The distribution of the initial state vector α_1 is diffuse, with $P_* = Diag[\sigma_\epsilon^2, 0, 0]$ and $P_\infty = Diag[0, 1, 1]$. The parameter vector θ consists of all the disturbance variances—that is, $\theta = (\sigma_\epsilon^2, \sigma_\eta^2, \sigma_\xi^2)$.

Basic Structural Model

The basic structural model (BSM) is obtained by adding a seasonal component, γ_t , to the local level model. In order to economize on the space, the state space formulation of a BSM with a relatively short season length, season length = 4 (quarterly seasonality), is considered here. The pattern for longer season lengths such as 12 (monthly) and 52 (weekly) is easy to see.

Let us first consider the dummy form of seasonality. In this case the state and state noise vectors are $\alpha_t = [\epsilon_t \mu_t \beta_t \gamma_{1,t} \gamma_{2,t} \gamma_{3,t}]'$ and $\zeta_t = [\epsilon_t \eta_t \xi_t \omega_t 0 0]'$, respectively. The first three elements of the state vector are the irregular, level, and slope components, respectively. The remaining elements, $\gamma_{i,t}$, are lagged versions of the seasonal component γ_t . $\gamma_{1,t}$ corresponds to lag zero—that is, the same as γ_t , $\gamma_{2,t}$ to

lag 1 and $\gamma_{3,t}$ to lag 2. The system matrices are

$$Z = [1 \ 1 \ 0 \ 1 \ 0 \ 0], \quad T = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & -1 & -1 & -1 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \end{bmatrix}$$

and $Q = \text{Diag}[\sigma_\epsilon^2, \sigma_\eta^2, \sigma_\xi^2, \sigma_\omega^2, 0, 0]$. The distribution of the initial state vector α_1 is diffuse, with $P_* = \text{Diag}[\sigma_\epsilon^2, 0, 0, 0, 0, 0]$ and $P_\infty = \text{Diag}[0, 1, 1, 1, 1, 1]$.

In the case of the trigonometric type of seasonality, $\alpha_t = [\epsilon_t \ \mu_t \ \beta_t \ \gamma_{1,t} \ \gamma_{1,t}^* \ \gamma_{2,t}]'$ and $\zeta_t = [\epsilon_t \ \eta_t \ \xi_t \ \omega_{1,t} \ \omega_{1,t}^* \ \omega_{2,t}]'$. The disturbance sequences, $\omega_{j,t}$, $1 \leq j \leq 2$, and $\omega_{1,t}^*$, are independent, zero-mean, Gaussian sequences with variance σ_ω^2 . The system matrices are

$$Z = [1 \ 1 \ 0 \ 1 \ 0 \ 1], \quad T = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & \cos \lambda_1 & \sin \lambda_1 & 0 \\ 0 & 0 & 0 & -\sin \lambda_1 & \cos \lambda_1 & 0 \\ 0 & 0 & 0 & 0 & 0 & \cos \lambda_2 \end{bmatrix}$$

and $Q = \text{Diag}[\sigma_\epsilon^2, \sigma_\eta^2, \sigma_\xi^2, \sigma_\omega^2, \sigma_\omega^2, \sigma_\omega^2]$. Here $\lambda_j = (2\pi j)/4$. The distribution of the initial state vector α_1 is diffuse, with $P_* = \text{Diag}[\sigma_\epsilon^2, 0, 0, 0, 0, 0]$ and $P_\infty = \text{Diag}[0, 1, 1, 1, 1, 1]$. The parameter vector in both the cases is $\theta = (\sigma_\epsilon^2, \sigma_\eta^2, \sigma_\xi^2, \sigma_\omega^2)$.

Seasons with Blocked Seasonal Values

Block seasons are special seasonal components that impose a special block structure on the seasonal effects. Let us consider a BSM with monthly seasonality that has a quarterly block structure—that is, months within the same quarter are assumed to have identical effects except for some random perturbation. Such a seasonal component is a block seasonal with block size m equal to 3 and the number of blocks k equal to 4. The state space structure for such a model with dummy-type seasonality is as follows: The state and state noise vectors are $\alpha_t = [\epsilon_t \ \mu_t \ \beta_t \ \gamma_{1,t} \ \gamma_{2,t} \ \gamma_{3,t}]'$ and $\zeta_t = [\epsilon_t \ \eta_t \ \xi_t \ \omega_t \ 0 \ 0]'$, respectively. The first three elements of the state vector are the irregular, level, and slope components, respectively. The remaining elements, $\gamma_{i,t}$, are lagged versions of the seasonal component γ_t . $\gamma_{1,t}$ corresponds to lag zero—that is, the same as γ_t , $\gamma_{2,t}$ to lag m and $\gamma_{3,t}$ to lag $2m$. All the system matrices are time invariant, except the matrix T . They can be seen to be $Z = [1 \ 1 \ 0 \ 1 \ 0 \ 0]$, $Q = \text{Diag}[\sigma_\epsilon^2, \sigma_\eta^2, \sigma_\xi^2, \sigma_\omega^2, 0, 0]$, and

$$T_t = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & -1 & -1 & -1 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \end{bmatrix}$$

when t is a multiple of the block size m , and

$$T_t = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

otherwise. Note that when t is not a multiple of m , the portion of the T_t matrix corresponding to the seasonal is identity. The distribution of the initial state vector α_1 is diffuse, with $P_* = \text{Diag}[\sigma_\epsilon^2, 0, 0, 0, 0, 0]$ and $P_\infty = \text{Diag}[0, 1, 1, 1, 1, 1]$.

Similarly in the case of the trigonometric form of seasonality, $\alpha_t = [\epsilon_t \mu_t \beta_t \gamma_{1,t} \gamma_{1,t}^* \gamma_{2,t}]'$ and $\zeta_t = [\epsilon_t \eta_t \xi_t \omega_{1,t} \omega_{1,t}^* \omega_{2,t}]'$. The disturbance sequences, $\omega_{j,t}$, $1 \leq j \leq 2$, and $\omega_{1,t}^*$, are independent, zero-mean, Gaussian sequences with variance σ_ω^2 . $Z = [1 \ 1 \ 0 \ 1 \ 0 \ 1]$, $Q = \text{Diag}[\sigma_\epsilon^2, \sigma_\eta^2, \sigma_\xi^2, \sigma_\omega^2, \sigma_\omega^2, \sigma_\omega^2]$, and

$$T_t = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & \cos \lambda_1 & \sin \lambda_1 & 0 \\ 0 & 0 & 0 & -\sin \lambda_1 & \cos \lambda_1 & 0 \\ 0 & 0 & 0 & 0 & 0 & \cos \lambda_2 \end{bmatrix}$$

when t is a multiple of the block size m , and

$$T_t = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

otherwise. As before, when t is not a multiple of m , the portion of the T_t matrix corresponding to the seasonal is identity. Here $\lambda_j = (2\pi j)/4$. The distribution of the initial state vector α_1 is diffuse, with $P_* = \text{Diag}[\sigma_\epsilon^2, 0, 0, 0, 0, 0]$ and $P_\infty = \text{Diag}[0, 1, 1, 1, 1, 1]$. The parameter vector in both the cases is $\theta = (\sigma_\epsilon^2, \sigma_\eta^2, \sigma_\xi^2, \sigma_\omega^2)$.

Cycles and Autoregression

The preceding examples have illustrated how to build a state space model corresponding to a UCM that includes components such as irregular, trend, and seasonal. There you can see that the state vector and the system matrices have a simple block structure with blocks corresponding to the components in the model. Therefore, here only a simple model consisting of a single cycle and an irregular component is considered. The state space form for more complex UCMs consisting of multiple cycles and other components can be easily deduced from this example.

Recall that a stochastic cycle ψ_t with frequency λ , $0 < \lambda < \pi$, and damping coefficient ρ can be modeled as

$$\begin{bmatrix} \psi_t \\ \psi_t^* \end{bmatrix} = \rho \begin{bmatrix} \cos \lambda & \sin \lambda \\ -\sin \lambda & \cos \lambda \end{bmatrix} \begin{bmatrix} \psi_{t-1} \\ \psi_{t-1}^* \end{bmatrix} + \begin{bmatrix} v_t \\ v_t^* \end{bmatrix}$$

where v_t and v_t^* are independent, zero-mean, Gaussian disturbances with variance σ_v^2 . In what follows, a state space form for a model consisting of such a stochastic cycle and an irregular component is given.

The state vector $\alpha_t = [\epsilon_t \psi_t \psi_t^*]'$, and the state noise vector $\zeta_t = [\epsilon_t v_t v_t^*]'$. The system matrices are

$$Z = [1 \ 1 \ 0] \quad T = \begin{bmatrix} 0 & 0 & 0 \\ 0 & \rho \cos \lambda & \rho \sin \lambda \\ 0 & -\rho \sin \lambda & \rho \cos \lambda \end{bmatrix} \quad Q = \text{Diag}[\sigma_\epsilon^2, \sigma_v^2, \sigma_v^2]$$

The distribution of the initial state vector α_1 is proper, with $P_* = \text{Diag}[\sigma_\epsilon^2, \sigma_\psi^2, \sigma_\psi^2]$, where $\sigma_\psi^2 = \sigma_v^2(1 - \rho^2)^{-1}$. The parameter vector $\theta = (\sigma_\epsilon^2, \rho, \lambda, \sigma_v^2)$.

An autoregression r_t can be considered as a special case of cycle with frequency λ equal to 0 or π . In this case the equation for ψ_t^* is not needed. Therefore, for a UCM consisting of an autoregressive component and an irregular component, the state space model simplifies to the following form.

The state vector $\alpha_t = [\epsilon_t r_t]'$, and the state noise vector $\zeta_t = [\epsilon_t v_t]'$. The system matrices are

$$Z = [1 \ 1], \quad T = \begin{bmatrix} 0 & 0 \\ 0 & \rho \end{bmatrix} \quad \text{and} \quad Q = \text{Diag}[\sigma_\epsilon^2, \sigma_v^2]$$

The distribution of the initial state vector α_1 is proper, with $P_* = \text{Diag}[\sigma_\epsilon^2, \sigma_r^2]$, where $\sigma_r^2 = \sigma_v^2(1 - \rho^2)^{-1}$. The parameter vector $\theta = (\sigma_\epsilon^2, \rho, \sigma_v^2)$.

Incorporating Predictors of Different Kinds

In the UCM procedure, predictors can be incorporated in a UCM in a variety of ways: simple time-invariant linear predictors are specified in the **MODEL** statement, predictors with time-varying coefficients can be specified in the **RANDOMREG** statement, and predictors that have a nonlinear relationship with the response variable can be specified in the **SPLINEREG** statement. As with earlier examples, how to obtain a state space form of a UCM consisting of such variety of predictors is illustrated using a simple special case. Consider a random walk trend model with predictors x , u_1 , u_2 , and v . Let us assume that x is a simple regressor specified in the **MODEL** statement, u_1 and u_2 are random regressors with time-varying regression coefficients that are specified in the same **RANDOMREG** statement, and v is a nonlinear regressor specified on a **SPLINEREG** statement. Let us further assume that the spline associated with v has degree one and is based on two internal knots. As explained in the section “**SPLINEREG Statement**” on page 2141, using v is equivalent to using $(nknots + degree) = (2 + 1) = 3$ derived (random) regressors: say, s_1, s_2, s_3 . In all there are $(1 + 2 + 3) = 6$ regressors, the first one being a simple regressor and the others being time-varying coefficient regressors. The time-varying regressors are in two groups, the first consisting of u_1 and u_2 and

the other consisting of s_1 , s_2 , and s_3 . The dynamics of this model are as follows:

$$\begin{aligned}
 y_t &= \mu_t + \beta x_t + \kappa_{1t} u_{1t} + \kappa_{2t} u_{2t} + \sum_{i=1}^3 \gamma_{it} s_{it} + \epsilon_t \\
 \mu_t &= \mu_{t-1} + \eta_t \\
 \kappa_{1t} &= \kappa_{1(t-1)} + \xi_{1t} \\
 \kappa_{2t} &= \kappa_{2(t-1)} + \xi_{2t} \\
 \gamma_{1t} &= \gamma_{1(t-1)} + \zeta_{1t} \\
 \gamma_{2t} &= \gamma_{2(t-1)} + \zeta_{2t} \\
 \gamma_{3t} &= \gamma_{3(t-1)} + \zeta_{3t}
 \end{aligned}$$

All the disturbances ϵ_t , η_t , ξ_{1t} , ξ_{2t} , ζ_{1t} , ζ_{2t} , and ζ_{3t} are independent, zero-mean, Gaussian variables, where ξ_{1t} , ξ_{2t} share a common variance parameter σ_ξ^2 and ζ_{1t} , ζ_{2t} , ζ_{3t} share a common variance σ_ζ^2 . These dynamics can be captured in the state space form by taking state $\alpha_t = [\epsilon_t \mu_t \beta \kappa_{1t} \kappa_{2t} \gamma_{1t} \gamma_{2t} \gamma_{3t}]'$, state disturbance $\zeta_t = [\epsilon_t \eta_t 0 \xi_{1t} \xi_{2t} \zeta_{1t} \zeta_{2t} \zeta_{3t}]'$, and the system matrices

$$\begin{aligned}
 Z_t &= [1 \ 1 \ x_t \ u_{1t} \ u_{2t} \ s_{1t} \ s_{2t} \ s_{3t}] \\
 T &= \text{Diag}[0, 1, 1, 1, 1, 1, 1, 1] \\
 Q &= \text{Diag}[\sigma_\epsilon^2, \sigma_\eta^2, 0, \sigma_\xi^2, \sigma_\xi^2, \sigma_\zeta^2, \sigma_\zeta^2, \sigma_\zeta^2]
 \end{aligned}$$

Note that the regression coefficients are elements of the state vector and that the system vector Z_t is not time invariant. The distribution of the initial state vector α_1 is diffuse, with $P_* = \text{Diag}[\sigma_\epsilon^2, 0, 0, 0, 0, 0, 0, 0]$ and $P_\infty = \text{Diag}[0, 1, 1, 1, 1, 1, 1, 1]$. The parameters of this model are the disturbance variances, σ_ϵ^2 , σ_η^2 , σ_ξ^2 , and σ_ζ^2 , which get estimated by maximizing the likelihood. The regression coefficients, time-invariant β and time-varying κ_{1t} , κ_{2t} , γ_{1t} , γ_{2t} and γ_{3t} , get implicitly estimated during the state estimation (smoothing).

Reporting Parameter Estimates for Random Regressors

If the random walk disturbance variance associated with a random regressor is held fixed at zero, then its coefficient is no longer time-varying. In the UCM procedure the random regressor parameter estimates are reported differently if the random walk disturbance variance associated with a random regressor is held fixed at zero. The following points explain how the parameter estimates are reported in the parameter estimates table and in the OUTEST= data set.

- If the random walk disturbance variance associated with a random regressor is not held fixed, then its estimate is reported in the parameter estimates table and in the OUTEST= data set.
- If more than one random regressor is specified in a **RANDOMREG** statement, then the first regressor in the list is used as a representative of the list while reporting the corresponding common variance parameter estimate.
- If the random walk disturbance variance is held fixed at zero, then the parameter estimates table and the OUTEST= data set contain the corresponding regression parameter estimate rather than the variance parameter estimate.

- Similar considerations apply in the case of the derived random regressors associated with a spline-regressor.

ARMA Irregular Component

The state space form for the irregular component that follows an $\text{ARMA}(p,q) \times (P,Q)_s$ model is described in this section. The notation for ARMA models is explained in the **IRREGULAR** statement. A number of alternate state space forms are possible in this case; the one given here is based on Jones (1980). With slight abuse of notation, let $p = p + sP$ denote the effective autoregressive order and $q = q + sQ$ denote the effective moving average order of the model. Similarly, let ϕ be the effective autoregressive polynomial and θ be the effective moving average polynomial in the backshift operator with coefficients ϕ_1, \dots, ϕ_p and $\theta_1, \dots, \theta_q$, obtained by multiplying the respective nonseasonal and seasonal factors. Then, a random sequence ϵ_t that follows an $\text{ARMA}(p,q) \times (P,Q)_s$ model with a white noise sequence a_t has a state space form with state vector of size $m = \max(p, q + 1)$. The system matrices, which are time invariant, are as follows: $Z = [1 \ 0 \ \dots \ 0]$. The state transition matrix T , in a blocked form, is given by

$$T = \begin{bmatrix} 0 & I_{m-1} \\ \phi_m & \dots & \phi_1 \end{bmatrix}$$

where $\phi_i = 0$ if $i > p$ and I_{m-1} is an $(m - 1)$ dimensional identity matrix. The covariance of the state disturbance matrix $Q = \sigma^2 \psi \psi'$ where σ^2 is the variance of the white noise sequence a_t and the vector $\psi = [\psi_0 \dots \psi_{m-1}]'$ contains the first m values of the impulse response function—that is, the first m coefficients in the expansion of the ratio θ/ϕ . Since ϵ_t is a stationary sequence, the initial state is nondiffuse and $P_\infty = 0$. The description of P_* , the covariance matrix of the initial state, is a little involved; the details are given in Jones (1980).

Models with Dependent Lags

The state space form of a UCM consisting of the lags of the dependent variable is quite different from the state space forms considered so far. Let us consider an example to illustrate this situation. Consider a model that has random walk trend, two simple time-invariant regressors, and that also includes a few—say, k —lags of the dependent variable. That is,

$$\begin{aligned} y_t &= \sum_{i=1}^k \phi_i y_{t-i} + \mu_t + \beta_1 x_{1t} + \beta_2 x_{2t} + \epsilon_t \\ \mu_t &= \mu_{t-1} + \eta_t \end{aligned}$$

The state space form of this augmented model can be described in terms of the state space form of a model that has random walk trend with two simple time-invariant regressors. A superscript dagger (\dagger) has been added to distinguish the augmented model state space entities from the corresponding entities of the state space form of the random walk with predictors model. With this notation, the state vector of the augmented model $\alpha_t^\dagger = [\alpha_t' \ y_t \ y_{t-1} \ \dots \ y_{t-k+1}]'$ and the new state noise vector $\zeta_t^\dagger = [\zeta_t' \ u_t \ 0 \ \dots \ 0]'$, where u_t is the matrix product $Z_t \zeta_t$. Note that the length of the new state vector is $k + \text{length}(\alpha_t) = k + 4$. The new

system matrices, in block form, are

$$Z_t^\dagger = [0 \ 0 \ 0 \ 0 \ 1 \ \dots \ 0], \quad T_t^\dagger = \begin{bmatrix} T_t & 0 & \dots & 0 \\ Z_{t+1}T_t & \phi_1 & \dots & \phi_k \\ 0 & I_{k-1,k-1} & & 0 \end{bmatrix}$$

where $I_{k-1,k-1}$ is the $k - 1$ dimensional identity matrix and

$$Q_t^\dagger = \begin{bmatrix} Q_t & Q_t Z_t' & 0 \\ Z_t Q_t & Z_t Q_t Z_t' & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

Note that the T and Q matrices of the random walk with predictors model are time invariant, and in the expressions above their time indices are kept because they illustrate the pattern for more general models. The initial state vector is diffuse, with

$$P_*^\dagger = \begin{bmatrix} P_* & 0 \\ 0 & 0 \end{bmatrix}, \quad P_\infty^\dagger = \begin{bmatrix} P_\infty & 0 \\ 0 & I_{k,k} \end{bmatrix}$$

The parameters of this model are the disturbance variances σ_ϵ^2 and σ_η^2 , the lag coefficients $\phi_1, \phi_2, \dots, \phi_k$, and the regression coefficients β_1 and β_2 . As before, the regression coefficients get estimated during the state smoothing, and the other parameters are estimated by maximizing the likelihood.

Outlier Detection

In time series analysis it is often useful to detect changes over time in the characteristics of the response series. In the UCM procedure you can search for two types of changes, additive outliers (AO) and level shifts (LS). An additive outlier is an unusual value in the series, the cause of which might be a data recording error or a temporary shock to the series generation process. A level shift represents a permanent shift, either up or down, in the level of the series. You can control different aspects of the outlier search, such as the significance level of the reported outliers, by choosing different options in the **OUTLIER** statement. The search for AOs is done by default, whereas the **CHECKBREAK** option in the **LEVEL** statement must be used to turn on the search for LSs.

The outlier detection process implemented in the UCM procedure is based on de Jong and Penzer (1998). In this approach the fitted model is taken to be the *null* model, and the series values and level shifts that are not adequately accounted for by the null model are flagged as outliers. The unusualness of a response series value at a particular time point t_0 , with respect to the fitted model, can be judged by estimating its value based on the rest of the data (that is, the series obtained by *deleting* the series value at t_0) and comparing the estimated value to the observed value. If the difference between the estimated and observed values is statistically significant, then such value can be regarded as an AO. Note that this difference between the estimated and observed values is also the regression coefficient of a *dummy* regressor that takes the value 1.0 at t_0 and is 0.0 elsewhere, assuming such a regressor is added to the null model. In this way the series value at t_0 is regarded as AO if the regression coefficient of this dummy regressor is significant. Similarly, you can say that a level shift has occurred at a time point t_0 if the regression coefficient of a regressor, which is 0.0 before t_0 and 1.0 at t_0 and thereafter, is statistically significant. De Jong and Penzer (1998) provide an efficient way to compute such AO and LS regression coefficients and their standard errors at all time points in the series. The outlier summary table, which is produced by default, simply lists the most statistically significant candidates among these.

Missing Values

Embedded missing values in the dependent variable usually cause no problems in UCM modeling. However, no embedded missing values are allowed in the predictor variables. Certain patterns of missing values in the dependent variable can lead to failure of the initialization step of the diffuse Kalman filtering for some models. For example, if in a monthly series all values are missing for a certain month—say, May—then a BSM with monthly seasonality leads to such a situation. However, in this case the initialization step can complete successfully for a nonseasonal model such as local linear model.

Parameter Estimation

The parameter vector in a UCM consists of the variances of the disturbance terms of the unobserved components, the damping coefficients and frequencies in the cycles, the damping coefficient in the autoregression, the lag coefficients of the dependent lags, and the regression coefficients in the regression terms. The regression coefficients are always part of the state vector and are estimated by state smoothing. The remaining parameters are estimated by maximizing either the full diffuse likelihood or the nondiffuse likelihood. The decision to use the full diffuse likelihood or the nondiffuse likelihood depends on the presence or absence of the dependent lag coefficients in the parameter vector. If the parameter vector does not contain any dependent lag coefficients, then the full diffuse likelihood is used. If, on the other hand, the parameter vector does contain some dependent lag coefficients, then the parameters are estimated by maximizing the nondiffuse likelihood. The optimization of the full diffuse likelihood is often unstable when the parameter vector contains dependent lag coefficients. In this sense, when the parameter vector contains dependent lag coefficients, the parameter estimates are not true maximum likelihood estimates.

The optimization of the likelihood, either full or nondiffuse, is carried out using one of several nonlinear optimization algorithms. The user can control many aspects of the optimization process by using the **NLOPTIONS** statement and by providing the starting values of the parameters while specifying the corresponding components. However, in most cases the default settings work quite well. The optimization process is not guaranteed to converge to a maximum likelihood estimate. In most cases the difficulties in parameter estimation are associated with the specification of a model that is not appropriate for the series being modeled.

Parameter Estimation by Profile Likelihood Optimization

If a disturbance variance, such as the disturbance variance of the irregular component, is a part of the UCM and is a free parameter, then it can be profiled out of the likelihood. This means solving analytically for its optimum and plugging this expression back into the likelihood formula, giving rise to the so-called *profile* likelihood. The expression of the profile likelihood and the MLE of the profiled variance are given earlier in the section “[The UCMs as State Space Models](#)” on page 2150, where the computation of the likelihood of the state space model is also discussed.

In some situations the optimization of the profile likelihood can be more efficient because the number of parameters to optimize is reduced by one; however, for a variety of reasons such gains might not always be observed. Moreover, in theory the estimates obtained by optimizing the profile likelihood and the usual

likelihood should be the same, but in practice this might not hold because of numerical rounding and other conditions.

In the UCM procedure, by default the usual likelihood is optimized if any of the disturbance variance parameters is held fixed to a nonzero value by using the NOEST option in the corresponding component statement. In other cases the decision whether to optimize the profile likelihood or the usual likelihood is based on several factors that are difficult to document. You can choose which likelihood to optimize during parameter estimation by specifying the **PROFILE** option for the profile likelihood optimization or the **NOPROFILE** option for the usual likelihood optimization. In the presence of the **PROFILE** option, the disturbance variance to profile is checked in a specific order, so that if the irregular component disturbance variance is free then it is always chosen. The situation in other cases is more complicated.

Profiling in the Presence of Fixed Variance Parameters

Note that when the parameter estimation is done by optimizing the profile likelihood, the interpretation of the variance parameters that are held fixed to nonzero values changes. In the presence of the **PROFILE** option, the disturbance variances that are held at a fixed value by using the NOEST option in their respective component statements are interpreted as being restricted to be that fixed multiple of the profiled variance rather than being fixed at that nominal value. That is, implicitly, the parameter estimation is done under the restriction of holding the disturbance variance *ratio* fixed at a given value rather than the disturbance variance itself. See [Example 34.5](#) for an example of this type of restriction to obtain a UC model that is equivalent to the famous Hodrick-Prescott filter.

***t* values**

The *t* values reported in the table of parameter estimates are approximations whose accuracy depends on the validity of the model, the nature of the model, and the length of the observed series. The distributional properties of the maximum likelihood estimates of general unobserved components models have not been explored fully; therefore the probability values that correspond to a *t* distribution should be interpreted carefully, as they can be misleading. This is particularly true if the parameters in question are close to the boundary of the parameter space. The two sources by Harvey (1989, 2001) are good references for information about this topic. For some parameters, such as, the cycle period, the reported *t* values are uninformative because comparison of the estimated parameter with zero is never needed. In such cases the *t* values and the corresponding probability values should be ignored.

Computational Issues

Convergence Problems

As explained in the section “[Parameter Estimation](#)” on page 2160, the model parameters are estimated by nonlinear optimization of the likelihood. This process is not guaranteed to succeed. For some data sets, the optimization algorithm can fail to converge. Nonconvergence can result from a number of causes, including flat or ridged likelihood surfaces and ill-conditioned data. It is also possible for the algorithm to converge to a point that is not the global optimum of the likelihood.

If you experience convergence problems, the following points might be helpful:

- Data that are extremely large or extremely small can adversely affect results because of the internal tolerances used during the filtering steps of the likelihood calculation. Rescaling the data can improve stability.
- Examine your model for redundancies in the included components and regressors. If some of the included components or regressors are nearly collinear to each other, then the optimization process can become unstable.
- Experimenting with different options offered by the `NLOPTIONS` statement can help.
- Lack of convergence can indicate model misspecification or a violation of the normality assumption.

Computer Resource Requirements

The computing resources required for the UCM procedure depend on several factors. The memory requirement for the procedure is largely dependent on the number of observations to be processed and the size of the state vector underlying the specified model. If n denotes the sample size and m denotes the size of the state vector, the memory requirement for the smoothing stage of the Kalman filter is of the order of $6 \times 8 \times n \times m^2$ bytes, ignoring the lower-order terms. If the smoothed component estimates are not needed then the memory requirement is of the order of $6 \times 8 \times (m^2 + n)$ bytes. Besides m and n , the computing time for the parameter estimation depends on the type of components included in the model. For example, the parameter estimation is usually faster if the model parameter vector consists only of disturbance variances, because in this case there is an efficient way to compute the likelihood gradient.

Displayed Output

The default printed output produced by the UCM procedure is described in the following list:

- brief information about the input data set, including the data set name and label, and the name of the ID variable specified in the ID statement
- summary statistics for the data in the estimation and forecast spans, including the names of the variables in the model, their categorization as dependent or predictor, the index of the beginning and ending observations in the spans, the total number of observations and the number of missing observations, the smallest and largest measurements, and the mean and standard deviation
- information about the model parameters at the start of the model-fitting stage, including the fixed parameters in the model and the initial estimates of the free parameters in the model
- convergence status of the likelihood optimization process if any parameter estimation is done
- estimates of the free parameters at the end of the model fitting-stage, including the parameter estimates, their approximate standard errors, t statistics, and the approximate p -value

- the likelihood-based goodness-of-fit statistics, including the full likelihood, the portion of the likelihood corresponding to the diffuse initialization, the sum of squares of residuals normalized by their standard errors, and the information criteria: AIC, AICC, HQIC, BIC, and CAIC
- the fit statistics that are based on the raw residuals (observed minus predicted), including the mean squared error (MSE), the root mean squared error (RMSE), the mean absolute percentage error (MAPE), the maximum percentage error (MAXPE), the R square, the adjusted R square, the random walk R square, and Amemiya's R square
- the significance analysis of the components included in the model that is based on the estimation span
- brief information about the components included in the model
- additive outliers in the series, if any are detected
- the multistep series forecasts
- post-sample-prediction analysis table that compares the multistep forecasts with the observed series values, if the BACK= option is used in the FORECAST statement

Statistical Graphics

Statistical procedures use ODS Graphics to create graphs as part of their output. ODS Graphics is described in detail in Chapter 21, “[Statistical Graphics Using ODS](#)” (*SAS/STAT User's Guide*).

Before you create graphs, ODS Graphics must be enabled (for example, with the ODS GRAPHICS ON statement). For more information about enabling and disabling ODS Graphics, see the section “Enabling and Disabling ODS Graphics” in that chapter.

The overall appearance of graphs is controlled by ODS styles. Styles and other aspects of using ODS Graphics are discussed in the section “A Primer on ODS Statistical Graphics” in that chapter.

This section provides information about the basic ODS statistical graphics produced by the UCM procedure.

You can obtain most plots relevant to the specified model by using the global **PLOTS=** option in the PROC UCM statement. The plot of series forecasts in the forecast horizon is produced by default. You can further control the production of individual plots by using the **PLOT=** options in the different statements.

The main types of plots available are as follows:

- Time series plots of the component estimates, either filtered or smoothed, can be requested by using the **PLOT=** option in the respective component statements. For example, the use of **PLOT=SMOOTH** option in a CYCLE statement produces a plot of smoothed estimate of that cycle.
- Residual plots for model diagnostics can be obtained by using the **PLOT=** option in the ESTIMATE statement.
- Plots of series forecasts and model decompositions can be obtained by using the **PLOT=** option in the FORECAST statement.

The following example is a simple illustration of the available plot options.

Analysis of Sunspot Data: Illustration of ODS Graphics

In this example a well-known series, Wolfer's sunspot data (Anderson 1971), is considered. The data consist of yearly sunspot numbers recorded from 1749 to 1924. These sunspot numbers are known to have a cyclical pattern with a period of about eleven years. The following DATA step creates the input data set:

```
data sunspot;
    input year wolfer @@;
    year = mdy(1,1, year);
    format year year4.;
datalines;
1749  809 1750  834 1751  477 1752  478 1753  307 1754  122 1755   96
1756  102 1757  324 1758  476 1759  540 1760  629 1761  859 1762  612

... more lines ...
```

The following statements specify a UCM that includes a cycle component and a random walk trend component:

```
proc ucm data=sunspot;
    id year interval=year;
    model wolfer;
    irregular;
        level ;
    cycle plot=(filter smooth);
    estimate back=24 plot=(loess panel cusum wn);
    forecast back=24 lead=24 plot=(forecasts decomp);
run;
```

The following subsections explain the graphics produced by the above statements.

Component Plots

The plots in Figure 34.8 and Figure 34.9, produced by specifying PLOT=(FILTER SMOOTH) in the CYCLE statement, show the filtered and smoothed estimates, respectively, of the cycle component in the model. Note that the smoothed estimate appears smoother than the filtered estimate. This is always true because the filtered estimate of a component at time t is based on the observations prior to time t —that is, it uses measurements from the first observation up to the $(t - 1)$ th observation. On the other hand, the corresponding smoothed estimate uses all the available observations—that is, all the measurements from the first observation to the last. This makes the smoothed estimate of the component more precise than the filtered estimate for the time points within historical period. In the forecast horizon, both filtered and smoothed estimates are identical, being based on the same set of observations.

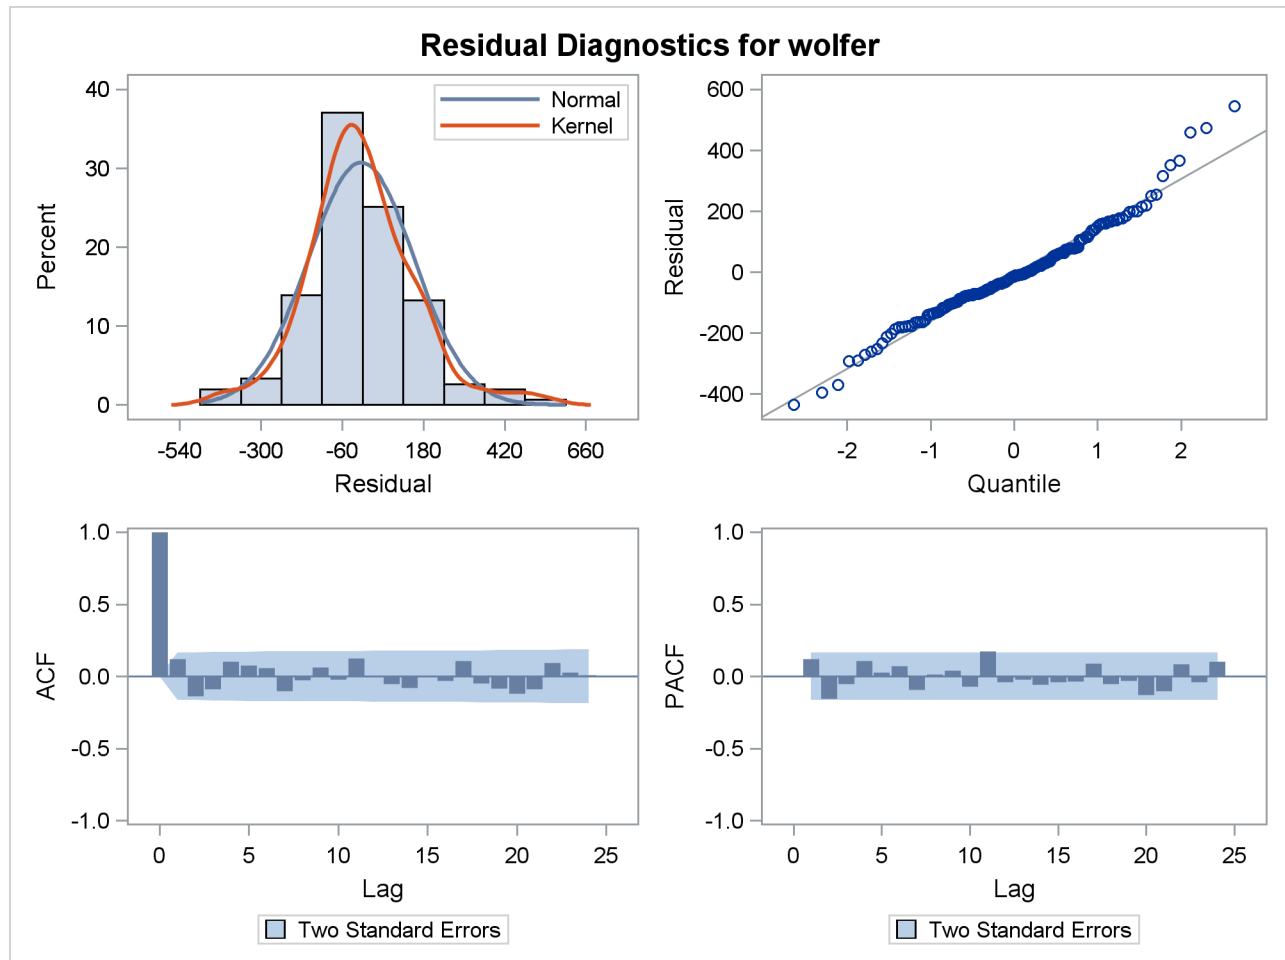

Figure 34.8 Sunspots Series: Filtered Cycle

Figure 34.9 Sunspots Series: Smoothed Cycle

Residual Diagnostics

If the fitted model is appropriate for the given data, then the corresponding one-step-ahead residuals should be approximately *white*—that is, uncorrelated—and approximately normal. Moreover, the residuals should not display any discernible pattern. You can detect departures from these conditions graphically. Different residual diagnostic plots can be requested by using the `PLOT=` option in the `ESTIMATE` statement.

The normality can be checked by examining the histogram and the normal quantile plot of residuals. The whiteness can be checked by examining the ACF and PACF plots that show the sample autocorrelation and sample partial-autocorrelation at different lags. The diagnostic panel shown in Figure 34.10, produced by specifying `PLOT=``PANEL`, contains these four plots.

Figure 34.10 Sunspots Series: Residual Diagnostics

The residual histogram and Q-Q plot show no serious violation of normality. The histogram appears reasonably symmetric and follows the overlaid normal density curve reasonably closely. Similarly in the Q-Q plot the residuals follow the reference line fairly closely. The ACF and PACF plots also do not exhibit any violation of the whiteness assumption; the correlations at all nonzero lags seem to be insignificant.

The residual whiteness can also be formally tested by using the Ljung-Box portmanteau test. The plot in [Figure 34.11](#), produced by specifying `PLOT=WN`, shows the p -values of the Ljung-Box test statistics at different lags. In these plots the p -values for the first few lags, equal to the number of estimated parameters in the model, are not shown because they are always missing. This portion of the plot is shaded blue to indicate this fact. In the case of this model, five parameters are estimated so the p -values for the first five lags are not shown. The p -values are displayed on a log scale in such a way that higher bars imply more extreme test statistics. In this plot some early p -values appear extreme. However, these p -values are based on large sample theory, which suggests that these statistics should be examined for lags larger than the square root of sample size. In this example it means that the p -values for the first $\sqrt{154} \approx 12$ lags can be ignored. With this consideration, the plot shows no violation of whiteness since the p -values after the 12th lag do not appear extreme.

Figure 34.11 Sunspots Series: Ljung-Box Portmanteau Test

The plot in [Figure 34.12](#), produced by specifying PLOT=LOESS, shows the residuals plotted against time with an overlaid LOESS curve. This plot is useful for checking whether any discernible pattern remains in the residuals. Here again, no significant pattern appears to be present.

Figure 34.12 Sunspots Series: Residual Loess Plot

The plot in [Figure 34.13](#), produced by specifying `PLOT=CUSUM`, shows the cumulative residuals plotted against time. This plot is useful for checking structural breaks. Here, there appears to be no evidence of structural break since the cumulative residuals remain within the confidence band throughout the sample period. Similarly you can request a plot of the squared cumulative residuals by specifying `PLOT=CUSUMSQ`.

Figure 34.13 Sunspots Series: CUSUM Plot

Brockwell and Davis (1991) can be consulted for additional information on diagnosing residuals. For more information on CUSUM and CUSUMSQ plots, you can consult Harvey (1989).

Forecast and Series Decomposition Plots

You can use the PLOT= option in the FORECAST statement to obtain the series forecast plot and the series decomposition plots. The series decomposition plots show the result of successively adding different components in the model starting with the trend component. The IRREGULAR component is left out of this process. The following two plots, produced by specifying PLOT=DECOMP, show the results of successive component addition for this example. The first plot, shown in Figure 34.14, shows the smoothed trend component and the second plot, shown in Figure 34.15, shows the sum of smoothed trend and cycle.

Figure 34.14 Sunspots Series: Smoothed Trend

Figure 34.15 Sunspots Series: Smoothed Trend plus Cycle

Finally, Figure 34.16 shows the forecast plot.

Figure 34.16 Sunspots Series: Series Forecasts

ODS Table Names

The UCM procedure assigns a name to each table it creates. You can use these names to reference the table when using the Output Delivery System (ODS) to select tables and create output data sets. These names are listed in [Table 34.2](#).

Table 34.2 ODS Tables Produced by PROC UCM

ODS Table Name	Description	Statement	Option
Tables Summarizing the Estimation and Forecast Spans			
EstimationSpan	Estimation span summary information		default
ForecastSpan	Forecast span summary information		default

Table 34.2 *continued*

ODS Table Name	Description	Statement	Option
Tables Related to Model Parameters			
ConvergenceStatus	Convergence status of the estimation process		default
FixedParameters	Fixed parameters in the model		default
InitialParameters	Initial estimates of the free parameters		default
ParameterEstimates	Final estimates of the free parameters		default
Tables Related to Model Information and Diagnostics			
BlockSeasonDescription	Information about the block seasonals in the model		default
ComponentSignificance	Significance analysis of the components in the model		default
CycleDescription	Information about the cycles in the model		default
FitStatistics	Fit statistics based on the one-step-ahead predictions		default
FitSummary	Likelihood-based fit statistics		default
OutlierSummary	Summary table of the detected outliers		default
SeasonDescription	Information about the seasonals in the model		default
SeasonHarmonics	Summary of harmonics in a trigonometric seasonal component	SEASON	PRINT=HARMONICS
SplineSeasonDescription	Information about the spline-seasonals in the model		default
TrendInformation	Summary information of the level and slope components		default
Tables Related to Filtered Component Estimates			
FilteredAutoReg	Filtered estimate of an autoreg component	AUTOREG	PRINT=FILTER
FilteredBlockSeason	Filtered estimate of a block seasonal component	BLOCKSEASON	PRINT=FILTER
FilteredCycle	Filtered estimate of a cycle component	CYCLE	PRINT=FILTER
FilteredIrregular	Filtered estimate of the irregular component	IRREGULAR	PRINT=FILTER
FilteredLevel	Filtered estimate of the level component	LEVEL	PRINT=FILTER

Table 34.2 *continued*

ODS Table Name	Description	Statement	Option
FilteredRandomReg	Filtered estimate of the time-varying random-regression coefficient	RANDOMREG	PRINT=FILTER
FilteredSeason	Filtered estimate of a seasonal component	SEASON	PRINT=FILTER
FilteredSlope	Filtered estimate of the slope component	SLOPE	PRINT=FILTER
FilteredSplineReg	Filtered estimate of the time-varying spline-regression coefficient	SPLINEREG	PRINT=FILTER
FilteredSplineSeason	Filtered estimate of a spline-seasonal component	SPLINESEASON	PRINT=FILTER
Tables Related to Smoothed Component Estimates			
SmoothedAutoReg	Smoothed estimate of an autoreg component	AUTOREG	PRINT=SMOOTH
SmoothedBlockSeason	Smoothed estimate of a block seasonal component	BLOCKSEASON	PRINT=SMOOTH
SmoothedCycle	Smoothed estimate of the cycle component	CYCLE	PRINT=SMOOTH
SmoothedIrregular	Smoothed estimate of the irregular component	IRREGULAR	PRINT=SMOOTH
SmoothedLevel	Smoothed estimate of the level component	LEVEL	PRINT=SMOOTH
SmoothedRandomReg	Smoothed estimate of the time-varying random-regression coefficient	RANDOMREG	PRINT=SMOOTH
SmoothedSeason	Smoothed estimate of a seasonal component	SEASON	PRINT=SMOOTH
SmoothedSlope	Smoothed estimate of the slope component	SLOPE	PRINT=SMOOTH
SmoothedSplineReg	Smoothed estimate of the time-varying spline-regression coefficient	SPLINEREG	PRINT=SMOOTH
SmoothedSplineSeason	Smoothed estimate of a spline-seasonal component	SPLINESEASON	PRINT=SMOOTH
Tables Related to Series Decomposition and Forecasting			
FilteredAllExceptIrreg	Filtered estimate of sum of all components except the irregular component	FORECAST	PRINT=FDECOMP
FilteredTrend	Filtered estimate of trend	FORECAST	PRINT= FDECOMP
FilteredTrendReg	Filtered estimate of trend plus regression	FORECAST	PRINT=FDECOMP

Table 34.2 *continued*

ODS Table Name	Description	Statement	Option
FilteredTrendRegCyc	Filtered estimate of trend plus regression plus cycles and autoreg	FORECAST	PRINT=FDECOMP
Forecasts	Dependent series forecasts		default
PostSamplePrediction	Forecasting performance in the holdout period	FORECAST	BACK=
SmoothedAllExceptIrreg	Smoothed estimate of sum of all components except the irregular component	FORECAST	PRINT=DECOMP
SmoothedTrend	Smoothed estimate of trend	FORECAST	PRINT= DECOMP
SmoothedTrendReg	Smoothed estimate of trend plus regression	FORECAST	PRINT=DECOMP
SmoothedTrendRegCyc	Smoothed estimate of trend plus regression plus cycles and autoreg	FORECAST	PRINT=DECOMP

NOTE: The tables are related to a single series within a BY group. In the case of models that contain multiple cycles, seasonal components, or block seasonal components, the corresponding component estimate tables are sequentially numbered. For example, if a model contains two cycles and a seasonal component and the PRINT=SMOOTH option is used for each of them, the ODS tables containing the smoothed estimates will be named SmoothedCycle1, SmoothedCycle2, and SmoothedSeason. Note that the seasonal table is not numbered because there is only one seasonal component.

ODS Graph Names

Statistical procedures use ODS Graphics to create graphs as part of their output. ODS Graphics is described in detail in Chapter 21, “[Statistical Graphics Using ODS](#)” (*SAS/STAT User’s Guide*).

Before you create graphs, ODS Graphics must be enabled (for example, with the ODS GRAPHICS ON statement). For more information about enabling and disabling ODS Graphics, see the section “Enabling and Disabling ODS Graphics” in that chapter.

The overall appearance of graphs is controlled by ODS styles. Styles and other aspects of using ODS Graphics are discussed in the section “A Primer on ODS Statistical Graphics” in that chapter.

You can reference every graph produced through ODS Graphics with a name. The names of the graphs that PROC UCM generates are listed in [Table 34.3](#), along with the required statements and options.

Table 34.3 ODS Graphics Produced by PROC UCM

ODS Graph Name	Description	Statement	Option
Plots Related to Residual Analysis			
ErrorACFPlot	Prediction error autocorrelation plot	ESTIMATE	PLOT=ACF
ErrorPACFPlot	Prediction error partial-autocorrelation plot	ESTIMATE	PLOT=PACF
ErrorHistogram	Prediction error histogram	ESTIMATE	PLOT=NORMAL
ErrorQQPlot	Prediction error normal quantile plot	ESTIMATE	PLOT=QQ
ErrorPlot	Plot of prediction errors	ESTIMATE	PLOT=RESIDUAL
ErrorWhiteNoiseLogProbPlot	Plot of p -values at different lags for the Ljung-Box portmanteau white noise test statistics	ESTIMATE	PLOT=WN
CUSUMPlot	Plot of cumulative residuals	ESTIMATE	PLOT=CUSUM

OUTFOR= Data Set

You can use the `OUTFOR=` option in the `FORECAST` statement to store the series and component forecasts produced by the procedure. This data set contains the following columns:

- the BY variables
- the ID variable. If an ID variable is not specified, then a numerical variable, `_ID_`, is created that contains the observation numbers from the input data set.
- the dependent series and the predictor series
- `FORECAST`, a numerical variable containing the one-step-ahead predicted values and the multistep forecasts
- `RESIDUAL`, a numerical variable containing the difference between the actual and forecast values
- `STD`, a numerical variable containing the standard error of prediction
- `LCL` and `UCL`, numerical variables containing the lower and upper forecast confidence limits
- `S_SERIES` and `VS_SERIES`, numerical variables containing the smoothed values of the dependent series and their variances
- `S_IRREG` and `VS_IRREG`, numerical variables containing the smoothed values of the irregular component and their variances. These variables are present only if the model has an irregular component.
- `F_LEVEL`, `VF_LEVEL`, `S_LEVEL`, and `VS_LEVEL`, numerical variables containing the filtered and smoothed values of the level component and the respective variances. These variables are present only if the model has a level component.
- `F_SLOPE`, `VF_SLOPE`, `S_SLOPE`, and `VS_SLOPE`, numerical variables containing the filtered and smoothed values of the slope component and the respective variances. These variables are present only if the model has a slope component.
- `F_AUTOREG`, `VF_AUTOREG`, `S_AUTOREG`, and `VS_AUTOREG`, numerical variables containing the filtered and smoothed values of the autoreg component and the respective variances. These variables are present only if the model has an autoreg component.
- `F_CYCLE`, `VF_CYCLE`, `S_CYCLE`, and `VS_CYCLE`, numerical variables containing the filtered and smoothed values of the cycle component and the respective variances. If there are multiple cycles in the model, these variables are sequentially numbered as `F_CYCLE1`, `F_CYCLE2`, etc. These variables are present only if the model has at least one cycle component.
- `F_SEASON`, `VF_SEASON`, `S_SEASON`, and `VS_SEASON`, numerical variables containing the filtered and smoothed values of the season component and the respective variances. If there are multiple seasons in the model, these variables are sequentially numbered as `F_SEASON1`, `F_SEASON2`, etc. These variables are present only if the model has at least one season component.

- F_BLKSEAS, VF_BLKSEAS, S_BLKSEAS, and VS_BLKSEAS, numerical variables containing the filtered and smoothed values of the blockseason component and the respective variances. If there are multiple block seasons in the model, these variables are sequentially numbered as F_BLKSEAS1, F_BLKSEAS2, etc.
- F_SPLSEAS, VF_SPLSEAS, S_SPLSEAS, and VS_SPLSEAS, numerical variables containing the filtered and smoothed values of the splinesseason component and the respective variances. If there are multiple spline seasons in the model, these variables are sequentially numbered as F_SPLSEAS1, F_SPLSEAS2, etc. These variables are present only if the model has at least one splinesseason component.
- Filtered and smoothed estimates, and their variances, of the time-varying regression coefficients of the variables specified in the RANDOMREG and SPLINEREG statements. A variable is not included if its coefficient is time-invariant, that is, if the associated disturbance variance is zero.
- S_TREG and VS_TREG, numerical variables containing the smoothed values of level plus regression component and their variances. These variables are present only if the model has at least one predictor variable or has dependent lags.
- S_TREGCYC and VS_TREGCYC, numerical variables containing the smoothed values of level plus regression plus cycle component and their variances. These variables are present only if the model has at least one cycle or an autoreg component.
- S_NOIRREG and VS_NOIRREG, numerical variables containing the smoothed values of the sum of all components except the irregular component and their variances. These variables are present only if the model has at least one seasonal or block seasonal component.

