS LASR Analytic Server Monitor in the Services window or by running the following script from the command line:

   SAS-configuration-directory\Applications\SASVisualAnalytics \HighPerformanceConfiguration\LASRMonitor.bat -start.

---

Enable SASHDAT Encryption

In order to support encryption of SASHDAT, you must apply the SAS Intelligence Platform 9.4m2f and the SAS Visual Analytics 7.2 hot fixes.

After the hot fixes are applied, you must delete and re-add the Hadoop Server and the SAS Data in HDFS Library resource templates in SAS Management Console.
To delete and re-add the two resource templates, follow these steps:

1. Sign on to SAS Management Console as a user with the appropriate permissions to add resource templates.

2. On the Plug-ins tab, expand Metadata Manager, and then click Resource Templates.

3. In the table on the right, right-click Hadoop Server, and choose Delete.

4. Repeat step 3 for SAS Data in HDFS Library.

5. In the tree on the left, right-click Resource Templates, and choose Add Resource Template.

   The Add Resource Template Wizard appears.

6. Choose Typical and click Next.

7. In the tree, expand Servers, expand Cloud Servers, click Hadoop Server, and finally click Next.

8. Click Finish.

   You have re-added the Hadoop Server resource template.

9. Repeat steps 5 and 6.

10. In the tree, expand Libraries, expand High-Performance Analytics, click SAS Data in HDFS Library, and finally click Next.

11. Click Finish.

   You have re-added the SAS Data in HDFS Library resource template.

12. To validate that the new templates are enabled for encryption, verify that each template has an Options tab with fields related to encryption present.
Validating Your SAS Visual Analytics Deployment

Overview of Validating Your SAS Visual Analytics Deployment

There are two basic types of SAS Visual Analytics deployments: one with a distributed analytics cluster (distributed) and one without (non-distributed). Make sure that you perform the correct validation steps for your deployment.

Remember that a large part of SAS Visual Analytics is shipped with SAS solutions. Therefore, you can use this section to validate any part of SAS Visual Analytics that your SAS solution contains (usually every part except SAS Visual Analytics Explorer).

You might want to wait to validate your deployment after you have deployed both the server tier and middle tier. If you have deployed only the server tier, then some of the validation steps cannot be completed until you have deployed the middle tier.

- “Validate Your SAS Visual Analytics Deployment (Non-Distributed)” on page 153
- “Validate Your SAS Visual Analytics Deployment (Distributed)” on page 154
Validate Your SAS Visual Analytics Deployment (Non-Distributed)

Here are suggestions of how you can validate your non-distributed SAS Visual Analytics deployment. The SAS Visual Analytics documentation referenced is available at http://support.sas.com/documentation/onlinedoc/va/index.html.

Table 6.2  Suggestions for SAS Visual Analytics Validation

2. Click **Home** in the banner to return to the home page. | **SAS Visual Analytics: User's Guide** |

* SAS Visual Data Builder requires that a SAS identity be a member of the Visual Data Builder Administrators group. Members of the Visual Analytics Data Administrators group do not have access to SAS Visual Data Builder.

** Some SAS orders do not contain SAS Visual Analytics Explorer.

---

### Validate Your SAS Visual Analytics Deployment (Distributed)

Here are suggestions of how you can validate your distributed SAS Visual Analytics deployment. The SAS Visual Analytics documentation referenced is available at [http://support.sas.com/documentation/onlinedoc/va/index.html](http://support.sas.com/documentation/onlinedoc/va/index.html).

**Table 6.3** Suggestions for SAS Visual Analytics Validation

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Actions</th>
<th>More Information</th>
</tr>
</thead>
</table>
| Create an account for use later in the validation. | In SAS High-Performance Computing Management Console:  
1. Use the SAS LASR Analytic Server installer account (sas) or create a new administrator account (such as saslasradm).  
2. Create SSH keys. (SSH keys have already been created for the installer account.) | To create an account, see “How to Add a User” in the SAS Visual Analytics: Administration Guide.  
To create SSH keys, see “Managing Users and Groups” in Chapter 4 of SAS High-Performance Computing Management Console: User's Guide. |
<table>
<thead>
<tr>

<th>Actions</th>
<th>More Information</th>
</tr>
</thead>
</table>
| Create a SAS identity for use later in the validation. | In SAS Management Console:  
1. Define a SAS Visual Analytics Administrator (use the account previously created (saslasradm)).  
2. Assign the administrator to the Visual Analytics Data Administrators group and the Visual Data Builder Administrators group. | SAS Management Console: Guide to Users and Permissions |
| Create sample data for use later in the validation. | In SAS Management Console, define a library and register a table.  
(You can use Sashelp: `!SASROOT/sashelp`) | SAS Intelligence Platform: Data Administration Guide |
| Validate that the home page is running and valid logins are accepted. | Sign on to the home page as saslasradm.  
| Demonstrate that SAS Visual Analytics Administrator is functional and able to communicate with the SAS LASR Analytic Server. | On the home page, click Administrator. Then, do the following:  
1. Start a SAS LASR Analytic Server.  
2. Load a SAS table into SAS LASR Analytic Server. | SAS Visual Analytics: Administration Guide |
| Demonstrate that SAS Visual Data Builder is functional. | On the home page, click Create Data Query. Then, do the following:  
1. Create a data query.  
2. Click Home in the banner to return to the home page. | SAS Visual Analytics: User's Guide |
| Demonstrate that SAS Visual Analytics Explorer is functional. | On the home page, click Create Exploration. Then, do the following:  
1. Create an exploration.  
2. Click Home in the banner to return to the home page. | SAS Visual Analytics: User's Guide |
| Demonstrate that SAS Visual Analytics Designer is functional. | On the home page, click Create Report. Then, do the following:  
1. Create a report.  
2. Click Home in the banner to return to the home page. | SAS Visual Analytics: User's Guide |
| Demonstrate that the SAS Visual Analytics Graph Builder is functional. | On the home page, click Custom Graph Builder. Then, do the following:  
1. Create a custom graph object.  
2. Click Home in the banner to return to the home page. | SAS Visual Analytics: User's Guide |
Use the object inspector on the home page to view details about the report, and then click View. | SAS Visual Analytics: User's Guide |
Validating Your SAS LASR Analytic Server Monitor Deployment

On distributed server deployments only, certain features in the SAS Visual Analytics Administrator rely on the SAS LASR Analytic Server Monitor.

