

## Paper 177-2012

**SUPPQUAL – Where's My Mommy?**

Sandra VanPelt Nguyen, PharmaNet/i3

**ABSTRACT**

When using CDISC standards, there may be situations in which a field has been collected on a CRF or included in a vendor data transfer which seems to be clinically relevant but is not “topic” data belonging in a standard or custom SDTM domain (any of the three general observation classes). Since non-standard variables cannot be added to SDTM domains, this data typically gets mapped to a SUPPQUAL (Supplemental Qualifiers) dataset, but what do we do when there is not an obvious “parent” record corresponding to this data within one of the SDTM domains? This paper will provide a set of guidelines to use to determine how best to handle these situations.

**INTRODUCTION**

Now that more and more people are becoming familiar with CDISC and the SDTM data standard, it seems that it should be easier to implement and use this standard, however in practice virtually every study seems to have those one or two (or more!) forms or modules that stump and challenge even the more seasoned CDISC users. One of these challenges is the “floating supplemental qualifier”. While reviewing or working with specifications on several projects, I have encountered the situation where there was a qualifier variable mapped to SUPPQUAL which had no “parent” to link to.....essentially, a lost child....leading to the question “Where's my Mommy?”. This situation is not CDISC compliant, so we need to address it. A few options are available – find a parent, figure out an alternate mapping to SDTM, or do not map it to SDTM altogether.

The Supplemental Qualifiers dataset is designed to capture any non-SDTM variables, but has a tendency to get abused by having any data which does not map to a standard SDTM domain and variable essentially “dumped” into SUPPQUAL. This dataset is not just a bucket to capture any data which doesn't fit elsewhere, but is intended to represent a relationship or association between data values where the data in SUPPQUAL serves as a qualifier for an observation in one of the general observation classes. The variables IDVAR (identifying variable) and IDVARVAL (identifying variable value) provide the linkage between records by identifying the variable to join on and the variable value of the specific record(s) which are related. If a proper linkage is not established, compliance checks (such as these from OpenCDISC) may identify issues with the datasets:

| Rule ID | Message                           | Description   | Category        | Type  |
|---------|-----------------------------------|---|-----------------|-------|
| SD0074  | Referenced Domain not found       | Identifies Supplemental Qualifiers domain reference to a key variable that isn't defined in the target domain | Consistency     | Error |
| SD0076  | Referenced key variable not found | Identifies Supplemental Qualifiers domain reference to a key variable that isn't defined in the target domain | Consistency     | Error |
| SD0078  | Referenced record not found       | Identifies Supplemental Qualifiers domain reference to a record that doesn't exist in the target domain       | Cross-reference | Error |

