ETL Fact Table Load Job Failure

SAS FM 4.1

Issue:

When loading a fact table via ETL, the last member in a dimension is not getting loaded into the format used for data verification. Therefore, when verification occurs, if this member exists in the fact, the member is not recognized and there is an error. In most cases this will be the 'Base' member of the SOURCE dimension, but it's possible that it could be the last member from another dimension.

How to fix:

Place this corrected version of imptdata.sas in the folder below, replacing the prior version:

Program Files\SAS\SAS 9.1\finance\sasmacro