To validate the SAS LASR Analytic Server Monitor deployment, follow these steps:

1. Log on to the SAS LASR Analytic Server Monitor machine (blade 0) using the SAS installer account.

2. Change to the SAS LASR Analytic Server Monitor configuration directory.
   
   By default, this directory is located at `SAS-configuration-directory/Applications/SASVisualAnalytics/HighPerformanceConfiguration`.

3. Run the `LASRMonitor.sh` script with a user account that normally starts the SAS LASR Analytic Server or with a user account that has Read permission on the `lasrmonitor.pid` file. (The `lasrmonitor.pid` file is in the same folder as the `LASRMonitor.sh` script.)

4. Enter the following command to confirm that SAS LASR Analytic Server Monitor is running:
   
   `LASRMonitor.sh status`

5. If the SAS LASR Analytic Server Monitor is not running, enter the following command:
   
   `LASRMonitor.sh start`

What to Do Next: Administration Tasks

Overview of Required Administration Tasks

Review Post-deployment Documentation

Review SAS Intelligence Platform Post-deployment Documentation

Check Status for SAS Visual Analytics Servers

Create SAS Users and Groups

SAS Web Application Required Tasks

Overview of Required Administration Tasks

After installing and configuring SAS Visual Analytics using the SAS Deployment Wizard, you must perform certain administration tasks. These tasks are organized into the following topics:

- "Review Post-deployment Documentation" on page 157
- "Check Status for SAS Visual Analytics Servers" on page 158
- "Create SAS Users and Groups" on page 159
- "SAS Web Application Required Tasks" on page 159

Review Post-deployment Documentation

Review the Instructions.html file that is generated by the SAS Deployment Wizard. This file provides an overview of the configuration guidelines and details. Any warnings that were generated during the deployment process are described in this file. The file is in the following location:

SAS-config-dir/Levn/Documents/Instructions.html
Review SAS Intelligence Platform Post-deployment Documentation

Check Status for SAS Visual Analytics Servers

Ensure that the SAS Visual Analytics servers are running:

- The status of SAS High-Performance Computing Management Console on the server tier is checked with the following command:
  
  ```
  service sashpcmc status
  ```

- The status of the server-tier SAS servers is checked with the following command:
  
  ```
  SAS-config-dir/Levn/sas.servers status
  ```

- The status of SAS LASR Analytic Server Monitor is checked with the following command:
  
  ```
  SAS-config-dir/Levn/Applications/SASVisualAnalytics/HighPerformanceConfiguration/LASRMonitor.sh status
  ```

- The status of SAS Information Retrieval Studio server is checked with the following command:
  
  ```
  SAS-config-dir/Levn/Applications/SASInformationRetrievalStudioforSAS/IRStudio.sh status
  ```

Create SAS Users and Groups

The following tasks related to SAS users and groups need to be performed. For more information, see the SAS Visual Analytics: Administration Guide, available at http://support.sas.com/documentation/onlinedoc/va/index.html.

- Create operating system groups and user accounts for data administrators on the machines in the cluster.
- Create SAS metadata users for the operating system accounts for data administrators and add these users to the Visual Analytics Data Administrators group.
  
  (Membership in the Visual Analytics Data Administrators group grants metadata users explicit permission to use a default library for the distributed database.)

SAS Web Application Required Tasks

The following SAS Web Application tasks must be performed:

- Specify the application-specific ulimit settings for SAS Web Application Server. In this document, SAS Web Application Server resides on blade 0.
  
  Specify the following ulimit settings for the SAS Web Application Server instance. The file is named SAS-configuration-directory/Web/WebAppServer/SASServer1_1/bin/setenv.sh.

  For a deployment with multiple JVM deployments, update SASServer12_1. For a single JVM deployment, update SASServer1_1:

  ```bash
  ulimit -n 20480
  ulimit -u 8192
  ulimit -s 256
  ```

  Note: These ulimit settings are set in the start-up scripts and not at the system level in /etc/security/limits.conf.

  Note: These ulimit settings correspond to the suggested JVM options for SAS Web Application Server. For more information, see “SAS Remote Services Application: JVM” on page 129.

- Specify ulimits for SAS Visual Analytics in /etc/security/limits.conf.

  The following is an example of ulimit settings. This can vary for deployments.

  ```bash
  ulimit -n 150000
  ```
By default, SAS Visual Analytics schedules cron to run the `loadindex.sh` command on a specified interval.

Overview of Deploying SAS LASR Analytic Server in a Different Mode

SAS LASR Analytic Server has two modes of operation:

- Distributed mode runs in a distributed computing environment and performs analytic tasks on data that is loaded in memory.
- Non-distributed mode runs on a single machine.

SAS enables you to license SAS LASR Analytic Server to run in distributed mode, non-distributed mode, or both modes. The server mode that you deploy and run is driven by the contents of your order and the license that accompanies it. For more information, see your SAS representative.

Using the SAS Deployment Wizard and the SAS Deployment Manager, you can do the following:

- Deploy the server in non-distributed mode.
  
  For more information, see “Deploy Visual Analytics with SAS LASR Analytic Server in Non-distributed Mode” on page 162.