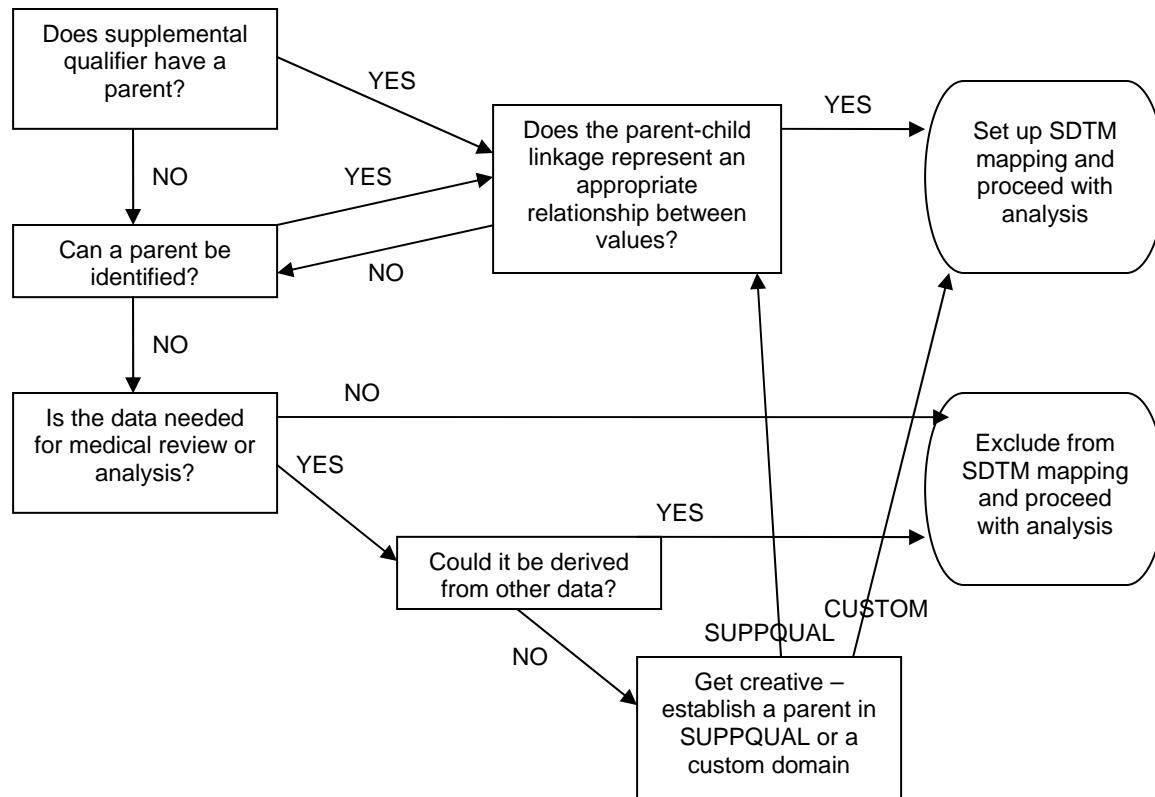

**GUIDELINES FOR RESOLUTION:**

To best resolve this situation, one should consider:

- 1) Does it actually belong in a SDTM domain and not SUPPQUAL?
  - a) Give this data a second look – is it actually topic data and possibly just not presented in the same way as other topic data? Does it have qualifiers of its own?
  - b) It may not be the same class as other data collected on the page, but is still topic data – perhaps it is Findings About an Event or Intervention. Use the new FA domain!

- 2) Is there a not-so-obvious parent?
  - a) Review the context to determine what this data is describing or related to. It may be related to information in another section of the form or on another form altogether. Alternately, it may be related to the entire form or be a subject-level qualifier.
- 3) If it is definitely not topic data and a parent cannot be found, then we need to ask: Is the data actually needed?
  - a) If the data is purely administrative (prompt questions, etc.), it does not need to be mapped.
  - b) Is the data clinically important or useful for medical review?
  - c) Is the data needed for any tables, figures, or listings?
- 4) When all else fails: It's time to get creative
  - a) Perhaps the collection field itself indicates the topic data and a record can be generated in one of the SDTM domains to link the qualifier to.
  - b) If there is no other solution and you must have this data captured in SDTM, then you may need to create a custom domain to hold the values from these data fields.

### DECISION CHART:

## EXAMPLES

### Example 1:

**PHYSICAL EXAMINATION** Domain: PE

See PDF page 7

Date of examination:           ☐ Not Done

Were there any changes from the previous physical examination?

☐ Yes → Specify changes below (enter body category from list below) Domain: SUPPPE

QVAL where QNAM = 'CHGPREV'

☐ No

| Body Category  | Normal                   | Abnormal                 | Only One Comment for Each Body Category |
|--|--------------------------|--------------------------|---|
| <input type="text"/> If '99 - Other', specify: _____ | <input type="checkbox"/> | <input type="checkbox"/> |   |
| <input type="text"/> If '99 - Other', specify: _____ | <input type="checkbox"/> | <input type="checkbox"/> |   |

In this physical examination module, if 'No' were to be selected, then there would be no other data from this form and thus nothing to link to in the PE (physical examination) domain. Initial thoughts were that this could be linked to the full physical examination done at screening, but this information was not describing the screening physical examination results plus this change from previous examination question was assessed at multiple visits, so it would not be possible to distinguish the records (and would cause duplicates in SUPPPE).

