Part 1: Getting Acquainted with the SAS Studio Environment.....	1
Chapter 1: Introduction to the SAS University Edition	3
Introduction: An Overview of SAS and the SAS University Edition.....	3
Obtaining Your Free Copy of SAS	4
Installing the SAS University Edition.....	6
Conclusion	10
Chapter 2: The SAS Studio Interface	11
Introduction	11
Exploring the Built-In Data Sets	13
Sorting Your Data.....	17
Switching Between Column Names and Column Labels	19
Resizing Tables	20
Creating Filters.....	20
Conclusion	23
Chapter 3: Importing Your Own Data	25
Introduction	25
Exploring the Utilities Tab	25
Importing Data from an Excel Workbook.....	27
Listing the SAS Data Set	32
Importing an Excel Workbook with Invalid SAS Variable Names	33
Importing an Excel Workbook That Does Not Have Variable Names	34

Importing Data from a CSV File	35
Conclusion	36
Chapter 4: Creating Reports	37
Introduction	37
Using the List Data Task to Create a Simple Listing.....	38
Filtering Data	44
Sorting Data.....	46
Outputting PDF and RTF Files	52
Joining Tables (Using the Query Window).....	53
Conclusion.....	63
Chapter 5: Summarizing Data Using SAS Studio	65
Introduction	65
Summarizing Numeric Variables	65
Adding a Classification Variable.....	70
Summarizing Character Variables.....	72
Conclusion.....	75
Chapter 6: Graphing Data	77
Introduction	77
Creating a Frequency Bar Chart.....	77
Creating a Bar Chart with a Response Variable	81
Adding a Group Variable	83
Creating a Pie Chart	84
Creating a Scatter Plot	86
Conclusion.....	88
Part 2: Learning How to Write Your Own SAS Programs..	89
Chapter 7: An Introduction to SAS Programming.....	91
SAS as a Programming Language	91
The SAS Studio Programming Windows	92
Your First SAS Program	92
How the DATA Step Works	97
How the INPUT Statement Works.....	102
Reading Delimited Data.....	102
How Procedures (PROCS) Work	104

How SAS Works: A Look Inside the “Black Box”	106
Conclusion	106
Chapter 8: Reading Data from External Files	107
Introduction	107
Reading Data Values Separated by Delimiters	107
Reading Comma-Separated Values Files	110
Reading Data Separated by Other Delimiters	111
Reading Data in Fixed Columns	112
Column Input.....	112
Formatted Input.....	114
Reading Excel Files.....	116
Reading from an Excel Workbook where Column Headings Are Invalid SAS Variable Names.....	118
Conclusion.....	119
Problems.....	120
Chapter 9: Reading and Writing SAS Data Sets.....	123
What's a SAS Data Set?	123
Temporary versus Permanent SAS Data Sets	125
Shared Folders: Communicating between Your Virtual Computer and Your Real Computer	126
Creating a Shared Folder and Reading Data from It.....	128
Creating a Permanent SAS Data Set.....	133
Reading from a Permanent SAS Data Set.....	134
Conclusion.....	135
Problems.....	136
Chapter 10: Creating Formats and Labels	137
What Is a SAS Format and Why Is It Useful?	137
Using SAS Built-in Formats	144
More Examples to Demonstrate How to Write Formats.....	145
Describing the Difference between a FORMAT Statement in a Procedure and a FORMAT Statement in a DATA Step.....	146
Making Your Formats Permanent	147
Creating Variable Labels	150
Conclusion.....	151
Problems.....	151

Chapter 11: Performing Conditional Processing	153
Introduction	153
Grouping Age Using Conditional Processing	153
Using Conditional Logic to Check for Data Errors.....	156
Describing the IN Operator	157
Using Boolean Logic (AND, OR, and NOT Operators).....	158
A Special Caution When Using Multiple OR Operators	159
Conclusion.....	161
Problems.....	162
Chapter 12: Performing Iterative Processing: Looping	165
Introduction	165
Demonstrating a DO Group	166
Describing a DO Loop	166
Using a DO Loop to Graph an Equation	169
DO Loops with Character Values	170
Leaving a Loop Based on Conditions (DO WHILE and DO UNTIL Statements)	172
DO WHILE.....	172
Combining an Iterative Loop with a WHILE Condition	174
Do UNTIL	174
Demonstrating That a DO UNTIL Loop Executes at Least Once	175
Combining an Iterative Loop with an UNTIL Condition.....	175
LEAVE and CONTINUE Statements	176
Conclusion	178
Problems.....	178
Chapter 13: Working with SAS Dates	181
Introduction	181
Reading Dates from Text Data	181
Creating a SAS Date from Month, Day, and Year Values	184
Describing a Date Constant.....	184
Extracting the Day of the Week, Day of the Month, and Year from a SAS Date	186
Adding a Format to the Bar Chart.....	188
Computing Age from Date of Birth: The YRDIF Function	190
Conclusion	190
Problems.....	191

Chapter 14: Subsetting and Combining SAS Data Sets	193
Introduction	193
Subsetting (Filtering) Data in a SAS Data Set	194
Describing a WHERE= Data Set Option.....	197
Describing a Subsetting IF Statement	198
A More Efficient Way to Subset Data When Reading Raw Data.....	199
Creating Several Data Subsets in One DATA Step.....	199
Combining SAS Data Sets (Combining Rows)	200
Adding a Few Observations to a Large Data Set (PROC APPEND).....	202
Interleaving Data Sets	203
Merging Two Data Sets (Adding Columns)	203
Controlling Which Observations Are Included in a Merge (IN= Data Set Option).....	205
Performing a One-to-Many or Many-to-One Merge	208
Merging Two Data Sets with Different BY Variable Names.....	210
Merging Two Data Sets with One Character and One Numeric BY Variable	211
Updating a Master File from a Transaction File (UPDATE Statement).....	214
Conclusion	216
Problems.....	217
Chapter 15: Describing SAS Functions	219
Introduction	220
Describing Some Useful Numeric Functions	220
Function Name: MISSING	221
Function Name: N.....	221
Function Name: NMISS.....	222
Function Name: SUM	222
Function Name: MEAN.....	223
Function Name: MIN.....	223
Function Name: MAX	224
Function Name: SMALLEST	224
Function Name: LARGEST.....	225
Programming Example Using the N, NMISS, MAX, LARGEST, and MEAN Functions .	226
Function Name: INPUT.....	227
CALL Routine: CALL SORTN.....	227
Function Name: LAG	229
Function Name: DIF.....	231

