Missing _X tables when running migration code

SAS FM 4.0 to 4.1 and SPM 2.0 to 2.1 migration issue

Background:

- During install _X tables are created in DDS
- During install, the _X tables in DDS are then deleted (occurs erroneously in conform registration code - register_conformed_mdata_new.sas)
- During normal usage of ETL Studio, if _X table does not exist, ETL Studio creates it.

Issue:

The current migration code will fail if the _X files are NOT in the DDS location.

How to fix:

Copy the updated [migrateDDSData.sas](#) code into your update location before running migration. This will ensure that the _X tables will be created if they do not exist before the migration is done.

Post .1 issues:

Register_conformed_mdata_new.sas will be changed, so only tables specifically created running this script will be deleted again.