Since the focus at the post-screening visits was on changes from the screening examination, this information was actually considered to be topic data and thus belonged in PE. The fact that a subject did not have changes from the previous examination was in itself a finding. Hence the annotations and mapping were changed to generate a record with PETESTCD = "PEALL" and PEORRES indicating that there were no changes:

**PHYSICAL EXAMINATION** Domain: PE

See PDF page 7

Date of examination:           ☐ Not Done

Were there any changes from the previous physical examination?

☐ Yes → Specify changes below (enter body category from list below)

PEORRES = "NO CHANGE FROM PREVIOUS" if No is checked

☐ No PETEST = "PHYSICAL EXAM"

PETESTCD = "PEALL"

| Body Category  | Normal                   | Abnormal                 | Only One Comment for Each Body Category |
|--|--------------------------|--------------------------|---|
| <input type="text"/> If '99 - Other', specify: _____ | <input type="checkbox"/> | <input type="checkbox"/> |   |
| <input type="text"/> If '99 - Other', specify: _____ | <input type="checkbox"/> | <input type="checkbox"/> |   |

**Example 2:**

**Psychiatric History (PH)** MHCAT=PSYCHIATRIC HISTORY  
MHTERM=BIPOLAR I DISORDER

**Psychiatric History**

|   |                      |  |                        |
|---|----------------------|--|------------------------|
| 1. Date of initial onset of bipolar I disorder<br>[Date of initial onset of bipolar I disorder]         | MHSCAT=INITIAL ONSET | [Date Picker]  | MHSTDTC                |
| 2. Date of onset of current bipolar I disorder<br>[Date of onset of current bipolar I disorder]         | MHSCAT=CURRENT ONSET | [Date Picker]  |                        |
| 3. Current episode of bipolar I disorder<br>[Current episode of bipolar I disorder]<br>QNAM=CUREPISD    |                      | <input type="radio"/> Manic<br><input type="radio"/> Mixed Manic<br><input type="radio"/> Depressive<br><input type="radio"/> Hypomanic  | DOMAIN: SUPPMH<br>QVAL |
| 4. Bipolar I disorder history - Cycling<br>[Bipolar I disorder history - Cycling]<br>QNAM=CYCLING       |                      | <input type="radio"/> Bipolar I disorder without rapid cycling (0 - 3 cycles within past 12 months)<br><input type="radio"/> Bipolar I disorder with rapid cycling (4 - 7 cycles within past 12 months)<br><input type="radio"/> Bipolar I disorder with rapid cycling with 8 or more cycles within past 12 months |                        |
| 5. Bipolar I disorder history - Psychotic features<br>[Bipolar I disorder history - Psychotic features] |                      | <input type="radio"/> Bipolar I disorder with psychotic features<br><input type="radio"/> Bipolar I disorder without psychotic features  |                        |

In this module, there are multiple questions for psychiatric history pertaining to the status of the subject's Bipolar disorder. The initial thought was to map the responses to SUPPMH based on the first two items being mapped to the MH (medical history) domain, however the questions did not necessarily refer only to the two collected dates in items 1 and 2, but described the overall nature of the subject's experience with Bipolar disorder.

Since each of the questions following question #2 were findings about the subject's Bipolar disorder (a prerequisite for this study), the Findings About Events or Interventions domain (FA) was used instead:

**Psychiatric History (PH)** MHCAT=PSYCHIATRIC HISTORY  
MHTERM=BIPOLAR I DISORDER

**Psychiatric History**

|  |                      |  |   |
|--|----------------------|--|---|
| 1. Date of initial onset of bipolar I disorder<br>[Date of initial onset of bipolar I disorder]                              | MHSCAT=INITIAL ONSET | [Date Picker]  | MHSTDTC   |
| 2. Date of onset of current bipolar I disorder<br>[Date of onset of current bipolar I disorder]                              | MHSCAT=CURRENT ONSET | [Date Picker]  |   |
| 3. Current episode of bipolar I disorder<br>[Current episode of bipolar I disorder]<br>FATESTCD=CUREPISD                     |                      | <input type="radio"/> Manic<br><input type="radio"/> Mixed Manic<br><input type="radio"/> Depressive<br><input type="radio"/> Hypomanic  | DOMAIN: FA<br>FAOBJ=BIPOLAR I DISORDER<br>FAORRES |
| 4. Bipolar I disorder history - Cycling<br>[Bipolar I disorder history - Cycling]<br>FATESTCD=CYCLING                        |                      | <input type="radio"/> Bipolar I disorder without rapid cycling (0 - 3 cycles within past 12 months)<br><input type="radio"/> Bipolar I disorder with rapid cycling (4 - 7 cycles within past 12 months)<br><input type="radio"/> Bipolar I disorder with rapid cycling with 8 or more cycles within past 12 months |   |
| 5. Bipolar I disorder history - Psychotic features<br>[Bipolar I disorder history - Psychotic features]<br>FATESTCD=PSYCHOFT |                      | <input type="radio"/> Bipolar I disorder with psychotic features<br><input type="radio"/> Bipolar I disorder without psychotic features  |   |

**Example 3:**

In this example, the study stage is collected in the demographics module. The study has two stages with different treatment regimens and assessment schedules. This information does not directly describe or relate to any other data collected here; however it is critical for the statistical analysis.

Although there is no obvious parent data point, this data is in fact relevant for each subject and affects all data collected for the subject, therefore it can be mapped to SUPPDM and be related to the corresponding USUBJID as a whole. In these cases, the IDVAR and IDVARVAL are left null in the supplemental qualifiers dataset:

**Domain: LB**

## CLINICAL LABORATORY TESTS

**Was blood collected for analysis at this visit?**

1 ☐ Yes  
 2 ☐ No **LBSTAT = "NOT DONE" if No is checked**

**LBCAT = "CHEMISTRY/HEMATOLOGY"**  
**LBSPEC = "SERUM"**

**Was urine collected for analysis at this visit?**

1 ☐ Yes  
 2 ☐ No **LBTESTCD = "LBALL"**  
**LBTEST = "LAB"**

**LBDTC**

Date of collection: 

|     |  |  |  |  |       |   |      |  |
|-----|--|--|--|--|-------|---|------|--|
|     |  |  |  |  | 2     | 0 |      |  |
| day |  |  |  |  | month |   | year |  |

Were any results clinically significant? 1 ☐ Yes **(update Medical History CRF)**  
 2 ☐ No **DOMAIN: SUPPLB**  
**QVAL where QNAM = "LB\_CS"**

### Example 5:

**SERIOUS ADVERSE EVENTS (SAEs)**

Event Page Number:  Event Number:   
 (from Events page) (from Events page)

☐ Initial report  
☐ Follow-up report

**Which of the following criteria were met?** (check all that apply)

☐ Death  
☐ Immediately life-threatening condition  
☐ Required prolonged hospitalization

☐ Persistent or significant disability or incapacity  
☐ Congenital anomaly/birth defect  
☐ Other, specify: \_\_\_\_\_

**DOMAIN: SUPPAE**

| RESULTS OF ACTION TAKEN WITH IMP  | DEATH INFORMATION   |
|---|---|
| Did event abate/stop when IMP was stopped?<br><input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Not applicable<br><b>QVAL where QNAM="STOP"</b><br>Did event reappear/worsen when IMP was restarted?<br><input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Not applicable<br><b>QVAL where QNAM="WORSEN"</b> | Cause(s): <b>QVAL where QNAM="CAUSEDTH"</b><br><br>Autopsy done? <input type="checkbox"/> Yes <input type="checkbox"/> No<br>Autopsy report available? <input type="checkbox"/> Yes <input type="checkbox"/> No<br><b>QVAL where QNAM="AUTOPSY"</b><br><b>QNAM="REPORT"</b> |