- Deploy the server in distributed mode.
  
  For more information, see “Deploying SAS Visual Analytics Interactively” on page 110.

- Add a server to run in non-distributed mode.
For sites that are licensed for both server modes, you can add and run a server in non-distributed mode. For more information, see “Add a SAS LASR Analytic Server to Run in Non-distributed Mode” on page 162.

- Convert a non-distributed server to a distributed server.

  Your non-distributed servers are upgraded, and you can run the server in distributed mode only.

  Also, during conversion, the SAS Deployment Wizard automatically configures the SAS LASR Analytic Server monitor.

  For more information, see “Convert a Non-distributed SAS LASR Analytic Server to Distributed Mode” on page 162.

---

**Deploy Visual Analytics with SAS LASR Analytic Server in Non-distributed Mode**

---

**Add a SAS LASR Analytic Server to Run in Non-distributed Mode**

For sites that are licensed to run both server modes, the SAS Deployment Wizard prompts you during installation to deploy SAS LASR Analytic Server in distributed mode only. (Actually, the non-distributed mode is deployed silently.) When sites are licensed for both server modes, to create a non-distributed SAS LASR Analytic Server, you use SAS Management Console.

---

**Convert a Non-distributed SAS LASR Analytic Server to Distributed Mode**

When converting to distributed mode, your non-distributed servers are upgraded, and SAS retains their names. (We recommend that you rename these new distributed servers.)

Also, during conversion, the SAS Deployment Wizard automatically configures the SAS LASR Analytic Server monitor.

To convert your SAS LASR Analytic Server to run in distributed mode, follow these steps:
1 Shut down your SAS server and middle tiers.

2 Deploy the SAS High-Performance Analytics environment on your data appliance or machine cluster.

3 Run the SAS Deployment Wizard with it set to install only.
   Follow the directions in the topic, “Deploying SAS Visual Analytics Interactively” on page 110. When the Select Deployment Type page appears, make sure that you choose Install SAS Software. Make sure that Configure SAS Software is deselected.

4 When the wizard is finished, restart your SAS server tier.

5 Rerun the SAS Deployment Wizard with it set to configure only.
   Follow the directions in the topic, “Deploy SAS Visual Analytics Interactively.” When the Select Deployment Type page appears, make sure that you choose Configure SAS Software. Make sure that Install SAS Software is deselected.
Note: When prompted for the SAS configuration directory, make sure that you specify the directory that contains your pre-existing SAS Visual Analytics configuration.

When the wizard displays the Select Products to Configure page, it is important that you choose SAS Visual Analytics High-Performance Configuration.

Figure A1.2 SAS Deployment Wizard Configure Mode

Figure A1.3 SAS Visual Analytics High-Performance Configuration
6 Using SAS Management Console, change the **Single machine server** property to **No** for the newly converted SAS LASR Analytic Server.

7 The deployment wizard retains a server’s text analytics binary paths. To update these paths, use SAS Management Console and navigate to the server’s **Extended Attributes** tab. Update the **VA.TextAnalyticsBinaryLocation** attribute.

8 Restart your SAS server and middle tiers.

9 Make sure that the signature file path for SAS LASR Analytic Server exists on the root node machine.

10 Regenerate all pre-existing code maintained by SAS applications (SAS Visual Analytics, SAS Enterprise Guide, SAS Data Integration Studio, and so on) that contain LIBNAME statements that reference SAS LASR Analytic Server tables. (You must also redeploy any scheduled jobs for this code.)
Overview of Migrating SAS Visual Analytics

How to Use This Document
This document is designed to be used with the SAS Intelligence Platform: Migration Guide and previous sections of the SAS Visual Analytics: Installation and Configuration Guide (Distributed SAS LASR).

What Is Migration and What Is Supported?
Migration is a process in which your SAS content and configuration from an earlier SAS release are upgraded to run in a later SAS release. Same release
Migration is also possible (for example, 7.2 to 7.2). When performed successfully, migration attempts to preserve as much of your current content and configuration as possible, reduce the number of manual upgrade tasks, and minimize system downtime.

SAS provides automated migration tools—the SAS Migration Utility and the SAS Deployment Wizard. You can migrate with the SAS automated migration tools in the following scenarios:

- SAS Visual Analytics 6.1 to SAS Visual Analytics 7.2
- SAS Visual Analytics 6.2 to SAS Visual Analytics 7.2
- SAS Visual Analytics 6.3 to SAS Visual Analytics 7.2
- SAS Visual Analytics 6.4 to SAS Visual Analytics 7.2
- SAS Visual Analytics 7.1 to SAS Visual Analytics 7.2
- SAS Visual Analytics 7.2 to SAS Visual Analytics 7.2

Migration is a one-time operation to deploy SAS Visual Analytics 7.2 and upgrade your release 6.1, 6.2, 6.3, 6.4, or 7.1 content. By contrast, you can choose to do the following:

- Deploy SAS Visual Analytics 7.2 and use promotion to upgrade your content piece by piece.
  

- Upgrade to SAS Visual Analytics 7.2.
  
  For more information, see “Upgrading SAS Visual Analytics” on page 189.

As with all migrations of SAS software, the system to which you are migrating (target) must have the same number of machines on the same operating systems as the system from which you are migrating (source).