Describing Some Useful Character Functions.....	231
Function Names: LENGTHN and LENGTHC	231
Function Names: TRIMN and STRIP.....	233
Function Names: UPCASE, LOWCASE, and PROPCASE (Functions That Change Case).....	234
Function Name: PUT	235
Function Name: SUBSTRN (Newer Version of the SUBSTR Function).....	236
Function Names: FIND and FINDC	237
Function Names: CAT, CATS, and CATX	238
Function Names: COUNT and COUNTC	240
Function Name: COMPRESS.....	241
Function Name: SCAN	244
CALL Routine: CALL MISSING.....	245
Function Names: NOTDIGIT, NOTALPHA, and NOTALNUM.....	246
Function Names: ANYDIGIT, ANYALPHA, and ANYALNUM	246
Function Name: TRANWRD	247
Conclusion.....	247
Problems.....	248
Chapter 16: Working with Multiple Observations per Subject.....	251
Introduction	251
Useful Tools for Working with Longitudinal Data.....	251
Describing First. and Last. Variables	252
Computing Visit-to-Visit Differences	253
Computing Differences Between the First and Last Visits.....	255
Counting the Number of Visits for Each Patient.....	256
Conclusion.....	258
Problems.....	258
Chapter 17: Describing Arrays	261
Introduction	261
What Is an Array?	261
Describing a Character Array	264
Performing an Operation on Every Numeric Variable in a Data Set	265
Performing an Operation on Every Character Variable in a Data Set	265
Converting a Data Set with One Observation per Subject into a Data Set with Multiple Observations per Subject.....	266

Converting a Data Set with Multiple Observations per Subject into a Data Set with One Observation per Subject.....	268
Conclusion.....	269
Problems.....	270
Chapter 18: Displaying Your Data.....	273
Introduction.....	273
Producing a Simple Report Using PROC PRINT.....	273
Using Labels Instead of Variable Names as Column Headings.....	277
Including a BY Variable in a Listing.....	279
Including the Number of Observations in a Listing.....	280
Conclusion.....	280
Problems.....	281
Chapter 19: Summarizing Data with SAS Procedures.....	283
Introduction.....	283
Using PROC MEANS (with the Default Options).....	283
Using PROC MEANS Options to Customize the Summary Report.....	286
Computing Statistics for Each Value of a BY Variable.....	288
Using a CLASS Statement Instead of a BY Statement.....	289
Including Multiple CLASS Variables with PROC MEANS.....	290
Statistics Broken Down Every Way.....	291
Using PROC MEANS to Create a Summary Data Set.....	293
Letting PROC MEANS Name the Variables in the Output Data Set.....	294
Creating a Summary Data Set with CLASS Variables.....	295
Using a Formatted CLASS Variable.....	297
Demonstrating PROC UNIVARIATE.....	298
Conclusion.....	302
Problems.....	303
Chapter 20: Computing Frequencies.....	305
Introduction.....	305
Creating a Data Set to Demonstrate Features of PROC FREQ.....	305
Using PROC FREQ to Generate One-Way Frequency Tables.....	307
Creating Two-Way Frequency Tables.....	309
Creating Three-Way Frequency Tables.....	311
Using Formats to Create Groups for Numeric Variables.....	313

Conclusion	314
Problems	314
Appendix: Solutions to the Odd-Numbered Problems	315
Index	329

Chapter 4: Creating Reports

Introduction	37
Using the List Data Task to Create a Simple Listing	38
Filtering Data	44
Sorting Data	46
Outputting PDF and RTF Files	52
Joining Tables (Using the Query Window)	53
Conclusion	63

Introduction

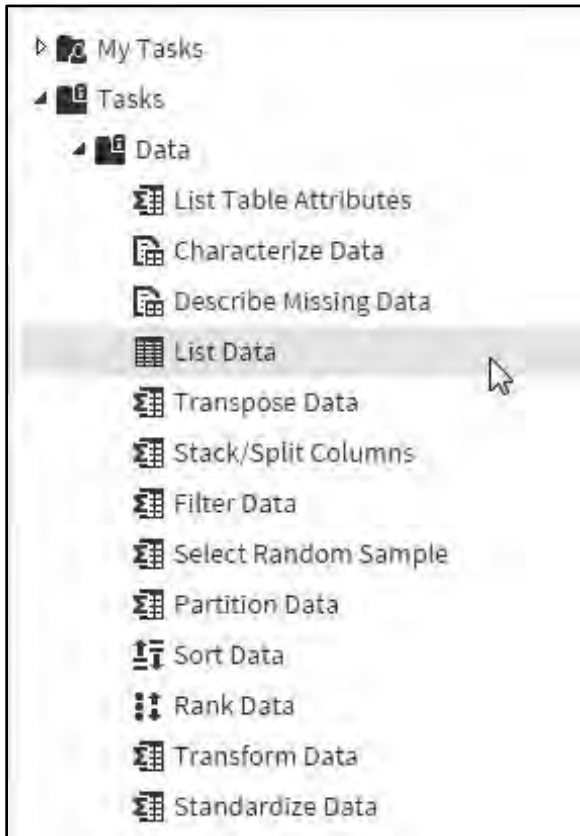

In the last chapter, you saw how to use the **Import Data** facility on the **Utilities** tab to import data. In this chapter, you will see how to use several of the most useful tasks as well as the Query tool on the **Utilities** tab.

In this book, as well as in SAS Studio, you will see the terms SAS data set and table used interchangeably as well as these other equivalent terms: variables are also called columns and observations are called rows.

Using the List Data Task to Create a Simple Listing

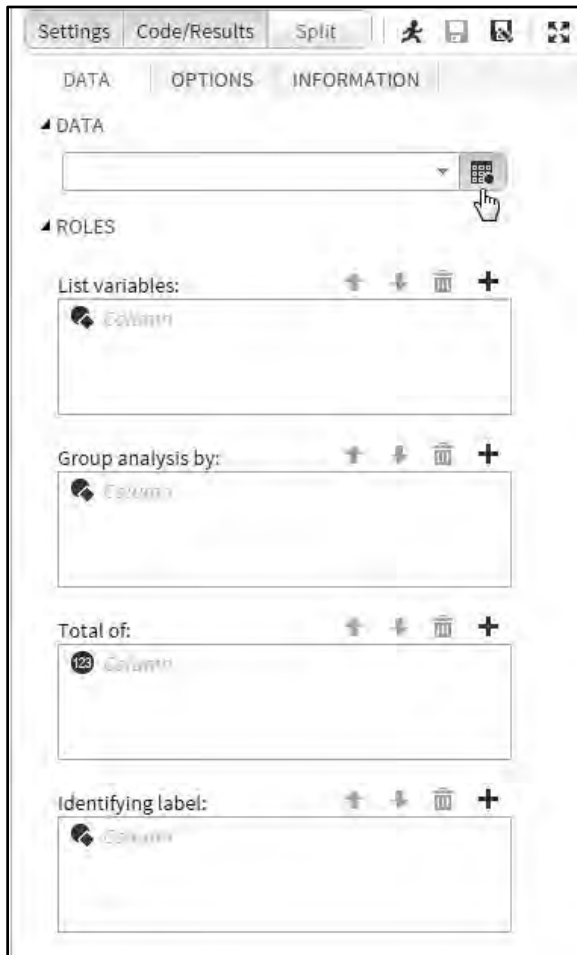

SAS Studio has dozens of built-in tasks. If you expand the **Tasks** tab, you will see the following:

Figure 4.1: Data Tasks

You can use the **List Data** task to create a listing of your data set. To demonstrate this, we are going to use the built-in Sashelp data set called Fish. This data set contains information on several species of fish, including weight, length, and width. To create a listing of this data set, expand the list of **Data** tasks and double-click on **List Data**. This brings up the screen shown in Figure 4.2:

Figure 4.2: The List Data Task Settings Screen

You can click on the icon at the top-right part of this screen to select the library and data set you wish to list. Because you want a listing of Sashelp.Fish, select this data set.

Figure 4.3: Selecting the Fish Data Set in the Sashelp Library

The next step is to click on the plus sign (+) to select which variables you want to include in your listing (see Figure 4.4):

Figure 4.4: Adding Columns (Variables)

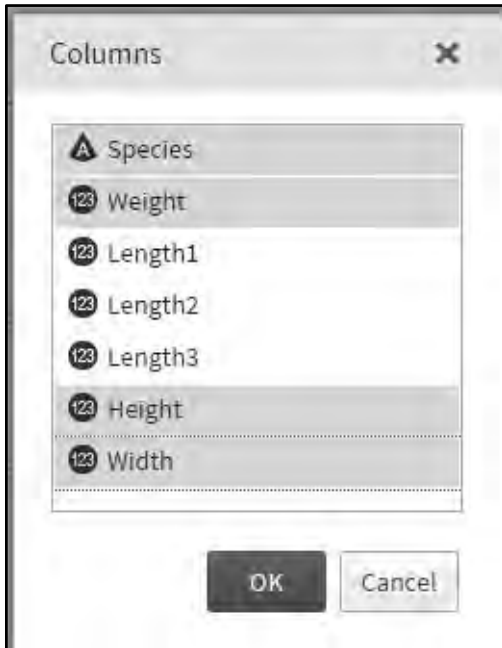

When you see the list of variables, you can select them in the usual way (see the instructions below):

To select variables from a list, use one of these two methods: 1) Hold the Ctrl key down and select the variables you want; or 2) click on one variable, hold the Shift key down, and click on another variable—all the variables from the first to the last will be selected.

In this example, you are selecting **Species**, **Weight**, **Height**, and **Width**.

Figure 4.5: Selecting Variables to List

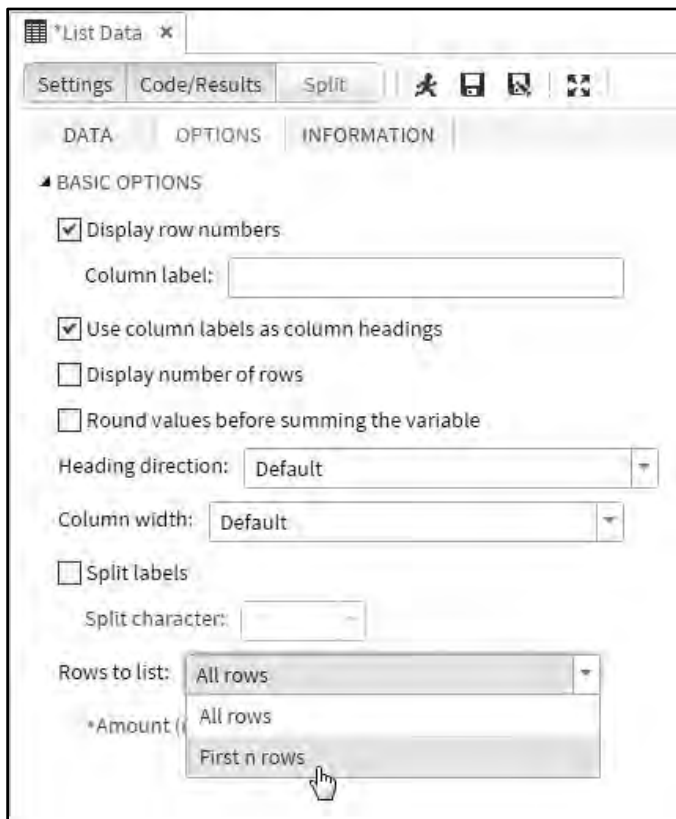

Click **OK** when you are finished. You can create the listing now or click on the **OPTIONS** tab to customize the listing.

Figure 4.6: Using the OPTIONS Tab to Customize the Listing

Here is the list of options available for the **List Data** task:

Figure 4.7: Options for the List Data Task

You can check or uncheck the **Display row numbers** box to include the Obs column in the listing or omit it. You have a choice of using column labels or column names in the listing. If you are a programmer, you will probably want to see column names as headings—if you are creating the listing for a report, you will probably want to see column labels.

The option displayed at the bottom of Figure 4.7 gives you the choice of listing all the rows of the table or the first n rows. In this example, you want to see the first seven rows of the Fish data set. This is shown in the next figure:

Figure 4.8: Requesting the First Seven Rows to Be Displayed

▲ BASIC OPTIONS

Display row numbers
 Column label:

Use column labels as column headings

Display number of rows

Round values before summing the variable

Heading direction:

Column width:

Split labels
 Split character:

Rows to list:

* Amount (n):

Clicking on the **Run** icon generates the following listing:

Figure 4.9: Listing of the First Seven Rows of the Fish Data Set

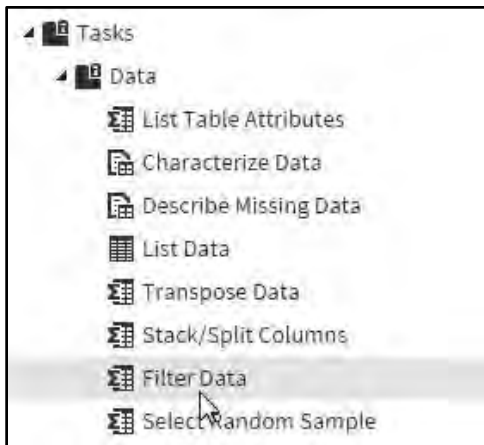

List Data for SASHELP.FISH

Obs	Species	Weight	Height	Width
1	Bream	242	11.5200	4.0200
2	Bream	290	12.4800	4.3056
3	Bream	340	12.3778	4.6981
4	Bream	383	12.7300	4.4555
5	Bream	430	12.4440	5.1340
6	Bream	450	13.6024	4.8274
7	Bream	500	14.1795	5.2785

Filtering Data

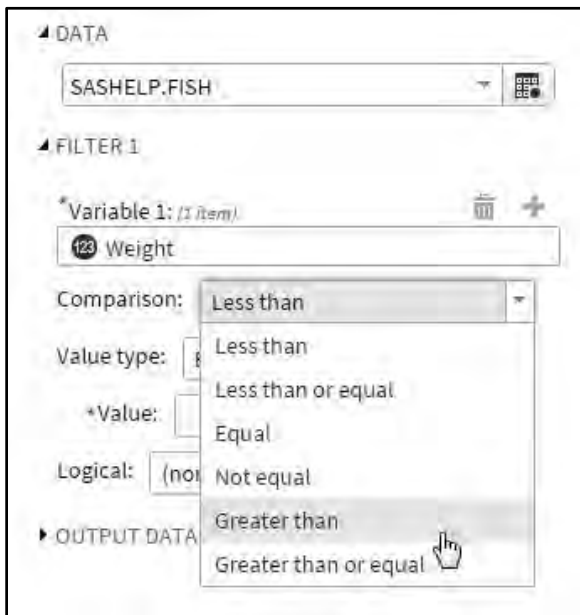

Another useful task is to filter the table—that is, you select rows that meet predefined criteria. To do this, double-click on **Filter Data** in the task list.

Figure 4.10: Selecting Filter Data from the Task List

This brings up the following:

Figure 4.11: Selections for Filtering Data

You select the data set as before. Next, you select a variable and a condition for your filter. In this example, you are selecting **Weight** as your variable and **Greater than** as your condition. You can now enter a value for the filter. In this example, you want to see rows in the table where the variable **Weight** is greater than 1,100.

Figure 4.12: Selecting Rows Where the Weight Is Greater Than 1,100

The screenshot shows a configuration window for a filter. It is divided into two main sections: 'FILTER 1' and 'OUTPUT DATA SET'.

- FILTER 1:**
 - Variable 1:** A dropdown menu showing 'Weight'.
 - Comparison:** A dropdown menu showing 'Greater than'.
 - Value type:** A dropdown menu showing 'Enter a value'.
 - Value:** A text input field containing '1100'.
 - Logical:** A dropdown menu showing '(none)'.
- OUTPUT DATA SET:**
 - Data set name:** A text input field containing 'Big_Fish'.
 - Show Output Data:** A section containing a checked checkbox labeled 'Show output data'.
 - Show:** A dropdown menu showing 'Show all output data'.

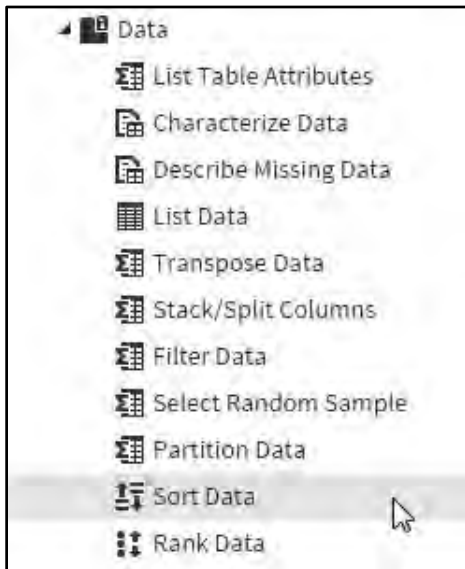

You can also expand the **OUTPUT DATA SET** option to override a default data set name. In most cases, you will want to supply your own data set name. Here you are naming the data set **Big_Fish**. You can also check or uncheck the **Show Output Data** box. Selecting it (as in this example) generates a listing of the filtered data set:

Figure 4.13: Listing of the Filtered Data Set (Big_Fish)**Filtered data set - WORK.Big_Fish**

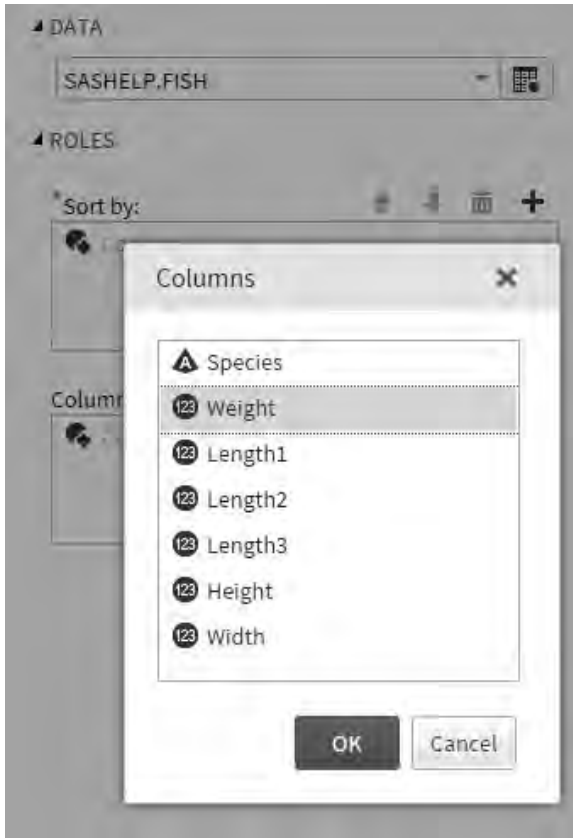

Obs	Species	Weight	Length1	Length2	Length3	Height	Width
1	Pike	1250	52	56.0	59.7	10.6863	6.9849
2	Pike	1600	58	60.0	64.0	9.6000	6.1440
3	Pike	1550	58	60.0	64.0	9.6000	6.1440
4	Pike	1650	59	63.4	68.0	10.8120	7.4800