OUTEST= Data Set

You can use the OUTEST= option in the ESTIMATE statement to store the model parameters and the related estimation details. This data set contains the following columns:

- the BY variables
- COMPONENT, a character variable containing the name of the component corresponding to the parameter being described
- PARAMETER, a character variable containing the parameter name
- TYPE, a character variable indicating whether the parameter value was fixed by the user or estimated
- _STATUS_, a character variable indicating whether the parameter estimation process converged or failed or there was an error of some other kind
- ESTIMATE, a numerical variable containing the parameter estimate
- STD, a numerical variable containing the standard error of the parameter estimate. This has a missing value if the parameter value is fixed.

- TVALUE, a numerical variable containing the t -statistic. This has a missing value if the parameter value is fixed.
- PVALUE, a numerical variable containing the p -value. This has a missing value if the parameter value is fixed.

Statistics of Fit

This section explains the goodness-of-fit statistics reported to measure how well the specified model fits the data.

First the various statistics of fit that are computed using the prediction errors, $y_t - \hat{y}_t$, are considered. In these formulas, n is the number of nonmissing prediction errors and k is the number of fitted parameters in the model. Moreover, the sum of squared errors, $SSE = \sum (y_t - \hat{y}_t)^2$, and the total sum of squares for the series corrected for the mean, $SST = \sum (y_t - \bar{y})^2$, where \bar{y} is the series mean, and the sums are over all the nonmissing prediction errors.

Mean Squared Error

The mean squared prediction error, $MSE = \frac{1}{n}SSE$

Root Mean Squared Error

The root mean square error, $RMSE = \sqrt{MSE}$

Mean Absolute Percent Error

The mean absolute percent prediction error, $MAPE = \frac{100}{n} \sum_{t=1}^n |(y_t - \hat{y}_t)/y_t|$.

The summation ignores observations where $y_t = 0$.

R-square

The R-square statistic, $R^2 = 1 - SSE/SST$.

If the model fits the series badly, the model error sum of squares, SSE , might be larger than SST and the R-square statistic will be negative.

Adjusted R-square

The adjusted R-square statistic, $1 - (\frac{n-1}{n-k})(1 - R^2)$

Amemiya's Adjusted R-square

Amemiya's adjusted R-square, $1 - (\frac{n+k}{n-k})(1 - R^2)$

Random Walk R-square

The random walk R-square statistic (Harvey's R-square statistic that uses the random walk model for comparison), $1 - (\frac{n-1}{n})SSE/RWSSE$, where $RWSSE = \sum_{t=2}^n (y_t - y_{t-1} - \mu)^2$, and $\mu = \frac{1}{n-1} \sum_{t=2}^n (y_t - y_{t-1})$

Maximum Percent Error

The largest percent prediction error, $100 \max((y_t - \hat{y}_t)/y_t)$. In this computation the observations where $y_t = 0$ are ignored.

The likelihood-based fit statistics are reported separately (see the section “[The UCMs as State Space Models](#)” on page 2150). They include the full log likelihood (L_∞), the diffuse part of the log likelihood, the normalized residual sum of squares, and several information criteria: AIC, AICC, HQIC, BIC, and CAIC. Let q denote the number of estimated parameters, n be the number of nonmissing measurements in the

estimation span, and d be the number of diffuse elements in the initial state vector that are successfully initialized during the Kalman filtering process. Moreover, let $n^* = (n - d)$. The reported information criteria, all in smaller-is-better form, are described in Table 34.4:

Table 34.4 Information Criteria

Criterion	Formula	Reference
AIC	$-2L_\infty + 2q$	Akaike (1974)
AICC	$-2L_\infty + 2qn^*/(n^* - q - 1)$	Hurvich and Tsai (1989) Burnham and Anderson (1998)
HQIC	$-2L_\infty + 2q \log \log(n^*)$	Hannan and Quinn (1979)
BIC	$-2L_\infty + q \log(n^*)$	Schwarz (1978)
CAIC	$-2L_\infty + q(\log(n^*) + 1)$	Bozdogan (1987)

Examples: UCM Procedure

Example 34.1: The Airline Series Revisited

The series in this example, the monthly airline passenger series, has already been discussed earlier; see the section “A Seasonal Series with Linear Trend” on page 2107. Recall that the series consists of monthly numbers of international airline travelers (from January 1949 to December 1960). Here additional output features of the UCM procedure are illustrated, such as how to use the ESTIMATE and FORECAST statements to limit the span of the data used in parameter estimation and forecasting. The following statements fit a BSM to the logarithm of the airline passenger numbers. The disturbance variance for the slope component is held fixed at value 0; that is, the trend is locally linear with constant slope. In order to evaluate the performance of the fitted model on observed data, some of the observed data are withheld during parameter estimation and forecast computations. The observations in the last two years, years 1959 and 1960, are not used in parameter estimation, while the observations in the last year, year 1960, are not used in the forecasting computations. This is done using the BACK= option in the ESTIMATE and FORECAST statements. In addition, a panel of residual diagnostic plots is obtained using the PLOT=PANEL option in the ESTIMATE statement.

```
data seriesG;
  set sashelp.air;
  logair = log(air);
run;
```

```

proc ucm data = seriesG;
  id date interval = month;
  model logair;
  irregular;
  level;
  slope var = 0 noest;
  season length = 12 type=trig;
  estimate back=24 plot=panel;
  forecast back=12 lead=24 print=forecasts;
run;

```

The following tables display the summary of data used in estimation and forecasting ([Output 34.1.1](#) and [Output 34.1.2](#)). These tables provide simple summary statistics for the estimation and forecast spans; they include useful information such as the beginning and ending dates of the span, the number of nonmissing values, etc.

Output 34.1.1 Observation Span Used in Parameter Estimation (partial output)

Variable	Type	First	Last	Nobs	Mean
logair	Dependent	JAN1949	DEC1958	120	5.43035

Output 34.1.2 Observation Span Used in Forecasting (partial output)

Variable	Type	First	Last	Nobs	Mean
logair	Dependent	JAN1949	DEC1959	132	5.48654

The following tables display the fixed parameters in the model, the preliminary estimates of the free parameters, and the final estimates of the free parameters ([Output 34.1.3](#), [Output 34.1.4](#), and [Output 34.1.5](#)).

Output 34.1.3 Fixed Parameters in the Model

The UCM Procedure		
Fixed Parameters in the Model		
Component	Parameter	Value
Slope	Error Variance	0

Output 34.1.4 Starting Values for the Parameters to Be Estimated

Preliminary Estimates of the Free Parameters		
Component	Parameter	Estimate
Irregular	Error Variance	6.64120
Level	Error Variance	2.49045
Season	Error Variance	1.26676

Output 34.1.5 Maximum Likelihood Estimates of the Free Parameters

Final Estimates of the Free Parameters					
Component	Parameter	Estimate	Approx Std Error	t Value	Approx Pr > t
Irregular	Error Variance	0.00018686	0.0001212	1.54	0.1233
Level	Error Variance	0.00040314	0.0001566	2.57	0.0100
Season	Error Variance	0.00000350	1.66319E-6	2.10	0.0354

Two types of goodness-of-fit statistics are reported after a model is fit to the series (see [Output 34.1.6](#) and [Output 34.1.7](#)). The first type is the likelihood-based goodness-of-fit statistics, which include the full likelihood of the data, the diffuse portion of the likelihood (see the section “[Details: UCM Procedure](#)” on page 2144), and the information criteria. The second type of statistics is based on the raw residuals, residual = observed – predicted. If the model is nonstationary, then one-step-ahead predictions are not available for some initial observations, and the number of values used in computing these fit statistics will be different from those used in computing the likelihood-based test statistics.

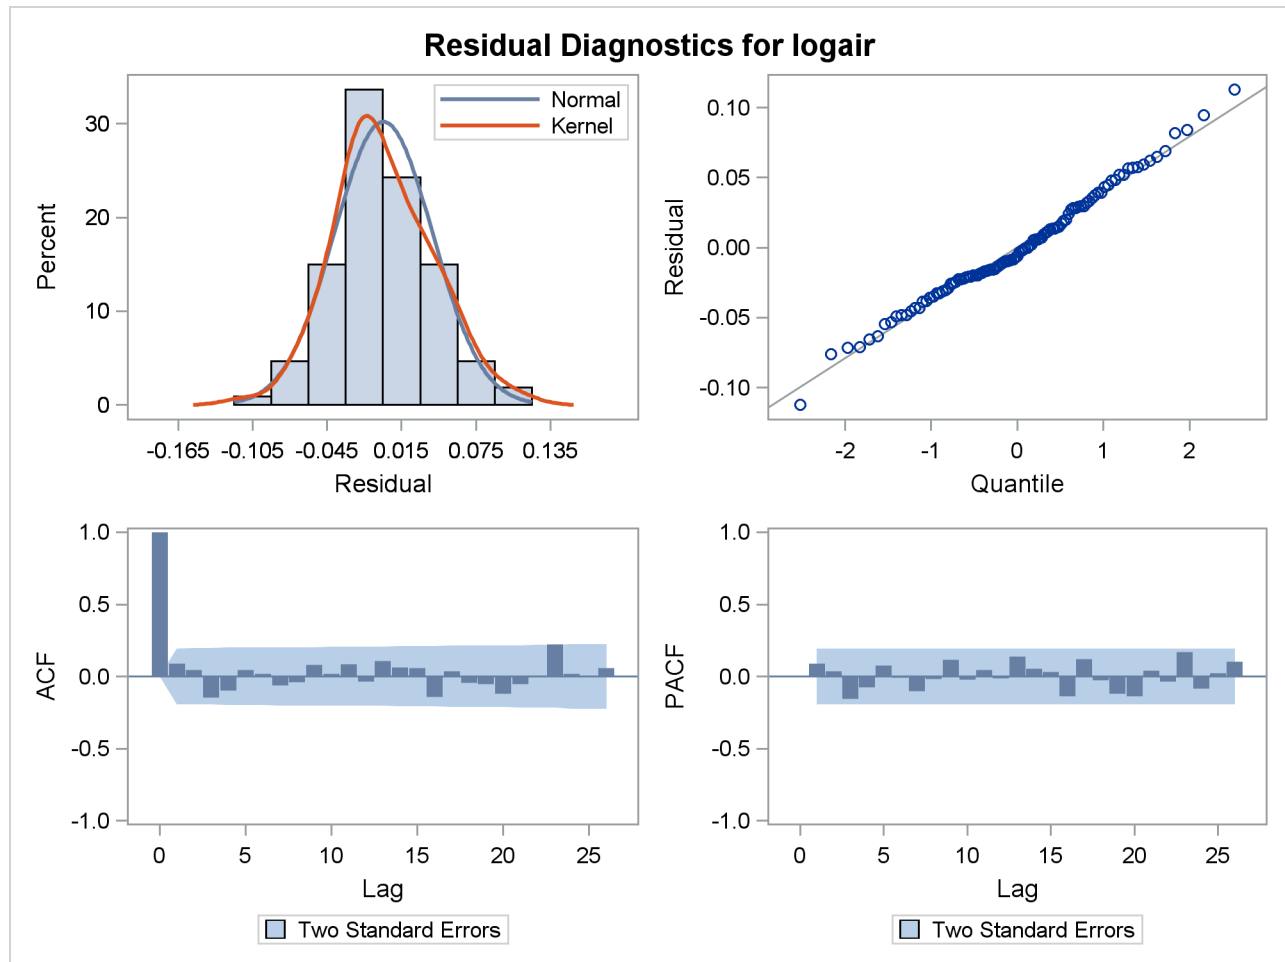

Output 34.1.6 Likelihood-Based Fit Statistics for the Airline Data

Likelihood Based Fit Statistics	
Statistic	Value
Full Log Likelihood	180.63
Diffuse Part of Log Likelihood	-13.93
Non-Missing Observations Used	120
Estimated Parameters	3
Initialized Diffuse State Elements	13
Normalized Residual Sum of Squares	107
AIC (smaller is better)	-355.3
BIC (smaller is better)	-347.2
AICC (smaller is better)	-355
HQIC (smaller is better)	-352
CAIC (smaller is better)	-344.2

Output 34.1.7 Residuals-Based Fit Statistics for the Airline Data

Fit Statistics Based on Residuals	
Mean Squared Error	0.00156
Root Mean Squared Error	0.03944
Mean Absolute Percentage Error	0.57677
Maximum Percent Error	2.19396
R-Square	0.98705
Adjusted R-Square	0.98680
Random Walk R-Square	0.86370
Amemiya's Adjusted R-Square	0.98630
Number of non-missing residuals used for computing the fit statistics = 107	

The diagnostic plots based on the one-step-ahead residuals are shown in [Output 34.1.8](#). The residual histogram and the Q-Q plot show no reasons to question the approximate normality of the residual distribution. The remaining plots check for the *whiteness* of the residuals. The sample correlation plots, the autocorrelation function (ACF) and the partial autocorrelation function (PACF), also do not show any significant violations of the whiteness of the residuals. Therefore, on the whole, the model seems to fit the data well.

Output 34.1.8 Residual Diagnostics for the Airline Series Using a BSM

The forecasts are given in [Output 34.1.9](#). In order to save the space, the upper and lower confidence limit columns are dropped from the output, and only the rows corresponding to the year 1960 are shown. Recall that the actual measurements in the years 1959 and 1960 were withheld during the parameter estimation, and the ones in 1960 were not used in the forecast computations.

Output 34.1.9 Forecasts for the Airline Data

	Obs	date	Forecast	StdErr	logair	Residual
	133	JAN60	6.050	0.038	6.033	-0.017
	134	FEB60	5.996	0.044	5.969	-0.027
	135	MAR60	6.156	0.049	6.038	-0.118
	136	APR60	6.124	0.053	6.133	0.010

	142	OCT60	6.138	0.073	6.133	-0.005
	143	NOV60	6.015	0.075	5.966	-0.049
	144	DEC60	6.121	0.077	6.068	-0.053

The figure [Output 34.1.10](#) shows the forecast plot. The forecasts in the year 1960 show that the model predictions were quite good.

Output 34.1.10 Forecast Plot of the Airline Series Using a BSM

Example 34.2: Variable Star Data

The series in this example is studied in detail in Bloomfield (2000). This series consists of brightness measurements (magnitude) of a variable star taken at midnight for 600 consecutive days. The data can be downloaded from a time series archive maintained by the University of York, England (<http://www.york.ac.uk/depts/maths/data/ts/welcome.htm> (series number 26)). The following DATA step statements read the data in a SAS data set.

```
data star;
  input magnitude @@;
  day = _n_;
datalines;
  25 28 31 32 33 33 32 31 28 25 22 18
  14 10 7 4 2 0 0 0 2 4 8 11
  15 19 23 26 29 32 33 34 33 32 30 27
  24 20 17 13 10 7 5 3 3 3 4 5
  7 10 13 16 19 22 24 26 27 28 29 28
  27 25 24 21 19 17 15 13 12 11 11 10

  ... more lines ...
```

The following statements use the TIMESERIES procedure to get a timeseries plot of the series (see [Output 34.2.1](#)).

```
proc timeseries data=star plot=series;
  var magnitude;
run;
```

Output 34.2.1 Plot of Star Brightness on Successive Days

The plot clearly shows the cyclic nature of the series. Bloomfield shows that the series is very well explained by a model that includes two deterministic cycles that have periods 29.0003 and 24.0001 days, a constant term, and a simple error term. He also mentions the difficulty involved in estimating the periods from the data (see Bloomfield 2000, Chapter 3). In his case the cycle periods are estimated by least squares, and the sum of squares surface has multiple local optima and ridges. The following statements show how to use the UCM procedure to fit this two-cycle model to the series. The constant term in the model is specified by holding the variance parameter of the level component to zero.

```
proc ucm data=star;
  model magnitude;
  irregular;
  level var=0 noest;
  cycle;
  cycle;
  estimate;
run;
```

The final parameter estimates and the goodness-of-fit statistics are shown in [Output 34.2.2](#) and [Output 34.2.3](#), respectively. The model fit appears to be good.

Output 34.2.2 Two-Cycle Model: Parameter Estimates

The UCM Procedure					
Final Estimates of the Free Parameters					
Component	Parameter	Estimate	Approx Std Error	t Value	Approx Pr > t
Irregular	Error Variance	0.09257	0.0053845	17.19	<.0001
Cycle_1	Damping Factor	1.00000	1.81175E-7	5519514	<.0001
Cycle_1	Period	29.00036	0.0022709	12770.4	<.0001
Cycle_1	Error Variance	0.00000882	5.27213E-6	1.67	0.0944
Cycle_2	Damping Factor	1.00000	2.11939E-7	4718334	<.0001
Cycle_2	Period	24.00011	0.0019128	12547.2	<.0001
Cycle_2	Error Variance	0.00000535	3.56374E-6	1.50	0.1330

Output 34.2.3 Two-Cycle Model: Goodness of Fit

Fit Statistics Based on Residuals	
Mean Squared Error	0.12072
Root Mean Squared Error	0.34745
Mean Absolute Percentage Error	2.65141
Maximum Percent Error	36.38991
R-Square	0.99850
Adjusted R-Square	0.99849
Random Walk R-Square	0.97281
Amemiya's Adjusted R-Square	0.99847
Number of non-missing residuals used for computing the fit statistics = 599	

A summary of the cycles in the model is given in [Output 34.2.4](#).

Output 34.2.4 Two-Cycle Model: Summary

Name	Type	period	Rho	ErrorVar
Cycle_1	Stationary	29.00036	1.00000	0.00000882
Cycle_2	Stationary	24.00011	1.00000	0.00000535

Note that the estimated periods are the same as in Bloomfield's model, the damping factors are nearly equal to 1.0, and the disturbance variances are very close to zero, implying persistent deterministic cycles. In fact, this model is identical to Bloomfield's model.

Example 34.3: Modeling Long Seasonal Patterns

This example illustrates some of the techniques you can use to model long seasonal patterns in a series. If the seasonal pattern is of moderate length and the underlying dynamics are simple, then it is easily modeled by using the basic settings of the SEASON statement and these additional techniques are not needed. However, if the seasonal pattern has a long season length and/or has a complex stochastic dynamics, then the techniques discussed here can be useful. You can obtain parsimonious models for a long seasonal pattern by using an appropriate subset of trigonometric harmonics, or by using a suitable spline function, or by using a block-season pattern in combination with a seasonal component of much smaller length. You can also vary the disturbance variances of the subcomponents that combine to form the seasonal component.

The time series used in this example consists of number of calls received per shift at a call center. Each shift is six hours long, and the first shift of the day begins at midnight, resulting in four shifts per day. The observations are available from December 15, 1999, to April 30, 2000. This series is seasonal with season length 28, which is moderate, and in fact there is no particular need to use pattern approximation techniques in this case. However, it is adequate for demonstration purposes. The plan of this example is as follows. First an initial model with a full seasonal component is created. This model is used as a baseline for comparing alternate models created by the techniques that are being illustrated. In practice any candidate model is first checked for adequacy by using various diagnostic procedures. In this illustration the main focus is on the different ways a long seasonal pattern can be modeled and no model diagnostics are done for the models being entertained. The alternate models are compared by using the sum of absolute prediction errors in the holdout region.

The following DATA step statements create the input data set used in this example.

```
data callCenter;
  input calls @@;
  label calls= "Number of Calls Received in a 6 Hour Shift";
  start = '15dec99:00:00'dt;
  datetime = INTNX( 'dthour6', start, _n_-1 );
  format datetime datetime10.;
datalines;
  18    122    244    128    19    113    230    119    17    112
  219    93    14    73    139    53    11    32    74    56
  15    137    289    153    20    125    227    106    16    101

  ... more lines ...
```

Initial exploration of the series clearly indicates that the series does not show any significant trend, and time of day and day of the week have a significant influence on the number of calls received. These considerations suggest a simple random walk trend model along with a seasonal component of season length 28, the total number of shifts in a week. The following statements specify this model. Note the PRINT=HARMONICS option in the SEASON statement, which produces a table that lists the full set of harmonics contributing to the seasonal along with the significance of their contribution. This table will be useful later in choosing a subset trigonometric model. The BACK=28 and the LEAD=28 specifications in the FORECAST statement create a holdout region of 28 observations. The sum of absolute prediction errors (SAE) in this holdout region are used to compare the different models.

```

proc ucm data=callCenter;
  id datetime interval=dthour6;
  model calls;
  irregular;
  level;
  season length=28 type=trig
    print=(harmonics);
  estimate back=28;
  forecast back=28 lead=28;
run;

```

The forecasting performance of this model in the holdout region is shown in [Output 34.3.1](#). The sum of absolute prediction errors $SAE = 516.22$, which appears in the last row of the holdout analysis table.

Output 34.3.1 Predictions in the Holdout Region: Baseline Model

Obs	datetime	Actual	Forecast	Error	SAE
525	24APR00:00	12	-4.004	16.004	16.004

547	29APR00:12	116	100.339	15.661	425.468
548	29APR00:18	54	34.700	19.300	444.768
549	30APR00:00	10	-6.209	16.209	460.978
550	30APR00:06	30	12.167	17.833	478.811
551	30APR00:12	66	49.524	16.476	495.287
552	30APR00:18	61	40.071	20.929	516.216

Now that a baseline model is created, the exploration for alternate models can begin. The review of the harmonic table in [Output 34.3.2](#) shows that all but the last three harmonics are significant, and deleting any of them to form a subset trigonometric seasonal component will lead to a poorer model. The last three harmonics, 12th, 13th and 14th, with periods of 2.333, 2.15 and 2.0, respectively, do appear to be possible choices for deletion. Note that the disturbance variance of the seasonal component is not very insignificant (see [Output 34.3.3](#)); therefore the seasonal component is stochastic and the preceding logic, which is based on the final state estimate, provides only a rough guideline.

Output 34.3.2 Harmonic Analysis of the Season: Initial Model

The UCM Procedure						
Harmonic Analysis of Trigonometric Seasons (Based on the Final State)						
Name	Season Length	Harmonic	Period	Chi-Square	DF	Pr > ChiSq
Season	28	1	28.00000	234.19	2	<.0001
Season	28	2	14.00000	264.19	2	<.0001

Season	28	14	2.00000	2.33	1	0.1272

Output 34.3.3 Parameter Estimates: Initial Model

Final Estimates of the Free Parameters					
Component	Parameter	Estimate	Approx Std Error	t Value	Approx Pr > t
Irregular	Error Variance	92.14591	13.10986	7.03	<.0001
Level	Error Variance	44.83595	10.65465	4.21	<.0001
Season	Error Variance	0.01250	0.0065153	1.92	0.0551

The following statements fit a subset trigonometric model formed by dropping the last three harmonics by specifying the DROPH= option in the SEASON statement:

```
proc ucm data=callCenter;
  id datetime interval=dthour6;
  model calls;
  irregular;
  level;
  season length=28 type=trig droph=12 13 14;
  estimate back=28;
  forecast back=28 lead=28;
run;
```

The last row of the holdout region prediction analysis table for the preceding model is shown in [Output 34.3.4](#). It shows that the subset trigonometric model has better prediction performance in the holdout region than the full trigonometric model, its SAE = 471.53 compared to the SAE = 516.22 for the full model.

Output 34.3.4 SAE for the Subset Trigonometric Model

Obs	datetime	Actual	Forecast	Error	SAE
552	30APR00:18	61	40.836	20.164	471.534

The following statements illustrate a spline approximation to this seasonal component. In the spline specification the knot placement is quite important, and usually some experimentation is needed. In the following model the knots are placed at the beginning and the middle of each day. Note that the knots at the beginning and end of the season, 1 and 28 in this case, should not be listed in the knot list because knots are always placed there anyway.

```
proc ucm data=callCenter;
  id datetime interval=dthour6;
  model calls;
  irregular;
  level;
  splinesseason length=28
    knots=3 5 7 9 11 13 15 17 19 21 23 25 27
    degree=3;
  estimate back=28;
  forecast back=28 lead=28;
run;
```

The spline season model takes about half the time to fit that the baseline model takes. The last row of the holdout region prediction analysis table for this model is shown in [Output 34.3.5](#), which shows that the spline season model performs even better than the previous two models in the holdout region, its SAE = 313.79 compared to SAE = 471.53 for the previous model.

Output 34.3.5 SAE for the Spline Season Model

Obs	datetime	Actual	Forecast	Error	SAE
552	30APR00:18	61	23.350	37.650	313.792

The following statements illustrate yet another way to approximate a long seasonal component. Here a combination of BLOCKSEASON and SEASON statements results in a seasonal component that is a sum of two seasonal patterns: one seasonal pattern is simply a regular season with season length 4 that captures the *within-day* seasonal pattern, and the other seasonal pattern is a block seasonal pattern that remains constant during the day but varies from day to day within a week. Note the use of NLOPTIONS statement to change the optimization technique during the parameter estimation to DBLDOG, which in this case performs better than the default technique, TRUREG.

```
proc ucm data=callCenter;
  id datetime interval=dthour6;
  model calls;
  irregular;
  level;
  season length=4 type=trig;
  nloptions dbldog;
```

```

blockseason nblocks=7 blocksize=4
      type=trig;
estimate back=28;
forecast back=28 lead=28;
nloptions tech=dbldog;
run;

```

This model also takes about half the time to fit that the baseline model takes. The last row of the holdout region prediction analysis table for this model is shown in [Output 34.3.6](#), which shows that the block season model does slightly better than the baseline model but not as good as the other two models, its SAE = 508.52 compared to the SAE = 516.22 of the baseline model.

Output 34.3.6 SAE for the Block Season Model

Obs	datetime	Actual	Forecast	Error	SAE
552	30APR00:18	61	39.339	21.661	508.522

This example showed a few different ways to model a long seasonal pattern. It showed that parsimonious models for long seasonal patterns can be useful, and in some cases even more effective than the full model. Moreover, for very long seasonal patterns the high memory requirements and long computing times might make full models impractical.

Example 34.4: Modeling Time-Varying Regression Effects

In April 1979 the Albuquerque Police Department began a special enforcement program aimed at reducing the number of DWI (driving while intoxicated) accidents. The program was administered by a squad of police officers, who used breath alcohol testing (BAT) devices and a van that houses a BAT device (Batmobile). These data were collected by the Division of Governmental Research of the University of New Mexico, under a contract with the National Highway Traffic Safety Administration of the U.S. Department of Transportation, to evaluate the Batmobile program. The first 29 observations are for a control period, and the next 23 observations are for the experimental (Batmobile) period. The data, freely available at <http://lib.stat.cmu.edu/DASL/Datafiles/batdat.html>, consist of two variables: ACC, which represents injuries and fatalities from Wednesday to Saturday nighttime accidents, and FUEL, which represents fuel consumption (millions of gallons) in Albuquerque. The variables are measured quarterly starting from the first quarter of 1972 up to the last quarter of 1984, covering the span of 13 years. The following DATA step statements create the input data set.

```

data bat;
  input ACC FUEL @@;
  batProgram = 0;
  if _n_ > 29 then batProgram = 1;
  date = INTNX( 'qtr', '1jan1972'd, _n_- 1 );
  format date qtr8.;
datalines;
192    32.592    238    37.250    232    40.032

There are a number of ways to study these data and the question of the effectiveness of the BAT program. One possibility is to study the *before-after* difference in the injuries and fatalities per million gallons of fuel consumed, by regressing ACC on the FUEL and the dummy variable BATPROGRAM, which is zero before the program began and one while the program is in place. However, it is possible that the effect of the Batmobiles might well be cumulative, because as awareness of the program becomes dispersed, its effectiveness as a deterrent to driving while intoxicated increases. This suggests that the regression coefficient of the BATPROGRAM variable might be *time varying*. The following program fits a model that incorporates these considerations. A seasonal component is included in the model since it is easy to see that the data show strong quarterly seasonality.

```

proc ucm data=bat;
  model acc = fuel;
  id date interval=qtr;
  irregular;
  level var=0 noest;
  randomreg batProgram / plot=smooth;
  season length=4 var=0 noest plot=smooth;
  estimate plot=(panel residual);
  forecast plot=forecasts lead=0;
run;

```

The model seems to fit the data adequately. No data are withheld for model validation because the series is relatively short. The plot of the time-varying coefficient of BATPROGRAM is shown in [Output 34.4.1](#). As expected, it shows that the effectiveness of the program increases as awareness of the program becomes dispersed. The effectiveness eventually seems to level off. The residual diagnostic plots are shown in

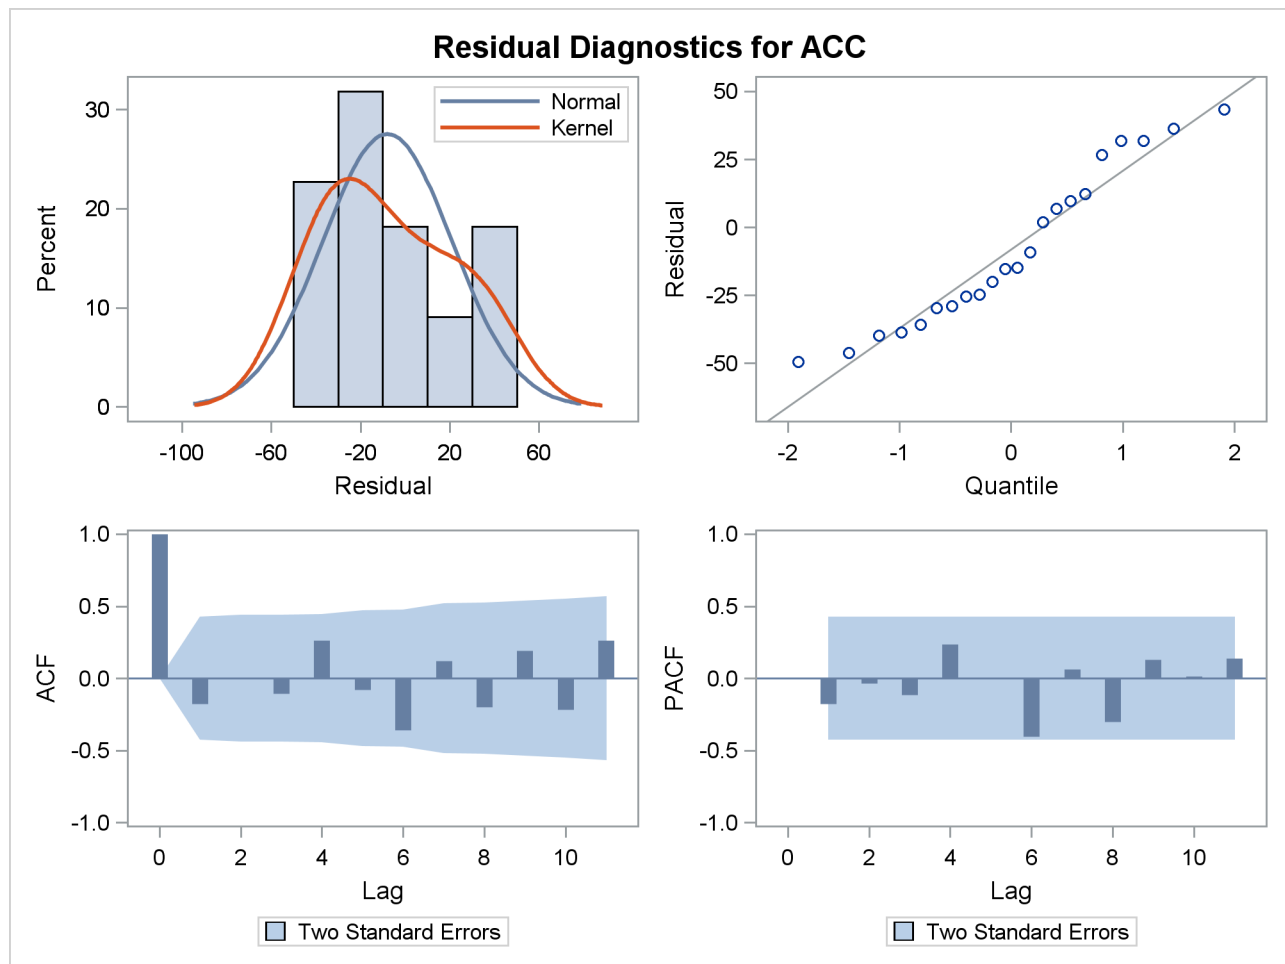

Output 34.4.2 and Output 34.4.3, the forecast plot is in Output 34.4.4, the goodness-of-fit statistics are in Output 34.4.5, and the parameter estimates are in Output 34.4.6.

Example 34.5: Trend Removal Using the Hodrick-Prescott Filter

Hodrick-Prescott filter (see Hodrick and Prescott (1997)) is a popular tool in macroeconomics for fitting smooth trend to time series. It is well known that the trend computation according to this filter is equivalent to fitting the local linear trend plus irregular model with the level disturbance variance restricted to zero and the slope disturbance variance restricted to be a suitable multiple of the irregular component variance. The multiple used depends on the frequency of the series; for example, for quarterly series the commonly recommended multiple is $1/1600 = 0.000625$. For other intervals there is no consensus, but a frequently suggested value for monthly series is $1/14400$ and the value for an annual series can range from $1/400 = 0.0025$ to $1/7 = 0.15$. The data set considered in this example consists of quarterly GNP values for the United States from 1960 to 1991. In the UCM procedure statements that follow, the presence of the PROFILE option in the ESTIMATE statement implies that the restriction that the disturbance variance of the slope component be fixed at 0.000625 is interpreted differently: it implies that the disturbance variance of the slope component be restricted to be 0.000625 *times* the estimated irregular component variance, as needed for the Hodrick-Prescott filter. The plot of the fitted trend is shown in [Output 34.5.1](#), and the plot of the smoothed irregular component, which corresponds to the detrended series, is given in [Output 34.5.2](#). The detrended series can be further analyzed for business cycles.

```
proc ucm data=sashelp.gnp;
  id date interval=qtr;
  model gnp;
  irregular plot=smooth;
  level var=0 noest plot=smooth;
  slope var=0.000625 noest;
  estimate PROFILE;
  forecast plot=(decomp);
run;
```

Output 34.5.1 Smoothed Trend for the GNP Series as per the Hodrick-Prescott Filter

Output 34.5.2 Detrended GNP Series

Example 34.6: Using Splines to Incorporate Nonlinear Effects

The data in this example are created to mirror the electricity demand and temperature data recorded at a utility company in the midwest region of the United States. The data set (not shown), `utility`, has three variables: `load`, `temp`, and `date`. The `load` column contains the daily electricity demand, the `temp` column has the average daily temperature readings, and the `date` column records the observation date.

The following statements produce a plot, shown in [Output 34.6.1](#), of electricity load versus temperature. Clearly the relationship is smooth but nonlinear: the load generally increases when the temperatures are away from the comfortable sixties.

```
proc sgplot data=utility;
  loess x=temp y=load / smooth=0.4;
run;
```

Output 34.6.1 Load versus Temperature Plot

The time series plot of the load (not shown) also shows that, apart from a day-of-the-week seasonal effect, there are no additional easily identifiable patterns in the series. The series has no apparent upward or downward trend. The following statements fit a UCM to the series that takes into account these observations. The particular choice of the model is a result of a little modeling exercise that compared a small number of competing models. The chosen model is adequate but by no means the best possible. The temperature effect is modeled by a deterministic three-degree spline with knots at 30, 40, 50, 60, and 75. The knot locations and the degree were chosen by visual inspection of the plot ([Output 34.6.1](#)). An autoreg component is used in place of the simple irregular component, which improved the residual analysis. The last 60 days of data are withheld for out-of-sample forecast evaluation (note the BACK= option in both the ESTIMATE and FORECAST statements). The OUTLIER statement is used to increase the number of outliers reported to 10. Since no CHECKBREAK option is used in the LEVEL statement, only the additive outliers are searched. In this example the use of the EXTRADIFFUSE= option in the ESTIMATE and FORECAST statements is useful for discarding some early one-step-ahead forecasts and residuals with large variance.

```

proc ucm data=utility;
  id date interval=day;
  model load;
  autoreg;
  level plot=smooth;
  splinereg temp knots=30 40 50 65 75 degree=3
    variance=0 noest;
  season length=7 var=0 noest;
    estimate plot=panel back=60
      extradiffuse=50;
  outlier maxnum=10;
  forecast back=60 lead=60
    extradiffuse=50;
run;

```

The parameter estimates are given in [Output 34.6.2](#), and the residual goodness-of-fit statistics are shown in [Output 34.6.3](#). The residual diagnostic plots are shown in [Output 34.6.4](#). The ACF and PACF plots appear satisfactory, but the normality plots, particularly the Q-Q plot, show possible violations. It appears that, at least in part, this nonNormal behavior of the residuals might be attributable to the outliers in the series. The outlier summary table, [Output 34.6.5](#), shows the most likely outlying observations. Notice that most of these outliers are holidays, like July 4th, when the electricity load is lower than usual for that day of the week.

The plot of the load forecasts for the withheld data is shown in [Output 34.6.6](#).

Output 34.6.6 Electricity Load: Forecast Evaluation of the Withheld Data

Example 34.7: Detection of Level Shift

The series in this example consists of the yearly water level readings of the Nile River recorded at Aswan, Egypt (see Cobb (1978) and de Jong and Penzer (1998)). The readings are from the years 1871 to 1970. The series does not show any apparent trend or any other distinctive patterns; however, there is a shift in the water level starting at the year 1899. This shift could be attributed to the start of construction of a dam near Aswan in that year. A time series plot of this series is given in [Output 34.7.1](#). The following DATA step statements create the input data set.

```
data nile;
  input waterlevel @@;
  year = intnx( 'year', '1jan1871'd, _n_-1 );
  format year year4.;
datalines;
  1120 1160 963 1210 1160 1160 813 1230 1370 1140
  995 935 1110 994 1020 960 1180 799 958 1140
  1100 1210 1150 1250 1260 1220 1030 1100 774 840
  874 694 940 833 701 916 692 1020 1050 969
  831 726 456 824 702 1120 1100 832 764 821
  768 845 864 862 698 845 744 796 1040 759
  781 865 845 944 984 897 822 1010 771 676
  649 846 812 742 801 1040 860 874 848 890
  744 749 838 1050 918 986 797 923 975 815
  1020 906 901 1170 912 746 919 718 714 740
;

proc timeseries data=nile plot=series;
  id year interval=year;
  var waterlevel;
run;
```

Output 34.7.1 Nile Water Level

In this situation it is known that a shift in the water level occurred within the span of the series, and its effect can be easily taken into account by including an appropriate indicator variable as a regressor. However, in many situation such prior information is not available, and it is useful to detect such a shift in a data analytic fashion. You can check for breaks in the level by using the [CHECKBREAK](#) option in the `LEVEL` statement. The following statements fit a simple locally constant level plus error model to the series:

```
proc ucm data=nile;
  id year interval=year;
  model waterlevel;
  irregular;
  level plot=smooth checkbreak;
  estimate;
  forecast plot=decomp;
run;
```

The plot in [Output 34.7.2](#) shows a noticeable drop in the smoothed water level around 1899.

Output 34.7.2 Smoothed Trend without the Shift of 1899

The “Outlier Summary” table in [Output 34.7.3](#) shows the most likely types of breaks and their locations within the series span. The shift of 1899 is easily detected.

Output 34.7.3 Detection of Structural Breaks in the Nile River Level

Outlier Summary					
Obs	year	Break Type	Standard		DF
			Estimate	Error Chi-Square	
29	1899	Level	-315.73791	97.639753	10.46
					1
					0.0012

The following statements specify a UCM that models the level of the river as a locally constant series with a shift in the year 1899, represented by a dummy regressor (SHIFT1899):

```
data nile;
  set nile;
  shift1899 = ( year >= '1jan1899'd );
run;
```

```

proc ucm data=nile;
  id year interval=year;
  model waterlevel = shift1899;
  irregular;
  level;
  estimate;
  forecast plot=decomp;
run;

```

The plot in [Output 34.7.4](#) shows the smoothed trend, including the correction due to the shift in the year 1899. Notice the simplicity in the shape of the smoothed curve after the incorporation of the shift information.

Output 34.7.4 Smoothed Trend plus Shift of 1899

Example 34.8: ARIMA Modeling

This example shows how you can use the UCM procedure for ARIMA modeling. The parameter estimates and predictions for ARIMA models obtained by using PROC UCM will be close to those obtained by using

PROC ARIMA (in the presence of the ML option in its ESTIMATE statement) if the model is stationary or if the model is nonstationary and there are no missing values in the data. See Chapter 7, “[The ARIMA Procedure](#),” for additional details about the ARIMA procedure. However, if there are missing values in the data and the model is nonstationary, then the UCM and ARIMA procedures can produce significantly different parameter estimates and predictions. An article by Kohn and Ansley (1986) suggests a statistically sound method of estimation, prediction, and interpolation for nonstationary ARIMA models with missing data. This method is based on an algorithm that is equivalent to the Kalman filtering and smoothing algorithm used in the UCM procedure. The results of an illustrative example in their article are reproduced here using the UCM procedure. In this example an $ARIMA(0,1,1) \times (0,1,1)_{12}$ model is applied to the logarithm of the air series in the `sashelp.air` data set. Four different missing value patterns are considered to highlight different aspects of the problem:

- *Data1*. The full data set of 144 observations.
- *Data2*. The set of 78 observations that omit January through November in each of the last 6 years.
- *Data3*. The data set with the 5 observations July 1949, June, July, and August 1957, and July 1960 missing.
- *Data4*. The data set with all July observations missing and June and August 1957 also missing.

The following DATA steps create these data sets:

```
data Data1;
    set sashelp.air;
    logair = log(air);
run;

data Data2;
    set data1;
    if year(date) >= 1955 and month(date) < 12 then logair = .;
run;

data Data3;
    set data1;
    if (year(date) = 1949 and month(date) = 7) then logair = .;
    if ( year(date) = 1957 and
        (month(date) = 6 or month(date) = 7 or month(date) = 8))
        then logair = .;
    if (year(date) = 1960 and month(date) = 7) then logair = .;
run;

data Data4;
    set data1;
    if month(date) = 7 then logair = .;
    if year(date) = 1957 and (month(date) = 6 or month(date) = 8)
        then logair = .;
run;
```

The following statements specify the $ARIMA(0, 1, 1) \times (0, 1, 1)_{12}$ model for the `logair` series in the first data set (`Data1`):

```

proc ucm data=Data1;
  id date interval=month;
  model logair;
  irregular q=1 sq=1 s=12;
  deplag lags=(1)(12) phi=1 1 noest;
  estimate outest=est1;
  forecast outfor=for1;
run;

```

Note that the moving average part of the model is specified by using the Q=, SQ=, and S= options in the IRREGULAR statement and the differencing operator, $(1 - B)(1 - B^{12})$, is specified by using the DEPLAG statement. The model does not contain an intercept term; therefore no LEVEL statement is needed. The parameter estimates are saved in a data set EST1 by using the OUTEST= option in the ESTIMATE statement and the forecasts and the component estimates are saved in a data set FOR1 by using the OUTFOR= option in the FORECAST statement. The same analysis is performed on the other three data sets, but is not shown here.

Output 34.8.1 resembles Table 1 in Kohn and Ansley (1986). This table is generated by merging the parameter estimates from the four analyses. Only the moving average parameter estimates and their standard errors are reported. The columns EST1 and STD1 correspond to the estimates for Data1. The parameter estimates and their standard errors for other three data sets are similarly named. Note that the parameter estimates closely match the parameter estimates in the article. However, their standard errors differ slightly. This difference could be the result of different ways of computing the Hessian at the optimum. The white noise error variance estimates are not reported here, but they agree quite closely with those in the article.

Output 34.8.1 Data Sets 1–4: Parameter Estimates and Standard Errors

Output 34.8.3 is based on Data2. It resembles Table 3 in Kohn and Ansley (1986). The columns S_SERIES and VS_SERIES in the **OUTFOR=** data set contain the interpolated values of logair and their variances. The estimate column in **Output 34.8.3** reports interpolated values (which are the same as S_SERIES), and the std column reports their standard errors (which are computed as square root of VS_SERIES) for January–November 1957. The actual logair values for these months, which are missing in Data2, are also provided for comparison. The numbers are very close to those in the article.

Output 34.8.3 Data Set 2: Interpolated Values and Standard Errors

DATE	logair	estimate	std
JAN57	5.753	5.733	0.045
FEB57	5.707	5.738	0.049

Overview: VARMAX Procedure

Given a multivariate time series, the VARMAX procedure estimates the model parameters and generates forecasts associated with vector autoregressive moving-average processes with exogenous regressors (VARMAX) models. Often, economic or financial variables are not only contemporaneously correlated to each other, they are also correlated to each other's past values. The VARMAX procedure can be used to model these types of time relationships. In many economic and financial applications, the variables of interest (dependent, response, or endogenous variables) are influenced by variables external to the system under consideration (independent, input, predictor, regressor, or exogenous variables). The VARMAX procedure enables you to model the dynamic relationship both between the dependent variables and also between the dependent and independent variables.

VARMAX models are defined in terms of the orders of the autoregressive or moving-average process (or both). When you use the VARMAX procedure, these orders can be specified by options or they can be automatically determined. Criteria for automatically determining these orders include the following:

- Akaike information criterion (AIC)
- corrected AIC (AICC)
- Hannan-Quinn (HQ) criterion
- final prediction error (FPE)
- Schwarz Bayesian criterion (SBC), also known as Bayesian information criterion (BIC)

If you do not want to use the automatic order selection, the VARMAX procedure provides autoregressive order identification aids:

- partial cross-correlations
- Yule-Walker estimates
- partial autoregressive coefficients
- partial canonical correlations

For situations where the stationarity of the time series is in question, the VARMAX procedure provides tests to aid in determining the presence of unit roots and cointegration. These tests include the following:

- Dickey-Fuller tests
- Johansen cointegration test for nonstationary vector processes of integrated order one
- Stock-Watson common trends test for the possibility of cointegration among nonstationary vector processes of integrated order one
- Johansen cointegration test for nonstationary vector processes of integrated order two

For stationary vector times series (or nonstationary series made stationary by appropriate differencing), the VARMAX procedure provides for vector autoregressive and moving-average (VARMA) and Bayesian vector autoregressive (BVAR) models. To cope with the problem of high dimensionality in the parameters of the VAR model, the VARMAX procedure provides both vector error correction model (VECM) and Bayesian vector error correction model (BVECM). Bayesian models are used when prior information about the model parameters is available. The VARMAX procedure also allows independent (exogenous) variables with their distributed lags to influence dependent (endogenous) variables in various models such as VARMAX, BVARX, VECMX, and BVECMX models.

Forecasting is one of the main objectives of multivariate time series analysis. After successfully fitting the VARMAX, BVARX, VECMX, and BVECMX models, the VARMAX procedure computes predicted values based on the parameter estimates and the past values of the vector time series.

The model parameter estimation methods are the following:

- least squares (LS)
- maximum likelihood (ML)

The VARMAX procedure provides various hypothesis tests of long-run effects and adjustment coefficients by using the likelihood ratio test based on Johansen cointegration analysis. The VARMAX procedure offers the likelihood ratio test of the weak exogeneity for each variable.

After fitting the model parameters, the VARMAX procedure provides for model checks and residual analysis by using the following tests:

- Durbin-Watson (DW) statistics

- F test for autoregressive conditional heteroscedastic (ARCH) disturbance
- F test for AR disturbance
- Jarque-Bera normality test
- Portmanteau test

The VARMAX procedure supports several modeling features, including the following:

- seasonal deterministic terms
- subset models
- multiple regression with distributed lags
- dead-start model that does not have present values of the exogenous variables
- GARCH-type multivariate conditional heteroscedasticity models

The VARMAX procedure provides a Granger causality test to determine the Granger-causal relationships between two distinct groups of variables. It also provides the following:

- infinite order AR representation
- impulse response function (or infinite order MA representation)
- decomposition of the predicted error covariances
- roots of the characteristic functions for both the AR and MA parts to evaluate the proximity of the roots to the unit circle
- contemporaneous relationships among the components of the vector time series

Getting Started: VARMAX Procedure

This section outlines the use of the VARMAX procedure and gives five different examples of the kinds of models supported.

Vector Autoregressive Process

Let $\mathbf{y}_t = (y_{1t}, \dots, y_{kt})'$, $t = 1, 2, \dots$, denote a k -dimensional time series vector of random variables of interest. The p th-order VAR process is written as

$$\mathbf{y}_t = \boldsymbol{\delta} + \Phi_1 \mathbf{y}_{t-1} + \dots + \Phi_p \mathbf{y}_{t-p} + \boldsymbol{\epsilon}_t$$

where the ϵ_t is a vector white noise process with $\epsilon_t = (\epsilon_{1t}, \dots, \epsilon_{kt})'$ such that $E(\epsilon_t) = 0$, $E(\epsilon_t \epsilon_t') = \Sigma$, and $E(\epsilon_t \epsilon_s') = 0$ for $t \neq s$; $\delta = (\delta_1, \dots, \delta_k)'$ is a constant vector and Φ_i is a $k \times k$ matrix.

Analyzing and modeling the series jointly enables you to understand the dynamic relationships over time among the series and to improve the accuracy of forecasts for individual series by using the additional information available from the related series and their forecasts.

Example of Vector Autoregressive Model

Consider the first-order stationary bivariate vector autoregressive model

$$y_t = \begin{pmatrix} 1.2 & -0.5 \\ 0.6 & 0.3 \end{pmatrix} y_{t-1} + \epsilon_t, \quad \text{with } \Sigma = \begin{pmatrix} 1.0 & 0.5 \\ 0.5 & 1.25 \end{pmatrix}$$

The following IML procedure statements simulate a bivariate vector time series from this model to provide test data for the VARMAX procedure:

```
proc iml;
  sig = {1.0 0.5, 0.5 1.25};
  phi = {1.2 -0.5, 0.6 0.3};
  /* simulate the vector time series */
  call varmasim(y,phi) sigma = sig n = 100 seed = 34657;
  cn = {'y1' 'y2'};
  create simull from y[colname=cn];
  append from y;
quit;
```

The following statements plot the simulated vector time series y_t shown in [Figure 35.1](#):

```
data simull;
  set simull;
  date = intnx( 'year', '01jan1900'd, _n_-1 );
  format date year4.;
run;

ods graphics on;
proc timeseries data=simull vectorplot=series;
  id date interval=year;
  var y1 y2;
run;
```

Figure 35.1 Plot of Generated Data Process

The following statements fit a VAR(1) model to the simulated data. First, you specify the input data set in the PROC VARMAX statement. Then, you use the MODEL statement to designate the dependent variables, y_1 and y_2 . To estimate a VAR model with mean zero, you specify the order of the autoregressive model with the P= option and the NOINT option. The MODEL statement fits the model to the data and prints parameter estimates and their significance. The PRINT=ESTIMATES option prints the matrix form of parameter estimates, and the PRINT=DIAGNOSE option prints various diagnostic tests. The LAGMAX=3 option is used to print the output for the residual diagnostic checks.

To output the forecasts to a data set, you specify the OUTPUT statement with the OUT= option. If you want to forecast five steps ahead, you use the LEAD=5 option. The ID statement specifies the yearly interval between observations and provides the Time column in the forecast output.

The VARMAX procedure output is shown in [Figure 35.2](#) through [Figure 35.10](#).