Provided that you are properly licensed, you can change the type of SAS LASR Analytic Server (distributed or non-distributed) in your SAS Visual Analytics environment with the automated migration tools. SAS LASR Analytic Server migration supports the following:

- non-distributed to non-distributed
- distributed to distributed
- non-distributed and distributed to non-distributed and distributed
- non-distributed to distributed

The following deployments are not supported by the automated migration tools:

- data migration from distributed to non-distributed
- earlier SAS Visual Analytics deployments where the SAS High-Performance Analytics environment is co-located with a Greenplum Data Computing Appliance or a Teradata Managed Server Cabinet

The alternative to migration is to use partial promotion or to perform a software update. For more information, see “Introduction to the Promotion Tools” in Chapter 21 of SAS Intelligence Platform: System Administration Guide available at http://support.sas.com/documentation/cdl/en/bisag/67481/HTML/default/viewer.htm#p04l8c3fo8tpyhn103dps7pxvru2.htm. See also
A High-Level View of Migration

The following list summarizes the steps required to install SAS 9.4 and migrate earlier SAS version content on a single machine or in a distributed, heterogeneous environment:

1. Review additional documentation on page 169.
2. Design your migration on page 169.
3. Perform pre-migration tasks on page 170.
5. Install SAS Visual Analytics 7.2 and migrate your content on page 170.
7. Validate your migration on page 170.

The sections that follow provide brief descriptions of each of these tasks. Subsequent sections provide the step-by-step instructions that you need to perform.

Step 1: Review Additional Documentation

It is very important to review all of the different documents associated with deploying your SAS software. There can be late-breaking information. Or, instructions that are specific to a particular configuration might be too narrow to be included in the SAS Visual Analytics: Installation and Configuration Guide (Distributed SAS LASR). For more information, see “Reviewing Additional Documentation” on page 171.

Step 2: Design Your Migration

Designing your migration means reviewing the SAS Visual Analytics 7.2 requirements (hardware, software, and migration), comparing them to your current deployment, and developing a plan for how to get your SAS content—your data and configuration—integrated into a SAS Visual Analytics 7.2 system.

Download your software order. In the SAS Software Depot that contains your order, run the SAS Migration Utility to generate a migration analysis report. Using this report, you can analyze every machine in your current SAS Visual Analytics deployment to answer these crucial design questions:

- Which SAS products currently reside on each machine?
- Are there any changes that I need to make to my current deployment before migrating?

The SAS Software Depot contains SAS Visual Analytics 7.2 software that you deploy in a later step.

For more information, see “Designing Your Migration” on page 172.
Step 3: Perform Pre-migration Tasks

During the pre-migration task phase, using the SAS Migration Utility, you create a migration package that contains your current SAS data and configuration. In a later step, the SAS Deployment Wizard uses your migration package as input to move your earlier SAS content successfully to SAS Visual Analytics 7.2. For more information, see “Performing Pre-migration Tasks” on page 173.

Step 4: Upgrade Your SAS High-Performance Analytics Infrastructure

Note: SAS Visual Analytics 7.2 requires that you use SAS High-Performance Analytics environment 2.9 or higher.

Step 5: Install SAS Visual Analytics 7.2 and Migrate Your Content

In step four, you use the SAS Deployment Wizard to install SAS Visual Analytics 7.2 and to migrate your current SAS content and configuration that you packaged using the SAS Migration Utility in step three. During your deployment wizard session, you select the migration option.

For more information, see “Deploying SAS Visual Analytics 7.2 and Migrating Your Content” on page 175.

Step 6: Perform Post-migration Tasks

Step five consists of performing any required manual tasks to complete your migration.

For more information, see “Performing Post-Migration Tasks” on page 176.

Step 7: Validate Your Migration

An important final step in migration is validating that your SAS Visual Analytics 7.2 servers, clients, middle tier, and web clients are functioning and can use migrated content from your earlier SAS Visual Analytics release.

For more information, see the “Validating Your Migrated Deployment” on page 178.
Reviewing Additional Documentation

Your review should include these documents:

- **QuickStart Guide**
  
  This document is shipped with your SAS software. Follow its instructions.
  
  The QuickStart Guides are also available online:
  
  - **Linux:** [http://support.sas.com/documentation/installcenter/94/unx/index.html](http://support.sas.com/documentation/installcenter/94/unx/index.html)

- **Software order e-mail (SOE)**
  
  This e-mail is sent to your site to announce the software and detail the order. It enumerates the initial installation steps and, for SAS 9.4, contains instructions for using Electronic Software Delivery (ESD), if applicable, and the SID file. The SID file contains your site’s SAS license (SETINIT).

- **SAS order information (SOI)**
  
  After you download your order to an existing SAS Software Depot, you can use the SAS order information (SOI) file to determine what products were in your order and when the order was placed. The SOI is in your SAS Software Depot in `install_doc/order-number/soi.html`.

- **SAS software summary**
  
  In the same depot location as the SOI, the SAS software summary is a more detailed list of the software included in your order. Unlike the SAS order information, which lists only the software that you have specifically ordered, this document also describes the included software that supports your order. The SAS software summary is in your SAS Software Depot in `install_doc/order-number/ordersummary.html`.

  **Note:** The SAS Deployment Wizard installs only what is listed in the deployment plan. The SAS software summary might list more products than the deployment plan. For more information, see “About Deployment Plans” on page 97.

- **SAS 9.4 system requirements**
  
  [http://support.sas.com/resources/sysreq/index.html](http://support.sas.com/resources/sysreq/index.html)

- **SAS Visual Analytics system requirements**
  

- **SAS Visual Statistics system requirements**
  

- **SAS Notes**

## Designing Your Migration

The tasks required for designing your migration are as follows:

1. Understand the high-level SAS migration requirements.

2. Determine which SAS products reside on each machine.
   - Run a SAS migration analysis report on your SAS Visual Analytics server and middle tier machine. (Do not run the migration utility on the SAS High-Performance Analytics environment.)
     - To report on SAS Visual Analytics 6.1, use smu93.
     - To report on SAS Visual Analytics 6.2 and later, use smu94.

