

Paper 066-2009**%LibDoc: A library documentation macro**

Richard Koopmann Jr., Capella University, Minneapolis, MN

ABSTRACT

%LibDoc is a simple macro that produces an Excel workbook containing meta data for a given library. The metadata is pulled from dictionary.* tables via proc sql. The macro is also implemented as a SAS Explorer Action.

Code was developed with SAS 9.1.3 SP4 and HTML Help Workshop 4.74 running under Windows XP Professional.

INTRODUCTION

Codebooks are often desired for documenting data sets. The contents procedure provides a simple way to get useful information for a single data set, but what about documenting an entire library of data sets? What about documenting format catalogs? Table views? Indexes? To address these additional documentation requirements, we'll exploit the dictionary tables. (While there are corresponding views in the SASHELP library which could be accessed in the DATA STEP, we'll access the dictionary tables via the SQL procedure. Querying the dictionary tables is considerably faster than going against the SASHELP views.)

The dictionary tables contain a wealth of information on various aspects of the current SAS session including library metadata, options, external files, libname engines, macro variables, titles, and footnotes. The LibDoc macro accesses the following dictionary tables containing library-specific metadata:

dictionary. Metadata returned

libnames	Library name, engine, path, concatenation level, format, read only flag, sequential flag, system description/name/value.
tables	Library name, member name/type/label, data set type, creation/modification date, number of observations, observation length, number of variables, password protection, compression, encryption, number of pages, etc.
views	Library name, member name/type, engine.
indexes	Library name, member name/type, column name, index type/name/position, nomiss/unique flags.
columns	Library name, member name/type, variable name,
catalogs	Library name, member name/type, object name/type/description, creation/modification date, alias, concatenation level.
members	Library name, member name/type, engine, presence of indexes, path.
formats	Library name, member name, path, object name, format name/type, source, minimum/maximum/default width and decimal width.

The *Summary of SAS Dictionary Tables and Views* tip sheet is a very useful and well-organized reference.

While `dictionary.formats` provides metadata on what informats and formats are applied to a given variable, often it is desirable to know how these informats and formats are defined. Fortunately, the FORMAT procedure offers an option for extracting definitions from a specific library into a SAS data set. The resulting control data set is then processed along with the other dictionary tables.

MACRO PARAMETERS

Parameter	Description	Default
LIBNAME	Identifies the SAS library to be processed.	Required parameter
PATH	Location for writing the output files.	C:\TEMP
FILE	Name of output file (Excel and PDF). Prefix of output files (HTML).	&LIBNAME
CHM	Generate a compiled help file. Requires HTML Help Workshop to be installed.	NO

Parameter	Description	Default
HTML	Generate HTML files for each table. Each filename will begin with the value of FILE parameter.	&CHM
PDF	Generate a PDF version of the documentation.	NO
STYLE	Set style for ODS outputs.	MINIMAL

Usage notes: Submitting %LibDoc(); or %LibDoc(HELP); will print help information in the log window. Submitting %LibDoc(EDIT); will open the macro source file in the editor window for revisions. Thus, the LibDoc macro will not process SAS libraries that are named EDIT or HELP.

SUPPORTED DESTINATIONS

The LibDoc macro uses the Excel libname engine and the HTML and PDF ODS Destinations. The macro may be modified to use the TAGSETS.EXCELXP ODS destination in lieu of the Excel libname engine if SAS/ACCESS Interface to PC Files is unavailable.

GENERATING A COMPILED HELP FILE

With HTML Help Workshop (HHW) installed, the LibDoc macro can generate a compiled help (CHM) file automatically. HHW compiles a set of HTML files into a single CHM file. To achieve this, the macro generates the project files needed by HHW; these project files include references to the HTML versions of the dictionary tables. The macro then uses the x command to generate the CHM file.

```
x """C:\Program Files\HTML Help Workshop\hhc"" ""&PATH.\&FILE..hhp""";
```

IMPLEMENTING LIBDOC AS A SAS EXPLORER ACTION

If the LibDoc macro is compiled at startup or is included in the autocall macro directory, the macro call can be implemented as a SAS Explorer Action. While users cannot customize explorer actions associated with SASLibrary metadata entries, we can add actions to SAS Library members (e.g., tables, views, & catalogs). Once installed, users can execute the macro by simply right-clicking on the table and selecting the LibDoc action.

To add the LibDoc action to tables, create a text file at C:\LibDoc_Action.txt containing:

```
[CORE\EXPLORER\MENUES\MEMBERS\TABLE]
"LibDoc"="gsubmit '%%LibDoc(%8b);';"
```

The action is imported with the REGISTRY procedure as follows:

```
proc registry import='C:\LibDoc_Action.txt'; run;
```

The new explorer action can also be added via the GUI. With the Explorer pane active, select Tools > Options > Explorer. Under the Members tab, select TABLE member and click Edit followed by Add. Set the Action field to LibDoc and the Action Command field to gsubmit '%%LibDoc(%8b);'. Press OK, OK, OK. Right-click on a table and see the LibDoc action command.

Optional macro parameters can be added as desired. For example, gsubmit '%%LibDoc(%8b, PDF=yes);'.

CONCLUSION

The LibDoc macro provides a quick method for compiling metadata on a specific SAS library and exporting this to three common destinations (Excel, PDF, and CHM).