```
/*--- Vector Autoregressive Model ---*/

proc varmax data=simul1;
  id date interval=year;
  model y1 y2 / p=1 noint lagmax=3
               print=(estimates diagnose);
  output out=for lead=5;
run;
```

Figure 35.2 Descriptive Statistics

The VARMAX Procedure						
		Number of Observations		100		
		Number of Pairwise Missing		0		
Simple Summary Statistics						
Variable Type		N	Mean	Standard Deviation	Min	Max
y1	Dependent	100	-0.21653	2.78210	-4.75826	8.37032
y2	Dependent	100	0.16905	2.58184	-6.04718	9.58487

The VARMAX procedure first displays descriptive statistics. The Type column specifies that the variables are dependent variables. The column N stands for the number of nonmissing observations.

Figure 35.3 shows the type and the estimation method of the fitted model for the simulated data. It also shows the AR coefficient matrix in terms of lag 1, the parameter estimates, and their significance, which can indicate how well the model fits the data.

The second table schematically represents the parameter estimates and allows for easy verification of their significance in matrix form.

In the last table, the first column gives the left-hand-side variable of the equation; the second column is the parameter name ARl_i_j , which indicates the (i, j) th element of the lag l autoregressive coefficient; the last column is the regressor that corresponds to the displayed parameter.

Figure 35.3 Model Type and Parameter Estimates

The VARMAX Procedure						
Type of Model			VAR(1)			
Estimation Method			Least Squares Estimation			
AR						
Lag	Variable	y1	y2			
1	y1	1.15977	-0.51058			
	y2	0.54634	0.38499			
Schematic Representation						
Variable/ Lag		AR1				
y1		+-				
y2		++				
+ is > 2*std error, - is < -2*std error, . is between, * is N/A						
Model Parameter Estimates						
Equation Parameter		Estimate	Standard Error	t Value	Pr > t	Variable
y1	AR1_1_1	1.15977	0.05508	21.06	0.0001	y1(t-1)
	AR1_1_2	-0.51058	0.05898	-8.66	0.0001	y2(t-1)
y2	AR1_2_1	0.54634	0.05779	9.45	0.0001	y1(t-1)
	AR1_2_2	0.38499	0.06188	6.22	0.0001	y2(t-1)

The fitted VAR(1) model with estimated standard errors in parentheses is given as

$$\mathbf{y}_t = \begin{pmatrix} 1.160 & -0.511 \\ (0.055) & (0.059) \\ 0.546 & 0.385 \\ (0.058) & (0.062) \end{pmatrix} \mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t$$

Clearly, all parameter estimates in the coefficient matrix Φ_1 are significant.

The model can also be written as two univariate regression equations.

$$\begin{aligned}y_{1t} &= 1.160 y_{1,t-1} - 0.511 y_{2,t-1} + \epsilon_{1t} \\y_{2t} &= 0.546 y_{1,t-1} + 0.385 y_{2,t-1} + \epsilon_{2t}\end{aligned}$$

The table in [Figure 35.4](#) shows the innovation covariance matrix estimates and the various information criteria results. The smaller value of information criteria fits the data better when it is compared to other models. The variable names in the covariance matrix are printed for convenience; y1 means the innovation for y1, and y2 means the innovation for y2.

Figure 35.4 Innovation Covariance Estimates and Information Criteria

Covariances of Innovations

Portmanteau Test for Cross Correlations of Residuals			
Up To Lag	DF	Chi-Square	Pr > ChiSq
2	4	1.58	0.8124
3	8	2.78	0.9473

The VARMAX procedure provides diagnostic checks for the univariate form of the equations. The table in Figure 35.8 describes how well each univariate equation fits the data. From two univariate regression equations in Figure 35.3, the values of R^2 in the second column are 0.84 and 0.80 for each equation. The standard deviations in the third column are the square roots of the diagonal elements of the covariance matrix from Figure 35.4. The F statistics are in the fourth column for hypotheses to test $\phi_{11} = \phi_{12} = 0$ and $\phi_{21} = \phi_{22} = 0$, respectively, where ϕ_{ij} is the (i, j) th element of the matrix Φ_1 . The last column shows the p -values of the F statistics. The results show that each univariate model is significant.

Figure 35.8 Univariate Diagnostic Checks

Univariate Model ANOVA Diagnostics				
Variable	R-Square	Standard Deviation	F Value	Pr > F
y1	0.8351	1.13523	491.25	<.0001
y2	0.7906	1.19096	366.29	<.0001

The check for white noise residuals in terms of the univariate equation is shown in [Figure 35.9](#). This output contains information that indicates whether the residuals are correlated and heteroscedastic. In the first table, the second column contains the Durbin-Watson test statistics to test the null hypothesis that the residuals are uncorrelated. The third and fourth columns show the Jarque-Bera normality test statistics and their p -values to test the null hypothesis that the residuals have normality. The last two columns show F statistics and their p -values for ARCH(1) disturbances to test the null hypothesis that the residuals have equal covariances. The second table includes F statistics and their p -values for AR(1), AR(1,2), AR(1,2,3) and AR(1,2,3,4) models of residuals to test the null hypothesis that the residuals are uncorrelated.

Figure 35.9 Univariate Diagnostic Checks Continued

Bayesian Vector Autoregressive Process

The Bayesian vector autoregressive (BVAR) model is used to avoid problems of collinearity and over-parameterization that often occur with the use of VAR models. BVAR models do this by imposing priors on the AR parameters.

The following statements fit a BVAR(1) model to the simulated data. You specify the PRIOR= option with the hyperparameters. The LAMBDA=0.9 and THETA=0.1 options are hyperparameters controlling the prior covariance. Part of the VARMAX procedure output is shown in [Figure 35.11](#).

```

/*--- Bayesian Vector Autoregressive Process ---*/

proc varmax data=simul1;
  model y1 y2 / p=1 noint
           prior=(lambda=0.9 theta=0.1);
run;

```

The output in [Figure 35.11](#) shows that parameter estimates are slightly different from those in [Figure 35.3](#). By choosing the appropriate priors, you might be able to get more accurate forecasts by using a BVAR model rather than by using an unconstrained VAR model. See the section “[Bayesian VAR and VARX Modeling](#)” on page 2311 for details.

Vector Error Correction Model

A vector error correction model (VECM) can lead to a better understanding of the nature of any non-stationarity among the different component series and can also improve longer term forecasting over an unconstrained model.

The VECM(p) form with the cointegration rank $r(\leq k)$ is written as

$$\Delta \mathbf{y}_t = \boldsymbol{\delta} + \Pi \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t$$

where Δ is the differencing operator, such that $\Delta \mathbf{y}_t = \mathbf{y}_t - \mathbf{y}_{t-1}$; $\Pi = \alpha\beta'$, where α and β are $k \times r$ matrices; Φ_i^* is a $k \times k$ matrix.

It has an equivalent VAR(p) representation as described in the preceding section.

$$\mathbf{y}_t = \boldsymbol{\delta} + (I_k + \Pi + \Phi_1^*) \mathbf{y}_{t-1} + \sum_{i=2}^{p-1} (\Phi_i^* - \Phi_{i-1}^*) \mathbf{y}_{t-i} - \Phi_{p-1}^* \mathbf{y}_{t-p} + \boldsymbol{\epsilon}_t$$

where I_k is a $k \times k$ identity matrix.

Example of Vector Error Correction Model

An example of the second-order nonstationary vector autoregressive model is

$$\mathbf{y}_t = \begin{pmatrix} -0.2 & 0.1 \\ 0.5 & 0.2 \end{pmatrix} \mathbf{y}_{t-1} + \begin{pmatrix} 0.8 & 0.7 \\ -0.4 & 0.6 \end{pmatrix} \mathbf{y}_{t-2} + \boldsymbol{\epsilon}_t$$

with

$$\Sigma = \begin{pmatrix} 100 & 0 \\ 0 & 100 \end{pmatrix} \text{ and } \mathbf{y}_0 = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

This process can be given the following VECM(2) representation with the cointegration rank one:

$$\Delta \mathbf{y}_t = \begin{pmatrix} -0.4 \\ 0.1 \end{pmatrix} (1, -2) \mathbf{y}_{t-1} - \begin{pmatrix} 0.8 & 0.7 \\ -0.4 & 0.6 \end{pmatrix} \Delta \mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t$$

The following PROC IML statements generate simulated data for the VECM(2) form specified above and plot the data as shown in [Figure 35.12](#):

```
proc iml;
  sig = 100*i(2);
  phi = {-0.2 0.1, 0.5 0.2, 0.8 0.7, -0.4 0.6};
  call varmasim(y,phi) sigma=sig n=100 initial=0
               seed=45876;

  cn = {'y1' 'y2'};
  create simul2 from y[colname=cn];
  append from y;
quit;

data simul2;
  set simul2;

Cointegration Testing

The following statements use the Johansen cointegration rank test. The COINTTEST=(JOHANSEN) option does the Johansen trace test and is equivalent to specifying COINTTEST with no additional options or the COINTTEST=(JOHANSEN=(TYPE=TRACE)) option.

```
/*--- Cointegration Test ---*/

proc varmax data=simul2;
  model y1 y2 / p=2 noint dftest cointtest=(johansen);
run;
```

Figure 35.13 shows the output for Dickey-Fuller tests for the nonstationarity of each series and Johansen cointegration rank test between series.

Figure 35.13 Dickey-Fuller Tests and Cointegration Rank Test

The VARMAX Procedure						
Unit Root Test						
Variable	Type	Rho	Pr < Rho	Tau	Pr < Tau	
y1	Zero Mean	1.47	0.9628	1.65	0.9755	
	Single Mean	-0.80	0.9016	-0.47	0.8916	
	Trend	-10.88	0.3573	-2.20	0.4815	
y2	Zero Mean	-0.05	0.6692	-0.03	0.6707	
	Single Mean	-6.03	0.3358	-1.72	0.4204	
	Trend	-50.49	0.0003	-4.92	0.0006	
Cointegration Rank Test Using Trace						
H0: Rank=r	H1: Rank>r	Eigenvalue	Trace	5% Critical Value	Drift in ECM	Drift in Process
0	0	0.5086	70.7279	12.21	NOINT	Constant
1	1	0.0111	1.0921	4.14		

In Dickey-Fuller tests, the second column specifies three types of models, which are zero mean, single mean, or trend. The third column (Rho) and the fifth column (Tau) are the test statistics for unit root testing. Other columns are their p -values. You can see that both series have unit roots. For a description of Dickey-Fuller tests, see the section “[PROBDF Function for Dickey-Fuller Tests](#)” on page 162 in Chapter 5, “[SAS Macros and Functions](#).”

In the cointegration rank test, the last two columns explain the drift in the model or process. Since the NOINT option is specified, the model is

$$\Delta \mathbf{y}_t = \Pi \mathbf{y}_{t-1} + \Phi_1^* \Delta \mathbf{y}_{t-1} + \epsilon_t$$

The column Drift In ECM means there is no separate drift in the error correction model, and the column Drift In Process means the process has a constant drift before differencing.

H0 is the null hypothesis, and H1 is the alternative hypothesis. The first row tests $r = 0$ against $r > 0$; the second row tests $r = 1$ against $r > 1$. The Trace test statistics in the fourth column are computed by $-T \sum_{i=r+1}^k \log(1 - \lambda_i)$ where T is the available number of observations and λ_i is the eigenvalue in the third column. By default, the critical values at 5% significance level are used for testing. You can compare the test statistics and critical values in each row. There is one cointegrated process in this example since the Trace statistic for testing $r = 0$ against $r > 0$ is greater than the critical value, but the Trace statistic for testing $r = 1$ against $r > 1$ is not greater than the critical value.

The following statements fit a VECM(2) form to the simulated data. From the result in [Figure 35.13](#), the time series are cointegrated with rank=1. You specify the ECM= option with the RANK=1 option. For normalizing the value of the cointegrated vector, you specify the normalized variable with the NORMALIZE= option. The PRINT=(IARR) option provides the VAR(2) representation. The VARMAX procedure output is shown in [Figure 35.14](#) through [Figure 35.16](#).

```

/*--- Vector Error-Correction Model ---*/

proc varmax data=simul2;
  model y1 y2 / p=2 noint lagmax=3
             ecm=(rank=1 normalize=y1)
             print=(iarr estimates);
run;

```

The ECM= option produces the estimates of the long-run parameter, β , and the adjustment coefficient, α . In Figure 35.14, “1” indicates the first column of the α and β matrices. Since the cointegration rank is 1 in the bivariate system, α and β are two-dimensional vectors. The estimated cointegrating vector is $\hat{\beta} = (1, -1.96)'$. Therefore, the long-run relationship between y_{1t} and y_{2t} is $y_{1t} = 1.96y_{2t}$. The first element of $\hat{\beta}$ is 1 since y_1 is specified as the normalized variable.

Figure 35.14 Parameter Estimates for the VECM(2) Form

The VARMAX Procedure		
Type of Model	VECM(2)	
Estimation Method	Maximum Likelihood Estimation

y2	-1.95575	
Alpha		
Variable	1	
y1	-0.46680	
y2	0.10667	

Figure 35.15 shows the parameter estimates in terms of lag one coefficients, y_{t-1} , and lag one first differenced coefficients, Δy_{t-1} , and their significance. “Alpha * Beta” indicates the coefficients of y_{t-1} and is obtained by multiplying the “Alpha” and “Beta” estimates in Figure 35.14. The parameter AR1_i_j corresponds to the elements in the “Alpha * Beta” matrix. The t values and p -values corresponding to the parameters AR1_i_j are missing since the parameters AR1_i_j have non-Gaussian distributions. The parameter AR2_i_j corresponds to the elements in the differenced lagged AR coefficient matrix. The “D_” prefixed to a variable name in Figure 35.15 implies differencing.

Figure 35.15 Parameter Estimates for the VECM(2) Form

	AR2_1_1	-0.74332	0.04526	-16.42	0.0001	D_y1(t-1)
	AR2_1_2	-0.74621	0.04769	-15.65	0.0001	D_y2(t-1)
D_y2	AR1_2_1	0.10667	0.05146			y1(t-1)
	AR1_2_2	-0.20862	0.10064			y2(t-1)
	AR2_2_1	0.40493	0.04867	8.32	0.0001	D_y1(t-1)
	AR2_2_2	-0.57157	0.05128	-11.15	0.0001	D_y2(t-1)

The fitted model is given as

$$\Delta \mathbf{y}_t = \begin{pmatrix} -0.467 & 0.913 \\ (0.048) & (0.094) \\ 0.107 & -0.209 \\ (0.051) & (0.100) \end{pmatrix} \mathbf{y}_{t-1} + \begin{pmatrix} -0.743 & -0.746 \\ (0.045) & (0.048) \\ 0.405 & -0.572 \\ (0.049) & (0.051) \end{pmatrix} \Delta \mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t$$

Figure 35.16 Change the VECM(2) Form to the VAR(2) Model

Infinite Order AR Representation				
Lag	Variable	y1	y2	
1	y1	-0.21013	0.16674	
	y2	0.51160	0.21980	
2	y1	0.74332	0.74621	
	y2	-0.40493	0.57157	
3	y1	0.00000	0.00000	
	y2	0.00000	0.00000	

The PRINT=(IARR) option in the previous SAS statements prints the reparameterized coefficient estimates. For the LAGMAX=3 in the SAS statements, the coefficient matrix of lag 3 is zero.

The VECM(2) form in Figure 35.16 can be rewritten as the following second-order vector autoregressive model:

$$\mathbf{y}_t = \begin{pmatrix} -0.210 & 0.167 \\ 0.512 & 0.220 \end{pmatrix} \mathbf{y}_{t-1} + \begin{pmatrix} 0.743 & 0.746 \\ -0.405 & 0.572 \end{pmatrix} \mathbf{y}_{t-2} + \boldsymbol{\epsilon}_t$$

Bayesian Vector Error Correction Model

Bayesian inference on a cointegrated system begins by using the priors of $\boldsymbol{\beta}$ obtained from the VECM(p) form. Bayesian vector error correction models can improve forecast accuracy for cointegrated processes.

The following statements fit a BVECM(2) form to the simulated data. You specify both the PRIOR= and ECM= options for the Bayesian vector error correction model. The VARMAX procedure output is shown in Figure 35.17.

```
/*--- Bayesian Vector Error-Correction Model ---*/

proc varmax data=simul2;
  model y1 y2 / p=2 noint
             prior=( lambda=0.5 theta=0.2 )
             ecm=( rank=1 normalize=y1 )
             print=(estimates);
run;
```

Figure 35.17 shows the model type fitted to the data, the estimates of the adjustment coefficient (α), the parameter estimates in terms of lag one coefficients (\mathbf{y}_{t-1}), and lag one first differenced coefficients ($\Delta \mathbf{y}_{t-1}$).

Vector Autoregressive Process with Exogenous Variables

A VAR process can be affected by other observable variables that are determined outside the system of interest. Such variables are called exogenous (independent) variables. Exogenous variables can be stochastic or nonstochastic. The process can also be affected by the lags of exogenous variables. A model used to describe this process is called a VARX(p,s) model.

The VARX(p,s) model is written as

$$\mathbf{y}_t = \boldsymbol{\delta} + \sum_{i=1}^p \Phi_i \mathbf{y}_{t-i} + \sum_{i=0}^s \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

where $\mathbf{x}_t = (x_{1t}, \dots, x_{rt})'$ is an r -dimensional time series vector and Θ_i^* is a $k \times r$ matrix.

For example, a VARX(1,0) model is

$$\mathbf{y}_t = \boldsymbol{\delta} + \Phi_1 \mathbf{y}_{t-1} + \Theta_0^* \mathbf{x}_t + \boldsymbol{\epsilon}_t$$

where $\mathbf{y}_t = (y_{1t}, y_{2t}, y_{3t})'$ and $\mathbf{x}_t = (x_{1t}, x_{2t})'$.

The following statements fit the VARX(1,0) model to the given data:

```
data grunfeld;
  input year y1 y2 y3 x1 x2 x3;
  label y1='Gross Investment GE'
        y2='Capital Stock Lagged GE'
        y3='Value of Outstanding Shares GE Lagged'

	AR1_3_3	0.93801	0.01821	51.50	0.0001	y3(t-1)

The fitted model is given as

$$\begin{pmatrix} y_{1t} \\ y_{2t} \\ y_{3t} \end{pmatrix} = \begin{pmatrix} -12.013 \\ (27.471) \\ 702.086 \\ (256.480) \\ -22.421 \\ (10.312) \end{pmatrix} + \begin{pmatrix} 1.693 & -0.009 \\ (0.544) & (0.054) \\ -6.099 & 2.580 \\ (5.078) & (0.501) \\ -0.023 & -0.013 \\ (0.204) & (0.020) \end{pmatrix} \begin{pmatrix} x_{1t} \\ x_{2t} \end{pmatrix} \\
 + \begin{pmatrix} 0.237 & 0.008 & 0.029 \\ (0.207) & (0.016) & (0.049) \\ -2.467 & 0.164 & -0.841 \\ (1.930) & (0.152) & (0.453) \\ 0.951 & 0.002 & 0.938 \\ (0.078) & (0.006) & (0.018) \end{pmatrix} \begin{pmatrix} y_{1,t-1} \\ y_{2,t-1} \\ y_{3,t-1} \end{pmatrix} + \begin{pmatrix} \epsilon_{1t} \\ \epsilon_{2t} \\ \epsilon_{3t} \end{pmatrix}$$

Parameter Estimation and Testing on Restrictions

In the previous example, the VARX(1,0) model is written as

$$y_t = \delta + \Theta_0^* x_t + \Phi_1 y_{t-1} + \epsilon_t$$

with

$$\Theta_0^* = \begin{pmatrix} \theta_{11}^* & \theta_{12}^* \\ \theta_{21}^* & \theta_{22}^* \\ \theta_{31}^* & \theta_{32}^* \end{pmatrix} \quad \Phi_1 = \begin{pmatrix} \phi_{11} & \phi_{12} & \phi_{13} \\ \phi_{21} & \phi_{22} & \phi_{23} \\ \phi_{31} & \phi_{32} & \phi_{33} \end{pmatrix}$$

In [Figure 35.20](#) of the preceding section, you can see several insignificant parameters. For example, the coefficients XL0_1_2, AR1_1_2, and AR1_3_2 are insignificant.

The following statements restrict the coefficients of $\theta_{12}^* = \phi_{12} = \phi_{32} = 0$ for the VARX(1,0) model.

```
/*--- Models with Restrictions and Tests ---*/

proc varmax data=grunfeld;
  model y1-y3 = x1 x2 / p=1 print=(estimates);
  restrict XL(0,1,2)=0, AR(1,1,2)=0, AR(1,3,2)=0;
run;
```

The output in [Figure 35.21](#) shows that three parameters θ_{12}^* , ϕ_{12} , and ϕ_{32} are replaced by the restricted values, zeros. In the schematic representation of parameter estimates, the three restricted parameters θ_{12}^* , ϕ_{12} , and ϕ_{32} are replaced by *.

Figure 35.21 Parameter Estimation with Restrictions

The VARMAX Procedure

y2	+	+.+	..-	
y3	-	..	+++	
+ is > 2*std error, -				
is < -2*std error, .				
is between, * is N/A				

The output in Figure 35.22 shows the estimates of the Lagrangian parameters and their significance. Based on the p -values associated with the Lagrangian parameters, you cannot reject the null hypotheses $\theta_{12}^* = 0$, $\phi_{12} = 0$, and $\phi_{32} = 0$ with the 0.05 significance level.

Figure 35.22 RESTRICT Statement Results

Testing of the Restricted Parameters				
Parameter	Estimate	Standard Error	t Value	Pr > t
XL0_1_2	1.74969	21.44026	0.08	0.9389
AR1_1_2	30.36254	70.74347	0.43	0.6899
AR1_3_2	55.42191	164.03075	0.34	0.7524

The TEST statement in the following example tests $\phi_{31} = 0$ and $\theta_{12}^* = \phi_{12} = \phi_{32} = 0$ for the VARX(1,0) model:

```

proc varmax data=grunfeld;
  model y1-y3 = x1 x2 / p=1;
  test AR(1,3,1)=0;
  test XL(0,1,2)=0, AR(1,1,2)=0, AR(1,3,2)=0;
run;

```

The output in Figure 35.23 shows that the first column in the output is the index corresponding to each TEST statement. You can reject the hypothesis test $\phi_{31} = 0$ at the 0.05 significance level, but you cannot reject the joint hypothesis test $\theta_{12}^* = \phi_{12} = \phi_{32} = 0$ at the 0.05 significance level.

Figure 35.23 TEST Statement Results

The VARMAX Procedure				
Testing of the Parameters				
Test	DF	Chi-Square	Pr > ChiSq	
1	1	150.31	<.0001	
2	3	0.34	0.9522	

Causality Testing

The following statements use the CAUSAL statement to compute the Granger causality test for a VAR(1) model. For the Granger causality tests, the autoregressive order should be defined by the P= option in the MODEL statement. The variable groups are defined in the MODEL statement as well. Regardless of whether the variables specified in the GROUP1= and GROUP2= options are designated as dependent or exogenous (independent) variables in the MODEL statement, the CAUSAL statement fits the VAR(p) model by considering the variables in the two groups as dependent variables.

```

/*--- Causality Testing ---*/

proc varmax data=grunfeld;
  model y1-y3 = x1 x2 / p=1 noprint;
  causal group1=(x1) group2=(y1-y3);
  causal group1=(y3) group2=(y1 y2);
run;

```

The output in Figure 35.24 is associated with the CAUSAL statement. The first CAUSAL statement fits the VAR(1) model by using the variables y1, y2, y3, and x1. The second CAUSAL statement fits the VAR(1) model by using the variables y1, y3, and y2.

Figure 35.24 CAUSAL Statement Results

The VARMAX Procedure			
Granger-Causality Wald Test			
Test	DF	Chi-Square	Pr > ChiSq
1	3	2.40	0.4946
2	2	262.88	<.0001
Test 1: Group 1 Variables: x1			
Group 2 Variables: y1 y2 y3			
Test 2: Group 1 Variables: y3			
Group 2 Variables: y1 y2			

The null hypothesis of the Granger causality test is that GROUP1 is influenced only by itself, and not by GROUP2.

The first column in the output is the index corresponding to each CAUSAL statement. The output shows that you cannot reject that $x1$ is influenced by itself and not by ($y1$, $y2$, $y3$) at the 0.05 significance level for Test 1. You can reject that $y3$ is influenced by itself and not by ($y1$, $y2$) for Test 2. See the section “VAR and VARX Modeling” on page 2305 for details.

Syntax: VARMAX Procedure

```

PROC VARMAX options ;
  BY variables ;
  CAUSAL GROUP1=(variables) GROUP2=(variables) ;
  COINTEG RANK=number < options > ;
  ID variable INTERVAL=value < ALIGN=value > ;
  MODEL dependents < = regressors > < , dependents < = regressors > ... > < / options > ;
  GARCH options ;
  NLOPTIONS options ;
  OUTPUT < options > ;
  RESTRICT restriction, ..., restriction ;
  TEST restriction, ..., restriction ;

```

Functional Summary

The statements and options used with the VARMAX procedure are summarized in the following table:

Table 35.1 VARMAX Functional Summary

Description	Statement	Option
Data Set Options		
Specifies the input data set	VARMAX	DATA=
Writes parameter estimates to an output data set	VARMAX	OUTEST=
include covariances in the OUTEST= data set	VARMAX	OUTCOV
Writes the diagnostic checking tests for a model and the cointegration test results to an output data set	VARMAX	OUTSTAT=
Writes actuals, predictions, residuals, and confidence limits to an output data set	OUTPUT	OUT=
Writes the conditional covariance matrix to an output data set	GARCH	OUTHT=
BY Groups		
Specifies BY-group processing	BY	
ID Variable		
Specifies the identifying variable	ID	
Specifies the time interval between observations	ID	INTERVAL=
Controls the alignment of SAS date values	ID	ALIGN=
Options to Control the Optimization Process		
Specifies the optimization options	NLOPTIONS	
Printing Control Options		
Specifies how many lags to print results	MODEL	LAGMAX=
Suppresses the printed output	MODEL	NOPRINT
Requests all printing options	MODEL	PRINTALL
Requests the printing format	MODEL	PRINTFORM=
Controls plots produced through ODS GRAPHICS	VARMAX	PLOTS=
PRINT= Option		
Prints the correlation matrix of parameter estimates	MODEL	CORRB
Prints the cross-correlation matrices of independent variables	MODEL	CORRX
Prints the cross-correlation matrices of dependent variables	MODEL	CORRY
Prints the covariance matrices of prediction errors	MODEL	COVPE
Prints the cross-covariance matrices of the independent variables	MODEL	COVX
Prints the cross-covariance matrices of the dependent variables	MODEL	COVY
Prints the covariance matrix of parameter estimates	MODEL	COVB
Prints the decomposition of the prediction error covariance matrix	MODEL	DECOMPOSE

Table 35.1 *continued*

Description	Statement	Option
Prints the residual diagnostics	MODEL	DIAGNOSE
Prints the contemporaneous relationships among the components of the vector time series	MODEL	DYNAMIC
Prints the parameter estimates	MODEL	ESTIMATES
Prints the infinite order AR representation	MODEL	IARR
Prints the impulse response function	MODEL	IMPULSE=
Prints the impulse response function in the transfer function	MODEL	IMPULSX=
Prints the partial autoregressive coefficient matrices	MODEL	PARCOEF
Prints the partial canonical correlation matrices	MODEL	PCANCORR
Prints the partial correlation matrices	MODEL	PCORR
Prints the eigenvalues of the companion matrix	MODEL	ROOTS
Prints the Yule-Walker estimates	MODEL	YW
Model Estimation and Order Selection Options		
Centers the dependent variables	MODEL	CENTER
Specifies the degrees of differencing for the specified model variables	MODEL	DIF=
Specifies the degrees of differencing for all independent variables	MODEL	DIFX=
Specifies the degrees of differencing for all dependent variables	MODEL	DIFY=
Specifies the vector error correction model	MODEL	ECM=
Specifies the estimation method	MODEL	METHOD=
Selects the tentative order	MODEL	MINIC=
Suppresses the current values of independent variables	MODEL	NOCURRENTX
Suppresses the intercept parameters	MODEL	NOINT
Specifies the number of seasonal periods	MODEL	NSEASON=
Specifies the order of autoregressive polynomial	MODEL	P=
Specifies the Bayesian prior model	MODEL	PRIOR=
Specifies the order of moving-average polynomial	MODEL	Q=
Centers the seasonal dummies	MODEL	SCENTER
Specifies the degree of time trend polynomial	MODEL	TREND=
Specifies the denominator for error covariance matrix estimates	MODEL	VARDEF=
Specifies the lag order of independent variables	MODEL	XLAG=
GARCH Related Options		
Specifies the GARCH-type model	GARCH	FORM=
Specifies the order of the GARCH polynomial	GARCH	P=
Specifies the order of the ARCH polynomial	GARCH	Q=

Table 35.1 *continued*

Description	Statement	Option
Cointegration Related Options		
Prints the results from the weak exogeneity test of the long-run parameters	COINTEG	EXOGENEITY
Specifies the restriction on the cointegrated coefficient matrix	COINTEG	H=
Specifies the restriction on the adjustment coefficient matrix	COINTEG	J=
Specifies the variable name whose cointegrating vectors are normalized	COINTEG	NORMALIZE=
Specifies a cointegration rank	COINTEG	RANK=
Prints the Johansen cointegration rank test	MODEL	COINTTEST= (JOHANSEN=)
Prints the Stock-Watson common trends test	MODEL	COINTTEST=(SW=)
Prints the Dickey-Fuller unit root test	MODEL	DFTEST=
Tests and Restrictions on Parameters		
Tests the Granger causality	CAUSAL	GROUP1= GROUP2=
Places and tests restrictions on parameter estimates	RESTRICT	
Tests hypotheses on parameter estimates	TEST	
Forecasting Control Options		
Specifies the size of confidence limits for forecasting	OUTPUT	ALPHA=
Starts forecasting before end of the input data	OUTPUT	BACK=
Specifies how many periods to forecast	OUTPUT	LEAD=
Suppresses the printed forecasts	OUTPUT	NOPRINT

PROC VARMAX Statement

PROC VARMAX *options* ;

The following options can be used in the PROC VARMAX statement:

DATA=SAS-data-set

specifies the input SAS data set. If the DATA= option is not specified, the PROC VARMAX statement uses the most recently created SAS data set.

OUTEST=SAS-data-set

writes the parameter estimates to the output data set.

COVOUT

OUTCOV

writes the covariance matrix for the parameter estimates to the OUTEST= data set. This option is valid only if the OUTEST= option is specified.

OUTSTAT=SAS-data-set

writes residual diagnostic results to an output data set. If the COINTTEST=(JOHANSEN) option is specified, the results of this option are also written to the output data set.

The following statements are the examples of these options in the PROC VARMAX statement:

```
proc varmax data=one outest=est outcov outstat=stat;
  model y1-y3 / p=1;
run;

proc varmax data=one outest=est outstat=stat;
  model y1-y3 / p=1 cointtest=(johansen);
run;
```

PLOTS<(global-plot-option)> = plot-request-option <(options)>

PLOTS<(global-plot-option)> = (plot-request-option <(options)> ... plot-request-option <(options)>)

controls the plots produced through ODS Graphics. When you specify only one plot, you can omit the parentheses around the plot request. Some examples follow:

```
plots=none
plots=all
plots(unpack)=residual(residual normal)
plots=(forecasts model)
```

For general information about ODS Graphics, see Chapter 21, “[Statistical Graphics Using ODS](#)” (*SAS/STAT User’s Guide*).

```
proc varmax data=one plots=impulse(simple);
  model y1-y3 / p=1;
run;

proc varmax data=one plots=(model residual);
  model y1-y3 / p=1;
run;

proc varmax data=one plots=forecasts;
  model y1-y3 / p=1;
  output lead=12;
run;
```

The first VARMAX program produces the simple response impulse plots. The second VARMAX program produces the plots associated with the model and prediction errors. The plots associated with prediction errors are the ACF, PACF, IACF, distribution, white-noise, and Normal quantile plots and the prediction error plot. The third VARMAX program produces the FORECASTS and FORECAST-ONLY plots.

The *global-plot-option* applies to the impulse and prediction error analysis plots generated by the VARMAX procedure. The following *global-plot-option* is available:

UNPACK breaks a graphic that is otherwise paneled into individual component plots.

The following *plot-request-options* are available:

ALL produces all plots appropriate for the particular analysis.

FORECASTS <(forecasts-plot-options)> produces plots of the forecasts. The forecasts-only plot that shows the multistep forecasts in the forecast region is produced by default. The following *forecasts-plot-options* are available:

ALL produces the FORECASTSONLY and the FORECASTS plots. This is the default.

FORECASTS produces a plot that shows the one-step-ahead as well as the multistep forecasts.

FORECASTSONLY produces a plot that shows only the multistep forecasts.

IMPULSE <(impulse-plot-options)> produces the plots of impulse response function and the impulse response of the transfer function.

ALL produces all impulse plots. This is the default.

ACCUM produces the accumulated impulse plot.

ORTH produces the orthogonalized impulse plot.

SIMPLE produces the simple impulse plot.

MODEL produces plots of dependent variables listed in the MODEL statement and plots of the one-step-ahead predicted values for each dependent variables.

NONE suppresses all plots.

RESIDUAL <(residual-plot-options)> produces plots associated with the prediction errors obtained after modeling the data. The following *residual-plot-options* are available:

ALL produces all plots associated with the analysis of the prediction errors. This is the default.

RESIDUAL produces prediction error plot.

DIAGNOSTICS produces a panel of plots useful in assessing the autocorrelations and white-noise of the prediction errors. The panel consists of the following:

- the autocorrelation plot of the prediction errors
- the partial autocorrelation plot of the prediction errors
- the inverse autocorrelation plot of the prediction errors
- the log scaled white noise plot of the prediction errors

NORMAL produces a panel of plots useful in assessing normality of the prediction errors. The panel consists of the following:

- distribution of the prediction errors with overlaid the normal curve
- normal quantile plot of the prediction errors

Other Options

In addition, any of the following MODEL statement options can be specified in the PROC VARMAX statement, which is equivalent to specifying the option for every MODEL statement: CENTER, DFTEST=, DIF=, DIFX=, DIFY=, LAGMAX=, METHOD=, MINIC=, NOCURRENTX, NOINT, NOPRINT, NSEASON=, P=, PRINT=, PRINTALL, PRINTFORM=, Q=, SCENTER, TREND=, VARDEF=, and XLAG= options.

The following is an example of the options in the PROC VARMAX statement:

```
proc varmax data=one lagmax=3 method=ml;
    model y1-y3 / p=1;
run;
```

BY Statement

BY variables ;

A BY statement can be used with PROC VARMAX to obtain separate analyses on observations in groups defined by the BY variables.

When a BY statement appears, the procedure expects the input data set to be sorted in order of the BY variables.

If your input data set is not sorted in ascending order, use one of the following alternatives:

- Sort the data using the SORT procedure with a similar BY statement.
- Specify the BY statement option NOTSORTED or DESCENDING in the BY statement for the VARMAX procedure. The NOTSORTED option does not mean that the data are unsorted but rather that the data are arranged in groups (according to values of the BY variables) and that these groups are not necessarily in alphabetical or increasing numeric order.
- Create an index on the BY variables using the DATASETS procedure.

For more information about the BY statement, see in *SAS Language Reference: Concepts*. For more information about the DATASETS procedure, see the discussion in the *Base SAS Procedures Guide*.

The following is an example of the BY statement:

```
proc varmax data=one;
    by region;
```

```

model y1-y3 / p=1;
run;

```

CAUSAL Statement

CAUSAL GROUP1=(variables) GROUP2=(variables) ;

A CAUSAL statement prints the Granger causality test by fitting the VAR(p) model by using all variables defined in GROUP1 and GROUP2. Any number of CAUSAL statements can be specified. The CAUSAL statement proceeds with the MODEL statement and uses the variables and the autoregressive order, p , specified in the MODEL statement. Variables in the GROUP1= and GROUP2= options should be defined in the MODEL statement. If the P=0 option is specified in the MODEL statement, the CAUSAL statement is not applicable.

The null hypothesis of the Granger causality test is that GROUP1 is influenced only by itself, and not by GROUP2. If the hypothesis test fails to reject the null, then the variables listed in GROUP1 might be considered as independent variables.

See the section “VAR and VARX Modeling” on page 2305 for details.

The following is an example of the CAUSAL statement. You specify the CAUSAL statement with the GROUP1= and GROUP2= options.

```

proc varmax data=one;
  model y1-y3 = x1 / p=1;
  causal group1=(x1) group2=(y1-y3);
  causal group1=(y2) group2=(y1 y3);
run;

```

The first CAUSAL statement fits the VAR(1) model by using the variables y1, y2, y3, and x1 and tests the null hypothesis that x1 causes the other variables, y1, y2, and y3, but the other variables do not cause x1. The second CAUSAL statement fits the VAR(1) model by using the variables y1, y3, and y2 and tests the null hypothesis that y2 causes the other variables, y1 and y3, but the other variables do not cause y2.

COINTEG Statement

**COINTEG RANK=number <H=(matrix)> <J=(matrix)>
< EXOGENEITY > < NORMALIZE=variable > ;**

The COINTEG statement fits the vector error correction model to the data, tests the restrictions of the long-run parameters and the adjustment parameters, and tests for the weak exogeneity in the long-run parameters. The cointegrated system uses the maximum likelihood analysis proposed by Johansen and Juselius (1990) and Johansen (1995a, 1995b). Only one COINTEG statement is allowed.

You specify the ECM= option in the MODEL statement or the COINTEG statement to fit the VECM(p). The P= option in the MODEL statement is used to specify the autoregressive order of the VECM.

The following statements are equivalent for fitting a VECM(2).

```
proc varmax data=one;
  model y1-y3 / p=2 ecm=(rank=1);
run;
```

```
proc varmax data=one;
  model y1-y3 / p=2;
  cointeg rank=1;
run;
```

To test restrictions of either α or β or both, you specify either J= or H= or both, respectively. You specify the EXOGENEITY option in the COINTEG statement for tests of the weak exogeneity in the long-run parameters.

The following is an example of the COINTEG statement.

```
proc varmax data=one;
  model y1-y3 / p=2;
  cointeg rank=1 h=(1 0, -1 0, 0 1)
                j=(1 0, 0 0, 0 1) exogeneity;
run;
```

The following options can be used in the COINTEG statement:

EXOGENEITY

formulates the likelihood ratio tests for testing weak exogeneity in the long-run parameters. The null hypothesis is that one variable is weakly exogenous for the others.

H=(matrix)

specifies the restrictions H on the $k \times r$ or $(k + 1) \times r$ cointegrated coefficient matrix β such that $\beta = H\phi$, where H is known and ϕ is unknown. If the VECM(p) is specified with the COINTEG statement or with the ECM= option in the MODEL statement and the ECTREND option is not included with the ECM= specification, then the H matrix has dimension $k \times m$. If the VECM(p) is specified with the COINTEG statement or with the ECM= option in the MODEL statement and the ECTREND option is also used, then the H matrix has dimension $(k + 1) \times m$. Here k is the number of dependent variables, and m is $r \leq m < k$ where r is defined with the RANK= r option.

For example, consider a system that contains four variables and the RANK=1 option with $\beta = (\beta_1, \beta_2, \beta_3, \beta_4)'$. The restriction matrix for the test of $\beta_1 + \beta_2 = 0$ can be specified as

```
cointeg rank=1 h=(1 0 0, -1 0 0, 0 1 0, 0 0 1);
```

Here the matrix H is 4×3 where $k = 4$ and $m = 3$, and each row of the matrix H is separated by commas.

When the series has no separate deterministic trend, the constant term should be restricted by $\alpha'_{\perp} \delta = 0$. In the preceding example, the β can be either $\beta = (\beta_1, \beta_2, \beta_3, \beta_4, 1)'$ or $\beta = (\beta_1, \beta_2, \beta_3, \beta_4, t)'$. You can specify the restriction matrix for the previous test of $\beta_1 + \beta_2 = 0$ as follows:

```
cointeg rank=1
  h=(1 0 0 0, -1 0 0 0, 0 1 0 0, 0 0 1 0, 0 0 0 1);
```

When the cointegrated system contains three dependent variables and the RANK=2 option, you can specify the restriction matrix for the test of $\beta_{1j} = -\beta_{2j}$ for $j = 1, 2$ as follows:

```
cointeg rank=2 h=(1 0, -1 0, 0 1);
```

J=(matrix)

specifies the restrictions J on the $k \times r$ adjustment matrix α such that $\alpha = J\psi$, where J is known and ψ is unknown. The $k \times m$ matrix J is specified by using this option, where k is the number of dependent variables, m is $r \leq m < k$, and r is defined with the RANK= r option.

For example, when the system contains four variables and the RANK=1 option is used, you can specify the restriction matrix for the test of $\alpha_j = 0$ for $j = 2, 3, 4$ as follows:

```
cointeg rank=1 j=(1, 0, 0, 0);
```

When the system contains three variables and the RANK=2 option, you can specify the restriction matrix for the test of $\alpha_{2j} = 0$ for $j = 1, 2$ as follows:

```
cointeg rank=2 j=(1 0, 0 0, 0 1);
```

NORMALIZE=variable

specifies a single dependent (endogenous) variable name whose cointegrating vectors are normalized. If the variable name is different from that specified in the COINTTEST=(JOHANSEN=) or ECM= option in the MODEL statement, the variable name specified in the COINTEG statement is used. If the normalized variable is not specified, cointegrating vectors are not normalized.

RANK=number

specifies the cointegration rank of the cointegrated system. This option is required in the COINTEG statement. The rank of cointegration should be greater than zero and less than the number of dependent (endogenous) variables. If the value of the RANK= option in the COINTEG statement is different from that specified in the ECM= option, the rank specified in the COINTEG statement is used.

ID Statement

ID variable INTERVAL=value < ALIGN=value > ;

The ID statement specifies a variable that identifies observations in the input data set. The datetime variable specified in the ID statement is included in the OUT= data set if the OUTPUT statement is specified. The ID *variable* is usually a SAS datetime variable. The values of the ID variable are extrapolated for the forecast observations based on the value of the INTERVAL= option.

ALIGN= value

controls the alignment of SAS dates used to identify output observations. The ALIGN= option allows the following values: BEGINNING | BEG | B, MIDDLE | MID | M, and ENDING | END | E. The default is BEGINNING. The ALIGN= option is used to align the ID variable to the beginning, middle, or end of the time ID interval specified by the INTERVAL= option.

INTERVAL= value

specifies the time interval between observations. This option is required in the ID statement. The INTERVAL= option is used in conjunction with the ID variable to check that the input data are in order and have no missing periods. The INTERVAL= option is also used to extrapolate the ID values past the end of the input data when the OUTPUT statement is specified.

The following is an example of the ID statement:

```
proc varmax data=one;
  id date interval=qtr align=mid;
  model y1-y3 / p=1;
run;
```

MODEL Statement

MODEL *dependents < = regressors >*
 < , *dependents < = regressors > ... >*
 < / options > ;

The MODEL statement specifies dependent (endogenous) variables and independent (exogenous) variables for the VARMAX model. The multivariate model can have the same or different independent variables corresponding to the dependent variables. As a special case, the VARMAX procedure allows you to analyze one dependent variable. Only one MODEL statement is allowed.

For example, the following statements are equivalent ways of specifying the multivariate model for the vector (y1, y2, y3):

```
model y1 y2 y3 </options>;
model y1-y3 </options>;
```

The following statements are equivalent ways of specifying the multivariate model with independent variables, where y1, y2, y3, and y4 are the dependent variables and x1, x2, x3, x4, and x5 are the independent variables:

```
model y1 y2 y3 y4 = x1 x2 x3 x4 x5 </options>;
model y1 y2 y3 y4 = x1-x5 </options>;
model y1 = x1-x5, y2 = x1-x5, y3 y4 = x1-x5 </options>;
model y1-y4 = x1-x5 </options>;
```

When the multivariate model has different independent variables that correspond to each of the dependent variables, equations are separated by commas (,) and the model can be specified as illustrated by the following MODEL statement:

```
model y1 = x1-x3, y2 = x3-x5, y3 y4 = x1-x5 </options>;
```

The following options can be used in the MODEL statement after a forward slash (/):

CENTER

centers the dependent (endogenous) variables by subtracting their means. Note that centering is done after differencing when the DIF= or DIFY= option is specified. If there are exogenous (independent) variables, this option is not applicable.

```
model y1 y2 / p=1 center;
```

DIF(*variable (number-list) < ... variable (number-list) >*)

DIF=(*variable (number-list) < ... variable (number-list) >*)

specifies the degrees of differencing to be applied to the specified dependent or independent variables. The *number-list* must contain one or more numbers, each of which should be greater than zero. The differencing can be the same for all variables, or it can vary among variables. For example, the DIF=($y_1(1,4)$ $y_3(1)$ $x_2(2)$) option specifies that the series y_1 is differenced at lag 1 and at lag 4, which is

$$(1 - B^4)(1 - B)y_{1t} = (y_{1t} - y_{1,t-1}) - (y_{1,t-4} - y_{1,t-5})$$

the series y_3 is differenced at lag 1, which is $(y_{3t} - y_{3,t-1})$; and the series x_2 is differenced at lag 2, which is $(x_{2t} - x_{2,t-2})$.

The following uses the data dy_1 , y_2 , x_1 , and dx_2 , where $dy_1 = (1 - B)y_{1t}$ and $dx_2 = (1 - B)^2x_{2t}$.

```
model y1 y2 = x1 x2 / p=1 dif=(y1(1) x2(2));
```

DIFX(*number-list*)

DIFX=(*number-list*)

specifies the degrees of differencing to be applied to all independent variables. The *number-list* must contain one or more numbers, each of which should be greater than zero. For example, the DIFX=(1) option specifies that all of the independent series are differenced once at lag 1. The DIFX=(1,4) option specifies that all of the independent series are differenced at lag 1 and at lag 4. If independent variables are specified in the DIF= option, then the DIFX= option is ignored.

The following statement uses the data y_1 , y_2 , dx_1 , and dx_2 , where $dx_1 = (1 - B)x_{1t}$ and $dx_2 = (1 - B)x_{2t}$.

```
model y1 y2 = x1 x2 / p=1 difx(1);
```

DIFY(*number-list*)

DIFY=(*number-list*)

specifies the degrees of differencing to be applied to all dependent (endogenous) variables. The *number-list* must contain one or more numbers, each of which should be greater than zero. For details, see the DIFX= option. If dependent variables are specified in the DIF= option, then the DIFY= option is ignored.

```
model y1 y2 / p=1 dify(1);
```

METHOD=*value*

requests the type of estimates to be computed. The possible values of the METHOD= option are as follows:

LS specifies least squares estimates.
ML specifies maximum likelihood estimates.

When the ECM=, PRIOR=, and Q= options and the GARCH statement are specified, the default ML method is used regardless of the method given by the METHOD= option.

```
model y1 y2 / p=1 method=ml;
```

NOCURRENTX

suppresses the current values x_t of the independent variables. In general, the VARX(p, s) model is

$$y_t = \delta + \sum_{i=1}^p \Phi_i y_{t-i} + \sum_{i=0}^s \Theta_i^* x_{t-i} + \epsilon_t$$

where p is the number of lags of the dependent variables included in the model, and s is the number of lags of the independent variables included in the model, including the contemporaneous values of x_t .

A VARX(1,2) model can be specified as:

```
model y1 y2 = x1 x2 / p=1 xlag=2;
```

If the NOCURRENTX option is specified, it suppresses the current values x_t and starts with x_{t-1} . The VARX(p, s) model is redefined as:

$$y_t = \delta + \sum_{i=1}^p \Phi_i y_{t-i} + \sum_{i=1}^s \Theta_i^* x_{t-i} + \epsilon_t$$

This model with $p = 1$ and $s = 2$ can be specified as:

```
model y1 y2 = x1 x2 / p=1 xlag=2 nocurrentx;
```

NOINT

suppresses the intercept parameter δ .

```
model y1 y2 / p=1 noint;
```

NSEASON=*number*

specifies the number of seasonal periods. When the NSEASON=*number* option is specified, (*number* - 1) seasonal dummies are added to the regressors. If the NOINT option is specified, the NSEASON= option is not applicable.

```
model y1 y2 / p=1 nseason=4;
```

SCENTER

centers seasonal dummies specified by the NSEASON= option. The centered seasonal dummies are generated by $c - (1/s)$, where c is a seasonal dummy generated by the NSEASON= s option.

```
model y1 y2 / p=1 nseason=4 scenter;
```

TREND=value

specifies the degree of deterministic time trend included in the model. Valid values are as follows:

LINEAR	includes a linear time trend as a regressor.
QUAD	includes linear and quadratic time trends as regressors.

The TREND=QUAD option is not applicable for a cointegration analysis.