3. Obtain a SAS 9.4 deployment plan.
   - With a current migration analysis report at hand, contact your SAS representative to obtain a valid SAS 9.4 deployment plan for your current SAS deployment.
   - **Note:** The SAS Visual Analytics Explorer Server Configuration component in release 6.1 has been merged into SAS Visual Analytics Server Components.

4. Plan SAS user downtime at your site.
   - You need to schedule a window of time when your SAS deployment is not being used to install and configure SAS 9.4 and migrate your SAS content.
Performing Pre-migration Tasks

Pre-migration tasks are as follows:

1. Back up your current SAS deployment.
   This is a best practice to ensure that your current SAS deployment is protected.

2. Apply required maintenance to any current SAS products.
   During your migration design, you identified any current SAS products that required maintenance before you can migrate them.

3. Complete all pre-migration checklists.
   The SAS Deployment Wizard prompts you for the required operating system accounts that you used with SAS and for ports to designate for the new SAS 9.4 servers.
   For more information, see “Completing the Pre-migration Checklists” in Chapter 3 of SAS Intelligence Platform: Migration Guide available at http://support.sas.com/documentation/cdl/en/bimig/63853/HTML/default/viewer.htm#n03004intelplatform00migrate.htm.

   The SAS Software Depot contains the SAS installation files used by the SAS Deployment Wizard to install and configure SAS 9.4.
   For more information, see “Creating SAS Software Depots” on page 18.

5. Create a migration package.
   Using the SAS Migration Utility, you create a package containing your current SAS data and configuration that the SAS Deployment Wizard uses.
   (Do not run the migration utility on the SAS High-Performance Analytics environment.)
   - To package SAS Visual Analytics 6.1, use smu93.
To package SAS Visual Analytics 6.2 and later, use smu94.

Migration Considerations for SAS Visual Analytics 7.2

Because of the many ways that you can customize SAS Visual Analytics, the automated SAS migration tools cannot fully migrate all user customizations. The following list describes actions that you might need to perform to complete your SAS Visual Analytics 7.2 migration:

- Signature files are not migrated.
- Migration for user-created SAS LASR Analytic Servers is only partially supported. After migration, you must specify their port numbers and any changes to the install paths or signature files paths.
- The metadata labels for the two SAS LASR Analytic Servers created at installation remain the same. If these labels are to be changed in SAS Visual Analytics 7.2, you must do this manually.
- SAS Visual Analytics 6.1 GeoMap data sets are replaced when migrating.
- SAS LASR Analytic Server names are maintained. (The server names automatically created by the SAS Deployment Wizard include the host name. If you choose, you can easily change server names using SAS Management Console.)
- A device limitation whitelist is new for SAS Visual Analytics after release 6.1. The previous SAS Visual Analytics 6.1 blacklist is migrated forward. When doing a SAS Visual Analytics migration, both the blacklist and the whitelist are migrated. When a database other than Postgres is used, special migration utility properties must be specified. For more information, see Appendix 3, “Product-Specific SAS Migration Utility Properties,” in SAS Intelligence Platform: Migration Guide available at http://support.sas.com/documentation/cdl/en/bimig/63853/HTML/default/viewer.htm#p10intellplatform00migrategd.htm.
- During migration from SAS Visual Analytics 6.1, the metadata user groups Visual Analytics Admin Group and Visual Analytics Data Builder Group are renamed to Visual Analytics Admin and Visual Analytics Data Builder, respectively.
- Java Virtual Machine (JVM) settings for SAS Visual Analytics web applications are not migrated from release 6.1. The JVM settings used in release 7.2 are the values supplied to the SAS Deployment Wizard during migration.
Upgrading Your SAS High-Performance Analytics Infrastructure

Note: SAS Visual Analytics 7.2 requires that you use SAS High-Performance Analytics environment 2.9 or higher.

Deploying SAS Visual Analytics 7.2 and Migrating Your Content

The deploy step when performing a migration is similar to a typical SAS Visual Analytics deployment experience. The major difference is that early in the SAS Deployment Wizard session, you select the Perform migration option.

Figure A2.1  Migration Information Page

On the Remap Ports page, by default, the wizard assumes that ports used in your current SAS deployment are identical to the ports that will be used in your SAS Visual Analytics 7.1 deployment. Use this page if you want to specify different ports in your SAS Visual Analytics 7.2 deployment. The wizard displays the port being used in your current SAS deployment (Port from Source column). To specify a different port to use for SAS Visual Analytics 7.2, click the
Port for Target cell in the appropriate row for the SAS product and enter the new port number.

Figure A2.2 Remap Ports Page

For more information, follow the directions in Chapter 6, “Deploying the SAS Visual Analytics Server and Middle Tier,” on page 95.

TIP If you are migrating the SAS High-Performance Computing Management Console, be sure to check the target host name when prompted by the SAS Deployment Wizard. The wizard assumes that the target host name for the computing management console is the same as the machine name from which you are migrating.

Performing Post-Migration Tasks

After deploying SAS Visual Analytics 7.2 and migrating your content, complete the following post-migration tasks:

- If you are using encryption for SASHDAT, follow the post-deployment tasks in “Enable SASHDAT Encryption” on page 150.
- Regenerate all pre-existing code maintained by SAS applications (SAS Visual Analytics, SAS Enterprise Guide, SAS Data Integration Studio, and so on) that contains LIBNAME statements that reference SAS LASR Analytic Server tables. (You must also redeploy any scheduled jobs for this code.)
- The SAS Migration Utility migrates the default, system-created autoload directories and their contents to the target system. However, before you can use these autoload files, you must update the host names and paths that they reference.
For your convenience, the SAS Migration Utility locates these migrated autoload files in a subdirectory named `backup` under the following directory (`SAS-configuration-directory/Lev/AppData/SASVisualAnalytics/VisualAnalyticsAdministrator`).