Sorting Data

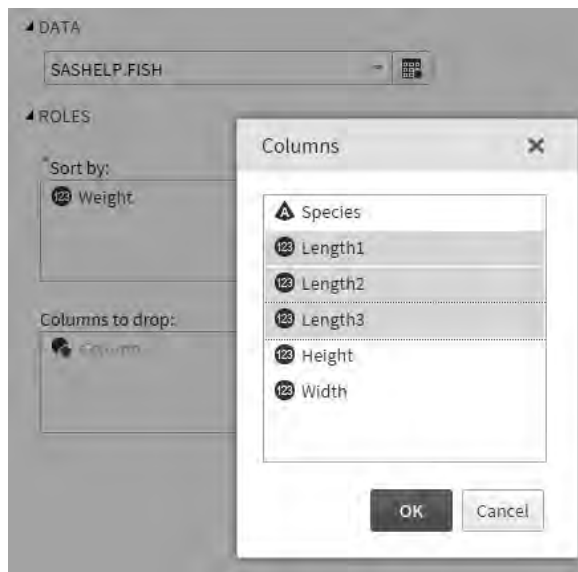

To sort data, select **Sort Data** from the list:

Figure 4.14: The Sort Data Task

Just as in the previous tasks, you can now choose a data set and options.

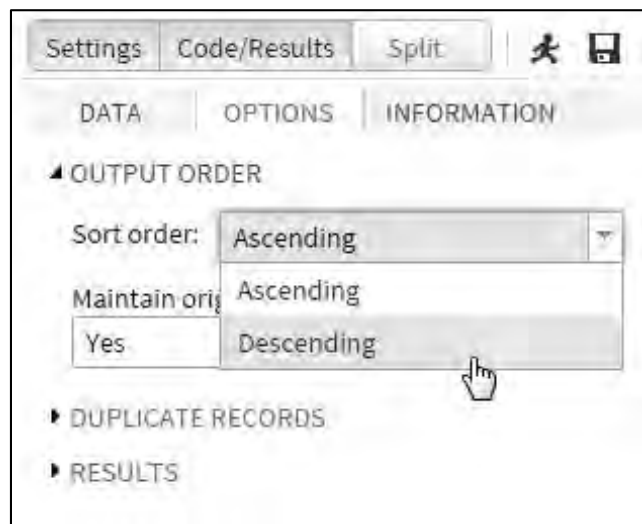

Figure 4.15: Selecting a Data Set and Variables for the Sort

You are starting with the Sashelp.Fish data set and requesting a sort based on the variable Weight. You can also choose columns to drop:

Figure 4.16: Selecting Columns to Drop

You are dropping the three Length variables.

Before you execute the sort, there are several options you should consider. The default sort order is ascending (from smallest to largest). In this case, you want to see the heavier fish at the top of the list, so you choose **Descending** as the sort order.

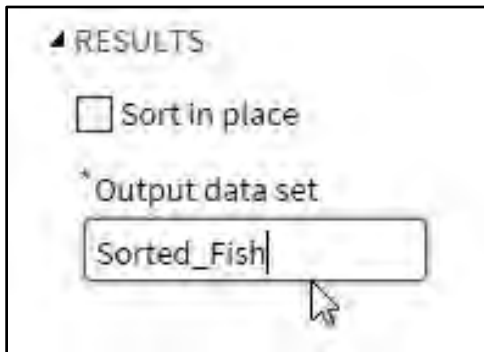

Figure 4.17: Selecting a Descending Sort

Expand the **RESULTS** option to either sort in place or create a new data set with the sorted data.

CAUTION: Sorting in place replaces the original data set with the sorted data. If you drop columns, they will no longer be in the sorted data set.

In this example, you want to create a new data set called Sorted_Fish:

Figure 4.18: Naming the Output Data Set

Click on the **Run** icon to see the following screen:

Figure 4.19: Result of Executing the Sort

Table: WORK.SORTED_FISH View: Column names Filter:

(none)

Columns: Select all, Species, Weight, Height, Width

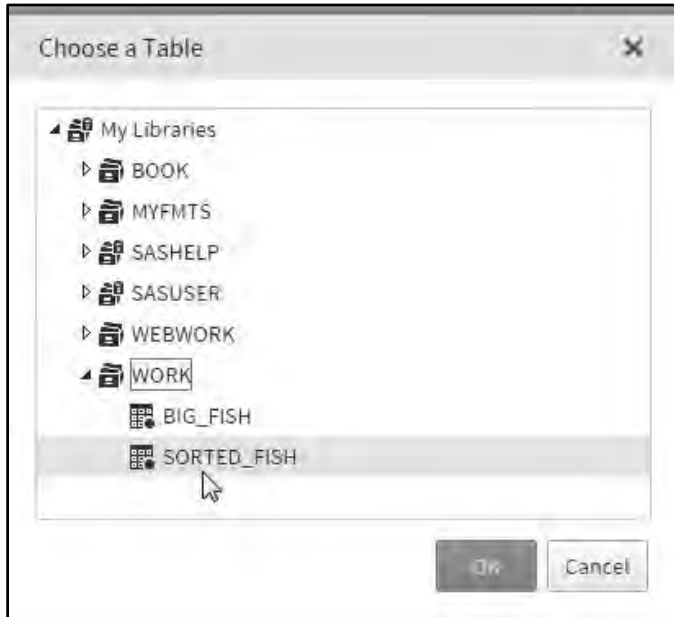

Total rows: 159 Total columns: 4 Rows 1-100

	Species	Weight
1	Pike	1650
2	Pike	1600
3	Pike	1550
4	Pike	1250
5	Perch	1100
6	Perch	1100
7	Perch	1015
8	Bream	1000
9	Whitefish	1000
10	Perch	1000
11	Perch	1000
12	Perch	1000
13	Bream	975
14	Bream	955
15	Bream	950
16	Pike	950
17	Bream	925
18	Bream	920
19	Perch	900

Property Value

Property	Value
Label	
Name	
Length	
Type	
Format	
Informat	

To see a nicer listing of this data set, go back to the **List Data** selection and proceed as you did in the first section of this chapter. Once you have opened the **List Data** task, choose a table to display and any options that you want.

Figure 4.20: Choose a Table to List

Next, choose which variables to include in the listing.

Figure 4.21: Choosing Variables to List

Finally, select any options that you want. In this example, you want to see the first eight rows of the table.