```
model y1 y2 / p=1 trend=linear;
```

VARDEF=value

corrects for the degrees of freedom of the denominator for computing an error covariance matrix for the METHOD=LS option. If the METHOD=ML option is specified, the VARDEF=N option is always used. Valid values are as follows:

DF	specifies that the number of nonmissing observation minus the number of regressors be used.
N	specifies that the number of nonmissing observation be used.

```
model y1 y2 / p=1 vardef=n;
```

Printing Control Options

LAGMAX=number

specifies the maximum number of lags for which results are computed and displayed by the PRINT=(CORRX CORRY COVX COVY IARR IMPULSE= IMPULSX= PARCOEF PCANCORR PCORR) options. This option is also used to limit the printed results for the cross covariances and cross-correlations of residuals. The default is LAGMAX=min(12, $T-2$), where T is the number of nonmissing observations.

```
model y1 y2 / p=1 lagmax=6;
```

NOPRINT

suppresses all printed output.

```
model y1 y2 / p=1 noprint;
```

PRINTALL

requests all printing control options. The options set by the option PRINTALL are DFTEST=, MINIC=, PRINTFORM=BOTH, and PRINT=(CORRB CORRX CORRY COVB COVPE COVX COVY DECOMPOSE DYNAMIC IARR IMPULSE=(ALL) IMPULSX=(ALL) PARCOEF PCAN-CORR PCORR ROOTS YW).

You can also specify this option as the option ALL.

```
model y1 y2 / p=1 printall;
```

PRINTFORM=value

requests the printing format of the output generated by the PRINT= option and cross covariances and cross-correlations of residuals. Valid values are as follows:

BOTH	prints output in both MATRIX and UNIVARIATE forms.
MATRIX	prints output in matrix form. This is the default.
UNIVARIATE	prints output by variables.

```
model y1 y2 / p=1 print=(impulse) printform=univariate;
```

Printing Options**PRINT=(options)**

The following options can be used in the PRINT=() option. The options are listed within parentheses. If a number in parentheses follows an option listed below, then the option prints the number of lags specified by *number* in parentheses. The default is the number of lags specified by the LAG-MAX=*number* option.

CORRB

prints the estimated correlations of the parameter estimates.

CORRX**CORRX(number)**

prints the cross-correlation matrices of exogenous (independent) variables. The *number* should be greater than zero.

CORRY**CORRY(number)**

prints the cross-correlation matrices of dependent (endogenous) variables. The *number* should be greater than zero.

COVB

prints the estimated covariances of the parameter estimates.

COVPE

COVPE(*number*)

prints the covariance matrices of *number*-ahead prediction errors for the VARMAX(*p,q,s*) model. The *number* should be greater than zero. If the DIF= or DIFY= option is specified, the covariance matrices of multistep prediction errors are computed based on the differenced data. This option is not applicable when the PRIOR= option is specified. See the section “[Forecasting](#)” on page 2294 for details.

COVX**COVX(*number*)**

prints the cross-covariance matrices of exogenous (independent) variables. The *number* should be greater than zero.

COVY**COVY(*number*)**

prints the cross-covariance matrices of dependent (endogenous) variables. The *number* should be greater than zero.

DECOMPOSE**DECOMPOSE(*number*)**

prints the decomposition of the prediction error covariances using up to the number of lags specified by *number* in parentheses for the VARMA(*p,q*) model. The *number* should be greater than zero. It can be interpreted as the contribution of innovations in one variable to the mean squared error of the multistep forecast of another variable. The DECOMPOSE option also prints proportions of the forecast error variance.

If the DIF= or DIFY= option is specified, the covariance matrices of multistep prediction errors are computed based on the differenced data. This option is not applicable when the PRIOR= option is specified. See the section “[Forecasting](#)” on page 2294 for details.

DIAGNOSE

prints the residual diagnostics and model diagnostics.

DYNAMIC

prints the contemporaneous relationships among the components of the vector time series.

ESTIMATES

prints the coefficient estimates and a schematic representation of the significance and sign of the parameter estimates.

IARR**IARR(*number*)**

prints the infinite order AR representation of a VARMA process. The *number* should be greater than zero. If the ECM= option and the COINTEG statement are specified, then the reparameterized AR coefficient matrices are printed.

IMPULSE**IMPULSE(*number*)**

IMPULSE=(SIMPLE ACCUM ORTH STDERR ALL)

IMPULSE(*number*)=(SIMPLE ACCUM ORTH STDERR ALL)

prints the impulse response function. The *number* should be greater than zero. It investigates the response of one variable to an impulse in another variable in a system that involves a number of other variables as well. It is an infinite order MA representation of a VARMA process. See the section “[Impulse Response Function](#)” on page 2283 for details.

The following options can be used in the IMPULSE=() option. The options are specified within parentheses.

ACCUM	prints the accumulated impulse response function.
ALL	is equivalent to specifying all of SIMPLE, ACCUM, ORTH, and STDERR.
ORTH	prints the orthogonalized impulse response function.
SIMPLE	prints the impulse response function. This is the default.
STDERR	prints the standard errors of the impulse response function, the accumulated impulse response function, or the orthogonalized impulse response function.

If the exogenous variables are used to fit the model, then the STDERR option is ignored.

IMPULSX**IMPULSX(*number*)****IMPULSX=(SIMPLE ACCUM ALL)****IMPULSX(*number*)=(SIMPLE ACCUM ALL)**

prints the impulse response function related to exogenous (independent) variables. The *number* should be greater than zero. See the section “[Impulse Response Function](#)” on page 2283 for details.

The following options can be used in the IMPULSX=() option. The options are specified within parentheses.

ACCUM	prints the accumulated impulse response matrices for the transfer function.
ALL	is equivalent to specifying both SIMPLE and ACCUM.
SIMPLE	prints the impulse response matrices for the transfer function. This is the default.

PARCOEF**PARCOEF**(*number*)

prints the partial autoregression coefficient matrices, Φ_{mm} up to the lag *number*. The *number* should be greater than zero. With a VAR process, this option is useful for the identification of the order since the Φ_{mm} have the property that they equal zero for $m > p$ under the hypothetical assumption of a VAR(*p*) model. See the section “[Tentative Order Selection](#)” on page 2299 for details.

PCANCORR**PCANCORR**(*number*)

prints the partial canonical correlations of the process at lag *m* and the test for testing $\Phi_m=0$ for $m > p$ up to the lag *number*. The *number* should be greater than zero. The lag *m* partial canonical correlations are the canonical correlations between \mathbf{y}_t and \mathbf{y}_{t-m} , after adjustment for the dependence of these variables on the intervening values $\mathbf{y}_{t-1}, \dots, \mathbf{y}_{t-m+1}$. See the section “[Tentative Order Selection](#)” on page 2299 for details.

PCORR**PCORR**(*number*)

prints the partial correlation matrices. The *number* should be greater than zero. With a VAR process, this option is useful for a tentative order selection by the same property as the partial autoregression coefficient matrices, as described in the PRINT=(PARCOEF) option. See the section “[Tentative Order Selection](#)” on page 2299 for details.

ROOTS

prints the eigenvalues of the $kp \times kp$ companion matrix associated with the AR characteristic function $\Phi(B)$, where *k* is the number of dependent (endogenous) variables, and $\Phi(B)$ is the finite order matrix polynomial in the backshift operator *B*, such that $B^i \mathbf{y}_t = \mathbf{y}_{t-i}$. These eigenvalues indicate the stationary condition of the process since the stationary condition on the roots of $|\Phi(B)| = 0$ in the VAR(*p*) model is equivalent to the condition in the corresponding VAR(1) representation that all eigenvalues of the companion matrix be less than one in absolute value. Similarly, you can use this option to check the invertibility of the MA process. In addition, when the GARCH statement is specified, this option prints the roots of the GARCH characteristic polynomials to check covariance stationarity for the GARCH process.

YW

prints Yule-Walker estimates of the preliminary autoregressive model for the dependent (endogenous) variables. The coefficient matrices are printed using the maximum order of the autoregressive process.

Some examples of the PRINT= option are as follows:

```
model y1 y2 / p=1 print=(covy(10) corry(10));
model y1 y2 / p=1 print=(parcoef pcancorr pcorr);
model y1 y2 / p=1 print=(impulse(8) decompose(6) covpe(6));
model y1 y2 / p=1 print=(dynamic roots yw);
```

Lag Specification Options

P=number

P=(number-list)

specifies the order of the vector autoregressive process. Subset models of vector autoregressive orders can be specified by listing the desired set of lags. For example, you can specify the P=(1,3,4) option. The P=3 option is equivalent to the P=(1,2,3) option. The default is P=0.

If P=0 and there are no exogenous (independent) variables, then the AR polynomial order is automatically determined by minimizing an information criterion. If P=0 and the PRIOR= or ECM= option or both are specified, then the AR polynomial order is determined automatically.

If the ECM= option is specified, then subset models of vector autoregressive orders are not allowed and the AR maximum order specified is used.

Examples illustrating the P= option follow:

```
model y1 y2 / p=3;
model y1 y2 / p=(1,3);
model y1 y2 / p=(1,3) prior;
```

Q=number

Q=(number-list)

specifies the order of the moving-average error process. Subset models of moving-average orders can be specified by listing the desired set of lags. For example, you can specify the Q=(1,5) option. The default is Q=0.

```
model y1 y2 / p=1 q=1;
model y1 y2 / q=(2);
```

XLAG=*number*

XLAG=(*number-list*)

specifies the lags of exogenous (independent) variables. Subset models of distributed lags can be specified by listing the desired set of lags. For example, XLAG=(2) selects only a lag 2 of the exogenous variables. The default is XLAG=0. To exclude the present values of exogenous variables from the model, the NOCURRENTX option must be used.

```
model y1 y2 = x1-x3 / xlag=2 nocurrentx;
model y1 y2 = x1-x3 / p=1 xlag=(2);
```

Tentative Order Selection Options

MINIC

MINIC=(**TYPE=***value* **P=***number* **Q=***number* **PERROR=***number*)

prints the information criterion for the appropriate AR and MA tentative order selection and for the diagnostic checks of the fitted model.

If the MINIC= option is not specified, all types of information criteria are printed for diagnostic checks of the fitted model.

The following options can be used in the MINIC=() option. The options are specified within parentheses.

P=*number*

P=(*p_{min}:p_{max}*)

specifies the range of AR orders to be considered in the tentative order selection. The default is P=(0:5). The P=3 option is equivalent to the P=(0:3) option.

PERROR=*number*

PERROR=(*p_{ε,min}:p_{ε,max}*)

specifies the range of AR orders for obtaining the error series. The default is PERROR=(*p_{max} : p_{max} + q_{max}*).

Q=*number*

Q=(*q_{min}:q_{max}*)

specifies the range of MA orders to be considered in the tentative order selection. The default is Q=(0:5).

TYPE=*value*

specifies the criterion for the model order selection. Valid criteria are as follows:

AIC	specifies the Akaike information criterion.
AICC	specifies the corrected Akaike information criterion. This is the default criterion.
FPE	specifies the final prediction error criterion.
HQC	specifies the Hanna-Quinn criterion.
SBC	specifies the Schwarz Bayesian criterion. You can also specify this value as TYPE=BIC.

```

model y1 y2 / minic;
model y1 y2 / minic=(type=aic p=5);

```

Cointegration Related Options

Two options are related to integrated time series; one is the DFTEST option to test for a unit root and the other is the COINTTEST option to test for cointegration.

DFTEST

DFTEST=(DLAG=number)

DFTEST=(DLAG=(number) ... (number))

prints the Dickey-Fuller unit root tests. The **DLAG=(number) ... (number)** option specifies the regular or seasonal unit root test. Supported values of *number* are in 1, 2, 4, 12. If the *number* is greater than one, a seasonal Dickey-Fuller test is performed. If the **TREND=** option is specified, the seasonal unit root test is not available. The default is **DLAG=1**.

For example, the **DFTEST=(DLAG=(1)(12))** option produces two tables: the Dickey-Fuller regular unit root test and the seasonal unit root test.

Some examples of the **DFTEST=** option follow:

```

model y1 y2 / p=2 dftest;
model y1 y2 / p=2 dftest=(dlag=4);
model y1 y2 / p=2 dftest=(dlag=(1) (12));
model y1 y2 / p=2 dftest cointtest;

```

COINTTEST

COINTTEST=(JOHANSEN <(=options)> SW <(=options)> SIGLEVEL=number)

The following *options* can be used with the **COINTTEST=()** option. The *options* are specified within parentheses.

JOHANSEN

JOHANSEN=(TYPE=value IORDER=number NORMALIZE=variable)

prints the cointegration rank test for multivariate time series based on Johansen's method. This test is provided when the number of dependent (endogenous) variables is less than or equal to 11. See the section "[Vector Error Correction Modeling](#)" on page 2325 for details.

The VARX(*p,s*) model can be written as the error correction model

$$\Delta \mathbf{y}_t = \Pi \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + A D_t + \sum_{i=0}^s \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

where Π , Φ_i^* , A , and Θ_i^* are coefficient parameters; D_t is a deterministic term such as a constant, a linear trend, or seasonal dummies.

The $I(1)$ model is defined by one reduced-rank condition. If the cointegration rank is $r < k$, then there exist $k \times r$ matrices $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$ of rank r such that $\Pi = \boldsymbol{\alpha}\boldsymbol{\beta}'$.

The $I(1)$ model is rewritten as the $I(2)$ model

$$\Delta^2 \mathbf{y}_t = \Pi \mathbf{y}_{t-1} - \Psi \Delta \mathbf{y}_{t-1} + \sum_{i=1}^{p-2} \Psi_i \Delta^2 \mathbf{y}_{t-i} + A D_t + \sum_{i=0}^s \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

where $\Psi = I_k - \sum_{i=1}^{p-1} \Phi_i^*$ and $\Psi_i = -\sum_{j=i+1}^{p-1} \Phi_j^*$.

The $I(2)$ model is defined by two reduced-rank conditions. One is that $\Pi = \boldsymbol{\alpha} \boldsymbol{\beta}'$, where $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$ are $k \times r$ matrices of full-rank r . The other is that $\boldsymbol{\alpha}'_{\perp} \Psi \boldsymbol{\beta}_{\perp} = \boldsymbol{\xi} \boldsymbol{\eta}'$ where $\boldsymbol{\xi}$ and $\boldsymbol{\eta}$ are $(k-r) \times s$ matrices with $s \leq k-r$; $\boldsymbol{\alpha}_{\perp}$ and $\boldsymbol{\beta}_{\perp}$ are $k \times (k-r)$ matrices of full-rank $k-r$ such that $\boldsymbol{\alpha}' \boldsymbol{\alpha}_{\perp} = 0$ and $\boldsymbol{\beta}' \boldsymbol{\beta}_{\perp} = 0$.

The following options can be used in the JOHANSEN=() option. The options are specified within parentheses.

IORDER=*number* specifies the integrated order.

IORDER=1	prints the cointegration rank test for an integrated order 1 and prints the long-run parameter, $\boldsymbol{\beta}$, and the adjustment coefficient, $\boldsymbol{\alpha}$. This is the default. If the IORDER=1 option is specified, then the AR order should be greater than or equal to 1. When the P=0 option, the value of P is set to 1 for the Johansen test.
IORDER=2	prints the cointegration rank test for integrated orders 1 and 2. If the IORDER=2 option is specified, then the AR order should be greater than or equal to 2. If the P=1 option with the IORDER=2 option, then the value of IORDER is set to 1; if the P=0 option with the IORDER=2 option, then the value of P is set to 2.

NORMALIZE=*variable* specifies the dependent (endogenous) variable name whose cointegration vectors are to be normalized. If the normalized variable is different from that specified in the ECM= option or the COINTEG statement, then the value specified in the COINTEG statement is used.

TYPE=*value* specifies the type of cointegration rank test to be printed. Valid values are as follows:

MAX	prints the cointegration maximum eigenvalue test.
TRACE	prints the cointegration trace test. This is the default.

If the NOINT option is not specified, the procedure prints two different cointegration rank tests in the presence of the unrestricted and restricted deterministic terms (constant or linear trend) models. If the IORDER=2 option is specified, the procedure automatically determines that the TYPE=TRACE option.

Some examples that illustrate the COINTTEST= option follow:

```
model y1 y2 / p=2 cointtest=(johansen=(type=max normalize=y1));
model y1 y2 / p=2 cointtest=(johansen=(iorder=2 normalize=y1));
```

SIGLEVEL=*value*

sets the size of cointegration rank tests and common trends tests.

The SIGLEVEL=*value* can be set to 0.1, 0.05, or 0.01. The default is SIGLEVEL=0.05.

```
model y1 y2 / p=2 cointtest=(johansen siglevel=0.1);
model y1 y2 / p=2 cointtest=(sw siglevel=0.1);
```

SW**SW=(***TYPE=**value* *LAG=**number***)**

prints common trends tests for a multivariate time series based on the Stock-Watson method. This test is provided when the number of dependent (endogenous) variables is less than or equal to 6. See the section “[Common Trends](#)” on page 2322 for details.

The following options can be used in the SW=() option. The options are listed within parentheses.

LAG=*number* specifies the number of lags. The default is LAG=max(1,*p*) for the TYPE=FILTDIF or TYPE=FILTRES option, where *p* is the AR maximum order specified by the P= option; LAG= $T^{1/4}$ for the TYPE=KERNEL option, where *T* is the number of nonmissing observations. If the specified LAG=*number* exceeds the default, then it is replaced by the default.

TYPE=*value* specifies the type of common trends test to be printed. Valid values are as follows:

FILTDIF	prints the common trends test based on the filtering method applied to the differenced series. This is the default.
FILTRES	prints the common trends test based on the filtering method applied to the residual series.
KERNEL	prints the common trends test based on the kernel method.

```
model y1 y2 / p=2 cointtest=(sw);
model y1 y2 / p=2 cointtest=(sw=(type=kernel));
model y1 y2 / p=2 cointtest=(sw=(type=kernel lag=3));
```

Bayesian VARX Estimation Options**PRIOR****PRIOR=(***prior-options***)**

specifies the prior value of parameters for the BVARX(*p*, *s*) model. The BVARX model allows for a subset model specification. If the ECM= option is specified with the PRIOR option, the BVECMX(*p*, *s*) form is fitted. See the section “[Bayesian VAR and VARX Modeling](#)” on page 2311 for details.

The following options can be used with the PRIOR=(*prior-options*) option. The *prior-options* are listed within parentheses.

IVAR**IVAR=(***variables***)**

specifies an integrated BVAR(*p*) model. The *variables* should be specified in the MODEL statement

as dependent variables. If you use the IVAR option without *variables*, then it sets the overall prior mean of the first lag of each variable equal to one in its own equation and sets all other coefficients to zero. If *variables* are specified, it sets the prior mean of the first lag of the specified variables equal to one in its own equation and sets all other coefficients to zero. When the series $\mathbf{y}_t = (y_1, y_2)'$ follows a bivariate BVAR(2) process, the IVAR or IVAR=($y_1 \ y_2$) option is equivalent to specifying MEAN=(1 0 0 0 0 1 0 0).

If the PRIOR=(MEAN=) or ECM= option is specified, the IVAR= option is ignored.

LAMBDA=value

specifies the prior standard deviation of the AR coefficient parameter matrices. It should be a positive number. The default is LAMBDA=1. As the value of the LAMBDA= option is increased, the BVAR(p) model becomes closer to a VAR(p) model.

MEAN=(vector)

specifies the mean vector in the prior distribution for the AR coefficients. If the vector is not specified, the prior value is assumed to be a zero vector. See the section “[Bayesian VAR and VARX Modeling](#)” on page 2311 for details.

You can specify the mean vector by order of the equation. Let $(\delta, \Phi_1, \dots, \Phi_p)$ be the parameter sets to be estimated and $\Phi = (\Phi_1, \dots, \Phi_p)$ be the AR parameter sets. The mean vector is specified by row-wise from Φ ; that is, the MEAN=(vec(Φ')) option.

For the PRIOR=(mean) option in the BVAR(2),

$$\Phi = \begin{pmatrix} \phi_{1,11} & \phi_{1,12} & \phi_{2,11} & \phi_{2,12} \\ \phi_{1,21} & \phi_{1,22} & \phi_{2,21} & \phi_{2,22} \end{pmatrix} = \begin{pmatrix} 2 & 0.1 & 1 & 0 \\ 0.5 & 3 & 0 & -1 \end{pmatrix}$$

where $\phi_{l,ij}$ is an element of Φ , l is a lag, i is associated with the first dependent variable, and j is associated with the second dependent variable.

```
model y1 y2 / p=2 prior=(mean=(2 0.1 1 0 0.5 3 0 -1));
```

The deterministic terms and exogenous variables are considered to shrink toward zero; you must omit prior means of exogenous variables and deterministic terms such as a constant, seasonal dummies, or trends.

For a Bayesian error correction model estimated when both the ECM= and PRIOR= options are used, a mean vector for only lagged AR coefficients, Φ_i^* , in terms of regressors $\Delta \mathbf{y}_{t-i}$, for $i = 1, \dots, (p-1)$ is used in the VECM(p) representation. The diffused prior variance of α is used, since β is replaced by $\hat{\beta}$ estimated in a nonconstrained VECM(p) form.

$$\Delta \mathbf{y}_t = \alpha \mathbf{z}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + AD_t + \sum_{i=0}^s \Theta_i^* \mathbf{x}_{t-i} + \epsilon_t$$

where $\mathbf{z}_t = \beta' \mathbf{y}_t$.

For example, in the case of a bivariate ($k = 2$) BVECM(2) form, the option

$$\text{MEAN} = (\phi_{1,11}^* \ \phi_{1,12}^* \ \phi_{1,21}^* \ \phi_{1,22}^*)$$

where $\phi_{1,ij}^*$ is the (i, j) th element of the matrix Φ_1^* .

NREP=number

determines the number of repetitions that are used to compute the measure of forecast accuracy. See the equation in the section “[Forecasting of BVAR Modeling](#)” on page 2312 for details. The default is $NREP=0.5T$, where T is the number of observations. If $NREP$ is above $0.5T$, it is decreased to $0.5T$; if $NREP$ is below the value of the $LEAD=$ option, it is increased to the value of the $LEAD=$ option.

THETA=value

specifies the prior standard deviation of the AR coefficient parameter matrices. The *value* is in the interval (0,1). The default is $THETA=0.1$. As the value of the $THETA=$ option approaches 1, the specified $BVAR(p)$ model approaches a $VAR(p)$ model.

Some examples of the $PRIOR=$ option follow:

```
model y1 y2 / p=2 prior;
model y1 y2 / p=2 prior=(theta=0.2 lambda=5);
model y1 y2 = x1 / p=2 prior=(theta=0.2 lambda=5);
model y1 y2 = x1 / p=2
    prior=(theta=0.2 lambda=5 mean=(2 0.1 1 0 0.5 3 0 -1));
```

See the section “[Bayesian VAR and VARX Modeling](#)” on page 2311 for details.

Vector Error Correction Model Options

ECM=(RANK=number NORMALIZE=variable ECTREND)

specifies a vector error correction model.

The following options can be used in the $ECM=()$ option. The options are specified within parentheses.

NORMALIZE=variable

specifies a single dependent variable name whose cointegrating vectors are normalized. If the variable name is different from that specified in the $COINTEG$ statement, then the value specified in the $COINTEG$ statement is used.

RANK=number

specifies the cointegration rank. This option is required in the $ECM=$ option. The value of the $RANK=$ option should be greater than zero and less than or equal to the number of dependent (endogenous) variables, k . If the rank is different from that specified in the $COINTEG$ statement, then the value specified in the $COINTEG$ statement is used.

ECTREND

specifies the restriction on the drift in the $VECM(p)$ form.

- There is no separate drift in the $VECM(p)$ form, but a constant enters only through the error correction term.

$$\Delta \mathbf{y}_t = \alpha(\beta', \beta_0)(\mathbf{y}'_{t-1}, 1)' + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \epsilon_t$$

An example of the $ECTREND$ option follows:

```
model y1 y2 / p=2 ecm=(rank=1 ectrend);
```

- There is a separate drift and no separate linear trend in the VECM(p) form, but a linear trend enters only through the error correction term.

$$\Delta \mathbf{y}_t = \boldsymbol{\alpha}(\boldsymbol{\beta}', \beta_1)(\mathbf{y}'_{t-1}, t)' + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \delta_0 + \boldsymbol{\epsilon}_t$$

An example of the ECTREND option with the TREND= option follows:

```
model y1 y2 / p=2 ecm=(rank=1 ectrend) trend=linear;
```

If the NSEASON option is specified, then the NSEASON option is ignored; if the NOINT option is specified, then the ECTREND option is ignored.

Some examples of the ECM= option follow:

```
model y1 y2 / p=2 ecm=(rank=1 normalized=y1);
model y1 y2 / p=2 ecm=(rank=1 ectrend) trend=linear;
```

See the section “[Vector Error Correction Modeling](#)” on page 2325 for details.

GARCH Statement

GARCH *options* ;

The GARCH statement specifies a GARCH-type multivariate conditional heteroscedasticity model.

The following options can be used in the GARCH statement.

FORM=*value*

specifies the representation for a GARCH model. Valid values are as follows:

BEKK specifies a BEKK representation. This is the default.

CCC specifies a constant conditional correlation representation.

OUTHT=*SAS-data-set*

writes the conditional covariance matrix to an output data set.

P=*number*

P=*(number-list)*

specifies the order of the process or the subset of GARCH terms to be fitted. For example, you can specify the P=(1,3) option. The P=3 option is equivalent to the P=(1,2,3) option. The default is P=0.

Q=*number*

Q=(number-list)

specifies the order of the process or the subset of ARCH terms to be fitted. This option is required in the GARCH statement. For example, you can specify the Q=(2) option. The Q=2 option is equivalent to the Q=(1,2) option.

For the VAR(1)–ARCH(1) model,

```
model y1 y2 / p=1;
garch q=1 form=bekk;
```

For the multivariate GARCH(1,1) model,

```
model y1 y2;
garch q=1 p=1 form=ccc;
```

Other multivariate GARCH-type models are

```
model y1 y2 = x1 / xlag=1;
garch q=1;
```

```
model y1 y2 / q=1;
garch q=1 p=1;
```

See the section “[Multivariate GARCH Modeling](#)” on page 2344 for details.

NLOPTIONS Statement

NLOPTIONS *options* ;

The VARMAX procedure uses the nonlinear optimization (NLO) subsystem to perform nonlinear optimization tasks. For a list of all the options of the NLOPTIONS statement, see Chapter 6, “[Nonlinear Optimization Methods](#).”

An example of the NLOPTIONS statement follows:

```
proc varmax data=one;
  nloptions tech=qn;
  model y1 y2 / p=2;
run;
```

The VARMAX procedure uses the dual quasi-Newton optimization method by default when no NLOPTIONS statement is specified. However, it uses Newton-Raphson ridge optimization when the NLOPTIONS statement is specified.

The following example uses the TECH=QUANEW by default.

```
proc varmax data=one;
  model y1 y2 / p=2 method=ml;
run;
```

The next example uses the TECH=NRRIDG by default.

```
proc varmax data=one;
  nloptions maxiter=500 maxfunc=5000;
  model y1 y2 / p=2 method=ml;
run;
```

OUTPUT Statement

OUTPUT <options> ;

The OUTPUT statement generates and prints forecasts based on the model estimated in the previous MODEL statement and, optionally, creates an output SAS data set that contains these forecasts.

When the GARCH model is estimated, the upper and lower confidence limits of forecasts are calculated by assuming that the error covariance has homoscedastic conditional covariance.

ALPHA=number

sets the forecast confidence limit size, where *number* is between 0 and 1. When you specify the ALPHA=*number* option, the upper and lower confidence limits define the $100(1 - \alpha)\%$ confidence interval. The default is ALPHA=0.05, which produces 95% confidence intervals.

BACK=number

specifies the number of observations before the end of the data at which the multistep forecasts begin. The BACK= option value must be less than or equal to the number of observations minus the number of lagged regressors in the model. The default is BACK=0, which means that the forecasts start at the end of the available data.

LEAD=number

specifies the number of multistep forecast values to compute. The default is LEAD=12.

NOPRINT

suppresses the printed forecast values of each dependent (endogenous) variable.

OUT=SAS-data-set

writes the forecast values to an output data set.

Some examples of the OUTPUT statements follow:

```
proc varmax data=one;
  model y1 y2 / p=2;
  output lead=6 back=2;
run;
```

```
proc varmax data=one;
  model y1 y2 / p=2;
  output out=for noprint;
run;
```

RESTRICT Statement

RESTRICT *restriction, ..., restriction ;*

The RESTRICT statement restricts the specified parameters to the specified values. Only one RESTRICT statement is allowed, but multiple restrictions can be specified in one RESTRICT statement.

The syntax for *restriction* is *parameter=value*, and each restriction is separated by commas. Parameters are referred by the following keywords:

- $\text{CONST}(i)$ is the intercept parameter of the i th time series y_{it}
- $\text{AR}(l, i, j)$ is the autoregressive parameter of the lag l value of the j th dependent (endogenous) variable, $y_{j,t-l}$, to the i th dependent variable at time t , y_{it}
- $\text{MA}(l, i, j)$ is the moving-average parameter of the lag l value of the j th error process, $\epsilon_{j,t-l}$, to the i th dependent variable at time t , y_{it}
- $\text{XL}(l, i, j)$ is the exogenous parameter of the lag l value of the j th exogenous (independent) variable, $x_{j,t-l}$, to the i th dependent variable at time t , y_{it}
- $\text{SDUMMY}(i, j)$ is the j th seasonal dummy of the i th time series at time t , y_{it} , where $j = 1, \dots, (nseason-1)$, where $nseason$ is based on the NSEASON= option in the MODEL statement
- $\text{LTREND}(i)$ is the linear trend parameter of the current value i th time series y_{it}
- $\text{QTREND}(i)$ is the quadratic trend parameter of the current value i th time series y_{it}

The following keywords are for the fitted GARCH model. The indexes i and j refer to the position of the element in the coefficient matrix.

- $\text{GCHC}(i, j)$ is the constant parameter of the covariance matrix, H_t , and (i, j) is $1 \leq i = j \leq k$ for CCC representation and $1 \leq i \leq j \leq k$ for BEKK representations, where k is the number of dependent variables
- $\text{ACH}(l, i, j)$ is the ARCH parameter of the lag l value of $\epsilon_t \epsilon_t'$, where $i, j = 1, \dots, k$ for BEKK representation and $i = j = 1, \dots, k$ for CCC representation
- $\text{GCH}(l, i, j)$ is the GARCH parameter of the lag l value of covariance matrix, H_t , where $i, j = 1, \dots, k$ for BEKK representation and $i = j = 1, \dots, k$ for CCC representation
- $\text{CCC}(i, j)$ is the constant conditional correlation parameter for only the CCC representation; (i, j) is $1 \leq i < j \leq k$

To use the RESTRICT statement, you need to know the form of the model. If the P=, Q=, and XLAG= options are not specified, then the RESTRICT statement is not applicable.

Restricted parameter estimates are computed by introducing a Lagrangian parameter for each restriction (Pringle and Rayner 1971). The Lagrangian parameter measures the sensitivity of the sum of square errors to the restriction. The estimates of these Lagrangian parameters and their significance are printed in the restriction results table.

The following are examples of the RESTRICT statement. The first example shows a bivariate ($k=2$) VAR(2) model,

```
proc varmax data=one;
  model y1 y2 / p=2;
  restrict AR(1,1,2)=0, AR(2,1,2)=0.3;
run;
```

The AR(1,1,2) and AR(2,1,2) parameters are fixed as AR(1,1,2)=0 and AR(2,1,2)=0.3, respectively, and other parameters are to be estimated.

The following shows a bivariate ($k=2$) VARX(1,1) model with three exogenous variables,

```
proc varmax data=two;
  model y1 = x1 x2, y2 = x2 x3 / p=1 xlag=1;
  restrict XL(0,1,1)=-1.2, XL(1,2,3)=0;
run;
```

The XL(0,1,1) and XL(1,2,3) parameters are fixed as XL(0,1,1)=-1.2 and XL(1,2,3)=0, respectively, and other parameters are to be estimated.

TEST Statement

TEST *restriction, ..., restriction* ;

The TEST statement performs the Wald test for the joint hypothesis specified in the statement. The syntax of *restriction* is *parameter=value*, and each restriction is separated by commas. The *restrictions* are specified in the same manner as in the RESTRICT statement. See the RESTRICT statement for description of model parameter naming conventions used by the RESTRICT and TEST statements. Any number of TEST statements can be specified.

To use the TEST statement, you need to know the form of the model. If the P=, Q=, and XLAG= options are not specified, then the TEST statement is not applicable.

See the section “[Granger Causality Test](#)” on page 2308 for the Wald test.

The following is an example of the TEST statement. In the case of a bivariate ($k=2$) VAR(2) model,

```
proc varmax data=one;
  model y1 y2 / p=2;
```

```
test AR(1,1,2)=0, AR(2,1,2)=0;
run;
```

After estimating the parameters, the TEST statement tests the null hypothesis that $AR(1,1,2)=0$ and $AR(2,1,2)=0$.

Details: VARMAX Procedure

Missing Values

The VARMAX procedure currently does not support missing values. The procedure uses the first contiguous group of observations with no missing values for any of the MODEL statement variables. Observations at the beginning of the data set with missing values for any MODEL statement variables are not used or included in the output data set. At the end of the data set, observations can have dependent (endogenous) variables with missing values and independent (exogenous) variables with nonmissing values.

VARMAX Model

The vector autoregressive moving-average model with exogenous variables is called the VARMAX(p,q,s) model. The form of the model can be written as

$$\mathbf{y}_t = \sum_{i=1}^p \Phi_i \mathbf{y}_{t-i} + \sum_{i=0}^s \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t - \sum_{i=1}^q \Theta_i \boldsymbol{\epsilon}_{t-i}$$

where the output variables of interest, $\mathbf{y}_t = (y_{1t}, \dots, y_{kt})'$, can be influenced by other input variables, $\mathbf{x}_t = (x_{1t}, \dots, x_{rt})'$, which are determined outside of the system of interest. The variables \mathbf{y}_t are referred to as dependent, response, or endogenous variables, and the variables \mathbf{x}_t are referred to as independent, input, predictor, regressor, or exogenous variables. The unobserved noise variables, $\boldsymbol{\epsilon}_t = (\epsilon_{1t}, \dots, \epsilon_{kt})'$, are a vector white noise process.

The VARMAX(p,q,s) model can be written

$$\Phi(B)\mathbf{y}_t = \Theta^*(B)\mathbf{x}_t + \Theta(B)\boldsymbol{\epsilon}_t$$

where

$$\begin{aligned}\Phi(B) &= I_k - \Phi_1 B - \dots - \Phi_p B^p \\ \Theta^*(B) &= \Theta_0^* + \Theta_1^* B + \dots + \Theta_s^* B^s \\ \Theta(B) &= I_k - \Theta_1 B - \dots - \Theta_q B^q\end{aligned}$$

are matrix polynomials in B in the backshift operator, such that $B^i \mathbf{y}_t = \mathbf{y}_{t-i}$, the Φ_i and Θ_i are $k \times k$ matrices, and the Θ_i^* are $k \times r$ matrices.

The following assumptions are made:

- $E(\epsilon_t) = 0$, $E(\epsilon_t \epsilon_t') = \Sigma$, which is positive-definite, and $E(\epsilon_t \epsilon_s') = 0$ for $t \neq s$.
- For stationarity and invertibility of the VARMAX process, the roots of $|\Phi(z)| = 0$ and $|\Theta(z)| = 0$ are outside the unit circle.
- The exogenous (independent) variables \mathbf{x}_t are not correlated with residuals ϵ_t , $E(\mathbf{x}_t \epsilon_t') = 0$. The exogenous variables can be stochastic or nonstochastic. When the exogenous variables are stochastic and their future values are unknown, forecasts of these future values are needed to forecast the future values of the endogenous (dependent) variables. On occasion, future values of the exogenous variables can be assumed to be known because they are deterministic variables. The VARMAX procedure assumes that the exogenous variables are nonstochastic if future values are available in the input data set. Otherwise, the exogenous variables are assumed to be stochastic and their future values are forecasted by assuming that they follow the VARMA(p, q) model, prior to forecasting the endogenous variables, where p and q are the same as in the VARMAX(p, q, s) model.

State-Space Representation

Another representation of the VARMAX(p, q, s) model is in the form of a state-variable or a state-space model, which consists of a state equation

$$\mathbf{z}_t = F \mathbf{z}_{t-1} + K \mathbf{x}_t + G \epsilon_t$$

and an observation equation

$$\mathbf{y}_t = H \mathbf{z}_t$$

where

$$\mathbf{z}_t = \begin{bmatrix} \mathbf{y}_t \\ \vdots \\ \mathbf{y}_{t-p+1} \\ \mathbf{x}_t \\ \vdots \\ \mathbf{x}_{t-s+1} \\ \epsilon_t \\ \vdots \\ \epsilon_{t-q+1} \end{bmatrix}, \quad K = \begin{bmatrix} \Theta_0^* \\ 0_{k \times r} \\ \vdots \\ 0_{k \times r} \\ I_r \\ 0_{r \times r} \\ \vdots \\ 0_{r \times r} \\ 0_{k \times r} \\ \vdots \\ 0_{k \times r} \end{bmatrix}, \quad G = \begin{bmatrix} I_k \\ 0_{k \times k} \\ \vdots \\ 0_{k \times k} \\ 0_{r \times k} \\ \vdots \\ 0_{r \times k} \\ I_{k \times k} \\ 0_{k \times k} \\ \vdots \\ 0_{k \times k} \end{bmatrix}$$

$$F = \begin{bmatrix} \Phi_1 & \cdots & \Phi_{p-1} & \Phi_p & \Theta_1^* & \cdots & \Theta_{s-1}^* & \Theta_s^* & -\Theta_1 & \cdots & -\Theta_{q-1} & -\Theta_q \\ I_k & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & \cdots & I_k & 0 & 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 \\ 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 \\ 0 & \cdots & 0 & 0 & I_r & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & \cdots & 0 & 0 & 0 & \cdots & I_r & 0 & 0 & \cdots & 0 & 0 \\ 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 \\ 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 & I_k & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & \cdots & 0 & 0 & 0 & \cdots & 0 & 0 & 0 & \cdots & I_k & 0 \end{bmatrix}$$

and

$$H = [I_k, 0_{k \times k}, \dots, 0_{k \times k}, 0_{k \times r}, \dots, 0_{k \times r}, 0_{k \times k}, \dots, 0_{k \times k}]$$

On the other hand, it is assumed that \mathbf{x}_t follows a VARMA(p, q) model

$$\mathbf{x}_t = \sum_{i=1}^p A_i \mathbf{x}_{t-i} + \mathbf{a}_t - \sum_{i=1}^q C_i \mathbf{a}_{t-i}$$

The model can also be expressed as

$$A(B)\mathbf{x}_t = C(B)\mathbf{a}_t$$

where $A(B) = I_r - A_1 B - \cdots - A_p B^p$ and $C(B) = I_r - C_1 B - \cdots - C_q B^q$ are matrix polynomials in B , and the A_i and C_i are $r \times r$ matrices. Without loss of generality, the AR and MA orders can be taken to be the same as the VARMAX(p, q, s) model, and \mathbf{a}_t and ϵ_t are independent white noise processes.

Under suitable conditions such as stationarity, \mathbf{x}_t is represented by an infinite order moving-average process

$$\mathbf{x}_t = A(B)^{-1} C(B) \mathbf{a}_t = \Psi^x(B) \mathbf{a}_t = \sum_{j=0}^{\infty} \Psi_j^x \mathbf{a}_{t-j}$$

where $\Psi^x(B) = A(B)^{-1} C(B) = \sum_{j=0}^{\infty} \Psi_j^x B^j$.

The optimal minimum mean squared error (minimum MSE) i -step-ahead forecast of \mathbf{x}_{t+i} is

$$\begin{aligned} \mathbf{x}_{t+i|t} &= \sum_{j=i}^{\infty} \Psi_j^x \mathbf{a}_{t+i-j} \\ \mathbf{x}_{t+i|t+1} &= \mathbf{x}_{t+i|t} + \Psi_{i-1}^x \mathbf{a}_{t+1} \end{aligned}$$

For $i > q$,

$$\mathbf{x}_{t+i|t} = \sum_{j=1}^p A_j \mathbf{x}_{t+i-j|t}$$

The VARMAX(p, q, s) model has an absolutely convergent representation as

$$\begin{aligned} \mathbf{y}_t &= \Phi(B)^{-1} \Theta^*(B) \mathbf{x}_t + \Phi(B)^{-1} \Theta(B) \boldsymbol{\epsilon}_t \\ &= \Psi^*(B) \Psi^x(B) \mathbf{a}_t + \Phi(B)^{-1} \Theta(B) \boldsymbol{\epsilon}_t \\ &= V(B) \mathbf{a}_t + \Psi(B) \boldsymbol{\epsilon}_t \end{aligned}$$

or

$$\mathbf{y}_t = \sum_{j=0}^{\infty} V_j \mathbf{a}_{t-j} + \sum_{j=0}^{\infty} \Psi_j \boldsymbol{\epsilon}_{t-j}$$

where $\Psi(B) = \Phi(B)^{-1} \Theta(B) = \sum_{j=0}^{\infty} \Psi_j B^j$, $\Psi^*(B) = \Phi(B)^{-1} \Theta^*(B)$, and $V(B) = \Psi^*(B) \Psi^x(B) = \sum_{j=0}^{\infty} V_j B^j$.

The optimal (minimum MSE) i -step-ahead forecast of \mathbf{y}_{t+i} is

$$\begin{aligned} \mathbf{y}_{t+i|t} &= \sum_{j=i}^{\infty} V_j \mathbf{a}_{t+i-j} + \sum_{j=i}^{\infty} \Psi_j \boldsymbol{\epsilon}_{t+i-j} \\ \mathbf{y}_{t+i|t+1} &= \mathbf{y}_{t+i|t} + V_{i-1} \mathbf{a}_{t+1} + \Psi_{i-1} \boldsymbol{\epsilon}_{t+1} \end{aligned}$$

for $i = 1, \dots, v$ with $v = \max(p, q + 1)$. For $i > q$,

$$\begin{aligned} \mathbf{y}_{t+i|t} &= \sum_{j=1}^p \Phi_j \mathbf{y}_{t+i-j|t} + \sum_{j=0}^s \Theta_j^* \mathbf{x}_{t+i-j|t} \\ &= \sum_{j=1}^p \Phi_j \mathbf{y}_{t+i-j|t} + \Theta_0^* \mathbf{x}_{t+i|t} + \sum_{j=1}^s \Theta_j^* \mathbf{x}_{t+i-j|t} \\ &= \sum_{j=1}^p \Phi_j \mathbf{y}_{t+i-j|t} + \Theta_0^* \sum_{j=1}^p A_j \mathbf{x}_{t+i-j|t} + \sum_{j=1}^s \Theta_j^* \mathbf{x}_{t+i-j|t} \\ &= \sum_{j=1}^p \Phi_j \mathbf{y}_{t+i-j|t} + \sum_{j=1}^u (\Theta_0^* A_j + \Theta_j^*) \mathbf{x}_{t+i-j|t} \end{aligned}$$

where $u = \max(p, s)$.

Define $\Pi_j = \Theta_0^* A_j + \Theta_j^*$. For $i = v > q$ with $v = \max(p, q + 1)$, you obtain

$$\begin{aligned} \mathbf{y}_{t+v|t} &= \sum_{j=1}^p \Phi_j \mathbf{y}_{t+v-j|t} + \sum_{j=1}^u \Pi_j \mathbf{x}_{t+v-j|t} \quad \text{for } u \leq v \\ \mathbf{y}_{t+v|t} &= \sum_{j=1}^p \Phi_j \mathbf{y}_{t+v-j|t} + \sum_{j=1}^r \Pi_j \mathbf{x}_{t+v-j|t} \quad \text{for } u > v \end{aligned}$$

From the preceding relations, a state equation is

$$\mathbf{z}_{t+1} = F\mathbf{z}_t + K\mathbf{x}_t^* + G\mathbf{e}_{t+1}$$

and an observation equation is

$$\mathbf{y}_t = H\mathbf{z}_t$$

where

$$\mathbf{z}_t = \begin{bmatrix} \mathbf{y}_t \\ \mathbf{y}_{t+1|t} \\ \vdots \\ \mathbf{y}_{t+v-1|t} \\ \mathbf{x}_t \\ \mathbf{x}_{t+1|t} \\ \vdots \\ \mathbf{x}_{t+v-1|t} \end{bmatrix}, \quad \mathbf{x}_t^* = \begin{bmatrix} \mathbf{x}_{t+v-u} \\ \mathbf{x}_{t+v-u+1} \\ \vdots \\ \mathbf{x}_{t-1} \end{bmatrix}, \quad \mathbf{e}_{t+1} = \begin{bmatrix} \mathbf{a}_{t+1} \\ \boldsymbol{\epsilon}_{t+1} \end{bmatrix}$$

$$F = \begin{bmatrix} 0 & I_k & 0 & \cdots & 0 & 0 & 0 & 0 & \cdots & 0 \\ 0 & 0 & I_k & \cdots & 0 & 0 & 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ \Phi_v & \Phi_{v-1} & \Phi_{v-2} & \cdots & \Phi_1 & \Pi_v & \Pi_{v-1} & \Pi_{v-2} & \cdots & \Pi_1 \\ 0 & 0 & 0 & \cdots & 0 & 0 & I_r & 0 & \cdots & 0 \\ 0 & 0 & 0 & \cdots & 0 & 0 & 0 & I_r & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & 0 & A_v & A_{v-1} & A_{v-2} & \cdots & A_1 \end{bmatrix}$$

$$K = \begin{bmatrix} 0 & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ \Pi_u & \Pi_{u-1} & \cdots & \Pi_{v+1} \\ 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 0 \end{bmatrix}, \quad G = \begin{bmatrix} V_0 & I_k \\ V_1 & \Psi_1 \\ \vdots & \vdots \\ V_{v-1} & \Psi_{v-1} \\ I_r & 0_{r \times k} \\ \Psi_1^x & 0_{r \times k} \\ \vdots & \vdots \\ \Psi_{v-1}^x & 0_{r \times k} \end{bmatrix}$$

and

$$H = [I_k, 0_{k \times k}, \dots, 0_{k \times k}, 0_{k \times r}, \dots, 0_{k \times r}]$$

Note that the matrix K and the input vector \mathbf{x}_t^* are defined only when $u > v$.

Dynamic Simultaneous Equations Modeling

In the econometrics literature, the VARMAX(p, q, s) model is sometimes written in a form that is slightly different than the one shown in the previous section. This alternative form is referred to as a *dynamic simultaneous equations* model or a *dynamic structural equations* model.

Since $E(\epsilon_t \epsilon_t') = \Sigma$ is assumed to be positive-definite, there exists a lower triangular matrix A_0 with ones on the diagonals such that $A_0 \Sigma A_0' = \Sigma^d$, where Σ^d is a diagonal matrix with positive diagonal elements.

$$A_0 y_t = \sum_{i=1}^p A_i y_{t-i} + \sum_{i=0}^s C_i^* x_{t-i} + C_0 \epsilon_t - \sum_{i=1}^q C_i \epsilon_{t-i}$$

where $A_i = A_0 \Phi_i$, $C_i^* = A_0 \Theta_i^*$, $C_0 = A_0$, and $C_i = A_0 \Theta_i$.

As an alternative form,

$$A_0 y_t = \sum_{i=1}^p A_i y_{t-i} + \sum_{i=0}^s C_i^* x_{t-i} + a_t - \sum_{i=1}^q C_i a_{t-i}$$

where $A_i = A_0 \Phi_i$, $C_i^* = A_0 \Theta_i^*$, $C_i = A_0 \Theta_i A_0^{-1}$, and $a_t = C_0 \epsilon_t$ has a diagonal covariance matrix Σ^d . The PRINT=(DYNAMIC) option returns the parameter estimates that result from estimating the model in this form.

A dynamic simultaneous equations model involves a leading (lower triangular) coefficient matrix for y_t at lag 0 or a leading coefficient matrix for ϵ_t at lag 0. Such a representation of the VARMAX(p, q, s) model can be more useful in certain circumstances than the standard representation. From the linear combination of the dependent variables obtained by $A_0 y_t$, you can easily see the relationship between the dependent variables in the current time.

The following statements provide the dynamic simultaneous equations of the VAR(1) model.