Manually created autoload files and directories from the source system are not migrated. You must manually create them to migrate them. For reference, SAS migrates copies of the manually created files to the backup location specified earlier. When re-creating these autoload files, be sure to use new autoload files as templates. Compare the new autoload files to the migrated autoload files to integrate custom code into the target system.

Starting with SAS Visual Analytics 6.4, you are no longer prompted for the path to the TKGrid installation on the SAS High-Performance Analytics environment root node host.

If this location has changed for release 7.2, then after migration, you must do the following:

1. Shut down your SAS LASR Analytic Servers.
   

2. Manually modify the **High-Performance Analytics environment install location** property using SAS Management Console (Plug-ins > Server Manager, right-click the server, and select Properties > Options).

   ![Image of high-performance analytics environment install location](image)

3. Restart your SAS LASR Analytic Servers.
   

Custom themes must be redeployed.

Also, review “Migration Considerations for SAS Visual Analytics 7.2” on page 174.

Validating Your Migrated Deployment

Also, review “Validating Your SAS LASR Analytic Server Monitor Deployment” on page 156.
Shortly after you begin running the SAS Deployment Wizard to interactively install and initially configure SAS, you are asked to choose between three wizard prompting levels:

**Express**
- displays the minimum number of wizard pages needed to complete the SAS configuration.

**Typical**
- displays the basic set of wizard pages needed to complete the SAS configuration.

**Custom**
- displays all the wizard pages needed to complete the SAS configuration.
Figure A3.1  Select Configuration Prompting Level Page

Table A3.1 on page 180 lists the SAS Deployment Wizard pages found in these prompting levels.

Managing Your SAS Visual Analytics Deployment

Upgrading SAS Visual Analytics

Overview of Upgrading SAS Visual Analytics
You have two options for upgrading SAS Visual Analytics:

- SAS automatic migration tools
  For more information, see Appendix 2, "Migrating SAS Visual Analytics," on page 167.

- SAS Deployment Wizard (Update mode)
  For more information, see "Upgrade SAS Visual Analytics" on page 189.

Upgrade SAS Visual Analytics
Follow these steps to upgrade SAS Visual Analytics 6.4 to 7.2 using the SAS Deployment Wizard running in Update mode:

1. Understand how the SAS Deployment Wizard upgrades SAS software.

2. Understand how your SAS Visual Analytics deployment will change. In some releases, new SAS products are added during upgrades.

3 If you are running SAS Visual Analytics with a distributed SAS LASR Analytic Server, then upgrade your SAS High-Performance Analytics infrastructure before you upgrade SAS Visual Analytics. For more information, see Chapter 82, “SAS Visual Analytics,” in SAS Guide to Software Updates, available at http://support.sas.com/documentation/cdl/en/whatsdiff/66129/HTML/default/viewer.htm#n0tylmjo0dvr2n1r9r2x4y15a0j.htm.

4 Prepare your SAS Visual Analytics deployment.

5 Locate and familiarize yourself with your SAS software order.

6 Download your order and create a SAS Software Depot.

7 Upgrade your SAS High-Performance Analytics infrastructure

Note: SAS Visual Analytics 7.2 requires that you use SAS High-Performance Analytics environment 2.9 or higher.

8 Upgrade SAS Visual Analytics 7.1 to 7.2.

9 Perform any post-upgrade deployment tasks.

10 Before you begin using SAS Visual Analytics, check to see whether there are any new groups or capabilities that have been added to SAS metadata and whether any new metadata properties need to be manually updated. See Chapter 82, “SAS Visual Analytics,” in SAS Guide to Software Updates, available at http://support.sas.com/documentation/cdl/en/whatsdiff/66129/HTML/default/viewer.htm#n0tylmjo0dvr2n1r9r2x4y15a0j.htm.

11 Be sure to load your data sources into SAS LASR Analytic Server to enable reporting and exploration.
Add on SAS Visual Analytics Administration and Reporting

If you are adding on SAS Visual Analytics or SAS Visual Analytics Administration and Reporting to SAS 9.4 (SAS 9.4_M0) or later, do the following before deploying your SAS software order:

1. On your middle-tier machines, check your deployment summary to determine whether you already have these two SAS components:
   - SAS Visual Analytics Administrator
   - SAS Visual Analytics Services
   Your SAS Deployment Registry is located on your machine here:
   
   $SAS-installation-directory$/SASHome/InstallMisc/InstallLogs/DeploymentRegistry.html

2. If you plan to deploy the middle tier for SAS Visual Analytics or SAS Visual Analytics Administration and Reporting to:
   - the same middle-tier machine, then you do not need to do anything further before deploying your SAS software order.
   - a different middle-tier machine, continue to step 3.

3. Before deploying your SAS software order, unconfigure these two SAS software components:
   - SAS Visual Analytics Administrator
   - SAS Visual Analytics Services

Remove SAS Visual Analytics Product Configurations

The Remove Existing Configuration feature of the SAS Deployment Manager provides an automated way to remove one or more products of a SAS 9.4 configuration from your environment. With this feature, you can remove the configurations of all SAS products or just selected products from a machine.

When removing a product configuration, you must first determine the product’s dependencies. If you remove a product configuration that another product depends on, then the dependent product is not able to function. Therefore, when you remove a product’s configuration, the SAS Deployment Manager requires that you also remove the configurations of any dependent products.

Identify Dependent SAS Visual Analytics Products

Product dependencies are shown in the following table. If you remove the configuration for a product in the left column, then you must also remove the configurations for all of the products that are in the right column opposite that product. For example:

- If you remove SAS Visual Analytics Hub, then you do not need to remove any other products. No products depend on SAS Visual Analytics Hub.
- If you remove SAS Visual Analytics High-Performance Configuration, then you must also remove the following dependent products: SAS Visual Analytics Services and SAS Visual Analytics Administrator.