COMMENTS AND DESCRIPTION OF EVENT COURSE

6

**Example 6:**

**Form: Concomitant Therapy (Medication Associated with SAE) CMCAT**

Was the subject taking any drug/therapy when an SAE started OR was the subject receiving any drug/therapy for an SAE during the study? SUPPCM.QVAL where QNAM = CMSAE Yes ☐ No ☒

*If 'Yes', List below (click Add New Log Line if you want to add subsequent records):*

Name of Drug, Medication, or Therapy CMTRT

Dose CMDOSTXT

Dose units CMDOSU

mg (Milligram) ☐

mcg (Microgram) ☐

g (Gram) ☐

Tablet ☐

mL (Milliliter) ☐

In this concomitant therapy form, if 'No' were to be checked for this question, there would be no other data from this form and thus nothing to link to in the CM (concomitant medications) domain.

We checked with the project team to determine if this information was truly needed.

If No → Change annotation to '[NOT SUBMITTED]' and only output the actual drugs/therapies used

If Yes → The lack of SAE related drug/therapy could be derived in ADaM by crosschecking the subjects with this CMCAT to the DM (demographics) domain and identifying subjects who did not take these drugs/therapies.

**Example 7:**

**Form: Prior/Concomitant GnRH monotherapy CMCAT**

Is the subject currently receiving GnRH monotherapy and have received it for at least 6 months prior to screening? SUPPCM.QVAL where QNAM = GNRHMONO Yes ☐ No, subject has undergone orchiectomy without receiving any previous GnRH monotherapy ☒

No, subject has undergone orchiectomy and has previously received GnRH monotherapy ☐

*If 'Yes' please record the GnRH monotherapy that the subject is currently receiving and has received for at least 6 months prior to screening*

*If "No, subject has undergone orchiectomy and has previously received GnRH monotherapy" record the previous GnRH monotherapy.*

Name of Drug, Medication, or Therapy CMTRT

Dose CMDOSTXT

Dose units CMDOSU

mg (Milligram) ☐

mcg (Microgram) ☐

g (Gram) ☐

Tablet ☐

mL (Milliliter) ☐

In this example, if the second option were to be checked, there would be no other data from this form and thus nothing to link to in the CM (concomitant medications) domain, yet it was important to be able to distinguish between the different possible options.

We got a little creative and figured that we could denote the time period via CMENRF. Similar to Example 6, the second option could then be '[NOT SUBMITTED]' since we would be able to identify these subjects by crosschecking CM with DM.

**Form: Prior/Concomitant GnRH monotherapy CMCAT**

Is the subject currently receiving GnRH monotherapy and have received it for at least 6 months prior to screening?

Yes ☐

No, subject has undergone orchiectomy without receiving any previous GnRH monotherapy ☐ [NOT SUBMITTED]

No, subject has undergone orchiectomy and has previously received GnRH monotherapy ☐

**CMENRF = DURING/AFTER if Yes**  
**CMENRF = BEFORE if 3rd option**

If 'Yes' please record the GnRH monotherapy that the subject is currently receiving and has received for at least 6 months prior to screening  
 If 'No, subject has undergone orchiectomy and has previously received GnRH monotherapy' record the previous GnRH monotherapy.

| Name of Drug, Medication, or Therapy | CMTRT    |
|--------------------------------------|----------|
| Dose                                 | CMDOSTXT |
| Dose units                           | CMDOSU   |

mg (Milligram) ☐

mcg (Microgram) ☐

g (Gram) ☐

Tablet ☐

## CONCLUSION

The floating supplemental qualifier is a compliance issue which must be addressed prior to submitting data. Any "lost children" will be identified by compliance checking tools such as WebSDM or OpenCDISC. A thorough review of mapping specifications can help to catch this issue up front, but one must be careful in determining an appropriate solution which adheres to CDISC SDTM guidelines and specifications, keeping in mind the full context of the situation and the impact of the modified mapping strategy in terms of programming, medical review, and regulatory review.