```
proc iml;
  sig = {1.0 0.5, 0.5 1.25};
  phi = {1.2 -0.5, 0.6 0.3};
  /* simulate the vector time series */
  call varmasim(y, phi) sigma = sig n = 100 seed = 34657;
  cn = {'y1' 'y2'};
  create simull from y[colname=cn];
  append from y;
quit;

data simull;
  set simull;
  date = intnx('year', '01jan1900'd, _n_-1 );
  format date year4.;
run;

proc varmax data=simull;
  model y1 y2 / p=1 noint print=(dynamic);
run;
```

This is the same data set and model used in the section “[Getting Started: VARMAX Procedure](#)” on page 2222. You can compare the results of the VARMA model form and the dynamic simultaneous equations model form.

	AR1_1_2	-0.51058	0.07140	-7.15	0.0001	y2(t-1)
y2	AR0_2_1	0.30845				y1(t)
	AR1_2_1	0.18861	0.05779	3.26	0.0015	y1(t-1)
	AR1_2_2	0.54247	0.07491	7.24	0.0001	y2(t-1)

In Figure 35.4 in the section “Getting Started: VARMAX Procedure” on page 2222, the covariance of ϵ_t estimated from the VARMAX model form is

$$\Sigma_{\epsilon} = \begin{pmatrix} 1.28875 & 0.39751 \\ 0.39751 & 1.41839 \end{pmatrix}$$

Figure 35.25 shows the results from estimating the model as a dynamic simultaneous equations model. By the decomposition of Σ_{ϵ} , you get a diagonal matrix (Σ_a) and a lower triangular matrix (A_0) such as $\Sigma_a = A_0 \Sigma_{\epsilon} A_0'$ where

$$\Sigma_a = \begin{pmatrix} 1.28875 & 0 \\ 0 & 1.29578 \end{pmatrix} \text{ and } A_0 = \begin{pmatrix} 1 & 0 \\ -0.30845 & 1 \end{pmatrix}$$

The lower triangular matrix (A_0) is shown in the left side of the simultaneous equations model. The parameter estimates in equations system are shown in the right side of the two-equations system.

The simultaneous equations model is written as

$$\begin{pmatrix} 1 & 0 \\ -0.30845 & 1 \end{pmatrix} \mathbf{y}_t = \begin{pmatrix} 1.15977 & -0.51058 \\ 0.18861 & 0.54247 \end{pmatrix} \mathbf{y}_{t-1} + \mathbf{a}_t$$

The resulting two-equation system can be written as

$$\begin{aligned} y_{1t} &= 1.15977y_{1,t-1} - 0.51058y_{2,t-1} + a_{1t} \\ y_{2t} &= 0.30845y_{1t} + 0.18861y_{1,t-1} + 0.54247y_{2,t-1} + a_{2t} \end{aligned}$$

Impulse Response Function

Simple Impulse Response Function (IMPULSE=SIMPLE Option)

The VARMAX(p, q, s) model has a convergent representation

$$\mathbf{y}_t = \Psi^*(B)\mathbf{x}_t + \Psi(B)\boldsymbol{\epsilon}_t$$

where $\Psi^*(B) = \Phi(B)^{-1}\Theta^*(B) = \sum_{j=0}^{\infty} \Psi_j^* B^j$ and $\Psi(B) = \Phi(B)^{-1}\Theta(B) = \sum_{j=0}^{\infty} \Psi_j B^j$.

The elements of the matrices Ψ_j from the operator $\Psi(B)$, called the impulse response, can be interpreted as the impact that a shock in one variable has on another variable. Let $\psi_{j,in}$ be the in^{th} element of Ψ_j at lag j , where i is the index for the impulse variable, and n is the index for the response variable (impulse \rightarrow response). For instance, $\psi_{j,11}$ is an impulse response to $y_{1t} \rightarrow y_{1t}$, and $\psi_{j,12}$ is an impulse response to $y_{1t} \rightarrow y_{2t}$.

Accumulated Impulse Response Function (IMPULSE=ACCUM Option)

The accumulated impulse response function is the cumulative sum of the impulse response function, $\Psi_l^a = \sum_{j=0}^l \Psi_j$.

Orthogonalized Impulse Response Function (IMPULSE=ORTH Option)

The MA representation of a VARMA(p, q) model with a standardized white noise innovation process offers another way to interpret a VARMA(p, q) model. Since Σ is positive-definite, there is a lower triangular matrix P such that $\Sigma = PP'$. The alternate MA representation of a VARMA(p, q) model is written as

$$\mathbf{y}_t = \Psi^o(B)\mathbf{u}_t$$

where $\Psi^o(B) = \sum_{j=0}^{\infty} \Psi_j^o B^j$, $\Psi_j^o = \Psi_j P$, and $\mathbf{u}_t = P^{-1}\boldsymbol{\epsilon}_t$.

The elements of the matrices Ψ_j^o , called the *orthogonal impulse response*, can be interpreted as the effects of the components of the standardized shock process \mathbf{u}_t on the process \mathbf{y}_t at lag j .

Impulse Response of Transfer Function (IMPULSX=SIMPLE Option)

The coefficient matrix Ψ_j^* from the transfer function operator $\Psi^*(B)$ can be interpreted as the effects that changes in the exogenous variables \mathbf{x}_t have on the output variable \mathbf{y}_t at lag j ; it is called an impulse response matrix in the transfer function.

Impulse Response of Transfer Function (IMPULSX=ACCUM Option)

The accumulated impulse response in the transfer function is the cumulative sum of the impulse response in the transfer function, $\Psi_l^{*a} = \sum_{j=0}^l \Psi_j^*$.

The asymptotic distributions of the impulse functions can be seen in the section “[VAR and VARX Modeling](#)” on page 2305.

The following statements provide the impulse response and the accumulated impulse response in the transfer function for a VARX(1,0) model.

```
proc varmax data=grunfeld plot=impulse;
  model y1-y3 = x1 x2 / p=1 lagmax=5
          printform=univariate
          print=(impulsx=(all) estimates);
run;
```

In Figure 35.26, the variables x_1 and x_2 are impulses and the variables y_1 , y_2 , and y_3 are responses. You can read the table matching the pairs of *impulse* \rightarrow *response* such as $x_1 \rightarrow y_1$, $x_1 \rightarrow y_2$, $x_1 \rightarrow y_3$, $x_2 \rightarrow y_1$, $x_2 \rightarrow y_2$, and $x_2 \rightarrow y_3$. In the pair of $x_1 \rightarrow y_1$, you can see the long-run responses of y_1 to an impulse in x_1 (the values are 1.69281, 0.35399, 0.09090, and so on for lag 0, lag 1, lag 2, and so on, respectively).

Figure 35.26 Impulse Response in Transfer Function (IMPULSX= Option)

Figure 35.29 shows the accumulated responses of y_1 , y_2 , and y_3 to a forecast error impulse in x_1 .

Figure 35.29 Plot of Accumulated Impulse Response in Transfer Function

The following statements provide the impulse response function, the accumulated impulse response function, and the orthogonalized impulse response function with their standard errors for a VAR(1) model. Parts of the VARMAX procedure output are shown in Figure 35.30, Figure 35.32, and Figure 35.34.

```
proc varmax data=simul1 plot=impulse;
  model y1 y2 / p=1 noint lagmax=5
           print=(impulse=(all))
           printform=univariate;
run;
```

Figure 35.30 is the output in a univariate format associated with the PRINT=(IMPULSE=) option for the impulse response function. The keyword STD stands for the standard errors of the elements. The matrix in terms of the lag 0 does not print since it is the identity. In Figure 35.30, the variables y_1 and y_2 of the first row are impulses, and the variables y_1 and y_2 of the first column are responses. You can read the table matching the *impulse* \rightarrow *response* pairs, such as $y_1 \rightarrow y_1$, $y_1 \rightarrow y_2$, $y_2 \rightarrow y_1$, and $y_2 \rightarrow y_2$. For example, in the pair of $y_1 \rightarrow y_1$ at lag 3, the response is 0.8055. This represents the impact on y_1 of one-unit change in y_1 after 3 periods. As the lag gets higher, you can see the long-run responses of y_1 to an impulse in itself.

In Figure 35.4, there is a positive correlation between ε_{1t} and ε_{2t} . Therefore, shock in $y1$ can be accompanied by a shock in $y2$ in the same period. For example, in the pair of $y1_innovation \rightarrow y2$, you can see the long-run responses of $y2$ to an impulse in $y1_innovation$.

Figure 35.35 shows the orthogonalized responses of y_1 and y_2 to a forecast error impulse in y_1 with two standard errors.

Figure 35.35 Plot of Orthogonalized Impulse Response

Forecasting

The optimal (minimum MSE) l -step-ahead forecast of \mathbf{y}_{t+l} is

$$\mathbf{y}_{t+l|t} = \sum_{j=1}^p \Phi_j \mathbf{y}_{t+l-j|t} + \sum_{j=0}^s \Theta_j^* \mathbf{x}_{t+l-j|t} - \sum_{j=l}^q \Theta_j \boldsymbol{\epsilon}_{t+l-j}, \quad l \leq q$$

$$\mathbf{y}_{t+l|t} = \sum_{j=1}^p \Phi_j \mathbf{y}_{t+l-j|t} + \sum_{j=0}^s \Theta_j^* \mathbf{x}_{t+l-j|t}, \quad l > q$$

with $\mathbf{y}_{t+l-j|t} = \mathbf{y}_{t+l-j}$ and $\mathbf{x}_{t+l-j|t} = \mathbf{x}_{t+l-j}$ for $l \leq j$. For the forecasts $\mathbf{x}_{t+l-j|t}$, see the section “State-Space Representation” on page 2277.

Covariance Matrices of Prediction Errors without Exogenous (Independent) Variables

Under the stationarity assumption, the optimal (minimum MSE) l -step-ahead forecast of \mathbf{y}_{t+l} has an infinite moving-average form, $\mathbf{y}_{t+l|t} = \sum_{j=l}^{\infty} \Psi_j \boldsymbol{\epsilon}_{t+l-j}$. The prediction error of the optimal l -step-ahead forecast is $\mathbf{e}_{t+l|t} = \mathbf{y}_{t+l} - \mathbf{y}_{t+l|t} = \sum_{j=0}^{l-1} \Psi_j \boldsymbol{\epsilon}_{t+l-j}$, with zero mean and covariance matrix,

$$\Sigma(l) = \text{Cov}(\mathbf{e}_{t+l|t}) = \sum_{j=0}^{l-1} \Psi_j \Sigma \Psi_j' = \sum_{j=0}^{l-1} \Psi_j^o \Psi_j^{o'}$$

where $\Psi_j^o = \Psi_j P$ with a lower triangular matrix P such that $\Sigma = PP'$. Under the assumption of normality of the $\boldsymbol{\epsilon}_t$, the l -step-ahead prediction error $\mathbf{e}_{t+l|t}$ is also normally distributed as multivariate $N(0, \Sigma(l))$. Hence, it follows that the diagonal elements $\sigma_{ii}^2(l)$ of $\Sigma(l)$ can be used, together with the point forecasts $y_{i,t+l|t}$, to construct l -step-ahead prediction intervals of the future values of the component series, $y_{i,t+l}$.

The following statements use the COVPE option to compute the covariance matrices of the prediction errors for a VAR(1) model. The parts of the VARMAX procedure output are shown in Figure 35.36 and Figure 35.37.

```
proc varmax data=simul1;
  model y1 y2 / p=1 noint lagmax=5
    printform=both
    print=(decompose(5) impulse=(all) covpe(5));
run;
```

Figure 35.36 is the output in a matrix format associated with the COVPE option for the prediction error covariance matrices.

	5	3.85346	5.07010

Covariance Matrices of Prediction Errors in the Presence of Exogenous (Independent) Variables

Exogenous variables can be both stochastic and nonstochastic (deterministic) variables. Considering the forecasts in the VARMAX(p, q, s) model, there are two cases.

When exogenous (independent) variables are stochastic (future values not specified):

As defined in the section “[State-Space Representation](#)” on page 2277, $\mathbf{y}_{t+l|t}$ has the representation

$$\mathbf{y}_{t+l|t} = \sum_{j=l}^{\infty} V_j \mathbf{a}_{t+l-j} + \sum_{j=l}^{\infty} \Psi_j \boldsymbol{\epsilon}_{t+l-j}$$

and hence

$$\mathbf{e}_{t+l|t} = \sum_{j=0}^{l-1} V_j \mathbf{a}_{t+l-j} + \sum_{j=0}^{l-1} \Psi_j \boldsymbol{\epsilon}_{t+l-j}$$

Therefore, the covariance matrix of the l -step-ahead prediction error is given as

$$\Sigma(l) = \text{Cov}(\mathbf{e}_{t+l|t}) = \sum_{j=0}^{l-1} V_j \Sigma_a V_j' + \sum_{j=0}^{l-1} \Psi_j \Sigma_{\epsilon} \Psi_j'$$

where Σ_a is the covariance of the white noise series \mathbf{a}_t , and \mathbf{a}_t is the white noise series for the VARMA(p, q) model of exogenous (independent) variables, which is assumed not to be correlated with $\boldsymbol{\epsilon}_t$ or its lags.

When future exogenous (independent) variables are specified:

The optimal forecast $\mathbf{y}_{t+l|t}$ of \mathbf{y}_t conditioned on the past information and also on known future values $\mathbf{x}_{t+1}, \dots, \mathbf{x}_{t+l}$ can be represented as

$$\mathbf{y}_{t+l|t} = \sum_{j=0}^{\infty} \Psi_j^* \mathbf{x}_{t+l-j} + \sum_{j=l}^{\infty} \Psi_j \boldsymbol{\epsilon}_{t+l-j}$$

and the forecast error is

$$\mathbf{e}_{t+l|t} = \sum_{j=0}^{l-1} \Psi_j \boldsymbol{\epsilon}_{t+l-j}$$

Thus, the covariance matrix of the l -step-ahead prediction error is given as

$$\Sigma(l) = \text{Cov}(\mathbf{e}_{t+l|t}) = \sum_{j=0}^{l-1} \Psi_j \Sigma_{\epsilon} \Psi_j'$$

Decomposition of Prediction Error Covariances

In the relation $\Sigma(l) = \sum_{j=0}^{l-1} \Psi_j^o \Psi_j^{o'}$, the diagonal elements can be interpreted as providing a decomposition of the l -step-ahead prediction error covariance $\sigma_{ii}^2(l)$ for each component series y_{it} into contributions from the components of the standardized innovations $\boldsymbol{\epsilon}_t$.

If you denote the (i, n) th element of Ψ_j^o by $\psi_{j,in}$, the MSE of $y_{i,t+h|t}$ is

$$\text{MSE}(y_{i,t+h|t}) = E(y_{i,t+h} - y_{i,t+h|t})^2 = \sum_{j=0}^{l-1} \sum_{n=1}^k \psi_{j,in}^2$$

Note that $\sum_{j=0}^{l-1} \psi_{j,in}^2$ is interpreted as the contribution of innovations in variable n to the prediction error covariance of the l -step-ahead forecast of variable i .

The proportion, $\omega_{l,in}$, of the l -step-ahead forecast error covariance of variable i accounting for the innovations in variable n is

$$\omega_{l,in} = \sum_{j=0}^{l-1} \psi_{j,in}^2 / \text{MSE}(y_{i,t+h|t})$$

The following statements use the DECOMPOSE option to compute the decomposition of prediction error covariances and their proportions for a VAR(1) model:

```
proc varmax data=simul1;
  model y1 y2 / p=1 noint print=(decompose(15))
          printform=univariate;
run;
```

The proportions of decomposition of prediction error covariances of two variables are given in [Figure 35.38](#). The output explains that about 91.356% of the one-step-ahead prediction error covariances of the variable y_{2t} is accounted for by its own innovations and about 8.644% is accounted for by y_{1t} innovations.

Figure 35.38 Decomposition of Prediction Error Covariances (DECOMPOSE Option)

Proportions of Prediction Error Covariances by Variable

	5	0.53549	0.46451

Forecasting of the Centered Series

If the CENTER option is specified, the sample mean vector is added to the forecast.

Forecasting of the Differenced Series

If dependent (endogenous) variables are differenced, the final forecasts and their prediction error covariances are produced by integrating those of the differenced series. However, if the PRIOR option is specified, the forecasts and their prediction error variances of the differenced series are produced.

Let \mathbf{z}_t be the original series with some appended zero values that correspond to the unobserved past observations. Let $\Delta(B)$ be the $k \times k$ matrix polynomial in the backshift operator that corresponds to the differencing specified by the MODEL statement. The off-diagonal elements of Δ_i are zero, and the diagonal elements can be different. Then $\mathbf{y}_t = \Delta(B)\mathbf{z}_t$.

This gives the relationship

$$\mathbf{z}_t = \Delta^{-1}(B)\mathbf{y}_t = \sum_{j=0}^{\infty} \Lambda_j \mathbf{y}_{t-j}$$

where $\Delta^{-1}(B) = \sum_{j=0}^{\infty} \Lambda_j B^j$ and $\Lambda_0 = I_k$.

The l -step-ahead prediction of \mathbf{z}_{t+l} is

$$\mathbf{z}_{t+l|t} = \sum_{j=0}^{l-1} \Lambda_j \mathbf{y}_{t+l-j|t} + \sum_{j=l}^{\infty} \Lambda_j \mathbf{y}_{t+l-j}$$

The l -step-ahead prediction error of \mathbf{z}_{t+l} is

$$\sum_{j=0}^{l-1} \Lambda_j (\mathbf{y}_{t+l-j} - \mathbf{y}_{t+l-j|t}) = \sum_{j=0}^{l-1} \left(\sum_{u=0}^j \Lambda_u \Psi_{j-u} \right) \boldsymbol{\epsilon}_{t+l-j}$$

Letting $\Sigma_z(0) = 0$, the covariance matrix of the l -step-ahead prediction error of \mathbf{z}_{t+l} , $\Sigma_z(l)$, is

$$\begin{aligned}\Sigma_z(l) &= \sum_{j=0}^{l-1} \left(\sum_{u=0}^j \Lambda_u \Psi_{j-u} \right) \Sigma_\epsilon \left(\sum_{u=0}^j \Lambda_u \Psi_{j-u} \right)' \\ &= \Sigma_z(l-1) + \left(\sum_{j=0}^{l-1} \Lambda_j \Psi_{l-1-j} \right) \Sigma_\epsilon \left(\sum_{j=0}^{l-1} \Lambda_j \Psi_{l-1-j} \right)'\end{aligned}$$

If there are stochastic exogenous (independent) variables, the covariance matrix of the l -step-ahead prediction error of \mathbf{z}_{t+l} , $\Sigma_z(l)$, is

$$\begin{aligned}\Sigma_z(l) &= \Sigma_z(l-1) + \left(\sum_{j=0}^{l-1} \Lambda_j \Psi_{l-1-j} \right) \Sigma_\epsilon \left(\sum_{j=0}^{l-1} \Lambda_j \Psi_{l-1-j} \right)' \\ &\quad + \left(\sum_{j=0}^{l-1} \Lambda_j V_{l-1-j} \right) \Sigma_a \left(\sum_{j=0}^{l-1} \Lambda_j V_{l-1-j} \right)'\end{aligned}$$

Tentative Order Selection

Sample Cross-Covariance and Cross-Correlation Matrices

Given a stationary multivariate time series \mathbf{y}_t , cross-covariance matrices are

$$\Gamma(l) = E[(\mathbf{y}_t - \boldsymbol{\mu})(\mathbf{y}_{t+l} - \boldsymbol{\mu})']$$

where $\boldsymbol{\mu} = E(\mathbf{y}_t)$, and cross-correlation matrices are

$$\rho(l) = D^{-1} \Gamma(l) D^{-1}$$

where D is a diagonal matrix with the standard deviations of the components of \mathbf{y}_t on the diagonal.

The sample cross-covariance matrix at lag l , denoted as $C(l)$, is computed as

$$\hat{\Gamma}(l) = C(l) = \frac{1}{T} \sum_{t=1}^{T-l} \tilde{\mathbf{y}}_t \tilde{\mathbf{y}}_{t+l}'$$

where $\tilde{\mathbf{y}}_t$ is the centered data and T is the number of nonmissing observations. Thus, $\hat{\Gamma}(l)$ has (i, j) th element $\hat{\gamma}_{ij}(l) = c_{ij}(l)$. The sample cross-correlation matrix at lag l is computed as

$$\hat{\rho}_{ij}(l) = c_{ij}(l) / [c_{ii}(0)c_{jj}(0)]^{1/2}, \quad i, j = 1, \dots, k$$

The following statements use the CORRY option to compute the sample cross-correlation matrices and their summary indicator plots in terms of +, −, and ·, where + indicates significant positive cross-correlations, − indicates significant negative cross-correlations, and · indicates insignificant cross-correlations.

```
proc varmax data=simul1;
  model y1 y2 / p=1 noint lagmax=3 print=(corry)
           printform=univariate;
run;
```

Figure 35.39 shows the sample cross-correlation matrices of y_{1t} and y_{2t} . As shown, the sample autocorrelation functions for each variable decay quickly, but are significant with respect to two standard errors.

Partial Autoregressive Matrices

For each $m = 1, 2, \dots, p$ you can define a sequence of matrices Φ_{mm} , which is called the partial autoregression matrices of lag m , as the solution for Φ_{mm} to the Yule-Walker equations of order m ,

$$\Gamma(l) = \sum_{i=1}^m \Gamma(l-i) \Phi'_{im}, \quad l = 1, 2, \dots, m$$

The sequence of the partial autoregression matrices Φ_{mm} of order m has the characteristic property that if the process follows the $AR(p)$, then $\Phi_{pp} = \Phi_p$ and $\Phi_{mm} = 0$ for $m > p$. Hence, the matrices Φ_{mm} have the cutoff property for a $VAR(p)$ model, and so they can be useful in the identification of the order of a pure VAR model.

The following statements use the PARCOEF option to compute the partial autoregression matrices:

```
proc varmax data=simul1;
  model y1 y2 / p=1 noint lagmax=3
    printform=univariate
    print=(corry parcoef pcorr
      pcancorr roots);
run;
```

Figure 35.40 shows that the model can be obtained by an AR order $m = 1$ since partial autoregression matrices are insignificant after lag 1 with respect to two standard errors. The matrix for lag 1 is the same as the Yule-Walker autoregressive matrix.

Figure 35.40 Partial Autoregression Matrices (PARCOEF Option)

Partial Correlation Matrices

Define the forward autoregression

$$y_t = \sum_{i=1}^{m-1} \Phi_{i,m-1} y_{t-i} + u_{m,t}$$

and the backward autoregression

$$\mathbf{y}_{t-m} = \sum_{i=1}^{m-1} \Phi_{i,m-1}^* \mathbf{y}_{t-m+i} + \mathbf{u}_{m,t-m}^*$$

The matrices $P(m)$ defined by Ansley and Newbold (1979) are given by

$$P(m) = \Sigma_{m-1}^{*1/2} \Phi_{mm}' \Sigma_{m-1}^{-1/2}$$

where

$$\Sigma_{m-1} = \text{Cov}(\mathbf{u}_{m,t}) = \Gamma(0) - \sum_{i=1}^{m-1} \Gamma(-i) \Phi_{i,m-1}'$$

and

$$\Sigma_{m-1}^* = \text{Cov}(\mathbf{u}_{m,t-m}^*) = \Gamma(0) - \sum_{i=1}^{m-1} \Gamma(m-i) \Phi_{m-i,m-1}^{*'}.$$

$P(m)$ are the partial cross-correlation matrices at lag m between the elements of \mathbf{y}_t and \mathbf{y}_{t-m} , given $\mathbf{y}_{t-1}, \dots, \mathbf{y}_{t-m+1}$. The matrices $P(m)$ have the cutoff property for a VAR(p) model, and so they can be useful in the identification of the order of a pure VAR structure.

The following statements use the PCORR option to compute the partial cross-correlation matrices:

```
proc varmax data=simul1;
  model y1 y2 / p=1 noint lagmax=3
           print=(pcorr)
           printform=univariate;
run;
```

The partial cross-correlation matrices in [Figure 35.41](#) are insignificant after lag 1 with respect to two standard errors. This indicates that an AR order of $m = 1$ can be an appropriate choice.

Figure 35.41 Partial Correlations (PCORR Option)

Partial Canonical Correlation Matrices

The partial canonical correlations at lag m between the vectors \mathbf{y}_t and \mathbf{y}_{t-m} , given $\mathbf{y}_{t-1}, \dots, \mathbf{y}_{t-m+1}$, are $1 \geq \rho_1(m) \geq \rho_2(m) \cdots \geq \rho_k(m)$. The partial canonical correlations are the canonical correlations between the residual series $\mathbf{u}_{m,t}$ and $\mathbf{u}_{m,t-m}^*$, where $\mathbf{u}_{m,t}$ and $\mathbf{u}_{m,t-m}^*$ are defined in the previous section. Thus, the squared partial canonical correlations $\rho_i^2(m)$ are the eigenvalues of the matrix

$$\{\text{Cov}(\mathbf{u}_{m,t})\}^{-1} \text{E}(\mathbf{u}_{m,t} \mathbf{u}_{m,t-m}^{*'}) \{\text{Cov}(\mathbf{u}_{m,t-m}^*)\}^{-1} \text{E}(\mathbf{u}_{m,t-m}^* \mathbf{u}_{m,t}') = \Phi_{mm}^{*'} \Phi_{mm}'$$

It follows that the test statistic to test for $\Phi_m = 0$ in the VAR model of order $m > p$ is approximately

$$(T - m) \text{tr} \{\Phi_{mm}^{*'} \Phi_{mm}'\} \approx (T - m) \sum_{i=1}^k \rho_i^2(m)$$

and has an asymptotic chi-square distribution with k^2 degrees of freedom for $m > p$.

The following statements use the PCANCORR option to compute the partial canonical correlations:

```
proc varmax data=simul1;
  model y1 y2 / p=1 noint lagmax=3 print=(pcancorr);
run;
```

Figure 35.42 shows that the partial canonical correlations $\rho_i(m)$ between \mathbf{y}_t and \mathbf{y}_{t-m} are $\{0.918, 0.773\}$, $\{0.092, 0.018\}$, and $\{0.109, 0.011\}$ for lags $m = 1$ to 3. After lag $m = 1$, the partial canonical correlations are insignificant with respect to the 0.05 significance level, indicating that an AR order of $m = 1$ can be an appropriate choice.

Figure 35.42 Partial Canonical Correlations (PCANCORR Option)

The VARMAX Procedure					
Partial Canonical Correlations					
Lag	Correlation1	Correlation2	DF	Chi-Square	Pr > ChiSq
1	0.91783	0.77335	4	142.61	<.0001
2	0.09171	0.01816	4	0.86	0.9307

The Minimum Information Criterion (MINIC) Method

The minimum information criterion (MINIC) method can tentatively identify the orders of a VARMA(p, q) process. Note that Spliid (1983), Koreisha and Pukkila (1989), and Quinn (1980) proposed this method. The first step of this method is to obtain estimates of the innovations series, ϵ_t , from the VAR(p_ϵ), where p_ϵ is chosen sufficiently large. The choice of the autoregressive order, p_ϵ , is determined by use of a selection criterion. From the selected VAR(p_ϵ) model, you obtain estimates of residual series

$$\tilde{\epsilon}_t = y_t - \sum_{i=1}^{p_\epsilon} \hat{\Phi}_i^{p_\epsilon} y_{t-i} - \hat{\delta}^{p_\epsilon}, \quad t = p_\epsilon + 1, \dots, T$$

In the second step, you select the order (p, q) of the VARMA model for p in ($p_{min} : p_{max}$) and q in ($q_{min} : q_{max}$)

$$y_t = \delta + \sum_{i=1}^p \Phi_i y_{t-i} - \sum_{i=1}^q \Theta_i \tilde{\epsilon}_{t-i} + \epsilon_t$$

which minimizes a selection criterion like SBC or HQ.

The following statements use the MINIC= option to compute a table that contains the information criterion associated with various AR and MA orders:

```
proc varmax data=simul1;
  model y1 y2 / p=1 noint minic=(p=3 q=3);
run;
```

Figure 35.43 shows the output associated with the MINIC= option. The criterion takes the smallest value at AR order 1.

Figure 35.43 MINIC= Option

The VARMAX Procedure

AR 2	0.6369334	0.6729736	0.7610413	0.8481559
AR 3	0.7235629	0.7551756	0.8053765	0.8654079

VAR and VARX Modeling

The p th-order VAR process is written as

$$\mathbf{y}_t - \boldsymbol{\mu} = \sum_{i=1}^p \Phi_i (\mathbf{y}_{t-i} - \boldsymbol{\mu}) + \boldsymbol{\epsilon}_t \text{ or } \Phi(B)(\mathbf{y}_t - \boldsymbol{\mu}) = \boldsymbol{\epsilon}_t$$

with $\Phi(B) = I_k - \sum_{i=1}^p \Phi_i B^i$.

Equivalently, it can be written as

$$\mathbf{y}_t = \boldsymbol{\delta} + \sum_{i=1}^p \Phi_i \mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t \text{ or } \Phi(B)\mathbf{y}_t = \boldsymbol{\delta} + \boldsymbol{\epsilon}_t$$

with $\boldsymbol{\delta} = (I_k - \sum_{i=1}^p \Phi_i)\boldsymbol{\mu}$.

Stationarity

For stationarity, the VAR process must be expressible in the convergent causal infinite MA form as

$$\mathbf{y}_t = \boldsymbol{\mu} + \sum_{j=0}^{\infty} \Psi_j \boldsymbol{\epsilon}_{t-j}$$

where $\Psi(B) = \Phi(B)^{-1} = \sum_{j=0}^{\infty} \Psi_j B^j$ with $\sum_{j=0}^{\infty} \|\Psi_j\| < \infty$, where $\|A\|$ denotes a norm for the matrix A such as $\|A\|^2 = \text{tr}\{A'A\}$. The matrix Ψ_j can be recursively obtained from the relation $\Phi(B)\Psi(B) = I$; it is

$$\Psi_j = \Phi_1 \Psi_{j-1} + \Phi_2 \Psi_{j-2} + \cdots + \Phi_p \Psi_{j-p}$$

where $\Psi_0 = I_k$ and $\Psi_j = 0$ for $j < 0$.

The stationarity condition is satisfied if all roots of $|\Phi(z)| = 0$ are outside of the unit circle. The stationarity condition is equivalent to the condition in the corresponding VAR(1) representation, $\mathbf{Y}_t = \Phi \mathbf{Y}_{t-1} + \boldsymbol{\varepsilon}_t$, that all eigenvalues of the $kp \times kp$ companion matrix Φ be less than one in absolute value, where $\mathbf{Y}_t = (\mathbf{y}'_t, \dots, \mathbf{y}'_{t-p+1})'$, $\boldsymbol{\varepsilon}_t = (\boldsymbol{\varepsilon}'_t, 0', \dots, 0')'$, and

$$\Phi = \begin{bmatrix} \Phi_1 & \Phi_2 & \cdots & \Phi_{p-1} & \Phi_p \\ I_k & 0 & \cdots & 0 & 0 \\ 0 & I_k & \cdots & 0 & 0 \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & \cdots & I_k & 0 \end{bmatrix}$$

If the stationarity condition is not satisfied, a nonstationary model (a differenced model or an error correction model) might be more appropriate.

The following statements estimate a VAR(1) model and use the ROOTS option to compute the characteristic polynomial roots:

```
proc varmax data=simul1;
  model y1 y2 / p=1 noint print=(roots);
run;
```

Figure 35.44 shows the output associated with the ROOTS option, which indicates that the series is stationary since the modulus of the eigenvalue is less than one.

Figure 35.44 Stationarity (ROOTS Option)

The VARMAX Procedure					
Roots of AR Characteristic Polynomial					
Index	Real	Imaginary	Modulus	Radian	Degree
1	0.77238	0.35899	0.8517	0.4351	24.9284
2	0.77238	-0.35899	0.8517	-0.4351	-24.9284

Parameter Estimation

Consider the stationary VAR(p) model

$$\mathbf{y}_t = \boldsymbol{\delta} + \sum_{i=1}^p \Phi_i \mathbf{y}_{t-i} + \boldsymbol{\varepsilon}_t$$

where $\mathbf{y}_{-p+1}, \dots, \mathbf{y}_0$ are assumed to be available (for convenience of notation). This can be represented by the general form of the multivariate linear model,

$$\mathbf{Y} = \mathbf{X}\mathbf{B} + \mathbf{E} \quad \text{or} \quad \mathbf{y} = (\mathbf{X} \otimes \mathbf{I}_k)\boldsymbol{\beta} + \mathbf{e}$$

where

$$\begin{aligned}
 Y &= (\mathbf{y}_1, \dots, \mathbf{y}_T)' \\
 B &= (\boldsymbol{\delta}, \Phi_1, \dots, \Phi_p)' \\
 X &= (X_0, \dots, X_{T-1})' \\
 X_t &= (1, \mathbf{y}_t', \dots, \mathbf{y}_{t-p+1}')' \\
 E &= (\boldsymbol{\epsilon}_1, \dots, \boldsymbol{\epsilon}_T)' \\
 \mathbf{y} &= \text{vec}(Y') \\
 \boldsymbol{\beta} &= \text{vec}(B') \\
 \mathbf{e} &= \text{vec}(E')
 \end{aligned}$$

with vec denoting the column stacking operator.

The conditional least squares estimator of $\boldsymbol{\beta}$ is

$$\hat{\boldsymbol{\beta}} = ((X'X)^{-1}X' \otimes I_k)\mathbf{y}$$

and the estimate of Σ is

$$\hat{\Sigma} = (T - (kp + 1))^{-1} \sum_{t=1}^T \hat{\boldsymbol{\epsilon}}_t \hat{\boldsymbol{\epsilon}}_t'$$

where $\hat{\boldsymbol{\epsilon}}_t$ is the residual vectors. Consistency and asymptotic normality of the LS estimator are that

$$\sqrt{T}(\hat{\boldsymbol{\beta}} - \boldsymbol{\beta}) \xrightarrow{d} N(0, \Gamma_p^{-1} \otimes \Sigma)$$

where $X'X/T$ converges in probability to Γ_p and \xrightarrow{d} denotes convergence in distribution.

The (conditional) maximum likelihood estimator in the VAR(p) model is equal to the (conditional) least squares estimator on the assumption of normality of the error vectors.

Asymptotic Distributions of Impulse Response Functions

As before, vec denotes the column stacking operator and vech is the corresponding operator that stacks the elements on and below the diagonal. For any $k \times k$ matrix A , the commutation matrix K_k is defined as $K_k \text{vec}(A) = \text{vec}(A')$; the duplication matrix D_k is defined as $D_k \text{vech}(A) = \text{vec}(A)$; the elimination matrix L_k is defined as $L_k \text{vec}(A) = \text{vech}(A)$.

The asymptotic distribution of the impulse response function (Lütkepohl 1993) is

$$\sqrt{T} \text{vec}(\hat{\Psi}_j - \Psi_j) \xrightarrow{d} N(0, G_j \Sigma_{\boldsymbol{\beta}} G_j') \quad j = 1, 2, \dots$$

where $\Sigma_{\boldsymbol{\beta}} = \Gamma_p^{-1} \otimes \Sigma$ and

$$G_j = \frac{\partial \text{vec}(\Psi_j)}{\partial \boldsymbol{\beta}'} = \sum_{i=0}^{j-1} \mathbf{J}(\Phi')^{j-1-i} \otimes \Psi_i$$

where $\mathbf{J} = [I_k, 0, \dots, 0]$ is a $k \times kp$ matrix and Φ is a $kp \times kp$ companion matrix.

The asymptotic distribution of the accumulated impulse response function is

$$\sqrt{T} \text{vec}(\hat{\Psi}_l^a - \Psi_l^a) \xrightarrow{d} N(0, F_l \Sigma_{\beta} F_l') \quad l = 1, 2, \dots$$

where $F_l = \sum_{j=1}^l G_j$.

The asymptotic distribution of the orthogonalized impulse response function is

$$\sqrt{T} \text{vec}(\hat{\Psi}_j^o - \Psi_j^o) \xrightarrow{d} N(0, C_j \Sigma_{\beta} C_j' + \bar{C}_j \Sigma_{\sigma} \bar{C}_j') \quad j = 0, 1, 2, \dots$$

where $C_0 = 0$, $C_j = (\Psi_0^{o'} \otimes I_k) G_j$, $\bar{C}_j = (I_k \otimes \Psi_j) H$,

$$H = \frac{\partial \text{vec}(\Psi_0^o)}{\partial \sigma'} = L_k' \{L_k(I_{k^2} + K_k)(\Psi_0^o \otimes I_k)L_k'\}^{-1}$$

and $\Sigma_{\sigma} = 2D_k^+(\Sigma \otimes \Sigma)D_k^{+'}$ with $D_k^+ = (D_k' D_k)^{-1} D_k'$ and $\sigma = \text{vech}(E)$.

Granger Causality Test

Let \mathbf{y}_t be arranged and partitioned in subgroups \mathbf{y}_{1t} and \mathbf{y}_{2t} with dimensions k_1 and k_2 , respectively ($k = k_1 + k_2$); that is, $\mathbf{y}_t = (\mathbf{y}_{1t}', \mathbf{y}_{2t}')'$ with the corresponding white noise process $\epsilon_t = (\epsilon_{1t}', \epsilon_{2t}')'$. Consider the VAR(p) model with partitioned coefficients $\Phi_{ij}(B)$ for $i, j = 1, 2$ as follows:

$$\begin{bmatrix} \Phi_{11}(B) & \Phi_{12}(B) \\ \Phi_{21}(B) & \Phi_{22}(B) \end{bmatrix} \begin{bmatrix} \mathbf{y}_{1t} \\ \mathbf{y}_{2t} \end{bmatrix} = \begin{bmatrix} \delta_1 \\ \delta_2 \end{bmatrix} + \begin{bmatrix} \epsilon_{1t} \\ \epsilon_{2t} \end{bmatrix}$$

The variables \mathbf{y}_{1t} are said to cause \mathbf{y}_{2t} , but \mathbf{y}_{2t} do not cause \mathbf{y}_{1t} if $\Phi_{12}(B) = 0$. The implication of this model structure is that future values of the process \mathbf{y}_{1t} are influenced only by its own past and not by the past of \mathbf{y}_{2t} , where future values of \mathbf{y}_{2t} are influenced by the past of both \mathbf{y}_{1t} and \mathbf{y}_{2t} . If the future \mathbf{y}_{1t} are not influenced by the past values of \mathbf{y}_{2t} , then it can be better to model \mathbf{y}_{1t} separately from \mathbf{y}_{2t} .

Consider testing $H_0: C\beta = c$, where C is a $s \times (k^2 p + k)$ matrix of rank s and c is an s -dimensional vector where $s = k_1 k_2 p$. Assuming that

$$\sqrt{T}(\hat{\beta} - \beta) \xrightarrow{d} N(0, \Gamma_p^{-1} \otimes \Sigma)$$

you get the Wald statistic

$$T(C\hat{\beta} - c)'[C(\hat{\Gamma}_p^{-1} \otimes \hat{\Sigma})C']^{-1}(C\hat{\beta} - c) \xrightarrow{d} \chi^2(s)$$

For the Granger causality test, the matrix C consists of zeros or ones and c is the zero vector. See Lütkepohl(1993) for more details of the Granger causality test.

VARX Modeling

The vector autoregressive model with exogenous variables is called the VARX(p,s) model. The form of the VARX(p,s) model can be written as

$$\mathbf{y}_t = \boldsymbol{\delta} + \sum_{i=1}^p \Phi_i \mathbf{y}_{t-i} + \sum_{i=0}^s \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

The parameter estimates can be obtained by representing the general form of the multivariate linear model,

$$Y = XB + E \text{ or } \mathbf{y} = (X \otimes I_k) \boldsymbol{\beta} + \mathbf{e}$$

where

$$\begin{aligned} Y &= (\mathbf{y}_1, \dots, \mathbf{y}_T)' \\ B &= (\boldsymbol{\delta}, \Phi_1, \dots, \Phi_p, \Theta_0^*, \dots, \Theta_s^*)' \\ X &= (X_0, \dots, X_{T-1})' \\ X_t &= (1, \mathbf{y}_t', \dots, \mathbf{y}_{t-p+1}', \mathbf{x}_{t+1}', \dots, \mathbf{x}_{t-s+1}')' \\ E &= (\boldsymbol{\epsilon}_1, \dots, \boldsymbol{\epsilon}_T)' \\ \mathbf{y} &= \text{vec}(Y') \\ \boldsymbol{\beta} &= \text{vec}(B') \\ \mathbf{e} &= \text{vec}(E') \end{aligned}$$

The conditional least squares estimator of $\boldsymbol{\beta}$ can be obtained by using the same method in a VAR(p) modeling. If the multivariate linear model has different independent variables that correspond to dependent variables, the SUR (seemingly unrelated regression) method is used to improve the regression estimates.

The following example fits the ordinary regression model:

```
proc varmax data=one;
  model y1-y3 = x1-x5;
run;
```

This is equivalent to the REG procedure in the SAS/STAT software:

```
proc reg data=one;
  model y1 = x1-x5;
  model y2 = x1-x5;
  model y3 = x1-x5;
run;
```

The following example fits the second-order lagged regression model:

```
proc varmax data=two;
  model y1 y2 = x / xlag=2;
run;
```

This is equivalent to the REG procedure in the SAS/STAT software:

```
data three;
  set two;
  xlag1 = lag1(x);
  xlag2 = lag2(x);
run;

proc reg data=three;
  model y1 = x xlag1 xlag2;
  model y2 = x xlag1 xlag2;
run;
```

The following example fits the ordinary regression model with different regressors:

```
proc varmax data=one;
  model y1 = x1-x3, y2 = x2 x3;
run;
```

This is equivalent to the following SYSLIN procedure statements:

```
proc syslin data=one vardef=df sur;
  endogenous y1 y2;
  model y1 = x1-x3;
  model y2 = x2 x3;
run;
```

From the output in [Figure 35.20](#) in the section “Getting Started: VARMAX Procedure” on page 2222, you can see that the parameters, XL0_1_2, XL0_2_1, XL0_3_1, and XL0_3_2 associated with the exogenous variables, are not significant. The following example fits the VARX(1,0) model with different regressors:

```
proc varmax data=grunfeld;
  model y1 = x1, y2 = x2, y3 / p=1 print=(estimates);
run;
```

Figure 35.45 Parameter Estimates for the VARX(1, 0) Model

The VARMAX Procedure				
XLag				
Lag	Variable	x1	x2	
0	y1	1.83231	—	
	y2	—	2.42110	
	y3	—	—	

As you can see in [Figure 35.45](#), the symbol ‘—’ in the elements of matrix corresponds to endogenous variables that do not take the denoted exogenous variables.

Bayesian VAR and VARX Modeling

Consider the VAR(p) model

$$\mathbf{y}_t = \boldsymbol{\delta} + \Phi_1 \mathbf{y}_{t-1} + \cdots + \Phi_p \mathbf{y}_{t-p} + \boldsymbol{\epsilon}_t$$

or

$$\mathbf{y} = (X \otimes I_k) \boldsymbol{\beta} + \mathbf{e}$$

When the parameter vector $\boldsymbol{\beta}$ has a prior multivariate normal distribution with known mean $\boldsymbol{\beta}^*$ and covariance matrix V_β , the prior density is written as

$$f(\boldsymbol{\beta}) = \left(\frac{1}{2\pi}\right)^{k^2 p/2} |V_\beta|^{-1/2} \exp\left[-\frac{1}{2}(\boldsymbol{\beta} - \boldsymbol{\beta}^*)' V_\beta^{-1} (\boldsymbol{\beta} - \boldsymbol{\beta}^*)\right]$$

The likelihood function for the Gaussian process becomes

$$\begin{aligned} \ell(\boldsymbol{\beta}|\mathbf{y}) &= \left(\frac{1}{2\pi}\right)^{kT/2} |I_T \otimes \Sigma|^{-1/2} \times \\ &\quad \exp\left[-\frac{1}{2}(\mathbf{y} - (X \otimes I_k) \boldsymbol{\beta})' (I_T \otimes \Sigma^{-1}) (\mathbf{y} - (X \otimes I_k) \boldsymbol{\beta})\right] \end{aligned}$$

Therefore, the posterior density is derived as

$$f(\boldsymbol{\beta}|\mathbf{y}) \propto \exp\left[-\frac{1}{2}(\boldsymbol{\beta} - \bar{\boldsymbol{\beta}})' \bar{\Sigma}_\beta^{-1} (\boldsymbol{\beta} - \bar{\boldsymbol{\beta}})\right]$$

where the posterior mean is

$$\bar{\boldsymbol{\beta}} = [V_\beta^{-1} + (X'X \otimes \Sigma^{-1})]^{-1} [V_\beta^{-1} \boldsymbol{\beta}^* + (X' \otimes \Sigma^{-1}) \mathbf{y}]$$

and the posterior covariance matrix is

$$\bar{\Sigma}_\beta = [V_\beta^{-1} + (X'X \otimes \Sigma^{-1})]^{-1}$$

In practice, the prior mean $\boldsymbol{\beta}^*$ and the prior variance V_β need to be specified. If all the parameters are considered to shrink toward zero, the null prior mean should be specified. According to Litterman (1986), the prior variance can be given by

$$v_{ij}(l) = \begin{cases} (\lambda/l)^2 & \text{if } i = j \\ (\lambda \theta \sigma_{ii} / l \sigma_{jj})^2 & \text{if } i \neq j \end{cases}$$

where $v_{ij}(l)$ is the prior variance of the (i, j) th element of Φ_l , λ is the prior standard deviation of the diagonal elements of Φ_l , θ is a constant in the interval $(0, 1)$, and σ_{ii}^2 is the i th diagonal element of Σ . The deterministic terms have diffused prior variance. In practice, you replace the σ_{ii}^2 by the diagonal element of the ML estimator of Σ in the nonconstrained model.

For example, for a bivariate BVAR(2) model,

$$\begin{aligned} y_{1t} &= 0 + \phi_{1,11}y_{1,t-1} + \phi_{1,12}y_{2,t-1} + \phi_{2,11}y_{1,t-2} + \phi_{2,12}y_{2,t-2} + \epsilon_{1t} \\ y_{2t} &= 0 + \phi_{1,21}y_{1,t-1} + \phi_{1,22}y_{2,t-1} + \phi_{2,21}y_{1,t-2} + \phi_{2,22}y_{2,t-2} + \epsilon_{2t} \end{aligned}$$

with the prior covariance matrix

$$V_\beta = \text{Diag} \begin{pmatrix} \infty, \lambda^2, (\lambda\theta\sigma_1/\sigma_2)^2, (\lambda/2)^2, (\lambda\theta\sigma_1/2\sigma_2)^2, \\ \infty, (\lambda\theta\sigma_2/\sigma_1)^2, \lambda^2, (\lambda\theta\sigma_2/2\sigma_1)^2, (\lambda/2)^2 \end{pmatrix}$$

For the Bayesian estimation of integrated systems, the prior mean is set to the first lag of each variable equal to one in its own equation and all other coefficients at zero. For example, for a bivariate BVAR(2) model,

$$\begin{aligned} y_{1t} &= 0 + 1 y_{1,t-1} + 0 y_{2,t-1} + 0 y_{1,t-2} + 0 y_{2,t-2} + \epsilon_{1t} \\ y_{2t} &= 0 + 0 y_{1,t-1} + 1 y_{2,t-1} + 0 y_{1,t-2} + 0 y_{2,t-2} + \epsilon_{2t} \end{aligned}$$

Forecasting of BVAR Modeling

The mean squared error (MSE) is used to measure forecast accuracy (Litterman 1986). The MSE of the s -step-ahead forecast is

$$MSE_s = \frac{1}{J-s+1} \sum_{j=1}^{J-s+1} (A_{t_j} - F_{t_j}^s)^2$$

where J is the number specified by NREP= option, t_j is the time index of the observation to be forecasted in repetition j , A_{t_j} is the actual value at time t_j , and $F_{t_j}^s$ is the forecast made s periods earlier.

Bayesian VARX Modeling

The Bayesian vector autoregressive model with exogenous variables is called the BVARX(p, s) model. The form of the BVARX(p, s) model can be written as

$$\mathbf{y}_t = \boldsymbol{\delta} + \sum_{i=1}^p \Phi_i \mathbf{y}_{t-i} + \sum_{i=0}^s \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t$$

The parameter estimates can be obtained by representing the general form of the multivariate linear model,

$$\mathbf{y} = (\mathbf{X} \otimes \mathbf{I}_k) \boldsymbol{\beta} + \mathbf{e}$$

The prior means for the AR coefficients are the same as those specified in $BVAR(p)$. The prior means for the exogenous coefficients are set to zero.

Some examples of the Bayesian VARX model are as follows:

```
model y1 y2 = x1 / p=1 xlag=1 prior;
```

```
model y1 y2 = x1 / p=(1 3) xlag=1 nocurrentx
prior=(lambda=0.9 theta=0.1);
```

VARMA and VARMAX Modeling

A VARMA(p, q) process is written as

$$\mathbf{y}_t = \boldsymbol{\delta} + \sum_{i=1}^p \Phi_i \mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t - \sum_{i=1}^q \Theta_i \boldsymbol{\epsilon}_{t-i}$$

or

$$\Phi(B)\mathbf{y}_t = \boldsymbol{\delta} + \Theta(B)\boldsymbol{\epsilon}_t$$

where $\Phi(B) = I_k - \sum_{i=1}^p \Phi_i B^i$ and $\Theta(B) = I_k - \sum_{i=1}^q \Theta_i B^i$.

Stationarity and Invertibility

For stationarity and invertibility of the VARMA process, the roots of $|\Phi(z)| = 0$ and $|\Theta(z)| = 0$ are outside the unit circle.

Parameter Estimation

Under the assumption of normality of the $\boldsymbol{\epsilon}_t$ with mean vector zero and nonsingular covariance matrix Σ , consider the conditional (approximate) log-likelihood function of a VARMA(p, q) model with mean zero.

Define $Y = (\mathbf{y}_1, \dots, \mathbf{y}_T)'$ and $E = (\boldsymbol{\epsilon}_1, \dots, \boldsymbol{\epsilon}_T)'$ with $B^i Y = (\mathbf{y}_{1-i}, \dots, \mathbf{y}_{T-i})'$ and $B^i E = (\boldsymbol{\epsilon}_{1-i}, \dots, \boldsymbol{\epsilon}_{T-i})'$; define $\mathbf{y} = \text{vec}(Y')$ and $\mathbf{e} = \text{vec}(E')$. Then

$$\mathbf{y} - \sum_{i=1}^p (I_T \otimes \Phi_i) B^i \mathbf{y} = \mathbf{e} - \sum_{i=1}^q (I_T \otimes \Theta_i) B^i \mathbf{e}$$

where $B^i \mathbf{y} = \text{vec}[(B^i Y)']$ and $B^i \mathbf{e} = \text{vec}[(B^i E)']$.

Then, the conditional (approximate) log-likelihood function can be written as follows (Reinsel 1997):

$$\begin{aligned}\ell &= -\frac{T}{2} \log |\Sigma| - \frac{1}{2} \sum_{t=1}^T \epsilon_t' \Sigma^{-1} \epsilon_t \\ &= -\frac{T}{2} \log |\Sigma| - \frac{1}{2} \mathbf{w}' \Theta'^{-1} (I_T \otimes \Sigma^{-1}) \Theta^{-1} \mathbf{w}\end{aligned}$$

where $\mathbf{w} = \mathbf{y} - \sum_{i=1}^p (I_T \otimes \Phi_i) B^i \mathbf{y}$, and Θ is such that $\mathbf{e} - \sum_{i=1}^q (I_T \otimes \Theta_i) B^i \mathbf{e} = \Theta \mathbf{e}$.

For the exact log-likelihood function of a VARMA(p, q) model, the Kalman filtering method is used transforming the VARMA process into the state-space form (Reinsel 1997).

The state-space form of the VARMA(p, q) model consists of a state equation

$$\mathbf{z}_t = F \mathbf{z}_{t-1} + G \epsilon_t$$

and an observation equation

$$\mathbf{y}_t = H \mathbf{z}_t$$

where for $v = \max(p, q + 1)$

$$\begin{aligned}\mathbf{z}_t &= (\mathbf{y}_t', \mathbf{y}_{t+1|t}', \dots, \mathbf{y}_{t+v-1|t}')' \\ F &= \begin{bmatrix} 0 & I_k & 0 & \cdots & 0 \\ 0 & 0 & I_k & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ \Phi_v & \Phi_{v-1} & \Phi_{v-2} & \cdots & \Phi_1 \end{bmatrix}, \quad G = \begin{bmatrix} I_k \\ \Psi_1 \\ \vdots \\ \Psi_{v-1} \end{bmatrix}\end{aligned}$$

and

$$H = [I_k, 0, \dots, 0]$$

The Kalman filtering approach is used for evaluation of the likelihood function. The updating equation is

$$\hat{\mathbf{z}}_{t|t} = \hat{\mathbf{z}}_{t|t-1} + K_t \epsilon_{t|t-1}$$

with

$$K_t = P_{t|t-1} H' [H P_{t|t-1} H']^{-1}$$

and the prediction equation is

$$\hat{\mathbf{z}}_{t|t-1} = F \hat{\mathbf{z}}_{t-1|t-1}, \quad P_{t|t-1} = F P_{t-1|t-1} F' + G \Sigma G'$$

with $P_{t|t} = [I - K_t H] P_{t|t-1}$ for $t = 1, 2, \dots, n$.

The log-likelihood function can be expressed as

$$\ell = -\frac{1}{2} \sum_{t=1}^T [\log |\Sigma_{t|t-1}| - (\mathbf{y}_t - \hat{\mathbf{y}}_{t|t-1})' \Sigma_{t|t-1}^{-1} (\mathbf{y}_t - \hat{\mathbf{y}}_{t|t-1})]$$

where $\hat{\mathbf{y}}_{t|t-1}$ and $\Sigma_{t|t-1}$ are determined recursively from the Kalman filter procedure. To construct the likelihood function from Kalman filtering, you obtain $\hat{\mathbf{y}}_{t|t-1} = H\hat{\mathbf{z}}_{t|t-1}$, $\hat{\boldsymbol{\epsilon}}_{t|t-1} = \mathbf{y}_t - \hat{\mathbf{y}}_{t|t-1}$, and $\Sigma_{t|t-1} = HP_{t|t-1}H'$.

Define the vector $\boldsymbol{\beta}$

$$\boldsymbol{\beta} = (\phi'_1, \dots, \phi'_p, \theta'_1, \dots, \theta'_q, \text{vech}(\Sigma))'$$

where $\phi_i = \text{vec}(\Phi_i)$ and $\theta_i = \text{vec}(\Theta_i)$.

The log-likelihood equations are solved by iterative numerical procedures such as the quasi-Newton optimization. The starting values for the AR and MA parameters are obtained from the least squares estimates.

Asymptotic Distribution of the Parameter Estimates

Under the assumptions of stationarity and invertibility for the VARMA model and the assumption that $\boldsymbol{\epsilon}_t$ is a white noise process, $\hat{\boldsymbol{\beta}}$ is a consistent estimator for $\boldsymbol{\beta}$ and $\sqrt{T}(\hat{\boldsymbol{\beta}} - \boldsymbol{\beta})$ converges in distribution to the multivariate normal $N(0, V^{-1})$ as $T \rightarrow \infty$, where V is the asymptotic information matrix of $\boldsymbol{\beta}$.

Asymptotic Distributions of Impulse Response Functions

Defining the vector $\boldsymbol{\beta}$

$$\boldsymbol{\beta} = (\phi'_1, \dots, \phi'_p, \theta'_1, \dots, \theta'_q)'$$

the asymptotic distribution of the impulse response function for a VARMA(p, q) model is

$$\sqrt{T} \text{vec}(\hat{\Psi}_j - \Psi_j) \xrightarrow{d} N(0, G_j \Sigma_{\boldsymbol{\beta}} G_j') \quad j = 1, 2, \dots$$

where $\Sigma_{\boldsymbol{\beta}}$ is the covariance matrix of the parameter estimates and

$$G_j = \frac{\partial \text{vec}(\Psi_j)}{\partial \boldsymbol{\beta}'} = \sum_{i=0}^{j-1} \mathbf{H}'(\mathbf{A}')^{j-1-i} \otimes \mathbf{J} \mathbf{A}^i \mathbf{J}'$$

where $\mathbf{H} = [I_k, 0, \dots, 0, I_k, 0, \dots, 0]'$ is a $k(p+q) \times k$ matrix with the second I_k following after p block matrices; $\mathbf{J} = [I_k, 0, \dots, 0]$ is a $k \times k(p+q)$ matrix; \mathbf{A} is a $k(p+q) \times k(p+q)$ matrix,

$$\mathbf{A} = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix}$$

where

$$A_{11} = \begin{bmatrix} \Phi_1 & \Phi_2 & \cdots & \Phi_{p-1} & \Phi_p \\ I_k & 0 & \cdots & 0 & 0 \\ 0 & I_k & \cdots & 0 & 0 \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & \cdots & I_k & 0 \end{bmatrix} \quad A_{12} = \begin{bmatrix} -\Theta_1 & \cdots & -\Theta_{q-1} & -\Theta_q \\ 0 & \cdots & 0 & 0 \\ 0 & \cdots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots \\ 0 & \cdots & 0 & 0 \end{bmatrix}$$

A_{21} is a $kq \times kp$ zero matrix, and

$$A_{22} = \begin{bmatrix} 0 & 0 & \cdots & 0 & 0 \\ I_k & 0 & \cdots & 0 & 0 \\ 0 & I_k & \cdots & 0 & 0 \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & \cdots & I_k & 0 \end{bmatrix}$$

An Example of a VARMA(1,1) Model

Consider a VARMA(1,1) model with mean zero

$$\mathbf{y}_t = \Phi_1 \mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t - \Theta_1 \boldsymbol{\epsilon}_{t-1}$$

where $\boldsymbol{\epsilon}_t$ is the white noise process with a mean zero vector and the positive-definite covariance matrix Σ .

The following IML procedure statements simulate a bivariate vector time series from this model to provide test data for the VARMAX procedure:

```
proc iml;
  sig = {1.0 0.5, 0.5 1.25};
  phi = {1.2 -0.5, 0.6 0.3};
  theta = {0.5 -0.2, 0.1 0.3};
  /* to simulate the vector time series */
  call varmasim(y,phi,theta) sigma=sig n=100 seed=34657;
  cn = {'y1' 'y2'};
  create simul3 from y[colname=cn];
  append from y;
run;
```

The following statements fit a VARMA(1,1) model to the simulated data. You specify the order of the autoregressive model with the P= option and the order of moving-average model with the Q= option. You specify the quasi-Newton optimization in the NLOPTIONS statement as an optimization method.