**Note:** Remove SAS Visual Analytics products in the opposite order in which you deployed them. For more information see, “Installation Rules for Multiple-Machine Deployments” on page 103.

<td>Visual Data Builder</td>
</tr>
</tbody>
</table>

* These products depend on the product in the left column. Therefore, they must be removed if the product in the left column is removed.

When you remove a product’s configuration, the SAS Deployment Manager checks to see whether your deployment plan includes any products that depend on that product. If dependent products exist, and if you have not selected those
products for removal, then the SAS Deployment Manager prompts you to remove them.

---

**Change Autoload Location for the Public LASR Library**

In SAS Visual Analytics 6.3 and later, the default directory for SAS autoload has changed to the following: `configuration-directory/LevN/AppData/SASVisualAnalytics/VisualAnalyticsAdministrator/Autoload`.

Recommended Reading

Here is the recommended reading list for this title:

- Help and tutorials integrated into SAS Mobile BI.
- SAS offers instructor-led training and self-paced e-Learning courses to help you administer SAS Visual Analytics. For more information about the courses available, see support.sas.com/admintraining.
For a complete list of SAS publications, go to sas.com/store/books. If you have questions about which titles you need, please contact a SAS Representative:

SAS Books
SAS Campus Drive
Cary, NC 27513-2414
Phone: 1-800-727-0025
Fax: 1-919-677-4444
E-mail: sasbook@sas.com
Web address: sas.com/store/books
**browser**
See web browser

**co-located data provider**
a distributed data source, such as SAS Visual Analytics Hadoop or a third-party vendor database, that has SAS High-Performance Analytics software installed on the same machines. The SAS software on each machine processes the data that is local to the machine or that the data source makes available as the result of a query.

**data set**
See SAS data set

**data warehouse**
a collection of data that is extracted from one or more sources for the purpose of query, reporting, and analysis. Data warehouses are generally used for storing large amounts of data that originates in other corporate applications or that is extracted from external data sources.

**encryption**
the act or process of converting data to a form that is unintelligible except to the intended recipients.

**Extensible Markup Language**
a markup language that structures information by tagging it for content, meaning, or use. Structured information contains both content (for example, words or numbers) and an indication of what role the content plays. For example, content in a section heading has a different meaning from content in a database table.

**foundation services**
See SAS Foundation Services

**grid host**
the machine to which the SAS client makes an initial connection in a SAS High-Performance Analytics application.

**Hadoop Distributed File System**
a framework for managing files as blocks of equal size, which are replicated across the machines in a Hadoop cluster to provide fault tolerance.

**HDFS**
See Hadoop Distributed File System

**identity**
See metadata identity
Integrated Windows authentication

a Microsoft technology that facilitates use of authentication protocols such as Kerberos. In the SAS implementation, all participating components must be in the same Windows domain or in domains that trust each other.

Internet Protocol Version 6

a protocol that specifies the format for network addresses for all computers that are connected to the Internet. This protocol, which is the successor of Internet Protocol Version 4, uses hexadecimal notation to represent 128-bit address spaces. The format can consist of up to eight groups of four hexadecimal characters, delimited by colons, as in FE80:0000:0000:0000:0202:B3FF:FE1E:8329. As an alternative, a group of consecutive zeros could be replaced with two colons, as in FE80::0202:B3FF:FE1E:8329.

IPv6

See Internet Protocol Version 6

IWA

See Integrated Windows authentication

JAR file

a Java Archive file. The JAR file format is used for aggregating many files into one file. JAR files have the file extension .jar.

Java

a set of technologies for creating software programs in both stand-alone environments and networked environments, and for running those programs safely. Java is an Oracle Corporation trademark.

Java Database Connectivity

a standard interface for accessing SQL databases. JDBC provides uniform access to a wide range of relational databases. It also provides a common base on which higher-level tools and interfaces can be built.

Java Development Kit

a software development environment that is available from Oracle Corporation. The JDK includes a Java Runtime Environment (JRE), a compiler, a debugger, and other tools for developing Java applets and applications.

JDBC

See Java Database Connectivity

JDK

See Java Development Kit

localhost

the keyword that is used to specify the machine on which a program is executing. If a client specifies localhost as the server address, the client connects to a server that runs on the same machine.

login

a SAS copy of information about an external account. Each login includes a user ID and belongs to one SAS user or group. Most logins do not include a password.
Message Passing Interface
is a message-passing library interface specification. SAS High-Performance Analytics applications implement MPI for use in high-performance computing environments.

metadata identity
a metadata object that represents an individual user or a group of users in a SAS metadata environment. Each individual and group that accesses secured resources on a SAS Metadata Server should have a unique metadata identity within that server.

metadata object
a set of attributes that describe a table, a server, a user, or another resource on a network. The specific attributes that a metadata object includes vary depending on which metadata model is being used.

middle tier
in a SAS business intelligence system, the architectural layer in which web applications and related services execute. The middle tier receives user requests, applies business logic and business rules, interacts with processing servers and data servers, and returns information to users.

MPI
See Message Passing Interface

object spawner
a program that instantiates object servers that are using an IOM bridge connection. The object spawner listens for incoming client requests for IOM services. When the spawner receives a request from a new client, it launches an instance of an IOM server to fulfill the request. Depending on which incoming TCP/IP port the request was made on, the spawner either invokes the administrator interface or processes a request for a UUID (Universally Unique Identifier).

planned deployment
a method of installing and configuring a SAS business intelligence system. This method requires a deployment plan that contains information about the different hosts that are included in the system and the software and SAS servers that are to be deployed on each host. The deployment plan then serves as input to the SAS Deployment Wizard.

root node
in a SAS High-Performance Analytics application, the role of the software that distributes and coordinates the workload of the worker nodes. In most deployments the root node runs on the machine that is identified as the grid host. SAS High-Performance Analytics applications assign the highest MPI rank to the root node.