Figure 4.22: Option to List the First Eight Rows of the Table

Here is the listing:

Figure 4.23: First Eight Rows of the Sorted_Fish Data Set

List Data for WORK.SORTED_FISH

Obs	Species	Weight	Height	Width
1	Pike	1650	10.8120	7.4800
2	Pike	1600	9.6000	6.1440
3	Pike	1550	9.6000	6.1440
4	Pike	1250	10.8863	6.9849
5	Perch	1100	12.8002	6.8684
6	Perch	1100	12.5125	7.4165
7	Perch	1015	12.3808	7.4624
8	Bream	1000	18.9570	6.8030

Outputting PDF and RTF Files

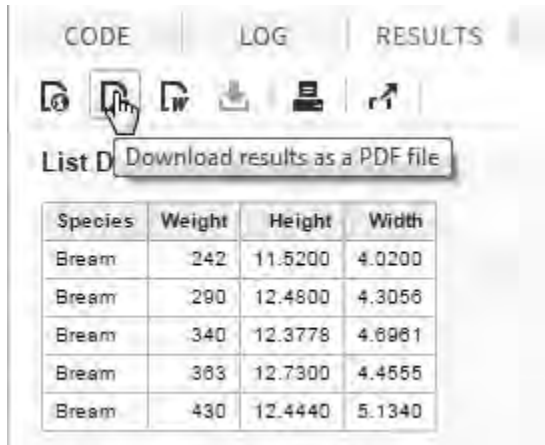

If you want either PDF or RTF (rich text format) output, first click on the SAS Studio **Options** icon.

Figure 4.24: Click on More Application Options

Click on **Preferences**, then **Results**, and then check or uncheck **PDF** and/or **RTF**. (Note: These preferences will remain in effect unless you change them later.)

If you have checked one of these file types, after you produce a listing, the two icons **Download results as a PDF file** or **Download results as an RTF file** will be displayed right above your listing (see Figure 4.25). Clicking on either of these icons will output the appropriate file type to a location of your choice.

Figure 4.25: Downloading a PDF File

Here is a listing of the PDF file:

Figure 4.26: Listing of the PDF File

List Data for SASHELP.FISH

Species	Weight	Height	Width
Bream	242	11.5200	4.0200
Bream	290	12.4800	4.3056
Bream	340	12.3778	4.6961
Bream	363	12.7300	4.4555
Bream	430	12.4440	5.1340

Joining Tables (Using the Query Window)

The last topic in this chapter describes how to use the **Query** utility to join two tables. Two data sets, `ID_Name` and `Grades`, were created to explain how the joining process works. Here is a listing of these two data sets:

Figure 4.27: Listing of Data Sets ID_Name and Grades**List Data for WORK.ID_NAME**

ID	Name
001	Ron
002	Jan
003	Peter
004	Paul
005	Mary

List Data for WORK.GRADES

ID	Grade1	Grade2	Grade3
005	78	80	82
002	100	90	95
001	99	95	98
006	65	67	69
004	85	86	84

There are several features of these two data sets that are important for you to notice. First, the ID variable in the ID_Name data set is in order—in the data set Grades, it is not. As you will see, this does not cause a problem—the Query tool automatically sort the data sets. Also, ID 003 is in data set ID_Name and not in data set Grades; ID 006 is in Grades but not in ID_Name. The goal is to join these two tables based on the ID column.

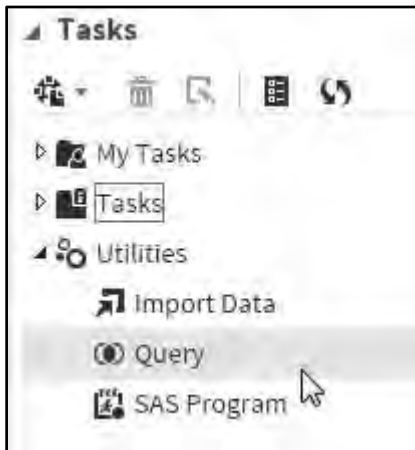

If you want to play along with this demonstration, you can run the program shown next to create these two tables (you may need to refer to the programming chapters to see how to do this):

Figure 4.28: Program to Create Data Sets ID_Name and Grades

```
data ID_Name;
    informat ID $3. Name $12.;
    input ID Name;
datalines;
001 Ron
002 Jan
003 Peter
004 Paul
005 Mary
;
data Grades;
    informat ID $3.;
    input ID Grade1-Grade3;
datalines;
005 78 80 82
002 100 90 95
001 99 95 98
006 65 67 69
004 85 86 84
;
```

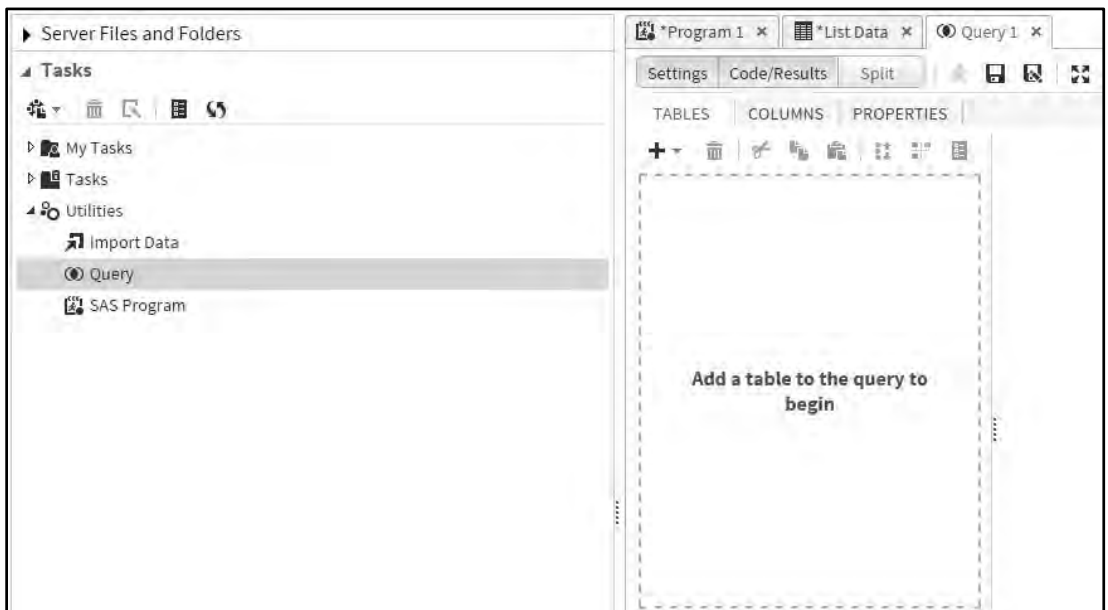

The first step in joining these two tables is to select **Query** from the **Utilities** tab.