```
proc varmax data=simul3;
  nloptions tech=qn;
  model y1 y2 / p=1 q=1 noint print=(estimates);
run;
```

Figure 35.46 shows the initial values of parameters. The initial values were estimated using the least squares method.

The fitted VARMA(1,1) model with estimated standard errors in parentheses is given as

$$\mathbf{y}_t = \begin{pmatrix} 1.01809 & -0.38651 \\ (0.10256) & (0.09644) \\ 0.39147 & 0.55290 \\ (0.10062) & (0.08421) \end{pmatrix} \mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t - \begin{pmatrix} 0.32291 & -0.02153 \\ (0.14530) & (0.14199) \\ -0.16566 & 0.58613 \\ (0.15699) & (0.14115) \end{pmatrix} \boldsymbol{\epsilon}_{t-1}$$

VARMAX Modeling

A VARMAX(p, q, s) process is written as

$$\mathbf{y}_t = \boldsymbol{\delta} + \sum_{i=1}^p \Phi_i \mathbf{y}_{t-i} + \sum_{i=0}^s \Theta_i^* \mathbf{x}_{t-i} + \boldsymbol{\epsilon}_t - \sum_{i=1}^q \Theta_i \boldsymbol{\epsilon}_{t-i}$$

or

$$\Phi(B)\mathbf{y}_t = \boldsymbol{\delta} + \Theta^*(B)\mathbf{x}_t + \Theta(B)\boldsymbol{\epsilon}_t$$

where $\Phi(B) = I_k - \sum_{i=1}^p \Phi_i B^i$, $\Theta^*(B) = \Theta_0^* + \Theta_1^* B + \cdots + \Theta_s^* B^s$, and $\Theta(B) = I_k - \sum_{i=1}^q \Theta_i B^i$.

The dimension of the state-space vector of the Kalman filtering method for the parameter estimation of the VARMAX(p, q, s) model is large, which takes time and memory for computing. For convenience, the parameter estimation of the VARMAX(p, q, s) model uses the two-stage estimation method, which first estimates the deterministic terms and exogenous parameters, and then maximizes the log-likelihood function of a VARMA(p, q) model.

Some examples of VARMAX modeling are as follows:

```
model y1 y2 = x1 / q=1;
nloptions tech=qn;

model y1 y2 = x1 / p=1 q=1 xlag=1 nocurrentx;
nloptions tech=qn;
```

Model Diagnostic Checks

Multivariate Model Diagnostic Checks

- **Information Criterion** After fitting some candidate models to the data, various model selection criteria (normalized by T) can be used to choose the appropriate model. The following list includes the Akaike information criterion (AIC), the corrected Akaike information criterion (AICC), the final prediction error criterion (FPE), the Hannan-Quinn criterion (HQC), and the Schwarz Bayesian criterion

(SBC, also referred to as BIC):

$$\begin{aligned} \text{AIC} &= \log(|\tilde{\Sigma}|) + 2r/T \\ \text{AICC} &= \log(|\tilde{\Sigma}|) + 2r/(T - r/k) \\ \text{FPE} &= \left(\frac{T + r/k}{T - r/k}\right)^k |\tilde{\Sigma}| \\ \text{HQC} &= \log(|\tilde{\Sigma}|) + 2r \log(\log(T))/T \\ \text{SBC} &= \log(|\tilde{\Sigma}|) + r \log(T)/T \end{aligned}$$

where r denotes the number of parameters estimated, k is the number of dependent variables, T is the number of observations used to estimate the model, and $\tilde{\Sigma}$ is the maximum likelihood estimate of Σ . When comparing models, choose the model with the smallest criterion values.

An example of the output was displayed in [Figure 35.4](#).

- **Portmanteau Q_s statistic** The Portmanteau Q_s statistic is used to test whether correlation remains on the model residuals. The null hypothesis is that the residuals are uncorrelated. Let $C_\epsilon(l)$ be the residual cross-covariance matrices, $\hat{\rho}_\epsilon(l)$ be the residual cross-correlation matrices as

$$C_\epsilon(l) = T^{-1} \sum_{t=1}^{T-l} \epsilon_t \epsilon'_{t+l}$$

and

$$\hat{\rho}_\epsilon(l) = \hat{V}_\epsilon^{-1/2} C_\epsilon(l) \hat{V}_\epsilon^{-1/2} \quad \text{and} \quad \hat{\rho}_\epsilon(-l) = \hat{\rho}_\epsilon(l)'$$

where $\hat{V}_\epsilon = \text{Diag}(\hat{\sigma}_{11}^2, \dots, \hat{\sigma}_{kk}^2)$ and $\hat{\sigma}_{ii}^2$ are the diagonal elements of $\hat{\Sigma}$. The multivariate portmanteau test defined in Hosking (1980) is

$$Q_s = T^2 \sum_{l=1}^s (T-l)^{-1} \text{tr}\{\hat{\rho}_\epsilon(l) \hat{\rho}_\epsilon(0)^{-1} \hat{\rho}_\epsilon(-l) \hat{\rho}_\epsilon(0)^{-1}\}$$

The statistic Q_s has approximately the chi-square distribution with $k^2(s - p - q)$ degrees of freedom. An example of the output is displayed in [Figure 35.7](#).

Univariate Model Diagnostic Checks

There are various ways to perform diagnostic checks for a univariate model. For details, see the section “Testing for Nonlinear Dependence: Heteroscedasticity Tests” on page 398 in Chapter 8, “The AUTOREG Procedure.” An example of the output is displayed in [Figure 35.8](#) and [Figure 35.9](#).

- **Durbin-Watson (DW) statistics:** The DW test statistics test for the first order autocorrelation in the residuals.
- **Jarque-Bera normality test:** This test is helpful in determining whether the model residuals represent a white noise process. This tests the null hypothesis that the residuals have normality.

- F tests for autoregressive conditional heteroscedastic (ARCH) disturbances: F test statistics test for the heteroscedastic disturbances in the residuals. This tests the null hypothesis that the residuals have equal covariances
- F tests for AR disturbance: These test statistics are computed from the residuals of the univariate AR(1), AR(1,2), AR(1,2,3) and AR(1,2,3,4) models to test the null hypothesis that the residuals are uncorrelated.

Cointegration

This section briefly introduces the concepts of cointegration (Johansen 1995b).

Definition 1. (Engle and Granger 1987): If a series y_t with no deterministic components can be represented by a stationary and invertible ARMA process after differencing d times, the series is integrated of order d , that is, $y_t \sim I(d)$.

Definition 2. (Engle and Granger 1987): If all elements of the vector \mathbf{y}_t are $I(d)$ and there exists a cointegrating vector $\boldsymbol{\beta} \neq 0$ such that $\boldsymbol{\beta}'\mathbf{y}_t \sim I(d - b)$ for any $b > 0$, the vector process is said to be cointegrated $CI(d, b)$.

A simple example of a cointegrated process is the following bivariate system:

$$\begin{aligned} y_{1t} &= \gamma y_{2t} + \epsilon_{1t} \\ y_{2t} &= y_{2,t-1} + \epsilon_{2t} \end{aligned}$$

with ϵ_{1t} and ϵ_{2t} being uncorrelated white noise processes. In the second equation, y_{2t} is a random walk, $\Delta y_{2t} = \epsilon_{2t}$, $\Delta \equiv 1 - B$. Differencing the first equation results in

$$\Delta y_{1t} = \gamma \Delta y_{2t} + \Delta \epsilon_{1t} = \gamma \epsilon_{2t} + \epsilon_{1t} - \epsilon_{1,t-1}$$

Thus, both y_{1t} and y_{2t} are $I(1)$ processes, but the linear combination $y_{1t} - \gamma y_{2t}$ is stationary. Hence $\mathbf{y}_t = (y_{1t}, y_{2t})'$ is cointegrated with a cointegrating vector $\boldsymbol{\beta} = (1, -\gamma)'$.

In general, if the vector process \mathbf{y}_t has k components, then there can be more than one cointegrating vector $\boldsymbol{\beta}'$. It is assumed that there are r linearly independent cointegrating vectors with $r < k$, which make the $k \times r$ matrix $\boldsymbol{\beta}$. The rank of matrix $\boldsymbol{\beta}$ is r , which is called the *cointegration rank* of \mathbf{y}_t .

Common Trends

This section briefly discusses the implication of cointegration for the moving-average representation. Let \mathbf{y}_t be cointegrated $CI(1, 1)$, then $\Delta \mathbf{y}_t$ has the Wold representation:

$$\Delta \mathbf{y}_t = \boldsymbol{\delta} + \Psi(B)\boldsymbol{\epsilon}_t$$

where ϵ_t is *iid*(0, Σ), $\Psi(B) = \sum_{j=0}^{\infty} \Psi_j B^j$ with $\Psi_0 = I_k$, and $\sum_{j=0}^{\infty} j |\Psi_j| < \infty$.

Assume that $\epsilon_t = 0$ if $t \leq 0$ and \mathbf{y}_0 is a nonrandom initial value. Then the difference equation implies that

$$\mathbf{y}_t = \mathbf{y}_0 + \delta t + \Psi(1) \sum_{i=0}^t \epsilon_i + \Psi^*(B) \epsilon_t$$

where $\Psi^*(B) = (1 - B)^{-1}(\Psi(B) - \Psi(1))$ and $\Psi^*(B)$ is absolutely summable.

Assume that the rank of $\Psi(1)$ is $m = k - r$. When the process \mathbf{y}_t is cointegrated, there is a cointegrating $k \times r$ matrix β such that $\beta' \mathbf{y}_t$ is stationary.

Premultiplying \mathbf{y}_t by β' results in

$$\beta' \mathbf{y}_t = \beta' \mathbf{y}_0 + \beta' \Psi^*(B) \epsilon_t$$

because $\beta' \Psi(1) = 0$ and $\beta' \delta = 0$.

Stock and Watson (1988) showed that the cointegrated process \mathbf{y}_t has a common trends representation derived from the moving-average representation. Since the rank of $\Psi(1)$ is $m = k - r$, there is a $k \times r$ matrix H_1 with rank r such that $\Psi(1)H_1 = 0$. Let H_2 be a $k \times m$ matrix with rank m such that $H_2' H_1 = 0$; then $A = C(1)H_2$ has rank m . The $H = (H_1, H_2)$ has rank k . By construction of H ,

$$\Psi(1)H = [0, A] = AS_m$$

where $S_m = (0_{m \times r}, I_m)$. Since $\beta' \Psi(1) = 0$ and $\beta' \delta = 0$, δ lies in the column space of $\Psi(1)$ and can be written

$$\delta = C(1)\tilde{\delta}$$

where $\tilde{\delta}$ is a k -dimensional vector. The common trends representation is written as

$$\begin{aligned} \mathbf{y}_t &= \mathbf{y}_0 + \Psi(1)[\tilde{\delta}t + \sum_{i=0}^t \epsilon_i] + \Psi^*(B)\epsilon_t \\ &= \mathbf{y}_0 + \Psi(1)H[H^{-1}\tilde{\delta}t + H^{-1}\sum_{i=0}^t \epsilon_i] + \mathbf{a}_t \\ &= \mathbf{y}_0 + A\tau_t + \mathbf{a}_t \end{aligned}$$

and

$$\tau_t = \pi + \tau_{t-1} + \mathbf{v}_t$$

where $\mathbf{a}_t = \Psi^*(B)\epsilon_t$, $\pi = S_m H^{-1}\tilde{\delta}$, $\tau_t = S_m [H^{-1}\tilde{\delta}t + H^{-1}\sum_{i=0}^t \epsilon_i]$, and $\mathbf{v}_t = S_m H^{-1}\epsilon_t$.

Stock and Watson showed that the common trends representation expresses \mathbf{y}_t as a linear combination of m random walks (τ_t) with drift π plus $I(0)$ components (\mathbf{a}_t).

Test for the Common Trends

Stock and Watson (1988) proposed statistics for common trends testing. The null hypothesis is that the k -dimensional time series \mathbf{y}_t has m common stochastic trends, where $m \leq k$ and the alternative is that it has s common trends, where $s < m$. The test procedure of m versus s common stochastic trends is performed based on the first-order serial correlation matrix of \mathbf{y}_t . Let β_\perp be a $k \times m$ matrix orthogonal to the cointegrating matrix such that $\beta_\perp' \beta = 0$ and $\beta_\perp \beta_\perp' = I_m$. Let $\mathbf{z}_t = \beta_\perp' \mathbf{y}_t$ and $\mathbf{w}_t = \beta_\perp' \mathbf{y}_t$. Then

$$\mathbf{w}_t = \beta_\perp' \mathbf{y}_0 + \beta_\perp' \delta t + \beta_\perp' \Psi(1) \sum_{i=0}^t \epsilon_i + \beta_\perp' \Psi^*(B) \epsilon_t$$

Combining the expression of \mathbf{z}_t and \mathbf{w}_t ,

$$\begin{bmatrix} \mathbf{z}_t \\ \mathbf{w}_t \end{bmatrix} = \begin{bmatrix} \beta_\perp' \mathbf{y}_0 \\ \beta_\perp' \mathbf{y}_0 \end{bmatrix} + \begin{bmatrix} 0 \\ \beta_\perp' \delta \end{bmatrix} t + \begin{bmatrix} 0 \\ \beta_\perp' \Psi(1) \end{bmatrix} \sum_{i=1}^t \epsilon_i + \begin{bmatrix} \beta_\perp' \Psi^*(B) \\ \beta_\perp' \Psi^*(B) \end{bmatrix} \epsilon_t$$

The Stock-Watson common trends test is performed based on the component \mathbf{w}_t by testing whether $\beta_\perp' \Psi(1)$ has rank m against rank s .

The following statements perform the Stock-Watson test for common trends:

```
proc iml;
  sig = 100*i(2);
  phi = {-0.2 0.1, 0.5 0.2, 0.8 0.7, -0.4 0.6};
  call varmasim(y,phi) sigma=sig n=100 initial=0
               seed=45876;

  cn = {'y1' 'y2'};
  create simul2 from y[colname=cn];
  append from y;
quit;

data simul2;
  set simul2;
  date = intnx('year', '01jan1900'd, _n_-1 );
  format date year4. ;
run;

proc varmax data=simul2;
  model y1 y2 / p=2 cointtest=(sw);
run;
```

In Figure 35.51, the first column is the null hypothesis that \mathbf{y}_t has $m \leq k$ common trends; the second column is the alternative hypothesis that \mathbf{y}_t has $s < m$ common trends; the third column contains the eigenvalues used for the test statistics; the fourth column contains the test statistics using $AR(p)$ filtering of the data. The table shows the output of the case $p = 2$.

Figure 35.51 Common Trends Test (COINTTEST=(SW) Option)

The VARMAX Procedure					
Common Trend Test					
H0: Rank=m	H1: Rank=s	Eigenvalue	Filter	5% Critical Value	Lag
1	0	1.000906	0.09	-14.10	2
2	0	0.996763	-0.32	-8.80	
	1	0.648908	-35.11	-23.00	

The test statistic for testing for 2 versus 1 common trends is more negative (-35.1) than the critical value (-23.0). Therefore, the test rejects the null hypothesis, which means that the series has a single common trend.

Vector Error Correction Modeling

This section discusses the implication of cointegration for the autoregressive representation. Assume that the cointegrated series can be represented by a vector error correction model according to the Granger representation theorem (Engle and Granger 1987). Consider the vector autoregressive process with Gaussian errors defined by

$$\mathbf{y}_t = \sum_{i=1}^p \Phi_i \mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t$$

or

$$\Phi(B)\mathbf{y}_t = \boldsymbol{\epsilon}_t$$

where the initial values, $\mathbf{y}_{-p+1}, \dots, \mathbf{y}_0$, are fixed and $\boldsymbol{\epsilon}_t \sim N(0, \Sigma)$. Since the AR operator $\Phi(B)$ can be re-expressed as $\Phi(B) = \Phi^*(B)(1 - B) + \Phi(1)B$, where $\Phi^*(B) = I_k - \sum_{i=1}^{p-1} \Phi_i^* B^i$ with $\Phi_i^* = -\sum_{j=i+1}^p \Phi_j$, the vector error correction model is

$$\Phi^*(B)(1 - B)\mathbf{y}_t = \boldsymbol{\alpha}\boldsymbol{\beta}'\mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t$$

or

$$\Delta\mathbf{y}_t = \boldsymbol{\alpha}\boldsymbol{\beta}'\mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta\mathbf{y}_{t-i} + \boldsymbol{\epsilon}_t$$

where $\boldsymbol{\alpha}\boldsymbol{\beta}' = -\Phi(1) = -I_k + \Phi_1 + \Phi_2 + \dots + \Phi_p$.

One motivation for the VECM(p) form is to consider the relation $\beta' \mathbf{y}_t = \mathbf{c}$ as defining the underlying economic relations and assume that the agents react to the disequilibrium error $\beta' \mathbf{y}_t - \mathbf{c}$ through the adjustment coefficient α to restore equilibrium; that is, they satisfy the economic relations. The cointegrating vector, β is sometimes called the *long-run parameters*.

You can consider a vector error correction model with a deterministic term. The deterministic term D_t can contain a constant, a linear trend, and seasonal dummy variables. Exogenous variables can also be included in the model.

$$\Delta \mathbf{y}_t = \Pi \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + A D_t + \sum_{i=0}^s \Theta_i^* \mathbf{x}_{t-i} + \epsilon_t$$

where $\Pi = \alpha \beta'$.

The alternative vector error correction representation considers the error correction term at lag $t - p$ and is written as

$$\Delta \mathbf{y}_t = \sum_{i=1}^{p-1} \Phi_i^{\#} \Delta \mathbf{y}_{t-i} + \Pi^{\#} \mathbf{y}_{t-p} + A D_t + \sum_{i=0}^s \Theta_i^* \mathbf{x}_{t-i} + \epsilon_t$$

If the matrix Π has a full-rank ($r = k$), all components of \mathbf{y}_t are $I(0)$. On the other hand, \mathbf{y}_t are stationary in difference if $\text{rank}(\Pi) = 0$. When the rank of the matrix Π is $r < k$, there are $k - r$ linear combinations that are nonstationary and r stationary cointegrating relations. Note that the linearly independent vector $\mathbf{z}_t = \beta' \mathbf{y}_t$ is stationary and this transformation is not unique unless $r = 1$. There does not exist a unique cointegrating matrix β since the coefficient matrix Π can also be decomposed as

$$\Pi = \alpha M M^{-1} \beta' = \alpha^* \beta^{*'}$$

where M is an $r \times r$ nonsingular matrix.

Test for the Cointegration

The cointegration rank test determines the linearly independent columns of Π . Johansen (1988, 1995a) and Johansen and Juselius (1990) proposed the cointegration rank test by using the reduced rank regression.

Different Specifications of Deterministic Trends

When you construct the VECM(p) form from the VAR(p) model, the deterministic terms in the VECM(p) form can differ from those in the VAR(p) model. When there are deterministic cointegrated relationships among variables, deterministic terms in the VAR(p) model are not present in the VECM(p) form. On the other hand, if there are stochastic cointegrated relationships in the VAR(p) model, deterministic terms appear in the VECM(p) form via the error correction term or as an independent term in the VECM(p) form. There are five different specifications of deterministic trends in the VECM(p) form.

- **Case 1:** There is no separate drift in the VECM(p) form.

$$\Delta \mathbf{y}_t = \alpha \beta' \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \epsilon_t$$

- **Case 2:** There is no separate drift in the VECM(p) form, but a constant enters only via the error correction term.

$$\Delta \mathbf{y}_t = \alpha (\beta', \beta_0) (\mathbf{y}'_{t-1}, 1)' + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \epsilon_t$$

- **Case 3:** There is a separate drift and no separate linear trend in the VECM(p) form.

$$\Delta \mathbf{y}_t = \alpha \beta' \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \delta_0 + \epsilon_t$$

- **Case 4:** There is a separate drift and no separate linear trend in the VECM(p) form, but a linear trend enters only via the error correction term.

$$\Delta \mathbf{y}_t = \alpha (\beta', \beta_1) (\mathbf{y}'_{t-1}, t)' + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \delta_0 + \epsilon_t$$

- **Case 5:** There is a separate linear trend in the VECM(p) form.

$$\Delta \mathbf{y}_t = \alpha \beta' \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + \delta_0 + \delta_1 t + \epsilon_t$$

First, focus on Cases 1, 3, and 5 to test the null hypothesis that there are at most r cointegrating vectors. Let

$$\begin{aligned} Z_{0t} &= \Delta \mathbf{y}_t \\ Z_{1t} &= \mathbf{y}_{t-1} \\ Z_{2t} &= [\Delta \mathbf{y}'_{t-1}, \dots, \Delta \mathbf{y}'_{t-p+1}, D_t]' \\ Z_0 &= [Z_{01}, \dots, Z_{0T}]' \\ Z_1 &= [Z_{11}, \dots, Z_{1T}]' \\ Z_2 &= [Z_{21}, \dots, Z_{2T}]' \end{aligned}$$

where D_t can be empty for Case 1, 1 for Case 3, and $(1, t)$ for Case 5.

In Case 2, Z_{1t} and Z_{2t} are defined as

$$\begin{aligned} Z_{1t} &= [\mathbf{y}'_{t-1}, 1]' \\ Z_{2t} &= [\Delta \mathbf{y}'_{t-1}, \dots, \Delta \mathbf{y}'_{t-p+1}]' \end{aligned}$$

In Case 4, Z_{1t} and Z_{2t} are defined as

$$\begin{aligned} Z_{1t} &= [\mathbf{y}'_{t-1}, t]' \\ Z_{2t} &= [\Delta \mathbf{y}'_{t-1}, \dots, \Delta \mathbf{y}'_{t-p+1}, 1]' \end{aligned}$$

Let Ψ be the matrix of parameters consisting of $\Phi_1^*, \dots, \Phi_{p-1}^*$, A , and $\Theta_0^*, \dots, \Theta_s^*$, where parameters A corresponds to regressors D_t . Then the VECM(p) form is rewritten in these variables as

$$Z_{0t} = \alpha \beta' Z_{1t} + \Psi Z_{2t} + \epsilon_t$$

The log-likelihood function is given by

$$\begin{aligned} \ell &= -\frac{kT}{2} \log 2\pi - \frac{T}{2} \log |\Sigma| \\ &\quad - \frac{1}{2} \sum_{t=1}^T (Z_{0t} - \alpha \beta' Z_{1t} - \Psi Z_{2t})' \Sigma^{-1} (Z_{0t} - \alpha \beta' Z_{1t} - \Psi Z_{2t}) \end{aligned}$$

The residuals, R_{0t} and R_{1t} , are obtained by regressing Z_{0t} and Z_{1t} on Z_{2t} , respectively. The regression equation of residuals is

$$R_{0t} = \alpha \beta' R_{1t} + \hat{\epsilon}_t$$

The crossproducts matrices are computed

$$S_{ij} = \frac{1}{T} \sum_{t=1}^T R_{it} R'_{jt}, \quad i, j = 0, 1$$

Then the maximum likelihood estimator for β is obtained from the eigenvectors that correspond to the r largest eigenvalues of the following equation:

$$|\lambda S_{11} - S_{10} S_{00}^{-1} S_{01}| = 0$$

The eigenvalues of the preceding equation are squared canonical correlations between R_{0t} and R_{1t} , and the eigenvectors that correspond to the r largest eigenvalues are the r linear combinations of \mathbf{y}_{t-1} , which have the largest squared partial correlations with the stationary process $\Delta \mathbf{y}_t$ after correcting for lags and deterministic terms. Such an analysis calls for a reduced rank regression of $\Delta \mathbf{y}_t$ on \mathbf{y}_{t-1} corrected for $(\Delta \mathbf{y}_{t-1}, \dots, \Delta \mathbf{y}_{t-p+1}, D_t)$, as discussed by Anderson (1951). Johansen (1988) suggests two test statistics to test the null hypothesis that there are at most r cointegrating vectors

$$H_0 : \lambda_i = 0 \text{ for } i = r + 1, \dots, k$$

Trace Test

The trace statistic for testing the null hypothesis that there are at most r cointegrating vectors is as follows:

$$\lambda_{trace} = -T \sum_{i=r+1}^k \log(1 - \lambda_i)$$

The asymptotic distribution of this statistic is given by

$$tr \left\{ \int_0^1 (dW) \tilde{W}' \left(\int_0^1 \tilde{W} \tilde{W}' dr \right)^{-1} \int_0^1 \tilde{W} (dW)' \right\}$$

where $tr(A)$ is the trace of a matrix A , W is the $k - r$ dimensional Brownian motion, and \tilde{W} is the Brownian motion itself, or the demeaned or detrended Brownian motion according to the different specifications of deterministic trends in the vector error correction model.

Maximum Eigenvalue Test

The maximum eigenvalue statistic for testing the null hypothesis that there are at most r cointegrating vectors is as follows:

$$\lambda_{max} = -T \log(1 - \lambda_{r+1})$$

The asymptotic distribution of this statistic is given by

$$\max \left\{ \int_0^1 (dW) \tilde{W}' \left(\int_0^1 \tilde{W} \tilde{W}' dr \right)^{-1} \int_0^1 \tilde{W} (dW)' \right\}$$

where $\max(A)$ is the maximum eigenvalue of a matrix A . Osterwald-Lenum (1992) provided detailed tables of the critical values of these statistics.

The following statements use the JOHANSEN option to compute the Johansen cointegration rank trace test of integrated order 1:

```
proc varmax data=simul2;
  model y1 y2 / p=2 cointtest=(johansen=(normalize=y1));
run;
```

Figure 35.52 shows the output based on the model specified in the MODEL statement, an intercept term is assumed. In the “Cointegration Rank Test Using Trace” table, the column Drift In ECM means there is no separate drift in the error correction model and the column Drift In Process means the process has a constant drift before differencing. The “Cointegration Rank Test Using Trace” table shows the trace statistics based on Case 3 and the “Cointegration Rank Test Using Trace under Restriction” table shows the trace statistics based on Case 2. The output indicates that the series are cointegrated with rank 1 because the trace statistics are smaller than the critical values in both Case 2 and Case 3.

Figure 35.52 Cointegration Rank Test (COINTTEST=(JOHANSEN=) Option)

The VARMAX Procedure						
Cointegration Rank Test Using Trace						
H0: Rank=r	H1: Rank>r	Eigenvalue	Trace	5% Critical Value	Drift in ECM	Drift in Process
0	0	0.4644	61.7522	15.34	Constant	Linear
1	1	0.0056	0.5552	3.84		
Cointegration Rank Test Using Trace Under Restriction						
H0: Rank=r	H1: Rank>r	Eigenvalue	Trace	5% Critical Value	Drift in ECM	Drift in Process
0	0	0.5209	76.3788	19.99	Constant	Constant
1	1	0.0426	4.2680	9.13		

Figure 35.53 shows which result, either Case 2 (the hypothesis H0) or Case 3 (the hypothesis H1), is appropriate depending on the significance level. Since the cointegration rank is chosen to be 1 by the result in Figure 35.52, look at the last row that corresponds to rank=1. Since the p -value is 0.054, the Case 2 cannot be rejected at the significance level 5%, but it can be rejected at the significance level 10%. For modeling of the two Case 2 and Case 3, see Figure 35.56 and Figure 35.57.

Figure 35.53 Cointegration Rank Test Continued

Hypothesis of the Restriction					
		Hypothesis	Drift in ECM	Drift in Process	
		H0 (Case 2)	Constant	Constant	
		H1 (Case 3)	Constant	Linear	
Hypothesis Test of the Restriction					
Rank	Eigenvalue	Restricted Eigenvalue	DF	Chi-Square	Pr > ChiSq
0	0.4644	0.5209	2	14.63	0.0007
1	0.0056	0.0426	1	3.71	0.0540

Figure 35.54 shows the estimates of long-run parameter (Beta) and adjustment coefficients (Alpha) based on Case 3.

Figure 35.54 Cointegration Rank Test Continued

Beta		
Variable	1	2
y1	1.00000	1.00000
y2	-2.04869	-0.02854
Alpha		
Variable	1	2
y1	-0.46421	-0.00502
y2	0.17535	-0.01275

Using the NORMALIZE= option, the first row of the “Beta” table has 1. Considering that the cointegration rank is 1, the long-run relationship of the series is

$$\begin{aligned}
 \beta' y_t &= \begin{bmatrix} 1 & -2.04869 \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix} \\
 &= y_{1t} - 2.04869 y_{2t} \\
 y_{1t} &= 2.04869 y_{2t}
 \end{aligned}$$

Figure 35.55 shows the estimates of long-run parameter (Beta) and adjustment coefficients (Alpha) based on Case 2.

Figure 35.55 Cointegration Rank Test Continued

Beta Under Restriction		
Variable	1	2
y1	1.00000	1.00000
y2	-2.04366	-2.75773
1	6.75919	101.37051
Alpha Under Restriction		
Variable	1	2
y1	-0.48015	0.01091
y2	0.12538	0.03722

Considering that the cointegration rank is 1, the long-run relationship of the series is

$$\begin{aligned}\beta' y_t &= \begin{bmatrix} 1 & -2.04366 & 6.75919 \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \\ 1 \end{bmatrix} \\ &= y_{1t} - 2.04366 y_{2t} + 6.75919 \\ y_{1t} &= 2.04366 y_{2t} - 6.75919\end{aligned}$$

Estimation of Vector Error Correction Model

The preceding log-likelihood function is maximized for

$$\begin{aligned}\hat{\beta} &= S_{11}^{-1/2} [v_1, \dots, v_r] \\ \hat{\alpha} &= S_{01} \hat{\beta} (\hat{\beta}' S_{11} \hat{\beta})^{-1} \\ \hat{\Pi} &= \hat{\alpha} \hat{\beta}' \\ \hat{\Psi}' &= (Z_2' Z_2)^{-1} Z_2' (Z_0 - Z_1 \hat{\Pi}') \\ \hat{\Sigma} &= (Z_0 - Z_2 \hat{\Psi}' - Z_1 \hat{\Pi}')' (Z_0 - Z_2 \hat{\Psi}' - Z_1 \hat{\Pi}') / T\end{aligned}$$

The estimators of the orthogonal complements of α and β are

$$\hat{\beta}_{\perp} = S_{11} [v_{r+1}, \dots, v_k]$$

and

$$\hat{\alpha}_{\perp} = S_{00}^{-1} S_{01} [v_{r+1}, \dots, v_k]$$

The ML estimators have the following asymptotic properties:

$$\sqrt{T} \text{vec}([\hat{\Pi}, \hat{\Psi}] - [\Pi, \Psi]) \xrightarrow{d} N(0, \Sigma_{co})$$

where

$$\Sigma_{co} = \Sigma \otimes \left(\begin{bmatrix} \beta & 0 \\ 0 & I_k \end{bmatrix} \Omega^{-1} \begin{bmatrix} \beta' & 0 \\ 0 & I_k \end{bmatrix} \right)$$

and

$$\Omega = \text{plim} \frac{1}{T} \begin{bmatrix} \beta' Z_1' Z_1 \beta & \beta' Z_1' Z_2 \\ Z_2' Z_1 \beta & Z_2' Z_2 \end{bmatrix}$$

The following statements are examples of fitting the five different cases of the vector error correction models mentioned in the previous section.

For fitting Case 1,

```
model y1 y2 / p=2 ecm=(rank=1 normalize=y1) noint;
```

For fitting Case 2,

```
model y1 y2 / p=2 ecm=(rank=1 normalize=y1 ectrend);
```

For fitting Case 3,

```
model y1 y2 / p=2 ecm=(rank=1 normalize=y1);
```

For fitting Case 4,

```
model y1 y2 / p=2 ecm=(rank=1 normalize=y1 ectrend)
trend=linear;
```

For fitting Case 5,

```
model y1 y2 / p=2 ecm=(rank=1 normalize=y1) trend=linear;
```

From [Figure 35.53](#) that uses the COINTTEST=(JOHANSEN) option, you can fit the model by using either Case 2 or Case 3 because the test was not significant at the 0.05 level, but was significant at the 0.10 level. Here both models are fitted to show the difference in output display. [Figure 35.56](#) is for Case 2, and [Figure 35.57](#) is for Case 3.

For Case 2,

```
proc varmax data=simul2;
  model y1 y2 / p=2 ecm=(rank=1 normalize=y1 ectrend)
    print=(estimates);
run;
```

	AR2_2_2	-0.51194	0.05643	-9.07	0.0001	D_y2 (t-1)

Figure 35.57 can be reported as follows:

$$\Delta \mathbf{y}_t = \begin{bmatrix} -0.46421 & 0.95103 \\ 0.17535 & -0.35293 \end{bmatrix} \mathbf{y}_{t-1} + \begin{bmatrix} -0.74052 & -0.76305 \\ 0.34820 & -0.51194 \end{bmatrix} \Delta \mathbf{y}_{t-1} + \begin{bmatrix} -2.60825 \\ 3.43005 \end{bmatrix} + \boldsymbol{\epsilon}_t$$

Test for the Linear Restriction on the Parameters

Consider the example with the variables m_t log real money, y_t log real income, i_t^d deposit interest rate, and i_t^b bond interest rate. It seems a natural hypothesis that in the long-run relation, money and income have equal coefficients with opposite signs. This can be formulated as the hypothesis that the cointegrated relation contains only m_t and y_t through $m_t - y_t$. For the analysis, you can express these restrictions in the parameterization of H such that $\boldsymbol{\beta} = H\boldsymbol{\phi}$, where H is a known $k \times s$ matrix and $\boldsymbol{\psi}$ is the $s \times r$ ($r \leq s < k$)

parameter matrix to be estimated. For this example, H is given by

$$H = \begin{bmatrix} 1 & 0 & 0 \\ -1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Restriction $H_0: \beta = H\phi$

When the linear restriction $\beta = H\phi$ is given, it implies that the same restrictions are imposed on all cointegrating vectors. You obtain the maximum likelihood estimator of β by reduced rank regression of Δy_t on $H y_{t-1}$ corrected for $(\Delta y_{t-1}, \dots, \Delta y_{t-p+1}, D_t)$, solving the following equation

$$|\rho H' S_{11} H - H' S_{10} S_{00}^{-1} S_{01} H| = 0$$

for the eigenvalues $1 > \rho_1 > \dots > \rho_s > 0$ and eigenvectors (v_1, \dots, v_s) , S_{ij} given in the preceding section. Then choose $\hat{\phi} = (v_1, \dots, v_r)$ that corresponds to the r largest eigenvalues, and the $\hat{\beta}$ is $H\hat{\phi}$.

The test statistic for $H_0: \beta = H\phi$ is given by

$$T \sum_{i=1}^r \log\{(1 - \rho_i)/(1 - \lambda_i)\} \xrightarrow{d} \chi_{r(k-s)}^2$$

If the series has no deterministic trend, the constant term should be restricted by $\alpha'_{\perp} \delta_0 = 0$ as in Case 2. Then H is given by

$$H = \begin{bmatrix} 1 & 0 & 0 & 0 \\ -1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

The following statements test that $2\beta_1 + \beta_2 = 0$:

```
proc varmax data=simul2;
  model y1 y2 / p=2 ecm=(rank=1 normalize=y1);
  cointeg rank=1 h=(1,-2);
run;
```

Figure 35.58 shows the results of testing $H_0: 2\beta_1 + \beta_2 = 0$. The input H matrix is $H = (1 - 2)'$. The adjustment coefficient is reestimated under the restriction, and the test indicates that you cannot reject the null hypothesis.

Test for the Weak Exogeneity and Restrictions of Alpha

Consider a vector error correction model:

$$\Delta \mathbf{y}_t = \alpha \beta' \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + A D_t + \epsilon_t$$

Divide the process \mathbf{y}_t into $(\mathbf{y}'_{1t}, \mathbf{y}'_{2t})'$ with dimension k_1 and k_2 and the Σ into

$$\Sigma = \begin{bmatrix} \Sigma_{11} & \Sigma_{12} \\ \Sigma_{21} & \Sigma_{22} \end{bmatrix}$$

Similarly, the parameters can be decomposed as follows:

$$\alpha = \begin{bmatrix} \alpha_1 \\ \alpha_2 \end{bmatrix} \quad \Phi_i^* = \begin{bmatrix} \Phi_{1i}^* \\ \Phi_{2i}^* \end{bmatrix} \quad A = \begin{bmatrix} A_1 \\ A_2 \end{bmatrix}$$

Then the VECM(p) form can be rewritten by using the decomposed parameters and processes:

$$\begin{bmatrix} \Delta \mathbf{y}_{1t} \\ \Delta \mathbf{y}_{2t} \end{bmatrix} = \begin{bmatrix} \alpha_1 \\ \alpha_2 \end{bmatrix} \beta' \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \begin{bmatrix} \Phi_{1i}^* \\ \Phi_{2i}^* \end{bmatrix} \Delta \mathbf{y}_{t-i} + \begin{bmatrix} A_1 \\ A_2 \end{bmatrix} D_t + \begin{bmatrix} \epsilon_{1t} \\ \epsilon_{2t} \end{bmatrix}$$

The conditional model for \mathbf{y}_{1t} given \mathbf{y}_{2t} is

$$\begin{aligned}\Delta \mathbf{y}_{1t} = & \omega \Delta \mathbf{y}_{2t} + (\alpha_1 - \omega \alpha_2) \boldsymbol{\beta}' \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} (\Phi_{1i}^* - \omega \Phi_{2i}^*) \Delta \mathbf{y}_{t-i} \\ & + (A_1 - \omega A_2) D_t + \boldsymbol{\epsilon}_{1t} - \omega \boldsymbol{\epsilon}_{2t}\end{aligned}$$

and the marginal model of \mathbf{y}_{2t} is

$$\Delta \mathbf{y}_{2t} = \alpha_2 \boldsymbol{\beta}' \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_{2i}^* \Delta \mathbf{y}_{t-i} + A_2 D_t + \boldsymbol{\epsilon}_{2t}$$

where $\omega = \Sigma_{12} \Sigma_{22}^{-1}$.

The test of weak exogeneity of \mathbf{y}_{2t} for the parameters $(\alpha_1, \boldsymbol{\beta})$ determines whether $\alpha_2 = 0$. Weak exogeneity means that there is no information about $\boldsymbol{\beta}$ in the marginal model or that the variables \mathbf{y}_{2t} do not react to a disequilibrium.

Restriction $H_0: \boldsymbol{\alpha} = J\boldsymbol{\psi}$

Consider the null hypothesis $H_0: \boldsymbol{\alpha} = J\boldsymbol{\psi}$, where J is a $k \times m$ matrix with $r \leq m < k$.

From the previous residual regression equation

$$R_{0t} = \boldsymbol{\alpha} \boldsymbol{\beta}' R_{1t} + \hat{\boldsymbol{\epsilon}}_t = J\boldsymbol{\psi} \boldsymbol{\beta}' R_{1t} + \hat{\boldsymbol{\epsilon}}_t$$

you can obtain

$$\begin{aligned}\bar{J}' R_{0t} &= \boldsymbol{\psi} \boldsymbol{\beta}' R_{1t} + \bar{J}' \hat{\boldsymbol{\epsilon}}_t \\ J_{\perp}' R_{0t} &= J_{\perp}' \hat{\boldsymbol{\epsilon}}_t\end{aligned}$$

where $\bar{J} = J(J'J)^{-1}$ and J_{\perp} is orthogonal to J such that $J_{\perp}' J = 0$.

Define

$$\Sigma_{JJ_{\perp}} = \bar{J}' \Sigma J_{\perp} \text{ and } \Sigma_{J_{\perp} J_{\perp}} = J_{\perp}' \Sigma J_{\perp}$$

and let $\omega = \Sigma_{JJ_{\perp}} \Sigma_{J_{\perp} J_{\perp}}^{-1}$. Then $\bar{J}' R_{0t}$ can be written as

$$\bar{J}' R_{0t} = \boldsymbol{\psi} \boldsymbol{\beta}' R_{1t} + \omega J_{\perp}' R_{0t} + \bar{J}' \hat{\boldsymbol{\epsilon}}_t - \omega J_{\perp}' \hat{\boldsymbol{\epsilon}}_t$$

Using the marginal distribution of $J_{\perp}' R_{0t}$ and the conditional distribution of $\bar{J}' R_{0t}$, the new residuals are computed as

$$\begin{aligned}\tilde{R}_{Jt} &= \bar{J}' R_{0t} - S_{JJ_{\perp}} S_{J_{\perp} J_{\perp}}^{-1} J_{\perp}' R_{0t} \\ \tilde{R}_{1t} &= R_{1t} - S_{1J_{\perp}} S_{J_{\perp} J_{\perp}}^{-1} J_{\perp}' R_{0t}\end{aligned}$$

where

$$S_{JJ_{\perp}} = \bar{J}' S_{00} J_{\perp}, \quad S_{J_{\perp} J_{\perp}} = J'_{\perp} S_{00} J_{\perp}, \quad \text{and} \quad S_{J_{\perp} 1} = J'_{\perp} S_{01}$$

In terms of \tilde{R}_{Jt} and \tilde{R}_{1t} , the MLE of β is computed by using the reduced rank regression. Let

$$S_{ij.J_{\perp}} = \frac{1}{T} \sum_{t=1}^T \tilde{R}_{it} \tilde{R}'_{jt}, \quad \text{for } i, j = 1, J$$

Under the null hypothesis $H_0: \alpha = J\psi$, the MLE $\tilde{\beta}$ is computed by solving the equation

$$|\rho S_{11.J_{\perp}} - S_{1J.J_{\perp}} S_{JJ.J_{\perp}}^{-1} S_{J1.J_{\perp}}| = 0$$

Then $\tilde{\beta} = (v_1, \dots, v_r)$, where the eigenvectors correspond to the r largest eigenvalues and are normalized such that $\tilde{\beta}' S_{11.J_{\perp}} \tilde{\beta} = I_r$; $\tilde{\alpha} = J S_{J1.J_{\perp}} \tilde{\beta}$. The likelihood ratio test for $H_0: \alpha = J\psi$ is

$$T \sum_{i=1}^r \log\{(1 - \rho_i)/(1 - \lambda_i)\} \xrightarrow{d} \chi^2_{r(k-m)}$$

See Theorem 6.1 in Johansen and Juselius (1990) for more details.

The test of weak exogeneity of y_{2t} is a special case of the test $\alpha = J\psi$, considering $J = (I_{k_1}, 0)'$. Consider the previous example with four variables (m_t, y_t, i_t^b, i_t^d) . If $r = 1$, you formulate the weak exogeneity of (y_t, i_t^b, i_t^d) for m_t as $J = [1, 0, 0, 0]'$ and the weak exogeneity of i_t^d for (m_t, y_t, i_t^b) as $J = [I_3, 0]'$.

The following statements test the weak exogeneity of other variables, assuming $r = 1$:

```
proc varmax data=simul2;
  model y1 y2 / p=2 ecm=(rank=1 normalize=y1);
  cointeg rank=1 exogeneity;
run;

proc varmax data=simul2;
  model y1 y2 / p=2 ecm=(rank=1 normalize=y1);
  cointeg rank=1 j=exogeneity;
run;
```

Figure 35.59 shows that each variable is not the weak exogeneity of other variable.

Forecasting of the VECM

Consider the cointegrated moving-average representation of the differenced process of \mathbf{y}_t

$$\Delta \mathbf{y}_t = \boldsymbol{\delta} + \Psi(B)\boldsymbol{\epsilon}_t$$

Assume that $\mathbf{y}_0 = 0$. The linear process \mathbf{y}_t can be written as

$$\mathbf{y}_t = \boldsymbol{\delta}t + \sum_{i=1}^t \sum_{j=0}^{t-i} \Psi_j \boldsymbol{\epsilon}_i$$

Therefore, for any $l > 0$,

$$\mathbf{y}_{t+l} = \boldsymbol{\delta}(t+l) + \sum_{i=1}^t \sum_{j=0}^{t+l-i} \Psi_j \boldsymbol{\epsilon}_i + \sum_{i=1}^l \sum_{j=0}^{l-i} \Psi_j \boldsymbol{\epsilon}_{t+i}$$

The l -step-ahead forecast is derived from the preceding equation:

$$\mathbf{y}_{t+l|t} = (t+l)\boldsymbol{\delta} + \sum_{i=1}^t \sum_{j=0}^{t+l-i} \Psi_j \boldsymbol{\epsilon}_i$$

Note that

$$\lim_{l \rightarrow \infty} \boldsymbol{\beta}' \mathbf{y}_{t+l|t} = 0$$

since $\lim_{l \rightarrow \infty} \sum_{j=0}^{t+l-i} \Psi_j = \Psi(1)$ and $\boldsymbol{\beta}'\Psi(1) = 0$. The long-run forecast of the cointegrated system shows that the cointegrated relationship holds, although there might exist some deviations from the equilibrium status in the short-run. The covariance matrix of the predict error $\mathbf{e}_{t+l|t} = \mathbf{y}_{t+l} - \mathbf{y}_{t+l|t}$ is

$$\Sigma(l) = \sum_{i=1}^l \left[\left(\sum_{j=0}^{l-i} \Psi_j \right) \Sigma \left(\sum_{j=0}^{l-i} \Psi_j' \right) \right]$$

When the linear process is represented as a VECM(p) model, you can obtain

$$\Delta \mathbf{y}_t = \Pi \mathbf{y}_{t-1} + \sum_{j=1}^{p-1} \Phi_j^* \Delta \mathbf{y}_{t-j} + \boldsymbol{\delta} + \boldsymbol{\epsilon}_t$$

The transition equation is defined as

$$\mathbf{z}_t = F \mathbf{z}_{t-1} + \mathbf{e}_t$$

where $\mathbf{z}_t = (\mathbf{y}'_{t-1}, \Delta \mathbf{y}'_t, \Delta \mathbf{y}'_{t-1}, \dots, \Delta \mathbf{y}'_{t-p+2})'$ is a state vector and the transition matrix is

$$F = \begin{bmatrix} I_k & I_k & 0 & \cdots & 0 \\ \Pi & (\Pi + \Phi_1^*) & \Phi_2^* & \cdots & \Phi_{p-1}^* \\ 0 & I_k & 0 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & I_k & 0 \end{bmatrix}$$

where 0 is a $k \times k$ zero matrix. The observation equation can be written

$$\mathbf{y}_t = \delta t + H \mathbf{z}_t$$

where $H = [I_k, I_k, 0, \dots, 0]$.

The l -step-ahead forecast is computed as

$$\mathbf{y}_{t+l|t} = \delta(t+l) + HF^l \mathbf{z}_t$$

Cointegration with Exogenous Variables

The error correction model with exogenous variables can be written as follows:

$$\Delta \mathbf{y}_t = \alpha \beta' \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + A D_t + \sum_{i=0}^s \Theta_i^* \mathbf{x}_{t-i} + \epsilon_t$$

The following statements demonstrate how to fit VECMX(p, s), where $p = 2$ and $s = 1$ from the P=2 and XLAG=1 options:

```
proc varmax data=simul3;
  model y1 y2 = x1 / p=2 xlag=1 ecm=(rank=1);
run;
```

The following statements demonstrate how to BVECMX(2,1):

```
proc varmax data=simul3;
  model y1 y2 = x1 / p=2 xlag=1 ecm=(rank=1)
  prior=(lambda=0.9 theta=0.1);
run;
```

I(2) Model

The VARX(p, s) model can be written in the error correction form:

$$\Delta \mathbf{y}_t = \alpha \beta' \mathbf{y}_{t-1} + \sum_{i=1}^{p-1} \Phi_i^* \Delta \mathbf{y}_{t-i} + A D_t + \sum_{i=0}^s \Theta_i^* \mathbf{x}_{t-i} + \epsilon_t$$

Johansen (1995a) proposed the two-step procedure to analyze the $I(2)$ model. In the first step, the values of (r, α, β) are estimated using the reduced rank regression analysis, performing the regression analysis $\Delta^2 \mathbf{y}_t$, $\Delta \mathbf{y}_{t-1}$, and \mathbf{y}_{t-1} on $\Delta^2 \mathbf{y}_{t-1}, \dots, \Delta^2 \mathbf{y}_{t-p+2}$, and D_t . This gives residuals R_{0t} , R_{1t} , and R_{2t} , and residual product moment matrices

$$M_{ij} = \frac{1}{T} \sum_{t=1}^T R_{it} R'_{jt} \text{ for } i, j = 0, 1, 2$$

Perform the reduced rank regression analysis $\Delta^2 \mathbf{y}_t$ on \mathbf{y}_{t-1} corrected for $\Delta \mathbf{y}_{t-1}, \Delta^2 \mathbf{y}_{t-1}, \dots, \Delta^2 \mathbf{y}_{t-p+2}$, and D_t , and solve the eigenvalue problem of the equation

$$|\lambda M_{22.1} - M_{20.1} M_{00.1}^{-1} M_{02.1}| = 0$$

where $M_{ij.1} = M_{ij} - M_{i1} M_{11}^{-1} M_{1j}$ for $i, j = 0, 2$.

In the second step, if (r, α, β) are known, the values of (s, ξ, η) are determined using the reduced rank regression analysis, regressing $\hat{\alpha}'_{\perp} \Delta^2 \mathbf{y}_t$ on $\hat{\beta}'_{\perp} \Delta \mathbf{y}_{t-1}$ corrected for $\Delta^2 \mathbf{y}_{t-1}, \dots, \Delta^2 \mathbf{y}_{t-p+2}$, D_t , and $\hat{\beta}' \Delta \mathbf{y}_{t-1}$.

The reduced rank regression analysis reduces to the solution of an eigenvalue problem for the equation

$$|\rho M_{\beta_{\perp} \beta_{\perp} \cdot \beta} - M_{\beta_{\perp} \alpha_{\perp} \cdot \beta} M_{\alpha_{\perp} \alpha_{\perp} \cdot \beta}^{-1} M_{\alpha_{\perp} \beta_{\perp} \cdot \beta}| = 0$$

where

$$\begin{aligned} M_{\beta_{\perp} \beta_{\perp} \cdot \beta} &= \beta'_{\perp} (M_{11} - M_{11} \beta (\beta' M_{11} \beta)^{-1} \beta' M_{11}) \beta_{\perp} \\ M'_{\beta_{\perp} \alpha_{\perp} \cdot \beta} &= M_{\alpha_{\perp} \beta_{\perp} \cdot \beta} = \bar{\alpha}'_{\perp} (M_{01} - M_{01} \beta (\beta' M_{11} \beta)^{-1} \beta' M_{11}) \beta_{\perp} \\ M_{\alpha_{\perp} \alpha_{\perp} \cdot \beta} &= \bar{\alpha}'_{\perp} (M_{00} - M_{01} \beta (\beta' M_{11} \beta)^{-1} \beta' M_{10}) \bar{\alpha}_{\perp} \end{aligned}$$

where $\bar{\alpha} = \alpha(\alpha' \alpha)^{-1}$.

The solution gives eigenvalues $1 > \rho_1 > \dots > \rho_s > 0$ and eigenvectors (v_1, \dots, v_s) . Then, the ML estimators are

$$\begin{aligned} \hat{\eta} &= (v_1, \dots, v_s) \\ \hat{\xi} &= M_{\alpha_{\perp} \beta_{\perp} \cdot \beta} \hat{\eta} \end{aligned}$$

The likelihood ratio test for the reduced rank model $H_{r,s}$ with rank $\leq s$ in the model $H_{r,k-r} = H_r^0$ is given by

$$Q_{r,s} = -T \sum_{i=s+1}^{k-r} \log(1 - \rho_i), \quad s = 0, \dots, k - r - 1$$

The following statements compute the rank test to test for cointegrated order 2:

```
proc varmax data=simul2;
  model y1 y2 / p=2 cointtest=(johansen=(iorder=2));
run;
```

The last two columns in Figure 35.60 explain the cointegration rank test with integrated order 1. The results indicate that there is the cointegrated relationship with the cointegration rank 1 with respect to the 0.05 significance level because the test statistic of 0.5552 is smaller than the critical value of 3.84. Now, look at the row associated with $r = 1$. Compare the test statistic value, 211.84512, to the critical value, 3.84, for the cointegrated order 2. There is no evidence that the series are integrated order 2 at the 0.05 significance level.

Figure 35.60 Cointegrated I(2) Test (IORDER= Option)

Multivariate GARCH Modeling

Stochastic volatility modeling is important in many areas, particularly in finance. To study the volatility of time series, GARCH models are widely used because they provide a good approach to conditional variance modeling.

BEKK Representation

Engle and Kroner (1995) propose a general multivariate GARCH model and call it a BEKK representation. Let $\mathcal{F}(t-1)$ be the sigma field generated by the past values of ϵ_t , and let H_t be the conditional covariance matrix of the k -dimensional random vector ϵ_t . Let H_t be measurable with respect to $\mathcal{F}(t-1)$; then the multivariate GARCH model can be written as

$$\epsilon_t | \mathcal{F}(t-1) \sim N(0, H_t)$$

$$H_t = C + \sum_{i=1}^q A_i' \epsilon_{t-i} \epsilon_{t-i}' A_i + \sum_{i=1}^p G_i' H_{t-i} G_i$$

where C , A_i and G_i are $k \times k$ parameter matrices.

Consider a bivariate GARCH(1,1) model as follows:

$$H_t = \begin{bmatrix} c_{11} & c_{12} \\ c_{12} & c_{22} \end{bmatrix} + \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}' \begin{bmatrix} \epsilon_{1,t-1}^2 & \epsilon_{1,t-1}\epsilon_{2,t-1} \\ \epsilon_{2,t-1}\epsilon_{1,t-1} & \epsilon_{2,t-1}^2 \end{bmatrix} \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} \\ + \begin{bmatrix} g_{11} & g_{12} \\ g_{21} & g_{22} \end{bmatrix}' H_{t-1} \begin{bmatrix} g_{11} & g_{12} \\ g_{21} & g_{22} \end{bmatrix}$$

or, representing the univariate model,

$$h_{11,t} = c_{11} + a_{11}^2 \epsilon_{1,t-1}^2 + 2a_{11}a_{21}\epsilon_{1,t-1}\epsilon_{2,t-1} + a_{21}^2 \epsilon_{2,t-1}^2 \\ + g_{11}^2 h_{11,t-1} + 2g_{11}g_{21}h_{12,t-1} + g_{21}^2 h_{22,t-1} \\ h_{12,t} = c_{12} + a_{11}a_{12}\epsilon_{1,t-1}^2 + (a_{21}a_{12} + a_{11}a_{22})\epsilon_{1,t-1}\epsilon_{2,t-1} + a_{21}a_{22}\epsilon_{2,t-1}^2 \\ + g_{11}g_{12}h_{11,t-1} + (g_{21}g_{12} + g_{11}g_{22})h_{12,t-1} + g_{21}g_{22}h_{22,t-1} \\ h_{22,t} = c_{22} + a_{12}^2 \epsilon_{1,t-1}^2 + 2a_{12}a_{22}\epsilon_{1,t-1}\epsilon_{2,t-1} + a_{22}^2 \epsilon_{2,t-1}^2 \\ + g_{12}^2 h_{11,t-1} + 2g_{12}g_{22}h_{12,t-1} + g_{22}^2 h_{22,t-1}$$

For the BEKK representation of the bivariate GARCH(1,1) model, the SAS statements are:

```
model y1 y2;
garch q=1 p=1 form=bekk;
```

CCC Representation

Bollerslev (1990) propose a multivariate GARCH model with time-varying conditional variances and covariances but constant conditional correlations.

The conditional covariance matrix H_t consists of

$$H_t = D_t \Gamma D_t$$

where D_t is a $k \times k$ stochastic diagonal matrix with element σ_{it} and Γ is a $k \times k$ time-invariant matrix with the typical element ρ_{ij} .

The elements of H_t are

$$h_{ii,t} = c_i + \sum_{l=1}^q a_{ii,l} \epsilon_{i,t-l}^2 + \sum_{l=1}^p g_{ii,l} h_{ii,t-l} \quad i, j = 1, \dots, k \\ h_{ij,t} = \rho_{ij} (h_{ii,t} h_{jj,t})^{1/2} \quad i \neq j$$

Estimation of GARCH Model

The log-likelihood function of the multivariate GARCH model is written without a constant term

$$\ell = -\frac{1}{2} \sum_{t=1}^T [\log |H_t| + \epsilon_t' H_t^{-1} \epsilon_t]$$

The log-likelihood function is maximized by an iterative numerical method such as quasi-Newton optimization. The starting values for the regression parameters are obtained from the least squares estimates. The covariance of ϵ_t is used as the starting values for the GARCH constant parameters, and the starting value used for the other GARCH parameters is either 10^{-6} or 10^{-3} depending on the GARCH models representation. For the identification of the parameters of a BEKK representation GARCH model, the diagonal elements of the GARCH constant, the ARCH, and the GARCH parameters are restricted to be positive.

Covariance Stationarity

Define the multivariate GARCH process as

$$\mathbf{h}_t = \sum_{i=1}^{\infty} G(B)^{i-1} [\mathbf{c} + A(B)\eta_t]$$

where $\mathbf{h}_t = \text{vec}(H_t)$, $\mathbf{c} = \text{vec}(C_0)$, and $\eta_t = \text{vec}(\epsilon_t \epsilon_t')$. This representation is equivalent to a GARCH(p, q) model by the following algebra:

$$\begin{aligned} \mathbf{h}_t &= \mathbf{c} + A(B)\eta_t + \sum_{i=2}^{\infty} G(B)^{i-1} [\mathbf{c} + A(B)\eta_t] \\ &= \mathbf{c} + A(B)\eta_t + G(B) \sum_{i=1}^{\infty} G(B)^{i-1} [\mathbf{c} + A(B)\eta_t] \\ &= \mathbf{c} + A(B)\eta_t + G(B)\mathbf{h}_t \end{aligned}$$

Defining $A(B) = \sum_{i=1}^q (A_i \otimes A_i)' B^i$ and $G(B) = \sum_{i=1}^p (G_i \otimes G_i)' B^i$ gives a BEKK representation.

The necessary and sufficient conditions for covariance stationarity of the multivariate GARCH process is that all the eigenvalues of $A(1) + G(1)$ are less than one in modulus.

An Example of a VAR(1)–ARCH(1) Model

The following DATA step simulates a bivariate vector time series to provide test data for the multivariate GARCH model:

```
data garch;
  retain seed 16587;
  esq1 = 0; esq2 = 0;
  ly1 = 0; ly2 = 0;
  do i = 1 to 1000;
    ht = 6.25 + 0.5*esq1;
    call rannor(seed,ehat);
    e1 = sqrt(ht)*ehat;
    ht = 1.25 + 0.7*esq2;
    call rannor(seed,ehat);
    e2 = sqrt(ht)*ehat;
    y1 = 2 + 1.2*ly1 - 0.5*ly2 + e1;
    y2 = 4 + 0.6*ly1 + 0.3*ly2 + e2;
    if i>500 then output;
    esq1 = e1*e1; esq2 = e2*e2;
    ly1 = y1; ly2 = y2;
  end;
  keep y1 y2;
run;
```

The following statements fit a VAR(1)–ARCH(1) model to the data. For a VAR-ARCH model, you specify the order of the autoregressive model with the P=1 option in the MODEL statement and the Q=1 option in the GARCH statement. In order to produce the initial and final values of parameters, the TECH=QN option is specified in the NLOPTIONS statement.

```
proc varmax data=garch;
  model y1 y2 / p=1
    print=(roots estimates diagnose);
  garch q=1;
  nloptions tech=qn;
run;
```

Figure 35.61 through Figure 35.65 show the details of this example. Figure 35.61 shows the initial values of parameters.

Output Data Sets

The VARMAX procedure can create the OUT=, OUTEST=, OUTHT=, and OUTSTAT= data sets. In general, if processing fails, the output is not recorded or is set to missing in the relevant output data set, and appropriate error and/or warning messages are recorded in the log.

OUT= Data Set

The OUT= data set contains the forecast values produced by the OUTPUT statement. The following output variables can be created:

- the BY variables
- the ID variable
- the MODEL statement dependent (endogenous) variables. These variables contain the actual values from the input data set.
- FOR_i , numeric variables that contain the forecasts. The FOR_i variables contain the forecasts for the i th endogenous variable in the MODEL statement list. Forecasts are one-step-ahead predictions until the end of the data or until the observation specified by the BACK= option. Multistep forecasts can be computed after that point based on the LEAD= option.
- RES_i , numeric variables that contain the residual for the forecast of the i th endogenous variable in the MODEL statement list. For multistep forecast observations, the actual values are missing and the RES_i variables contain missing values.
- STD_i , numeric variables that contain the standard deviation for the forecast of the i th endogenous variable in the MODEL statement list. The values of the STD_i variables can be used to construct univariate confidence limits for the corresponding forecasts.
- LCI_i , numeric variables that contain the lower confidence limits for the corresponding forecasts of the i th endogenous variable in the MODEL statement list.
- UCI_i , numeric variables that contain the upper confidence limits for the corresponding forecasts of the i th endogenous variable in the MODEL statement list.

The OUT= data set contains the values shown in Table 35.3 and Table 35.4 for a bivariate case.

Table 35.3 OUT= Data Set

Obs	ID variable	y1	FOR1	RES1	STD1	LCI1	UCI1

OUTEST= Data Set

The OUTEST= data set contains estimation results of the fitted model produced by the VARMAX statement. The following output variables can be created:

- the BY variables
- NAME, a character variable that contains the name of endogenous (dependent) variables or the name of the parameters for the covariance of the matrix of the parameter estimates if the OUTCOV option is specified
- TYPE, a character variable that contains the value EST for parameter estimates, the value STD for standard error of parameter estimates, and the value COV for the covariance of the matrix of the parameter estimates if the OUTCOV option is specified

- **CONST**, a numeric variable that contains the estimates of constant parameters and their standard errors
- **SEASON_*i***, a numeric variable that contains the estimates of seasonal dummy parameters and their standard errors, where $i = 1, \dots, (nseason - 1)$, and *nseason* is based on the NSEASON= option
- **LTREND**, a numeric variable that contains the estimates of linear trend parameters and their standard errors
- **QTREND**, a numeric variable that contains the estimates of quadratic trend parameters and their standard errors
- **XL*l*_i**, numeric variables that contain the estimates of exogenous parameters and their standard errors, where *l* is the lag *l*th coefficient matrix and $i = 1, \dots, r$, where *r* is the number of exogenous variables
- **AR*l*_i**, numeric variables that contain the estimates of autoregressive parameters and their standard errors, where *l* is the lag *l*th coefficient matrix and $i = 1, \dots, k$, where *k* is the number of endogenous variables
- **MA*l*_i**, numeric variables that contain the estimates of moving-average parameters and their standard errors, where *l* is the lag *l*th coefficient matrix and $i = 1, \dots, k$, where *k* is the number of endogenous variables
- **ACH*l*_i** are numeric variables that contain the estimates of the ARCH parameters of the covariance matrix and their standard errors, where *l* is the lag *l*th coefficient matrix and $i = 1, \dots, k$ for BEKK and CCC representations, where *k* is the number of endogenous variables.
- **GCH*l*_i** are numeric variables that contain the estimates of the GARCH parameters of the covariance matrix and their standard errors, where *l* is the lag *l*th coefficient matrix and $i = 1, \dots, k$ for BEKK and CCC representations, where *k* is the number of endogenous variables.
- **GCHC*i*** are numeric variables that contain the estimates of the constant parameters of the covariance matrix and their standard errors, where $i = 1, \dots, k$ for BEKK representation, *k* is the number of endogenous variables, and $i = 1$ for CCC representation.
- **CCC*i*** are numeric variables that contain the estimates of the conditional constant correlation parameters for CCC representation where $i = 2, \dots, k$.

The OUTEST= data set contains the values shown [Table 35.5](#) for a bivariate case.

Table 35.5 OUTEST= Data Set

Obs	NAME	TYPE	CONST	AR1_1	AR1_2	AR2_1	AR2_2
1	y1	EST	δ_1	$\phi_{1,11}$	$\phi_{1,12}$	$\phi_{2,11}$	$\phi_{2,12}$

OUTHT= Data Set

The OUTHT= data set contains prediction of the fitted GARCH model produced by the GARCH statement. The following output variables can be created.

- the BY variables
- H_{i_j} , numeric variables that contain the prediction of covariance, where $1 \leq i < j \leq k$, where k is the number of dependent variables

The OUTHT= data set contains the values shown in Table 35.6 for a bivariate case.

Table 35.6 OUTHT= Data Set

Obs	H1_1	H1_2	H2_2

OUTSTAT= Data Set

The OUTSTAT= data set contains estimation results of the fitted model produced by the VARMAX statement. The following output variables can be created. The subindex i is $1, \dots, k$, where k is the number of endogenous variables.

- the BY variables
- NAME, a character variable that contains the name of endogenous (dependent) variables
- SIGMA_ i , numeric variables that contain the estimate of the innovation covariance matrix
- AICC, a numeric variable that contains the corrected Akaike's information criterion value
- HQC, a numeric variable that contains the Hannan-Quinn's information criterion value
- AIC, a numeric variable that contains the Akaike's information criterion value
- SBC, a numeric variable that contains the Schwarz Bayesian's information criterion value
- FPEC, a numeric variable that contains the final prediction error criterion value
- FValue, a numeric variable that contains the F statistics
- PValue, a numeric variable that contains p -value for the F statistics

If the JOHANSEN= option is specified, the following items are added:

- Eigenvalue, a numeric variable that contains eigenvalues for the cointegration rank test of integrated order 1

- `RestrictedEigenvalue`, a numeric variable that contains eigenvalues for the cointegration rank test of integrated order 1 when the `NOINT` option is not specified
- `Beta_i`, numeric variables that contain long-run effect parameter estimates, β
- `Alpha_i`, numeric variables that contain adjustment parameter estimates, α

If the `JOHANSEN=(IORDER=2)` option is specified, the following items are added:

- `EValueI2_i`, numeric variables that contain eigenvalues for the cointegration rank test of integrated order 2
- `EValueI1`, a numeric variable that contains eigenvalues for the cointegration rank test of integrated order 1
- `Eta_i`, numeric variables that contain the parameter estimates in integrated order 2, η
- `Xi_i`, numeric variables that contain the parameter estimates in integrated order 2, ξ

The `OUTSTAT=` data set contains the values shown [Table 35.7](#) for a bivariate case.

Table 35.7 `OUTSTAT=` Data Set

Printed Output

The default printed output produced by the VARMAX procedure is described in the following list:

- descriptive statistics, which include the number of observations used, the names of the variables, their means and standard deviations (STD), their minimums and maximums, the differencing operations used, and the labels of the variables
- a type of model to fit the data and an estimation method
- a table of parameter estimates that shows the following for each parameter: the variable name for the left-hand side of equation, the parameter name, the parameter estimate, the approximate standard error, t value, the approximate probability ($Pr > |t|$), and the variable name for the right-hand side of equations in terms of each parameter
- the innovation covariance matrix
- the information criteria

If PRINT=ESTIMATES is specified, the VARMAX procedure prints the following list with the default printed output:

- the estimates of the constant vector (or seasonal constant matrix), the trend vector, the coefficient matrices of the distributed lags, the AR coefficient matrices, and the MA coefficient matrices
- the ALPHA and BETA parameter estimates for the error correction model
- the schematic representation of parameter estimates

If PRINT=DIAGNOSE is specified, the VARMAX procedure prints the following list with the default printed output:

- the cross-covariance and cross-correlation matrices of the residuals
- the tables of test statistics for the hypothesis that the residuals of the model are white noise:
 - Durbin-Watson (DW) statistics
 - F test for autoregressive conditional heteroscedastic (ARCH) disturbances
 - F test for AR disturbance
 - Jarque-Bera normality test
 - Portmanteau test

ODS Table Names

The VARMAX procedure assigns a name to each table it creates. You can use these names to reference the table when using the Output Delivery System (ODS) to select tables and create output data sets. These names are listed in the following table:

Table 35.8 ODS Tables Produced in the VARMAX Procedure

ODS Table Name	Description	Option
ODS Tables Created by the MODEL Statement

ODS Graphics

This section describes the use of ODS for creating statistical graphs with the VARMAX procedure.

When ODS GRAPHICS are in effect, the VARMAX procedure produces a variety of plots for each dependent variable.

The plots available are as follows:

- The procedure displays the following plots for each dependent variable in the MODEL statement with the PLOT= option in the VARMAX statement:
 - impulse response function
 - impulse response of the transfer function
 - time series and predicted series
 - prediction errors
 - distribution of the prediction errors
 - normal quantile of the prediction errors
 - ACF of the prediction errors
 - PACF of the prediction errors
 - IACF of the prediction errors
 - log scaled white noise test of the prediction errors
- The procedure displays forecast plots for each dependent variable in the OUTPUT statement with the PLOT= option in the VARMAX statement.

ODS Graph Names

The VARMAX procedure assigns a name to each graph it creates by using ODS. You can use these names to reference the graphs when using ODS. The names are listed in [Table 35.9](#).

Table 35.9 ODS Graphics Produced in the VARMAX Procedure

ODS Table Name	Plot Description	Statement
ErrorACFPlot	Autocorrelation function of prediction errors	MODEL
ErrorIACFPlot	Inverse autocorrelation function of prediction errors	MODEL

Computational Issues

Computational Method

The VARMAX procedure uses numerous linear algebra routines and frequently uses the sweep operator (Goodnight 1979) and the Cholesky root (Golub and Van Loan 1983).

In addition, the VARMAX procedure uses the nonlinear optimization (NLO) subsystem to perform nonlinear optimization tasks for the maximum likelihood estimation. The optimization requires intensive computation.

Convergence Problems

For some data sets, the computation algorithm can fail to converge. Nonconvergence can result from a number of causes, including flat or ridged likelihood surfaces and ill-conditioned data.

If you experience convergence problems, the following points might be helpful:

- Data that contain extreme values can affect results in PROC VARMAX. Rescaling the data can improve stability.
- Changing the TECH=, MAXITER=, and MAXFUNC= options in the [NLOPTIONS](#) statement can improve the stability of the optimization process.
- Specifying a different model that might fit the data more closely and might improve convergence.

Memory

Let T be the length of each series, k be the number of dependent variables, p be the order of autoregressive terms, and q be the order of moving-average terms. The number of parameters to estimate for a VARMA(p, q) model is

$$k + (p + q)k^2 + k * (k + 1)/2$$

As k increases, the number of parameters to estimate increases very quickly. Furthermore the memory requirement for VARMA(p, q) quadratically increases as k and T increase.

For a VARMAX(p, q, s) model and GARCH-type multivariate conditional heteroscedasticity models, the number of parameters to estimate and the memory requirements are considerable.

Computing Time

PROC VARMAX is computationally intensive, and execution times can be long. Extensive CPU time is often required to compute the maximum likelihood estimates.

Examples: VARMAX Procedure

Example 35.1: Analysis of U.S. Economic Variables

Consider the following four-dimensional system of U.S. economic variables. Quarterly data for the years 1954 to 1987 are used (Lütkepohl 1993, Table E.3.).

```

title 'Analysis of U.S. Economic Variables';
data us_money;
    date=intnx( 'qtr', '01jan54'd, _n_-1 );
    format date yyq. ;
    input y1 y2 y3 y4 @@;
    y1=log(y1);
    y2=log(y2);
    label y1='log(real money stock M1)'
          y2='log(GNP in bil. of 1982 dollars)'
          y3='Discount rate on 91-day T-bills'
          y4='Yield on 20-year Treasury bonds';
datalines;
450.9 1406.8 0.010800000 0.026133333
453.0 1401.2 0.0081333333 0.025233333

... more lines ...

```

The following statements plot the series and proceed with the VARMAX procedure.

```
proc timeseries data=us_money vectorplot=series;
  id date interval=qtr;
  var y1 y2;
run;
```

Output 35.1.1 shows the plot of the variables y1 and y2.

Output 35.1.1 Plot of Data

The following statements plot the variables y3 and y4.

```
proc timeseries data=us_money vectorplot=series;
  id date interval=qtr;
  var y3 y4;
run;
```

Output 35.1.2 shows the plot of the variables y3 and y4.

Output 35.1.2 Plot of Data

```
proc varmax data=us_money;
  id date interval=qtr;
  model y1-y4 / p=2 lagmax=6 dfest
    print=(iarr(3) estimates diagnose)
    cointtest=(johansen=(iorder=2))
    ecm=(rank=1 normalize=y1);
  cointeg rank=1 normalize=y1 exogeneity;
run;
```

This example performs the Dickey-Fuller test for stationarity, the Johansen cointegrated test integrated order 2, and the exogeneity test. The VECM(2) is fit to the data. From the outputs shown in [Output 35.1.5](#), you can see that the series has unit roots and is cointegrated in rank 1 with integrated order 1. The fitted

VECM(2) is given as

$$\Delta \mathbf{y}_t = \begin{pmatrix} 0.0408 \\ 0.0860 \\ 0.0052 \\ -0.0144 \end{pmatrix} + \begin{pmatrix} -0.0140 & 0.0065 & -0.2026 & 0.1306 \\ -0.0281 & 0.0131 & -0.4080 & 0.2630 \\ -0.0022 & 0.0010 & -0.0312 & 0.0201 \\ 0.0051 & -0.0024 & 0.0741 & -0.0477 \end{pmatrix} \mathbf{y}_{t-1} + \begin{pmatrix} 0.3460 & 0.0913 & -0.3535 & -0.9690 \\ 0.0994 & 0.0379 & 0.2390 & 0.2866 \\ 0.1812 & 0.0786 & 0.0223 & 0.4051 \\ 0.0322 & 0.0496 & -0.0329 & 0.1857 \end{pmatrix} \Delta \mathbf{y}_{t-1} + \boldsymbol{\epsilon}_t$$

The Δ prefixed to a variable name implies differencing.

Output 35.1.3 through Output 35.1.14 show the details. Output 35.1.3 shows the descriptive statistics.

Output 35.1.3 Descriptive Statistics

Analysis of U.S. Economic Variables						
The VARMAX Procedure						
		Number of Observations		136		
		Number of Pairwise Missing		0		
Simple Summary Statistics						
Variable Type		N	Mean	Standard Deviation	Min	Max

y4	Yield on 20-year Treasury bonds					

Output 35.1.4 shows the output for Dickey-Fuller tests for the nonstationarity of each series. The null hypotheses is to test a unit root. All series have a unit root.

Output 35.1.4 Unit Root Tests

Unit Root Test					
Variable	Type	Rho	Pr < Rho	Tau	Pr < Tau
y1	Zero Mean	0.05	0.6934	1.14	0.9343
	Single Mean	-2.97	0.6572	-0.76	0.8260
	Trend	-5.91	0.7454	-1.34	0.8725
y2	Zero Mean	0.13	0.7124	5.14	0.9999
	Single Mean	-0.43	0.9309	-0.79	0.8176
	Trend	-9.21	0.4787	-2.16	0.5063
y3	Zero Mean	-1.28	0.4255	-0.69	0.4182
	Single Mean	-8.86	0.1700	-2.27	0.1842
	Trend	-18.97	0.0742	-2.86	0.1803
y4	Zero Mean	0.40	0.7803	0.45	0.8100
	Single Mean	-2.79	0.6790	-1.29	0.6328
	Trend	-12.12	0.2923	-2.33	0.4170

The Johansen cointegration rank test shows whether the series is integrated order either 1 or 2 as shown in [Output 35.1.5](#). The last two columns in [Output 35.1.5](#) explain the cointegration rank test with integrated order 1. The results indicate that there is the cointegrated relationship with the cointegration rank 1 with respect to the 0.05 significance level because the test statistic of 20.6542 is smaller than the critical value of 29.38. Now, look at the row associated with $r = 1$. Compare the test statistic value and critical value pairs such as (219.62395, 29.38), (89.21508, 15.34), and (27.32609, 3.84). There is no evidence that the series are integrated order 2 at the 0.05 significance level.

Output 35.1.5 Cointegration Rank Test

Cointegration Rank Test for I(2)					
r\k-r-s	4	3	2	1	Trace of I(1)

Output 35.1.11 shows the innovation covariance matrix estimates, the various information criteria results, and the tests for white noise residuals. The residuals have significant correlations at lag 2 and 3. The Portmanteau test results into significant. These results show that a VECM(3) model might be better fit than the VECM(2) model is.

Output 35.1.11 Diagnostic Checks

y2	1	12.54	0.0004	
y3	1	0.09	0.7695	
y4	1	1.81	0.1786	

Example 35.2: Analysis of German Economic Variables

This example considers a three-dimensional VAR(2) model. The model contains the logarithms of a quarterly, seasonally adjusted West German fixed investment, disposable income, and consumption expenditures. The data used are in Lütkepohl (1993, Table E.1).

```

title 'Analysis of German Economic Variables';
data west;
    date = intnx( 'qtr', '01jan60'd, _n_-1 );
    format date yyq. ;
    input y1 y2 y3 @@;
    y1 = log(y1);
    y2 = log(y2);
    y3 = log(y3);
    label y1 = 'logarithm of investment'
           y2 = 'logarithm of income'
           y3 = 'logarithm of consumption';
datalines;
180 451 415 179 465 421 185 485 434 192 493 448

... more lines ...

data use;
    set west;
    where date < '01jan79'd;
    keep date y1 y2 y3;
run;

proc varmax data=use;
    id date interval=qtr;
    model y1-y3 / p=2 dify=(1)
           print=(decompose(6) impulse=(stderr) estimates diagnose)
           printform=both lagmax=3;
    causal group1=(y1) group2=(y2 y3);
    output lead=5;
run;

```

First, the differenced data is modeled as a VAR(2) with the following result:

$$\begin{aligned}
 \Delta \mathbf{y}_t = & \begin{pmatrix} -0.01672 \\ 0.01577 \\ 0.01293 \end{pmatrix} + \begin{pmatrix} -0.31963 & 0.14599 & 0.96122 \\ 0.04393 & -0.15273 & 0.28850 \\ -0.00242 & 0.22481 & -0.26397 \end{pmatrix} \Delta \mathbf{y}_{t-1} \\
 & + \begin{pmatrix} -0.16055 & 0.11460 & 0.93439 \\ 0.05003 & 0.01917 & -0.01020 \\ 0.03388 & 0.35491 & -0.02223 \end{pmatrix} \Delta \mathbf{y}_{t-2} + \boldsymbol{\epsilon}_t
 \end{aligned}$$

The parameter estimates AR1_1_2, AR1_1_3, AR2_1_2, and AR2_1_3 are insignificant, and the VARX model is fitted in the next step.

The detailed output is shown in [Output 35.2.1](#) through [Output 35.2.8](#).

[Output 35.2.1](#) shows the descriptive statistics.

Output 35.2.1 Descriptive Statistics

	80	1979:4	7.59344	0.02205	7.55022	7.63666
	81	1980:1	7.61232	0.02578	7.56179	7.66286

Output 35.2.9 shows that you cannot reject Granger noncausality from (y2, y3) to y1 using the 0.05 significance level.

Output 35.2.9 Granger Causality Tests

Granger-Causality Wald Test			
Test	DF	Chi-Square	Pr > ChiSq
1	4	6.37	0.1734
Test 1: Group 1 Variables: y1			
Group 2 Variables: y2 y3			

The following SAS statements show that the variable y1 is the exogenous variable and fit the VARX(2,1) model to the data.

```
proc varmax data=use;
  id date interval=qtr;
  model y2 y3 = y1 / p=2 dify=(1) difx=(1) xlag=1 lagmax=3
    print=(estimates diagnose);
run;
```

The fitted VARX(2,1) model is written as

$$\begin{pmatrix} \Delta y_{2t} \\ \Delta y_{3t} \end{pmatrix} = \begin{pmatrix} 0.01542 \\ 0.01319 \end{pmatrix} + \begin{pmatrix} 0.02520 \\ 0.05130 \end{pmatrix} \Delta y_{1t} + \begin{pmatrix} 0.03870 \\ 0.00363 \end{pmatrix} \Delta y_{1,t-1} \\
 + \begin{pmatrix} -0.12258 & 0.25811 \\ 0.24367 & -0.31809 \end{pmatrix} \begin{pmatrix} \Delta y_{2,t-1} \\ \Delta y_{3,t-1} \end{pmatrix} \\
 + \begin{pmatrix} 0.01651 & 0.03498 \\ 0.34921 & -0.01664 \end{pmatrix} \begin{pmatrix} \Delta y_{2,t-2} \\ \Delta y_{3,t-2} \end{pmatrix} + \begin{pmatrix} \epsilon_{1t} \\ \epsilon_{2t} \end{pmatrix}$$

The detailed output is shown in [Output 35.2.10](#) through [Output 35.2.13](#).

Output 35.2.10 shows the parameter estimates in terms of the constant, the current and the lag one coefficients of the exogenous variable, and the lag two coefficients of the dependent variables.

Output 35.2.10 Parameter Estimates

Overview: X11 Procedure

The X11 procedure, an adaptation of the U.S. Bureau of the Census X-11 Seasonal Adjustment program, seasonally adjusts monthly or quarterly time series. The procedure makes additive or multiplicative adjustments and creates an output data set containing the adjusted time series and intermediate calculations.

The X11 procedure also provides the X-11-ARIMA method developed by Statistics Canada. This method fits an ARIMA model to the original series, then uses the model forecast to extend the original series. This extended series is then seasonally adjusted by the standard X-11 seasonal adjustment method. The extension of the series improves the estimation of the seasonal factors and reduces revisions to the seasonally adjusted series as new data become available.

The X11 procedure incorporates sliding spans analysis. This type of analysis provides a diagnostic for determining the suitability of seasonal adjustment for an economic series.

Seasonal adjustment of a series is based on the assumption that seasonal fluctuations can be measured in the original series, O_t , $t = 1, \dots, n$, and separated from trend cycle, trading-day, and irregular fluctuations. The seasonal component of this time series, S_t , is defined as the intrayear variation that is repeated constantly or in an evolving fashion from year to year. The trend cycle component, C_t , includes variation due to the long-term trend, the business cycle, and other long-term cyclical factors. The trading-day component, D_t , is the variation that can be attributed to the composition of the calendar. The irregular component, I_t , is the residual variation. Many economic time series are related in a multiplicative fashion ($O_t = S_t C_t D_t I_t$). A seasonally adjusted time series, $C_t I_t$, consists of only the trend cycle and irregular components.

Getting Started: X11 Procedure

The most common use of the X11 procedure is to produce a seasonally adjusted series. Eliminating the seasonal component from an economic series facilitates comparison among consecutive months or quarters. A plot of the seasonally adjusted series is often more informative about trends or location in a business cycle than a plot of the unadjusted series.

The following example shows how to use PROC X11 to produce a seasonally adjusted series, $C_t I_t$, from an original series $O_t = S_t C_t D_t I_t$.

In the multiplicative model, the trend cycle component C_t keeps the same scale as the original series O_t , while S_t , D_t , and I_t vary around 1.0. In all printed tables and in the output data set, these latter components are expressed as percentages, and thus will vary around 100.0 (in the additive case, they vary around 0.0).

The naming convention used in PROC X11 for the tables follows the original U.S. Bureau of the Census X-11 Seasonal Adjustment program specification (Shiskin, Young, and Musgrave 1967). Also, see the section “Printed Output” on page 2440. This convention is outlined in Figure 36.1.

The tables corresponding to parts A – C are intermediate calculations. The final estimates of the individual components are found in the D tables: table D10 contains the final seasonal factors, table D12 contains the final trend cycle, and table D13 contains the final irregular series. If you are primarily interested in seasonally adjusting a series without consideration of intermediate calculations or diagnostics, you only need to look at table D11, the final seasonally adjusted series.

For further details about the X-11-ARIMA tables, see Ladiray and Quenneville (2001).

Basic Seasonal Adjustment

Suppose you have monthly retail sales data starting in September 1978 in a SAS data set named SALES. At this point you do not suspect that any calendar effects are present, and there are no prior adjustments that need to be made to the data.

In this simplest case, you need only specify the DATE= variable in the MONTHLY statement, which associates a SAS date value to each observation. To see the results of the seasonal adjustment, you must request table D11, the final seasonally adjusted series, in a TABLES statement.

```
data sales;
  input sales @@;
  date = intnx( 'month', '01sep1978'd, _n_-1 );
  format date monyy7.;
datalines;

    ... more lines ...

/*--- X-11 ARIMA ---*/
proc x11 data=sales;
  monthly date=date;
  var sales;
  tables d11;
run;
```

  yaxis label='Original and Seasonally Adjusted Time Series';
run;

```

Figure 36.3 Plot of Original and Seasonally Adjusted Data

X-11-ARIMA

An inherent problem with the X-11 method is the revision of the seasonal factor estimates as new data become available. The X-11 method uses a set of centered moving averages to estimate the seasonal components. These moving averages apply symmetric weights to all observations except those at the beginning and end of the series, where asymmetric weights have to be applied. These asymmetric weights can cause poor estimates of the seasonal factors, which then can cause large revisions when new data become available.

While large revisions to seasonally adjusted values are not common, they can happen. When they do happen, it undermines the credibility of the X-11 seasonal adjustment method.

A method to address this problem was developed at Statistics Canada (Dagum 1980, 1982a). This method, known as X-11-ARIMA, applies an ARIMA model to the original data (after adjustments, if any) to forecast the series one or more years. This extended series is then seasonally adjusted, allowing symmetric weights to be applied to the end of the original data. This method was tested against a large number of Canadian economic series and was found to greatly reduce the amount of revisions as new data were added.

The X-11-ARIMA method is available in PROC X11 through the use of the ARIMA statement. The ARIMA statement extends the original series either with a user-specified ARIMA model or by an automatic selection process in which the best model from a set of five predefined ARIMA models is used.

The following example illustrates the use of the ARIMA statement. The ARIMA statement does not contain a user-specified model, so the best model is chosen by the automatic selection process. Forecasts from this best model are then used to extend the original series by one year. The following partial listing shows parameter estimates and model diagnostics for the ARIMA model chosen by the automatic selection process.

```
proc x11 data=sales;
    monthly date=date;
    var sales;
    arima;
run;
```

Figure 36.4 X-11-ARIMA Model Selection

MU	0.0001728	0.0009596	0.18	0
MA1,1	0.3739984	0.0893427	4.19	1
MA1,2	0.0231478	0.0892154	0.26	2
MA2,1	0.5727914	0.0790835	7.24	12

Figure 36.4 continued

Conditional Least Squares Estimation				
Variance Estimate =	0.0014313			
Std Error Estimate =	0.0378326			
AIC	=	-482.2412	*	
SBC	=	-470.7404	*	
Number of Residuals=	131			
* Does not include log determinant				
Criteria Summary for Model 2: (0,1,2) (0,1,1)s, Log Transform				
Box-Ljung Chi-square: 22.03 with 21 df Prob= 0.40				
(Criteria prob > 0.05)				
Test for over-differencing: sum of MA parameters = 0.57				
(must be < 0.90)				
MAPE - Last Three Years: 2.84 (Must be < 15.00 %)				
- Last Year: 3.04				
- Next to Last Year: 1.96				
- Third from Last Year: 3.51				

Table D11 (final seasonally adjusted series) is now constructed using symmetric weights on observations at the end of the actual data. This should result in better estimates of the seasonal factors and, thus, smaller revisions in Table D11 as more data become available.

Syntax: X11 Procedure

The X11 procedure uses the following statements:

```

PROC X11 options ;
  ARIMA options ;
  BY variables ;
  ID variables ;
  MACURVES option ;
  MONTHLY options ;
  OUTPUT OUT=dataset options ;
  PDWEIGHTS option ;
  QUARTERLY options ;
  SSPAN options ;
  TABLES tablenames ;
  VAR variables ;

```

Either the MONTHLY or QUARTERLY statement must be specified, depending on the type of time series data you have. The PDWEIGHTS and MACURVES statements can be used only with the MONTHLY statement. The TABLES statement controls the printing of tables, while the OUTPUT statement controls the creation of the OUT= data set.

Functional Summary

The statements and options controlling the X11 procedures are summarized in the following table.

Description	Statement	Option
Data Set Options		
specify input data set	PROC X11	DATA=
write the trading-day regression results to an output data set	PROC X11	OUTTDR=
write the stable seasonality test results to an output data set	PROC X11	OUTSTB=
write table values to an output data set	OUTPUT	OUT=
add extrapolated values to the output data set	PROC X11	OUTEX
add year ahead estimates to the output data set	PROC X11	YRAHEADOUT
write the sliding spans analysis results to an output data set	PROC X11	OUTSPAN=
Printing Control Options		
suppress all printed output	PROC X11	NOPRINT
suppress all printed ARIMA output	ARIMA	NOPRINT
print all ARIMA output	ARIMA	PRINTALL
print selected tables and charts	TABLES	
print selected groups of tables	MONTHLY	PRINTOUT=
	QUARTERLY	PRINTOUT=
print selected groups of charts	MONTHLY	CHARTS=
	QUARTERLY	CHARTS=
print preliminary tables associated with ARIMA processing	ARIMA	PRINTFP
specify number of decimals for printed tables	MONTHLY	NDEC=
	QUARTERLY	NDEC=
suppress all printed SSPAN output	SSPAN	NOPRINT
print all SSPAN output	SSPAN	PRINTALL
Date Information Options		
specify a SAS date variable	MONTHLY	DATE=
	QUARTERLY	DATE=
specify the beginning date	MONTHLY	START=
	QUARTERLY	START=
specify the ending date	MONTHLY	END=
	QUARTERLY	END=
specify beginning year for trading-day regression	MONTHLY	TDCOMPUTE=

Description	Statement	Option
Declaring the Role of Variables		
specify BY-group processing	BY	
specify the variables to be seasonally adjusted	VAR	
specify identifying variables	ID	
specify the prior monthly factor	MONTHLY	PMFACTOR=
Controlling the Table Computations		
use additive adjustment	MONTHLY	ADDITIVE
	QUARTERLY	ADDITIVE
specify seasonal factor moving average length	MACURVES	
specify the extreme value limit for trading-day regression	MONTHLY	EXCLUDE=
specify the lower bound for extreme irregulars	MONTHLY	FULLWEIGHT=
	QUARTERLY	FULLWEIGHT=
specify the upper bound for extreme irregulars	MONTHLY	ZEROWEIGHT=
	QUARTERLY	ZEROWEIGHT=
include the length-of-month in trading-day regression	MONTHLY	LENGTH
specify trading-day regression action	MONTHLY	TDREGR=
compute summary measure only	MONTHLY	SUMMARY
	QUARTERLY	SUMMARY
modify extreme irregulars prior to trend cycle estimation	MONTHLY	TRENDADJ
	QUARTERLY	TRENDADJ
specify moving average length in trend cycle estimation	MONTHLY	TRENDMA=
	QUARTERLY	TRENDMA=
specify weights for prior trading-day factors	PDWEIGHTS	

PROC X11 Statement

PROC X11 *options* ;

The following options can appear in the PROC X11 statement:

DATA= *SAS-data-set*

specifies the input SAS data set used. If it is omitted, the most recently created SAS data set is used.

OUTEXTRAP

adds the extra observations used in ARIMA processing to the output data set.

When ARIMA forecasting/backcasting is requested, extra observations are appended to the ends of the series, and the calculations are carried out on this extended series. The appended observations are not normally written to the OUT= data set. However, if OUTEXTRAP is specified, these extra observations are written to the output data set. If a DATE= variable is specified in the MONTHLY/QUARTERLY statement, the date variable is extrapolated to identify forecasts/backcasts. The OUTEXTRAP option can be abbreviated as OUTEX.

NOPRINT

suppresses any printed output. The NOPRINT option overrides any PRINTOUT=, CHARTS=, or TABLES statement and any output associated with the ARIMA statement.

OUTSPAN= SAS-data-set

specifies the output data set to store the sliding spans analysis results. Tables A1, C18, D10, and D11 for each span are written to this data set. See the section “[The OUTSPAN= Data Set](#)” on page 2437 for details.

OUTSTB= SAS-data-set

specifies the output data set to store the stable seasonality test results (table D8). All the information in the analysis of variance table associated with the stable seasonality test is contained in the variables written to this data set. See the section “[OUTSTB= Data Set](#)” on page 2438 for details.

OUTTDR= SAS-data-set

specifies the output data set to store the trading-day regression results (tables B15 and C15). All the information in the analysis of variance table associated with the trading-day regression is contained in the variables written to this data set. This option is valid only when TDREGR=PRINT, TEST, or ADJUST is specified in the MONTHLY statement. See the section “[OUTTDR= Data Set](#)” on page 2438 for details.

YRAHEADOUT

adds one-year-ahead forecast values to the output data set for tables C16, C18, and D10. The original purpose of this option was to avoid recomputation of the seasonal adjustment factors when new data became available. While computing costs were an important factor when the X-11 method was developed, this is no longer the case and this option is obsolete. See the section “[The YRAHEADOUT Option](#)” on page 2432 for details.

ARIMA Statement

ARIMA options ;

The ARIMA statement applies the X-11-ARIMA method to the series specified in the VAR statement. This method uses an ARIMA model estimated from the original data to extend the series one or more years. The ARIMA statement options control the ARIMA model used and the estimation, forecasting, and printing of this model.