SAS Application Server
a logical entity that represents the SAS server tier, which in turn comprises servers that execute code for particular tasks and metadata objects.

SAS authentication
a form of authentication in which the target SAS server is responsible for requesting or performing the authentication check. SAS servers usually meet this responsibility by asking another component (such as the server's host
operating system, an LDAP provider, or the SAS Metadata Server) to perform the check. In a few cases (such as SAS internal authentication to the metadata server), the SAS server performs the check for itself. A configuration in which a SAS server trusts that another component has pre-authenticated users (for example, web authentication) is not part of SAS authentication.

**SAS configuration directory**

the location where configuration information for a SAS deployment is stored. The configuration directory contains configuration files, logs, scripts, repository files, and other items for the SAS software that is installed on the machine.

**SAS data set**

a file whose contents are in one of the native SAS file formats. There are two types of SAS data sets: SAS data files and SAS data views.

**SAS Deployment Manager**

a cross-platform utility that manages SAS deployments. The SAS Deployment Manager supports functions such as updating passwords for your SAS deployment, rebuilding SAS web applications, and removing configurations.

**SAS Deployment Wizard**

a cross-platform utility that installs and initially configures many SAS products. Using a SAS installation data file and, when appropriate, a deployment plan for its initial input, the wizard prompts the customer for other necessary input at the start of the session, so that there is no need to monitor the entire deployment.

**SAS Foundation Services**

a set of core infrastructure services that programmers can use in developing distributed applications that are integrated with the SAS platform. These services provide basic underlying functions that are common to many applications. These functions include making client connections to SAS application servers, dynamic service discovery, user authentication, profile management, session context management, metadata and content repository access, information publishing, and stored process execution.

**SAS installation data file**

See SID file

**SAS installation directory**

the location where your SAS software is installed. This location is the parent directory to the installation directories of all SAS products. The SAS installation directory is also referred to as SAS Home in the SAS Deployment Wizard.

**SAS IOM workspace**

in the IOM object hierarchy for a SAS Workspace Server, an object that represents a single session in SAS.

**SAS Metadata Server**

a multi-user server that enables users to read metadata from or write metadata to one or more SAS Metadata Repositories.
SAS Pooled Workspace Server
a SAS Workspace Server that is configured to use server-side pooling. In this configuration, the SAS object spawner maintains a collection of workspace server processes that are available for clients.

SAS Software Depot
a file system that consists of a collection of SAS installation files that represents one or more orders. The depot is organized in a specific format that is meaningful to the SAS Deployment Wizard, which is the tool that is used to install and initially configure SAS. The depot contains the SAS Deployment Wizard executable, one or more deployment plans, a SAS installation data file, order data, and product data.

SAS Stored Process Server
a SAS IOM server that is launched in order to fulfill client requests for SAS Stored Processes.

SAS Workspace Server
a SAS IOM server that is launched in order to fulfill client requests for IOM workspaces.

SASHDAT file
the data format used for tables that are added to HDFS by SAS. SASHDAT files are read in parallel by the server.

SASHOME directory
the location in a file system where an instance of SAS software is installed on a computer. The location of the SASHOME directory is established at the initial installation of SAS software by the SAS Deployment Wizard. That location becomes the default installation location for any other SAS software that is installed on the same computer.

server context
a SAS IOM server concept that describes how SAS Application Servers manage client requests. A SAS Application Server has an awareness (or context) of how it is being used and makes decisions based on that awareness. For example, when a SAS Data Integration Studio client submits code to its SAS Application Server, the server determines what type of code is submitted and directs it to the correct physical server for processing (in this case, a SAS Workspace Server).

server description file
a file that is created by a SAS client when the LASR procedure executes to create a server. The file contains information about the machines that are used by the server. It also contains the name of the server signature file that controls access to the server.

SID file
a control file containing license information that is required in order to install SAS.

single sign-on
an authentication model that enables users to access a variety of computing resources without being repeatedly prompted for their user IDs and passwords. For example, single sign-on can enable a user to access SAS servers that run on different platforms without interactively providing the
user’s ID and password for each platform. Single sign-on can also enable someone who is using one application to launch other applications based on the authentication that was performed when the user initially logged on.

SOE
See software order e-mail

dsoftware order e-mail
an e-mail message, sent to a customer site, that announces arrival of the software and describes the order. It explains the initial installation steps and might also contain instructions for using Electronic Software Delivery (ESD), if applicable.

spawner
See object spawner

SSO
See single sign-on

trusted user
a privileged service account that can act on behalf of other users on a connection to the metadata server.

unrestricted identity
a user or group that has all capabilities and permissions in the metadata environment due to membership in the META: Unrestricted Users Role (or listing in the adminUsers.txt file with a preceding asterisk).

update mode
an operating state of the SAS Deployment Wizard in which users are required to install software updates before they can perform any other deployment tasks. The SAS Deployment Wizard automatically goes into update mode when it determines that the current SAS order contains new versions or maintenance updates to the deployed products in a given SAS installation directory.

warehouse
See data warehouse

web application
an application that is accessed via a web browser over a network such as the Internet or an intranet. SAS web applications are Java Enterprise Edition (JEE) applications that are delivered via web application archive (WAR) files. The applications can depend on Java and non-Java web technologies.

web authentication
a configuration in which users of web applications and web services are verified at the web perimeter, and the metadata server trusts that verification.

web browser
a software application that is used to view web content, and also to download or upload information. The browser submits URL (Uniform Resource Locator) requests to a web server and then translates the HTML code into a visual display.
worker node
  in a SAS High-Performance Analytics application, the role of the software that receives the workload from the root node.