Figure 4.29: The Query Task in the Utilities Tab

This brings up the following screen:

Figure 4.30: The Query Window

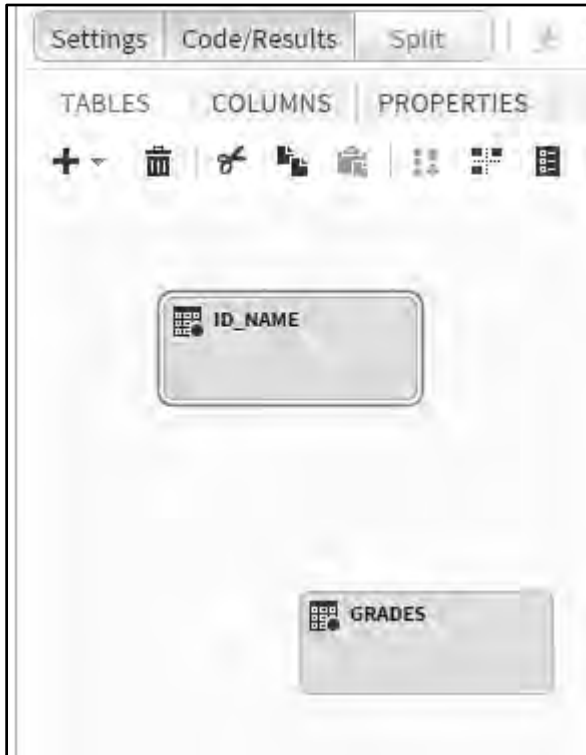

The next step is to open the **Libraries** tab and find the **Work** library.

Figure 4.31: Locate the Two Tables in the Work Library

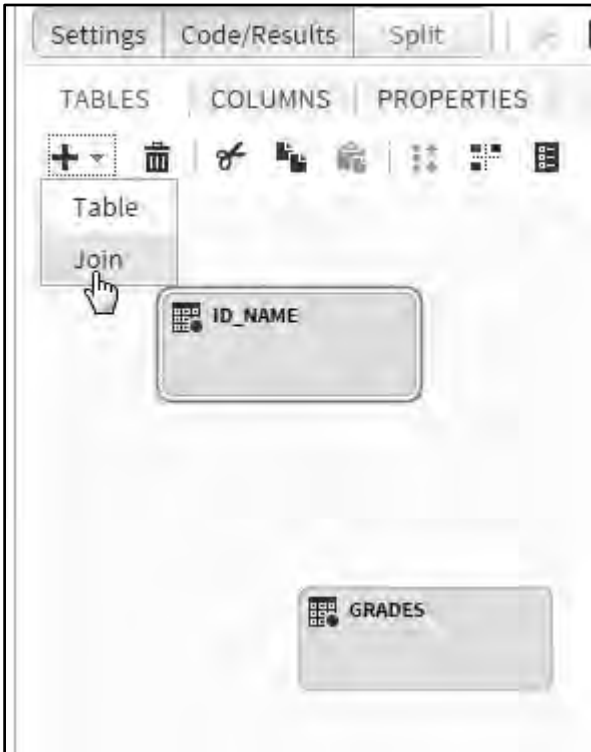

Left-click on each file and drag it into the Query window. (If you drag the second file on top of the first file, SAS Studio automatically assumes that you want to perform a join operation.)

Figure 4.32: Drag the Two Files into the Query Window

In the pull-down menu on the **TABLES** tab, select **Join** (unless you dragged the second file on top of the first, in which case the Query tool assumes that you want a join).

Figure 4.33: Selecting Join in the Pull-down Menu

This brings up the following screen:

Figure 4.34: Getting Ready to Join the Two Tables

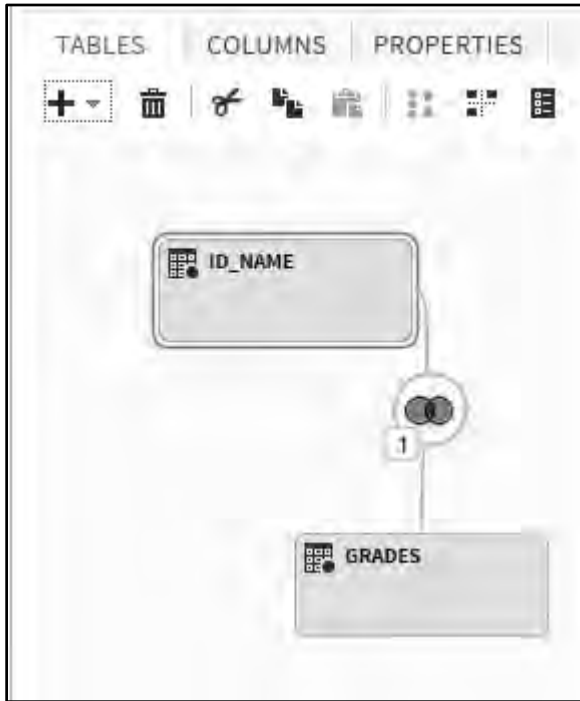

Select **ID_Name** for the **Left table** and **Grades** for the **Right table**. For **Join type**, select **Inner join**.

Figure 4.35: Selecting the Two Tables and Inner Join

Click **Save**. You now see the two tables with a Venn diagram that represents an inner join. If you are familiar with SQL, you already know the four types of joins. For those readers who are not, here is the explanation:

Because some IDs are only in one table, you have some decisions to make about how you want to handle the join. The most common join, selected in this example, is an *inner join*. This type of join includes only those rows where there is a matching ID in both files. An *outer join* includes all rows from both tables (with missing values in the rows from the table that does not contain an ID). Finally, the other two joins are a *left join* and a *right join*. In a left join, all IDs from the left table are included—in a right join, all IDs from the right table are included.

Figure 4.36: Venn Diagram Showing an Inner Join of the Two Tables

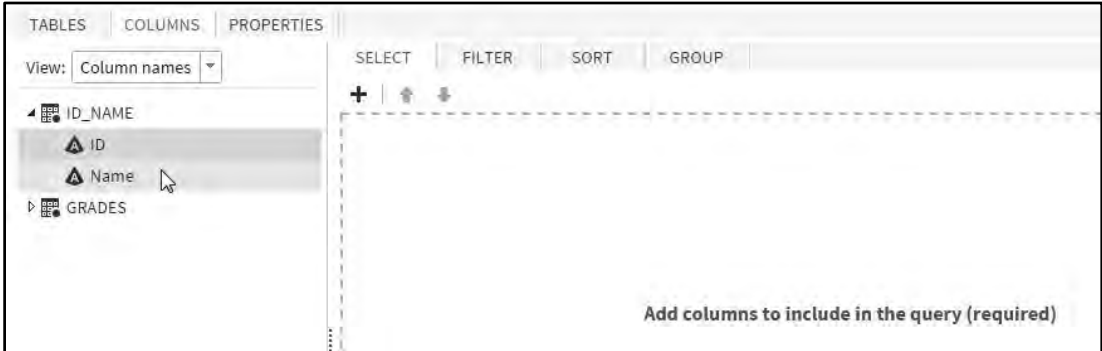

The next step is to name the columns that you want to use to join the tables. In this example, because ID is in both tables, the Query tool automatically selects ID for the join variables. You are free to select any variable from each file to construct the join, even if the variable names are not the same in the two files.

