

Release Notes for SAS® Fraud Management 4.1_M0, Hot Fix 11

Description	Component	Summary	Test Scenario
The Java OnDemand Scoring Engine (J-OSE) does not set the lookup key when it re-allocates a segment.	J-OSE	When the J-OSE reads a signature from the database that is larger than it expects, it re-allocates the segment. It fills in the header field values, but it does not set the lookup-key field value. This behavior causes a score mismatch on a model downgrade test.	After you apply this hot fix, the J-OSE sets the lookup-key value when it re-allocates a segment.
