

Description	Component	Summary	Test Scenario
Entering text drops characters unless you type very slowly in Rules Studio detail text areas	Rules Studio	when SFM version 3.3 in conjunction with IE 9.0 and above is used, the event handler that notes keystrokes in the Editor tab of Rules Studio detail window is taking too long (thus skipping characters).	After a change to the event handler for keystrokes to not use trigger€ but rather invoke SessionManager.setLastUserEvent, keystrokes will be recognized in the detail window.
MO selection (on users tab) is not retained if selected MO is the 6th level	Administrators Workbench	When reaching level 6 of multi orgs, the multi org was not saving when selecting to assign to a user.	After fixing input id, the proper multi orgs are tagged correctly in the user definition page
OSE startup excessively conservative in calculating possible transaction size	OSE	Transaction size limit is restricting the amount of space left for user variables when sent from J-OSE to OSE.	After the increase from 2 byte to 4 byte, allowing J-OSE to instead control what is sent, all necessary information is coming across.
In Oracle, get_alert_from_queue proc is not clearing records from fcm_alert_suspend	Database	The get_alert_from_queue stored procedure has an OR clause where there should be an AND resulting in the suspend count being increased when it should not and the alert is not removed from suspend state	Once the fix is in place, the alert will be removed from the suspend state as expected