Figure 4.37: Selecting the Join Conditions

Next, select which columns you want in the joined table. To do this, click on the **COLUMNS** tab. Select the columns in the usual way, and drag them to the Add columns area.

Figure 4.38: Selecting Columns for the Final Table

The figure below shows the final list of columns in the joined table.

Figure 4.39: Variables in the Joined Table

The screenshot shows a software interface with four tabs: SELECT, FILTER, SORT, and GROUP. The 'SELECT' tab is active. Below the tabs are three icons: a plus sign, an up arrow, and a down arrow. Below the icons is a table with two columns: 'Table' and 'Source Column'. The table contains the following rows:

Table	Source Column
ID_NAME	ID
ID_NAME	Name
GRADES	ID
GRADES	Grade1
GRADES	Grade2
GRADES	Grade3

The last step is to click on the **PROPERTIES** tab and indicate if you want a table or a report. If you choose a table, you can name the location (the Work library in this example) and the table name.

Figure 4.40: Options in the PROPERTIES Tab

TABLES COLUMNS **PROPERTIES**

▾ IDENTIFICATION

Name: Query 1

Location:

▾ RESULTS

Output type:

Table

Output location:

WORK

Output name:

Combined

Clicking on the **Run** icon finishes the join. A snapshot view of the resulting table is produced.

Figure 4.41: View of the Resulting Table

CODE LOG RESULTS **OUTPUT DATA**

Table: WORK.COMBINED View: Column names Filter: (none)

Columns: Select all, ID, Name, ID2, Grade1, Grade2, Grade

Total rows: 4 Total columns: 6 Rows 1-4

	ID	Name	ID2	Grade1	Grade2	Grade
1	005	Mary	005	78	80	
2	002	Jan	002	100	90	
3	001	Ron	001	99	95	

You can use the **List Data** task to create a listing of the resulting table. It is shown in Figure 4.42:

Figure 4.42: Listing of Combined Data Set

Listing of Data Set COMBINED

ID	Name	ID2	Grade1	Grade2	Grade3
005	Mary	005	78	80	82
002	Jan	002	100	90	95
001	Ron	001	99	95	98
004	Paul	004	85	86	84

Because this was an inner join, only those IDs that were in both tables are listed in the final table.

Conclusion

Only a few of the more popular data tasks were described in this chapter. Once you get the knack of running a task, you should feel confident in trying out some of the other data tasks in the list. The decision to use a task or write a SAS program is a personal choice. For those with programming experience, writing a program may be the way to go—for those folks who are new to SAS and just want to get things done, using the tasks is a great way to go. Or you can do both! Use a task or a utility to get the basic program written for you, and then take that and edit it to do more.

 STD function 286
 STDERR function 286
 STRIP function 233–234
 subsetting
 See data set
 SUBSTRN function 236–237
 SUM function 222–223
 SUM statement 257
 summarizing data
 adding classification variables 70–72
 character variables 72–75
 numeric variables 65–70
 summary data set
 creating with CLASS variables 295–297
 creating with MEANS procedure 293–
 294
 Summary reports, using MEANS procedure
 to customize 286–287
 Summary Statistics task 67
 supported files 26

T

tables
 joining 53–63
 resizing 20
 TABLES option 140–141
 TABLES statement 104–105
 TABLES tab 57–58
 tabular output 69
 Tasks tab (Navigation pane) 25, 38, 78, 104
 temporary data sets, compared with
 permanent data sets 125–126

text data, reading dates from 181–184
 three-way frequency tables 311–312
 TITLE statement 98, 149, 274
 trailing @ 199
 TRANSPOSE procedure 267, 268
 TRANWRD function 247
 TRIMN function 233–234
 two-way frequency tables 309–311

U

UNIVARIATE procedure 298–302
 UNTIL condition 175–176
 UPCASE function 234–235
 UPDATE statement 214–216
 updates, for SAS University Edition 9
 Utilities tab 25–27, 54–55

V

valid SAS names 95
 VALUE statements 140
 VAR statement 98, 274–276, 285, 287, 299
 variable labels 150–151
 variable names
 about 95
 importing Excel workbooks with invalid 33–34
 importing Excel workbooks with no 34–35
 using labels instead of 277–278
 variables
 character 72–75, 265–266
 choosing which to list 50–52
 classification 70–72
 contributor 205–206
 defined 99
 group 83–84
 naming in output data set with MEANS
 procedure 294–295
 numeric 65–70, 265
 response 81–83
 selecting 40, 73
 Variables pane (SAS Studio) 15–16
 View tab (SAS Studio) 19
 VirtualBox 11
 visit-to-visit differences, computing 253–255

VMWare Player, downloading SAS
University Edition using 6–9

W

WEEKDAY function 186–188, 220
WHERE= option 197–198
WHERE statement 195–196, 197–198
WHILE condition 174
Windows, virtualization software for 5
work area, expanding in SAS Studio 16–17
Work library 31
workbooks
 See Excel workbooks
writing SAS data sets
 See data sets

Y

year
 creating dates from values for 184
 extracting from 186–188
YEAR function 186–188
YRDIF function 190

About The Author

Ron Cody, EdD, a retired professor from the Rutgers Robert Wood Johnson Medical School now works as a private consultant and a national instructor for SAS Institute Inc. A SAS user since 1977, Ron's extensive knowledge and innovative style have made him a popular presenter at local, regional, and national SAS conferences. He has authored or co-authored numerous books, such as *Learning SAS by Example: A Programmer's Guide*; *SAS Statistics by Example, Applied Statistics and the SAS Programming Language, Fifth Edition*; *The SAS Workbook*; *The SAS Workbook Solutions*; *Cody's Data Cleaning Techniques Using SAS, Second Edition*; *Longitudinal Data and SAS: A Programmer's Guide*; *SAS Functions by Example, Second Edition*, and *Cody's Collection of Popular Programming Tasks and How to Tackle Them*, and *Test Scoring and Analysis Using SAS*, as well as countless articles in medical and scientific journals.