There are two ways of obtaining an ARIMA model to extend the series. A model can be given explicitly with the MODEL= and TRANSFORM= options. Alternatively, the best-fitting model from a set of five predefined models is found automatically whenever the MODEL= option is absent. See the section “[Details of Model Selection](#)” on page 2434 for details.

BACKCAST= n

specifies the number of years to backcast the series. The default is BACKCAST= 0. See the section “[Effect of Backcast and Forecast Length](#)” on page 2433 for details.

CHICR= value

specifies the criteria for the significance level for the Box-Ljung chi-square test for lack of fit when testing the five predefined models. The default is CHICR= 0.05. The CHICR= option values must be between 0.01 and 0.90. The hypothesis being tested is that of model adequacy. Nonrejection of the hypothesis is evidence for an adequate model. Making the CHICR= value smaller makes it easier to accept the model. See the section “[Criteria Details](#)” on page 2435 for further details on the CHICR= option.

CONVERGE= value

specifies the convergence criterion for the estimation of an ARIMA model. The default value is 0.001. The CONVERGE= value must be positive.

FORECAST= n

specifies the number of years to forecast the series. The default is FORECAST= 1. See the section “[Effect of Backcast and Forecast Length](#)” on page 2433 for details.

MAPECR= value

specifies the criteria for the mean absolute percent error (MAPE) when testing the five predefined models. A small MAPE value is evidence for an adequate model; a large MAPE value results in the model being rejected. The MAPECR= value is the boundary for acceptance/rejection. Thus a larger MAPECR= value would make it easier for a model to pass the criteria. The default is MAPECR= 15. The MAPECR= option values must be between 1 and 100. See the section “[Criteria Details](#)” on page 2435 for further details on the MAPECR= option.

MAXITER= n

specifies the maximum number of iterations in the estimation process. MAXITER must be between 1 and 60; the default value is 15.

METHOD= CLS**METHOD= ULS****METHOD= ML**

specifies the estimation method. ML requests maximum likelihood, ULS requests unconditional least squares, and CLS requests conditional least squares. METHOD=CLS is the default. The maximum likelihood estimates are more expensive to compute than the conditional least squares estimates. In some cases, however, they can be preferable. For further information on the estimation methods, see “[Estimation Details](#)” on page 250 in Chapter 7, “[The ARIMA Procedure](#).”

MODEL= (P=n1 Q=n2 SP=n3 SQ=n4 DIF=n5 SDIF=n6 < NOINT > < CENTER >)

specifies the ARIMA model. The AR and MA orders are given by P=n1 and Q=n2, respectively, while the seasonal AR and MA orders are given by SP=n3 and SQ=n4, respectively. The lag corresponding to seasonality is determined by the MONTHLY or QUARTERLY statement. Similarly, differencing and seasonal differencing are given by DIF=n5 and SDIF=n6, respectively.

For example

```
arima model=( p=2 q=1 sp=1 dif=1 sdif=1 );
```

specifies a (2,1,1)(1,1,0)_s model, where *s*, the seasonality, is either 12 (monthly) or 4 (quarterly). More examples of the MODEL= syntax are given in the section “[Details of Model Selection](#)” on page 2434.

NOINT

suppresses the fitting of a constant (or intercept) parameter in the model. (That is, the parameter μ is omitted.)

CENTER

centers each time series by subtracting its sample mean. The analysis is done on the centered data. Later, when forecasts are generated, the mean is added back. Note that centering is done after differencing. The CENTER option is normally used in conjunction with the NOCONSTANT option of the ESTIMATE statement.

For example, to fit an AR(1) model on the centered data without an intercept, use the following ARIMA statement:

```
arima model=( p=1 center noint );
```

NOPRINT

suppresses the normal printout generated by the ARIMA statement. Note that the effect of specifying the NOPRINT option in the ARIMA statement is different from the effect of specifying the NOPRINT in the PROC X11 statement, since the former only affects ARIMA output.

OVDIFCR= value

specifies the criteria for the over-differencing test when testing the five predefined models. When the MA parameters in one of these models sum to a number close to 1.0, this is an indication of over-parameterization and the model is rejected. The OVDIFCR= value is the boundary for this rejection; values greater than this value fail the over-differencing test. A larger OVDIFCR= value would make it easier for a model to pass the criteria. The default is OVDIFCR= 0.90. The OVDIFCR= option values must be between 0.80 and 0.99. See the section “[Criteria Details](#)” on page 2435 for further details on the OVDIFCR= option.

PRINTALL

provides the same output as the default printing for all models fit and, in addition, prints an estimation summary and chi-square statistics for each model fit. See “[Printed Output](#)” on page 2440 for details.

PRINTFP

prints the results for the initial pass of X11 made to exclude trading-day effects. This option has an effect only when the TDREGR= option specifies ADJUST, TEST, or PRINT. In these cases, an initial pass of the standard X11 method is required to get rid of calendar effects before doing any ARIMA estimation. Usually this first pass is not of interest, and by default no tables are printed. However, specifying PRINTFP in the ARIMA statement causes any tables printed in the final pass to also be printed for this initial pass.

TRANSFORM= (LOG) | LOG**TRANSFORM= (constant ** power)**

The ARIMA statement in PROC X11 allows certain transformations on the series before estimation. The specified transformation is applied only to a user-specified model. If TRANSFORM= is specified and the MODEL= option is not specified, the transformation request is ignored and a warning is printed.

The LOG transformation requests that the natural log of the series be used for estimation. The resulting forecast values are transformed back to the original scale.

A general power transformation of the form $X_t \rightarrow (X_t + a)^b$ is obtained by specifying

```
transform= ( a ** b )
```

If the constant a is not specified, it is assumed to be zero. The specified ARIMA model is then estimated using the transformed series. The resulting forecast values are transformed back to the original scale.

BY Statement

BY *variables* ;

A BY statement can be used with PROC X11 to obtain separate analyses on observations in groups defined by the BY variables. When a BY statement appears, the procedure expects the input DATA= data set to be sorted in order of the BY variables.

ID Statement

ID *variables* ;

If you are creating an output data set, use the ID statement to put values of the ID variables, in addition to the table values, into the output data set. The ID statement has no effect when an output data set is not created. If the DATE= variable is specified in the MONTHLY or QUARTERLY statement, this variable is included automatically in the OUTPUT data set. If no DATE= variable is specified, the variable _DATE_ is added.

The date variable (or _DATE_) values outside the range of the actual data (from ARIMA forecasting or backcasting, or from YRAHEADOUT) are extrapolated, while all other ID variables are missing.

MACURVES Statement

MACURVES *month=option* ... ;

The MACURVES statement specifies the length of the moving-average curves for estimating the seasonal factors for any month. This statement can be used only with monthly time series data.

The *month=option* specifications consist of the month name (or the first three letters of the month name), an equal sign, and one of the following option values:

'3'	specifies a three-term moving average for the month
'3X3'	specifies a three-by-three moving average
'3X5'	specifies a three-by-five moving average
'3X9'	specifies a three-by-nine moving average
STABLE	specifies a stable seasonal factor (average of all values for the month)

For example, the statement

```
macurves jan='3' feb='3x3' march='3x5' april='3x9';
```

uses a three-term moving average to estimate seasonal factors for January, a 3×3 (a three-term moving average of a three-term moving average) for February, a 3×5 (a three-term moving average of a five-term moving average) for March, and a 3×9 (a three-term moving average of a nine-term moving average) for April.

The numeric values used for the weights of the various moving averages and a discussion of the derivation of these weights are given in Shiskin, Young, and Musgrave (1967). A general discussion of moving average weights is given in Dagum (1985).

If the specification for a month is omitted, the X11 procedure uses a three-by-three moving average for the first estimate of each iteration and a three-by-five average for the second estimate.

MONTHLY Statement

MONTHLY *options* ;

The MONTHLY statement must be used when the input data to PROC X11 are a monthly time series. The MONTHLY statement specifies options that determine the computations performed by PROC X11 and what is included in its output. Either the DATE= or START= option must be used.

The following options can appear in the MONTHLY statement.

ADDITIVE

performs additive adjustments. If the ADDITIVE option is omitted, PROC X11 performs multiplicative adjustments.

CHARTS= STANDARD**CHARTS= FULL****CHARTS= NONE**

specifies the charts produced by the procedure. The default is CHARTS=STANDARD, which specifies 12 monthly seasonal charts and a trend cycle chart. If you specify CHARTS=FULL (or CHARTS=ALL), the procedure prints additional charts of irregular and seasonal factors. To print no charts, specify CHARTS=NONE.

The TABLES statement can also be used to specify particular monthly charts to be printed. If no CHARTS= option is given, and a TABLES statement is given, the TABLES statement overrides the default value of CHARTS=STANDARD; that is, no charts (or tables) are printed except those specified in the TABLES statement. However, if both the CHARTS= option and a TABLES statement are given, the charts corresponding to the CHARTS= option and those requested by the TABLES statement are printed.

For example, suppose you wanted only charts G1, the final seasonally adjusted series and trend cycle, and G4, the final irregular and final modified irregular series. You would specify the following statements:

```
monthly date=date;
tables g1 g4;
```

DATE= variable

specifies a variable that gives the date for each observation. The starting and ending dates are obtained from the first and last values of the DATE= variable, which must contain SAS date values. The procedure checks values of the DATE= variable to ensure that the input observations are sequenced correctly. This variable is automatically added to the OUTPUT= data set if one is requested and extrapolated if necessary. If the DATE= option is not specified, the START= option must be specified.

The DATE= option and the START= and END= options can be used in combination to subset a series for processing. For example, suppose you have 12 years of monthly data (144 observations, no missing values) beginning in January 1970 and ending in December 1981, and you wanted to seasonally adjust only six years beginning in January 1974. Specifying

```
monthly date=date start=jan1974 end=dec1979;
```

would seasonally adjust only this subset of the data. If instead you wanted to adjust the last eight years of data, only the START= option is needed:

```
monthly date=date start=jan1974;
```

END= mmmyyyy

specifies that only the part of the input series ending with the month and year given be adjusted (for example, END=DEC1970). See the DATE=variable option for using the START= and END= options to subset a series for processing.

EXCLUDE= *value*

excludes from the trading-day regression any irregular values that are more than *value* standard deviations from the mean. The EXCLUDE=*value* must be between 0.1 and 9.9, with the default value being 2.5.

FULLWEIGHT= *value*

assigns weights to irregular values based on their distance from the mean in standard deviation units. The weights are used for estimating seasonal and trend cycle components. Irregular values less than the FULLWEIGHT= *value* (in standard deviation units) are assigned full weights of 1, values that fall between the ZEROWEIGHT= and FULLWEIGHT= limits are assigned weights linearly graduated between 0 and 1, and values greater than the ZEROWEIGHT= limit are assigned a weight of 0.

For example, if ZEROWEIGHT=2 and FULLWEIGHT=1, a value 1.3 standard deviations from the mean would be assigned a graduated weight. The FULLWEIGHT=*value* must be between 0.1 and 9.9 but must be less than the ZEROWEIGHT=*value*. The default is FULLWEIGHT=1.5.

LENGTH

includes length-of-month allowance in computing trading-day factors. If this option is omitted, length-of-month allowances are included with the seasonal factors.

NDEC= *n*

specifies the number of decimal places shown in the printed tables in the listing. This option has no effect on the precision of the variable values in the output data set.

PMFACTOR= *variable*

specifies a variable containing the prior monthly factors. Use this option if you have previous knowledge of monthly adjustment factors. The PMFACTOR= option can be used to make the following adjustments:

- adjust the level of all or part of a series with discontinuities
- adjust for the influence of holidays that fall on different dates from year to year, such as the effect of Easter on certain retail sales
- adjust for unreasonable weather influence on series, such as housing starts
- adjust for changing starting dates of fiscal years (for budget series) or model years (for automobiles)
- adjust for temporary dislocating events, such as strikes

See the section “[Prior Daily Weights and Trading-Day Regression](#)” on page 2431 for details and examples using the PMFACTOR= option.

PRINTOUT= STANDARD | LONG | FULL | NONE

specifies the tables to be printed by the procedure. If the PRINTOUT=STANDARD option is specified, between 17 and 27 tables are printed, depending on the other options that are specified. PRINTOUT=LONG prints between 27 and 39 tables, and PRINTOUT=FULL prints between 44 and 59 tables. Specifying PRINTOUT=NONE results in no tables being printed; however, charts are still printed. The default is PRINTOUT=STANDARD.

The TABLES statement can also be used to specify particular monthly tables to be printed. If no PRINTOUT= option is specified, and a TABLES statement is given, the TABLES statement overrides

the default value of PRINTOUT=STANDARD; that is, no tables (or charts) are printed except those given in the TABLES statement. However, if both the PRINTOUT= option and a TABLES statement are specified, the tables corresponding to the PRINTOUT= option and those requested by the TABLES statement are printed.

START= *mmmyyyy*

adjusts only the part of the input series starting with the specified month and year. When the DATE= option is not used, the START= option gives the year and month of the first input observation — for example, START=JAN1966. START= must be specified if DATE= is not given. If START= is specified (and no DATE= option is given), and an OUT= data set is requested, a variable named _DATE_ is added to the data set, giving the date value for each observation. See the DATE= *variable* option for using the START= and END= options to subset a series.

SUMMARY

specifies that the data are already seasonally adjusted and the procedure is to produce summary measures. If the SUMMARY option is omitted, the X11 procedure performs seasonal adjustment of the input data before calculating summary measures.

TD COMPUTE= *year*

uses the part of the input series beginning with January of the specified year to derive trading-day weights. If this option is omitted, the entire series is used.

TD REGR= NONE | PRINT | ADJUST | TEST

specifies the treatment of trading-day regression. TDREG=NONE omits the computation of the trading-day regression. TDREG=PRINT computes and prints the trading-day regressions but does not adjust the series. TDREG=ADJUST computes and prints the trading-day regression and adjusts the irregular components to obtain preliminary weights. TDREG=TEST adjusts the final series if the trading-day regression estimates explain significant variation on the basis of an F test (or residual trading-day variation if prior weights are used). The default is TDREGR=NONE.

See the section “[Prior Daily Weights and Trading-Day Regression](#)” on page 2431 for details and examples using the TDREGR= option.

If ARIMA processing is requested, any value of TDREGR other than the default TDREGR=NONE will cause PROC X11 to perform an initial pass (see the “[Details: X11 Procedure](#)” on page 2422 section and the PRINTFP option).

The significance level reported in Table C15 should be viewed with caution. The dependent variable in the trading-day regression is the irregular component formed by an averaging operation. This induces a correlation in the dependent variable and hence in the residuals from which the F test is computed. Hence the distribution of the trading-day regression F statistics differs from an exact F ; see Cleveland and Devlin (1980) for details.

TRENDADJ

modifies extreme irregular values prior to computing the trend cycle estimates in the first iteration. If the TRENDADJ option is omitted, the trend cycle is computed without modifications for extremes.

TRENDMA= 9 | 13 | 23

specifies the number of terms in the moving average to be used by the procedure in estimating the variable trend cycle component. The value of the TRENDMA= option must be 9, 13, or 23. If the TRENDMA= option is omitted, the procedure selects an appropriate moving average. For information about the number of terms in the moving average, see Shiskin, Young, and Musgrave (1967).

ZEROWEIGHT= value

assigns weights to irregular values based on their distance from the mean in standard deviation units. The weights are used for estimating seasonal and trend cycle components. Irregular values beyond the standard deviation limit specified in the ZEROWEIGHT= option are assigned zero weights. Values that fall between the two limits (ZEROWEIGHT= and FULLWEIGHT=) are assigned weights linearly graduated between 0 and 1. For example, if ZEROWEIGHT=2 and FULLWEIGHT=1, a value 1.3 standard deviations from the mean would be assigned a graduated weight. The ZEROWEIGHT=value must be between 0.1 and 9.9 but must be greater than the FULLWEIGHT=value. The default is ZEROWEIGHT=2.5.

The ZEROWEIGHT option can be used in conjunction with the FULLWEIGHT= option to adjust outliers from a monthly or quarterly series. See [Example 36.3](#) later in this chapter for an illustration of this use.

OUTPUT Statement

OUTPUT OUT= *SAS-data-set tablename=var1 var2 ... ;*

The OUTPUT statement creates an output data set containing specified tables. The data set is named by the OUT= option.

OUT= SAS-data-set

If OUT= is omitted, the SAS System names the new data set by using the DATA n convention.

For each table to be included in the output data set, write the X11 table identification keyword, an equal sign, and a list of new variable names:

tablename = var1 var2 ...

The *tablename* keywords that can be used in the OUTPUT statement are listed in the section “[Printed Output](#)” on page 2440. The following is an example of a VAR statement and an OUTPUT statement:

```
var z1 z2 z3;
output out=out_x11 b1=s d11=w x y;
```

The variable *s* contains the table B1 values for the variable *z1*, while the table D11 values for variables *z1*, *z2*, and *z3* are contained in variables *w*, *x*, and *y*, respectively. As this example shows, the list of variables following a *tablename*= keyword can be shorter than the VAR variable list.

In addition to the variables named by *tablename* =var1 var2 ..., the ID variables, and BY variables, the output data set contains a date identifier variable. If the DATE= option is given in the MONTHLY or QUARTERLY statement, the DATE= variable is the date identifier. If no DATE= option is given, a variable named `_DATE_` is the date identifier.

PDWEIGHTS Statement

PDWEIGHTS *day=w ... ;*

The PDWEIGHTS statement can be used to specify one to seven daily weights. The statement can only be used with monthly series that are seasonally adjusted using the multiplicative model. These weights are used to compute prior trading-day factors, which are then used to adjust the original series prior to the seasonal adjustment process. Only relative weights are needed; the X11 procedure adjusts the weights so that they sum to 7.0. The weights can also be corrected by the procedure on the basis of estimates of trading-day variation from the input data.

See the section “[Prior Daily Weights and Trading-Day Regression](#)” on page 2431 for details and examples using the PDWEIGHTS statement.

Each *day=w* option specifies a weight (*w*) for the named day. The *day* can be any day, Sunday through Saturday. The *day* keyword can be the full spelling of the day, or the three-letter abbreviation. For example, SATURDAY=1.0 and SAT=1.0 are both valid. The weights *w* must be a numeric value between 0.0 and 10.0.

The following is an example of a PDWEIGHTS statement:

```
pdweights sun=.2 mon=.9 tue=1 wed=1 thu=1 fri=.8 sat=.3;
```

Any number of days can be specified with one PDWEIGHTS statement. The default weight value for any day that is not specified is 0. If you do not use a PDWEIGHTS statement, the program computes daily weights if TDREGR=ADJUST is specified. See Shiskin, Young, and Musgrave (1967) for details.

QUARTERLY Statement

QUARTERLY *options ;*

The QUARTERLY statement must be used when the input data are quarterly time series. This statement includes options that determine the computations performed by the procedure and what is in the printed output. The DATE= option or the START= option must be used.

The following options can appear in the QUARTERLY statement.

ADDITIVE

performs additive adjustments. If this option is omitted, the procedure performs multiplicative adjustments.

CHARTS= STANDARD**CHARTS= FULL****CHARTS= NONE**

specifies the charts to be produced by the procedure. The default value is **CHARTS=STANDARD**, which specifies four quarterly seasonal charts and a trend cycle chart. If you specify **CHARTS=FULL** (or **CHARTS=ALL**), the procedure prints additional charts of irregular and seasonal factors. To print no charts, specify **CHARTS=NONE**. The **TABLES** statement can also be used to specify particular charts to be printed. The presence of a **TABLES** statement overrides the default value of **CHARTS=STANDARD**; that is, if a **TABLES** statement is specified, and no **CHARTS=option** is specified, no charts (nor tables) are printed except those given in the **TABLES** statement. However, if both the **CHARTS= option** and a **TABLES** statement are given, the charts corresponding to the **CHARTS= option** and those requested by the **TABLES** statement are printed.

For example, suppose you wanted only charts G1, the final seasonally adjusted series and trend cycle, and G4, the final irregular and final modified irregular series. This is accomplished by specifying the following statements:

```
quarterly date=date;
tables g1 g4;
```

DATE= variable

specifies a variable that gives the date for each observation. The starting and ending dates are obtained from the first and last values of the **DATE= variable**, which must contain SAS date values. The procedure checks values of the **DATE= variable** to ensure that the input observations are sequenced correctly. This variable is automatically added to the **OUTPUT= data set** if one is requested, and extrapolated if necessary. If the **DATE= option** is not specified, the **START= option** must be specified.

The **DATE= option** and the **START=** and **END= options** can be used in combination to subset a series for processing. For example, suppose you have a series with 10 years of quarterly data (40 observations, no missing values) beginning in '1970Q1' and ending in '1979Q4', and you want to seasonally adjust only four years beginning in '1974Q1' and ending in '1977Q4'. Specifying

```
quarterly date=variable start='1974q1' end='1977q4';
```

seasonally adjusts only this subset of the data. If instead you wanted to adjust the last six years of data, only the **START= option** is needed:

```
quarterly date=variable start='1974q1';
```

END= 'yyyyQq'

specifies that only the part of the input series ending with the quarter and year given be adjusted (for example, **END='1973Q4'**). The specification must be enclosed in quotes and *q* must be 1, 2, 3, or 4. See the **DATE= variable** option for using the **START=** and **END= options** to subset a series.

FULLWEIGHT= value

assigns weights to irregular values based on their distance from the mean in standard deviation units. The weights are used for estimating seasonal and trend cycle components. Irregular values less than

the FULLWEIGHT= value (in standard deviation units) are assigned full weights of 1, values that fall between the ZEROWEIGHT= and FULLWEIGHT= limits are assigned weights linearly graduated between 0 and 1, and values greater than the ZEROWEIGHT= limit are assigned a weight of 0.

For example, if ZEROWEIGHT=2 and FULLWEIGHT=1, a value 1.3 standard deviations from the mean would be assigned a graduated weight. The default is FULLWEIGHT=1.5.

NDEC= *n*

specifies the number of decimal places shown on the output tables. This option has no effect on the precision of the variables in the output data set.

PRINTOUT= STANDARD

PRINTOUT= LONG

PRINTOUT= FULL

PRINTOUT= NONE

specifies the tables to print. If PRINTOUT=STANDARD is specified, between 17 and 27 tables are printed, depending on the other options that are specified. PRINTOUT=LONG prints between 27 and 39 tables, and PRINTOUT=FULL prints between 44 and 59 tables. Specifying PRINTOUT=NONE results in no tables being printed. The default is PRINTOUT=STANDARD.

The TABLES statement can also specify particular quarterly tables to be printed. If no PRINTOUT= is given, and a TABLES statement is given, the TABLES statement overrides the default value of PRINTOUT=STANDARD; that is, no tables (or charts) are printed except those given in the TABLES statement. However, if both the PRINTOUT= option and a TABLES statement are given, the tables corresponding to the PRINTOUT= option and those requested by the TABLES statement are printed.

START= 'yyyyQq'

adjusts only the part of the input series starting with the quarter and year given. When the DATE= option is not used, the START= option gives the year and quarter of the first input observation (for example, START='1967Q1'). The specification must be enclosed in quotes, and *q* must be 1, 2, 3, or 4. START= must be specified if the DATE= option is not given. If START= is specified (and no DATE= is given), and an OUTPUT= data set is requested, a variable named _DATE_ is added to the data set, giving the date value for a given observation. See the DATE= option for using the START= and END= options to subset a series.

SUMMARY

specifies that the input is already seasonally adjusted and that the procedure is to produce summary measures. If this option is omitted, the procedure performs seasonal adjustment of the input data before calculating summary measures.

TRENDADJ

modifies extreme irregular values prior to computing the trend cycle estimates. If this option is omitted, the trend cycle is computed without modification for extremes.

ZEROWEIGHT= *value*

assigns weights to irregular values based on their distance from the mean in standard deviation units. The weights are used for estimating seasonal and trend cycle components. Irregular values beyond the standard deviation limit specified in the ZEROWEIGHT= option are assigned zero weights. Values that fall between the two limits (ZEROWEIGHT= and FULLWEIGHT=) are assigned weights

linearly graduated between 0 and 1. For example, if ZEROWEIGHT=2 and FULLWEIGHT=1, a value 1.3 standard deviations from the mean would be assigned a graduated weight. The default is ZEROWEIGHT=2.5.

The ZEROWEIGHT option can be used in conjunction with the FULLWEIGHT= option to adjust outliers from a monthly or quarterly series. See [Example 36.3](#) later in this chapter for an illustration of this use.

SSPAN Statement

SSPAN options ;

The SSPAN statement applies sliding spans analysis to determine the suitability of seasonal adjustment for an economic series.

The following options can appear in the SSPAN statement:

NDEC= *n*

specifies the number of decimal places shown on selected sliding span reports. This option has no effect on the precision of the variables values in the OUTSPAN output data set.

CUTOFF= *value*

gives the percentage value for determining an excessive difference within a span for the seasonal factors, the seasonally adjusted series, and month-to-month and year-to-year differences in the seasonally adjusted series. The default value is 3.0. The use of the CUTOFF=value in determining the maximum percent difference (MPD) is described in the section “[Computational Details for Sliding Spans Analysis](#)” on page 2428. Caution should be used in changing the default CUTOFF=value. The empirical threshold ranges found by the U.S. Census Bureau no longer apply when value is changed.

TDCUTOFF= *value*

gives the percentage value for determining an excessive difference within a span for the trading-day factors. The default value is 2.0. The use of the TDCUTOFF=value in determining the maximum percent difference (MPD) is described in the section “[Computational Details for Sliding Spans Analysis](#)” on page 2428. Caution should be used in changing the default TDCUTOFF=value. The empirical threshold ranges found by the U.S. Census Bureau no longer apply when the value is changed.

NOPRINT

suppresses all sliding span reports. See “[Computational Details for Sliding Spans Analysis](#)” on page 2428 for more details on sliding span reports.

PRINT

prints the summary sliding span reports S 0 through S 6.E.

PRINTALL

prints the summary sliding spans report S 0 through S 6.E, along with detail reports S 7.A through S 7.E.

TABLES Statement

TABLES *tablenames* ;

The TABLES statement prints the tables specified in addition to the tables that are printed as a result of the PRINTOUT= option in the MONTHLY or QUARTERLY statement. Table names are listed in [Table 36.4](#) later in this chapter.

To print only selected tables, omit the PRINTOUT= option in the MONTHLY or QUARTERLY statement and list the tables to be printed in the TABLES statement. For example, to print only the final seasonal factors and final seasonally adjusted series, use the statement

```
tables d10 d11;
```

VAR Statement

VAR *variables* ;

The VAR statement is used to specify the variables in the input data set that are to be analyzed by the procedure. Only numeric variables can be specified. If the VAR statement is omitted, all numeric variables are analyzed except those appearing in a BY or ID statement or the variable named in the DATE= option in the MONTHLY or QUARTERLY statement.

Details: X11 Procedure

Historical Development of X-11

This section briefly describes the historical development of the standard X-11 seasonal adjustment method and the later development of the X-11-ARIMA method. Most of the following discussion is based on a comprehensive article by Bell and Hillmer (1984), which describes the history of X-11 and the justification of using seasonal adjustment methods, such as X-11, given the current availability of time series software. For further discussions about statistical problems associated with the X-11 method, see Ghysels (1990).

Seasonal adjustment methods began to be developed in the 1920s and 1930s, before there were suitable analytic models available and before electronic computing devices were in existence. The lack of any suitable model led to methods that worked the same for any series — that is, methods that were not model-based and that could be applied to any series. Experience with economic series had shown that a given mathematical form could adequately represent a time series only for a fixed length; as more data were added, the model became inadequate. This suggested an approach that used moving averages. For further analysis of the properties of X-11 moving averages, see Cleveland and Tiao (1976).

The basic method was to break up an economic time series into long-term trend, long-term cyclical movements, seasonal movements, and irregular fluctuations.

Early investigators found that it was not possible to uniquely decompose the trend and cycle components. Thus, these two were grouped together; the resulting component is usually referred to as the “trend cycle component.”

It was also found that estimating seasonal components in the presence of trend produced biased estimates of the seasonal components, but, at the same time, estimating trend in the presence of seasonality was difficult. This eventually led to the iterative approach used in the X-11 method.

Two other problems were encountered by early investigators. First, some economic series appear to have changing or evolving seasonality. Secondly, moving averages were very sensitive to extreme values. The estimation method used in the X-11 method allows for evolving seasonal components. For the second problem, the X-11 method uses repeated adjustment of extreme values.

All of these problems encountered in the early investigation of seasonal adjustment methods suggested the use of moving averages in estimating components. Even with the use of moving averages instead of a model-based method, massive amounts of hand calculations were required. Only a small number of series could be adjusted, and little experimentation could be done to evaluate variations on the method.

With the advent of electronic computing in the 1950s, work on seasonal adjustment methods proceeded rapidly. These methods still used the framework previously described; variants of these basic methods could now be easily tested against a large number of series.

Much of the work was done by Julian Shiskin and others at the U.S. Bureau of the Census beginning in 1954 and culminating after a number of variants into the *X-11 Variant of the Census Method II Seasonal Adjustment Program*, which PROC X11 implements.

References for this work during this period include Shiskin and Eisenpress (1957), Shiskin (1958), and Marris (1961). The authoritative documentation for the X-11 Variant is in Shiskin, Young, and Musgrave (1967). This document is not equivalent to a program specification; however, the FORTRAN code that implements the X-11 Variant is in the public domain. A less detailed description of the X-11 Variant is given in U.S. Bureau of the Census (1969).

Development of the X-11-ARIMA Method

The X-11 method uses symmetric moving averages in estimating the various components. At the end of the series, however, these symmetric weights cannot be applied. Either asymmetric weights have to be used, or some method of extending the series must be found.

While various methods of extending a series have been proposed, the most important method to date has been the X-11-ARIMA method developed at Statistics Canada. This method uses Box-Jenkins ARIMA models to extend the series.

The Time Series Research and Analysis Division of Statistics Canada investigated 174 Canadian economic series and found five ARIMA models out of twelve that fit the majority of series well and reduced revisions for the most recent months. References that give details of various aspects of the X-11-ARIMA methodology include Dagum (1980, 1982a, c, 1983, 1988), Laniel (1985), Lothian and Morry (1978a), and Huot et al. (1986).

Differences between X11ARIMA/88 and PROC X11

The original implementation of the X-11-ARIMA method was by Statistics Canada in 1980 (Dagum 1980), with later changes and enhancements made in 1988 (Dagum 1988). The calculations performed by PROC X11 differ from those in X11ARIMA/88, which will result in differences in the final component estimates provided by these implementations.

There are three areas where Statistics Canada made changes to the original X-11 seasonal adjustment method in developing X11ARIMA/80 (Monsell 1984). These are (a) selection of extreme values, (b) replacement of extreme values, and (c) generation of seasonal and trend cycle weights.

These changes have not been implemented in the current version of PROC X11. Thus the procedure produces results identical to those from previous versions of PROC X11 in the absence of an ARIMA statement.

Additional differences can result from the ARIMA estimation. X11ARIMA/88 uses conditional least squares (CLS), while CLS, unconditional least squares (ULS) and maximum likelihood (ML) are all available in PROC X11 by using the METHOD= option in the ARIMA statement. Generally, parameters estimates will differ for the different methods.

Implementation of the X-11 Seasonal Adjustment Method

The following steps describe the analysis of a monthly time series using multiplicative seasonal adjustment. Additional steps used by the X-11-ARIMA method are also indicated. Equivalent descriptions apply for an additive model if you replace *divide* with *subtract* where applicable.

In the multiplicative adjustment, the original series O_t is assumed to be of the form

$$O_t = C_t S_t I_t P_t D_t$$

where C_t is the trend cycle component, S_t is the seasonal component, I_t is the irregular component, P_t is the prior monthly factors component, and D_t is the trading-day component.

The trading-day component can be further factored as

$$D_t = D_{r,t} D_{tr,t},$$

where $D_{tr,t}$ are the trading-day factors derived from the prior daily weights, and $D_{r,t}$ are the residual trading-day factors estimated from the trading-day regression. For further information about estimating trading day variation, see Young (1965).

Additional Steps When Using the X-11-ARIMA Method

The X-11-ARIMA method consists of extending a given series by an ARIMA model and applying the usual X-11 seasonal adjustment method to this extended series. Thus in the simplest case in which there are no prior factors or calendar effects in the series, the ARIMA model selection, estimation, and forecasting are performed first, and the resulting extended series goes through the standard X-11 steps described in the next section.

If prior factor or calendar effects are present, they must be eliminated from the series before the ARIMA estimation is done because these effects are not stochastic.

Prior factors, if present, are removed first. Calendar effects represented by prior daily weights are then removed. If there are no further calendar effects, the adjusted series is extended by the ARIMA model, and this extended series goes through the standard X-11 steps without repeating the removal of prior factors and calendar effects from prior daily weights.

If further calendar effects are present, a trading-day regression must be performed. In this case it is necessary to go through an initial pass of the X-11 steps to obtain a final trading-day adjustment. In this initial pass, the series, adjusted for prior factors and prior daily weights, goes through the standard X-11 steps. At the conclusion of these steps, a final series adjusted for prior factors and all calendar effects is available. This adjusted series is then extended by the ARIMA model, and this extended series goes through the standard X-11 steps again, without repeating the removal of prior factors and calendar effects from prior daily weights and trading-day regression.

The Standard X-11 Seasonal Adjustment Method

The standard X-11 seasonal adjustment method consists of the following steps. These steps are applied to the original data or the original data extended by an ARIMA model.

1. In step 1, the data are read, ignoring missing values until the first nonmissing value is found. If prior monthly factors are present, the procedure reads prior monthly P_t factors and divides them into the original series to obtain $O_t/P_t = C_t S_t I_t D_{tr,t} D_{r,t}$.

Seven daily weights can be specified to develop monthly factors to adjust the series for trading-day variation, $D_{tr,t}$; these factors are then divided into the original or prior adjusted series to obtain $C_t S_t I_t D_{r,t}$.

2. In steps 2, 3, and 4, three iterations are performed, each of which provides estimates of the seasonal S_t , trading-day $D_{r,t}$, trend cycle C_t , and irregular components I_t . Each iteration refines estimates of the extreme values in the irregular components. After extreme values are identified and modified, final estimates of the seasonal component, seasonally adjusted series, trend cycle, and irregular components are produced. Step 2 consists of three substeps:

- a) During the first iteration, a centered, 12-term moving average is applied to the original series O_t to provide a preliminary estimate \hat{C}_t of the trend cycle curve C_t . This moving average combines 13 (a 2-term moving average of a 12-term moving average) consecutive monthly values, removing the S_t and I_t . Next, it obtains a preliminary estimate $\widehat{S_t I_t}$ by

$$\widehat{S_t I_t} = \frac{O_t}{\hat{C}_t}$$

- b) A moving average is then applied to the $\widehat{S}_t \widehat{I}_t$ to obtain an estimate \hat{S}_t of the seasonal factors. $\widehat{S}_t \widehat{I}_t$ is then divided by this estimate to obtain an estimate \hat{I}_t of the irregular component. Next, a moving standard deviation is calculated from the irregular component and is used in assigning a weight to each monthly value for measuring its degree of extremeness. These weights are used to modify extreme values in $\widehat{S}_t \widehat{I}_t$. New seasonal factors are estimated by applying a moving average to the modified value of $\widehat{S}_t \widehat{I}_t$. A preliminary seasonally adjusted series is obtained by dividing the original series by these new seasonal factors. A second estimate of the trend cycle is obtained by applying a weighted moving average to this seasonally adjusted series.
 - c) The same process is used to obtain second estimates of the seasonally adjusted series and improved estimates of the irregular component. This irregular component is again modified for extreme values and then used to provide estimates of trading-day factors and refined weights for the identification of extreme values.
3. Using the same computations, a second iteration is performed on the original series that has been adjusted by the trading-day factors and irregular weights developed in the first iteration. The second iteration produces final estimates of the trading-day factors and irregular weights.
4. A third and final iteration is performed using the original series that has been adjusted for trading-day factors and irregular weights computed during the second iteration. During the third iteration, PROC X11 develops final estimates of seasonal factors, the seasonally adjusted series, the trend cycle, and the irregular components. The procedure computes summary measures of variation and produces a moving average of the final adjusted series.

Sliding Spans Analysis

The motivation for sliding spans analysis is to answer the question, When is a economic series unsuitable for seasonal adjustment? There have been a number of past attempts to answer this question: stable seasonality F test; moving seasonality F test, Q statistics, and others.

Sliding spans analysis attempts to quantify the stability of the seasonal adjustment process, and hence quantify the suitability of seasonal adjustment for a given series.

It is based on a very simple idea: for a stable series, deleting a small number of observations should not result in greatly different component estimates compared with the original, full series. Conversely, if deleting a small number of observations results in drastically different estimates, the series is unstable. For example, a drastic difference in the seasonal factors (Table D10) might result from a dominating irregular component or sudden changes in the seasonally component. When the seasonal component estimates of a series is unstable in this manner, they have little meaning and the series is likely to be unsuitable for seasonal adjustment.

Sliding spans analysis, developed at the Statistical Research Division of the U.S. Census Bureau (Findley et al. 1990; Findley and Monsell 1986), performs a repeated seasonal adjustment on subsets or spans of the full series. In particular, an initial span of the data, typically eight years in length, is seasonally adjusted, and the Tables C18, the trading-day factors (if trading-day regression performed), D10, the seasonal factors, and D11, the seasonally adjusted series are retained for further processing. Next, one year of data is deleted from the beginning of the initial span and one year of data is added. This new span is seasonally adjusted as before, with the same tables retained. This process continues until the end of the data is reached. The beginning and ending dates of the spans are such that the last observation in the original data is also the last observation in the last span. This is discussed in more detail in the following paragraphs.

The following notation for the components or differences computed in the sliding spans analysis follows Findley et al. (1990). The meaning for the symbol $X_t(k)$ is component X in month (or quarter) t , computed from data in the k th span. These components are now defined.

- Seasonal Factors (Table D10): $S_t(k)$
- Trading-Day Factors (Table C18): $TD_t(k)$
- Seasonally Adjusted Data (Table D11): $SA_t(k)$
- Month-to-Month Changes in the Seasonally Adjusted Data: $MM_t(k)$
- Year-to-Year Changes in the Seasonally Adjusted Data: $YY_t(k)$

The key measure is the maximum percent difference across spans. For example, consider a series that begins in January 1972, ends in December 1984, and has four spans, each of length 8 years (see Figure 1 in Findley et al. (1990), p. 346). Consider $S_t(k)$ the seasonal factor (Table D10) for month t for span k , and let N_t denote the number of spans containing month t ; that is,

$$N_t = \{k : \text{span } k \text{ contains month } t\}$$

In the middle years of the series there is overlap of all four spans, and N_t will be 4. The last year of the series will have only one span, while the beginning can have 1 or 0 spans depending on the original length.

Since we are interested in how much the seasonal factors vary for a given month across the spans, a natural quantity to consider is

$$\max_{k \in N_t} S_t(k) - \min_{k \in N_t} S_t(k)$$

In the case of the multiplicative model, it is useful to compute a percentage difference; define the maximum percentage difference (MPD) at time t as

$$MPD_t = \frac{\max_{k \in N_t} S_t(k) - \min_{k \in N_t} S_t(k)}{\min_{k \in N_t} S_t(k)}$$

The seasonal factor for month t is then unreliable if MPD_t is large. While no exact significance level can be computed for this statistic, empirical levels have been established by considering over 500 economic series (Findley et al. 1990; Findley and Monsell 1986). For these series it was found that for four spans, stable series typically had less than 15% of the MPD values exceeding 3.0%, while in marginally stable series, between 15% and 25% of the MPD values exceeded 3.0%. A series in which 25% or more of the MPD values exceeded 3.0% is almost always unstable.

While these empirical values cannot be considered an exact significance level, they provide a useful empirical basis for deciding if a series is suitable for seasonal adjustment. These percentage values are shifted down when fewer than four spans are used.

Computational Details for Sliding Spans Analysis

Length and Number of Spans

The algorithm for determining the length and number of spans for a given series was developed at the U.S. Bureau of the Census, Statistical Research Division. A summary of this algorithm is as follows.

First, an initial length based on the MACURVE *month=option* specification is determined, and then the maximum number of spans possible using this length is determined. If this maximum number exceeds four, set the number of spans to four. If this maximum number is one or zero, there are not enough observations to perform the sliding spans analysis. In this case a note is written to the log and the sliding spans analysis is skipped for this variable.

If the maximum number of spans is two or three, the actual number of spans used is set equal to this maximum. Finally, the length is adjusted so that the spans begin in January (or the first quarter) of the beginning year of the span.

The remainder of this section gives the computation formulas for the maximum percentage difference (MPD) calculations along with the threshold regions.

Seasonal Factors (Table D10)

For the additive model, the MPD is defined as

$$\max_{k \in N_t} S_t(k) - \min_{k \in N_t} S_t(k)$$

For the multiplicative model, the MPD is

$$MPD_t = \frac{\max_{k \in N_t} S_t(k) - \min_{k \in N_t} S_t(k)}{\min_{k \in N_t} S_t(k)}$$

A series for which less than 15% of the MPD values of D10 exceed 3.0% is stable; between 15% and 25% is marginally stable; and greater than 25% is unstable. Span reports S 2.A through S 2.C give the various breakdowns for the number of times the MPD exceeded these levels.

Trading Day Factor (Table C18)

For the additive model, the MPD is defined as

$$\max_{k \in N_t} TD_t(k) - \min_{k \in N_t} TD_t(k)$$

For the multiplicative model, the MPD is

$$MPD_t = \frac{\max_{k \in N_t} TD_t(k) - \min_{k \in N_t} TD_t(k)}{\min_{k \in N_t} TD_t(k)}$$

The U.S. Census Bureau currently gives no recommendation concerning MPD thresholds for the trading-day factors. Span reports S 3.A through S 3.C give the various breakdowns for MPD thresholds. When TDREGR=NONE is specified, no trading-day computations are done, and this table is skipped.

Seasonally Adjusted Data (Table D11)

For the additive model, the MPD is defined as

$$\max_{k \in N_t} SA_t(k) - \min_{k \in N_t} SA_t(k)$$

For the multiplicative model, the MPD is

$$MPD_t = \frac{\max_{k \in N_t} SA_t(k) - \min_{k \in N_t} SA_t(k)}{\min_{k \in N_t} SA_t(k)}$$

A series for which less than 15% of the MPD values of D11 exceed 3.0% is stable; between 15% and 25% is marginally stable; and greater than 25% is unstable. Span reports S 4.A through S 4.C give the various breakdowns for the number of times the MPD exceeded these levels.

Month-to-Month Changes in the Seasonally Adjusted Data

Some additional notation is needed for the month-to-month and year-to-year differences. Define $N1_t$ as

$$N1_t = \{k : \text{span } k \text{ contains month } t \text{ and } t-1\}$$

For the additive model, the month-to-month change for span k is defined as

$$MM_t(k) = SA_t - SA_{t-1}$$

while for the multiplicative model

$$MM_t(k) = \frac{SA_t - SA_{t-1}}{SA_{t-1}}$$

Since this quantity is already in percentage form, the MPD for both the additive and multiplicative model is defined as

$$MPD_t = \max_{k \in N1_t} MM_t(k) - \min_{k \in N1_t} MM_t(k)$$

The current recommendation of the U.S. Census Bureau is that if 35% or more of the MPD values of the month-to-month differences of D11 exceed 3.0%, then the series is usually not stable; 40% exceeding this level clearly marks an unstable series. Span reports S 5.A.1 through S 5.C give the various breakdowns for the number of times the MPD exceeds these levels.

Year-to-Year Changes in the Seasonally Adjusted Data

First define $N12_t$ as

$$N12_t = \{k : \text{span } k \text{ contains month } t \text{ and } t - 12\}$$

(Appropriate changes in notation for a quarterly series are obvious.)

For the additive model, the month-to-month change for span k is defined as

$$YY_t(k) = SA_t - SA_{t-12}$$

while for the multiplicative model

$$YY_t(k) = \frac{SA_t - SA_{t-12}}{SA_{t-12}}$$

Since this quantity is already in percentage form, the MPD for both the additive and multiplicative model is defined as

$$MPD_t = \max_{k \in N1_t} YY_t(k) - \min_{k \in N1_t} YY_t(k)$$

The current recommendation of the U.S. Census Bureau is that if 10% or more of the MPD values of the month-to-month differences of D11 exceed 3.0%, then the series is usually not stable. Span reports S 6.A through S 6.C give the various breakdowns for the number of times the MPD exceeds these levels.

Data Requirements

The input data set must contain either quarterly or monthly time series, and the data must be in chronological order. For the standard X-11 method, there must be at least three years of observations (12 for quarterly time series or 36 for monthly) in the input data sets or in each BY group in the input data set if a BY statement is used.

For the X-11-ARIMA method, there must be at least five years of observations (20 for quarterly time series or 60 for monthly) in the input data sets or in each BY group in the input data set if a BY statement is used.

Missing Values

Missing values at the beginning of a series to be adjusted are skipped. Processing starts with the first nonmissing value and continues until the end of the series or until another missing value is found.

Missing values are not allowed for the DATE= variable. The procedure terminates if missing values are found for this variable.

Missing values found in the PMFACTOR= variable are replaced by 100 for the multiplicative model (default) and by 0 for the additive model.

Missing values can occur in the output data set. If the time series specified in the OUTPUT statement is not computed by the procedure, the values of the corresponding variable are missing. If the time series specified in the OUTPUT statement is a moving average, the values of the corresponding variable are missing for the first n and last n observations, where n depends on the length of the moving average. Additionally, if the time series specified is an irregular component modified for extremes, only the modified values are given, and the remaining values are missing.

Prior Daily Weights and Trading-Day Regression

Suppose that a detailed examination of retail sales at ZXY Company indicates that certain days of the week have higher amounts of sales. In particular, Thursday, Friday, and Saturday have approximately twice the amount of sales as Monday, Tuesday, and Wednesday, and no sales occur on Sunday. This means that months with five Saturdays would have higher amounts of sales than months with only four Saturdays.

This phenomenon is called a calendar effect; it can be handled in PROC X11 by using the PDWEIGHTS (prior daily weights) statement or the TDREGR=option (trading-day regression). The PDWEIGHTS statement and the TDREGR=option can be used separately or together.

If the relative weights are known (as in the preceding) it is appropriate to use the PDWEIGHTS statement. If further residual calendar variation is present, TDREGR=ADJUST should also be used. If you know that a calendar effect is present, but know nothing about the relative weights, use TDREGR=ADJUST without a PDWEIGHTS statement.

In this example, it is assumed that the calendar variation is due to both prior daily weights and residual variation. Thus both a PDWEIGHTS statement and TDREGR=ADJUST are specified.

Note that only the relative weights are needed; in the actual computations, PROC X11 normalizes the weights to sum to 7.0. If a day of the week is not present in the PDWEIGHTS statement, it is given a value of zero. Thus “sun=0” is not needed.

```
proc x11 data=sales;
    monthly date=date tdregr=adjust;
    var sales;
    tables a1 a4 b15 b16 c14 c15 c18 d11;
    pdweights mon=1 tue=1 wed=1 thu=2 fri=2 sat=2;
    output out=x11out a1=a1 a4=a4 b1=b1 c14=c14
                c16=c16 c18=c18 d11=d11;
run;
```

Tables of interest include A1, A4, B15, B16, C14, C15, C18, and D11. Table A4 contains the adjustment factors derived from the prior daily weights; Table C14 contains the extreme irregular values excluded from trading-day regression; Table C15 contains the trading-day-regression results; Table C16 contains the monthly factors derived from the trading-day regression; and Table C18 contains the final trading-day factors derived from the combined daily weights. Finally, Table D11 contains the final seasonally adjusted series.

Adjustment for Prior Factors

Suppose now that a strike at ZXY Company during July and August of 1988 caused sales to decrease an estimated 50%. Since this is a one-time event with a known cause, it is appropriate to prior adjust the data to reflect the effects of the strike. This is done in PROC X11 through the use of `PMFACTOR=varname` (prior monthly factor) in the `MONTHLY` statement.

In the following example, the `PMFACTOR` variable is named `PMF`. Since the estimate of the decrease in sales is 50%, `PMF` has a value of 50.0 for the observations corresponding to July and August 1988, and a value of 100.0 for the remaining observations.

This prior adjustment on `SALES` is performed by replacing `SALES` with the calculated value $(\text{SALES}/\text{PMF}) * 100.0$. A value of 100.0 for `PMF` leaves `SALES` unchanged, while a value of 50.0 for `PMF` doubles `SALES`. This value is the estimate of what `SALES` would have been without the strike. The following example shows how this prior adjustment is accomplished.

```
data sales2;
  set sales;
  if '01jul1988'd <= date <= '01aug1988'd then pmf = 50;
  else pmf = 100;
run;

proc x11 data=sales2;
  monthly date=date pmfactor=pmf;
  var sales;
  tables a1 a2 a3 d11;
  output out=x11out a1=a1 a2=a2 a3=a3 d11=d11;
run;
```

Table A2 contains the prior monthly factors (the values of `PMF`), and Table A3 contains the prior adjusted series.

The YRAHEADOUT Option

For monthly data, the `YRAHEADOUT` option affects only Tables C16 (regression trading-day adjustment factors), C18 (trading-day factors from combined daily weights), and D10 (seasonal factors). For quarterly data, only Table D10 is affected. Variables for all other tables have missing values for the forecast observations. The forecast values for a table are included only if that table is specified in the `OUTPUT` statement.

Tables C16 and C18 are calendar effects that are extrapolated by calendar composition. These factors are independent of the data once trading-day weights have been calculated. Table D10 is extrapolated by a linear combination of past values. If N is the total number of nonmissing observations for the analysis variable, this linear combination is given by

$$D10_t = \frac{1}{2}(3 \times D10_{t-12} - D10_{t-24}), \quad t = N + 1, \dots, N + 12$$

If the input data are monthly time series, 12 extra observations are added to the end of the output data set. (If a BY statement is used, 12 extra observations are added to the end of each BY group.) If the input data are a quarterly time series, four extra observations are added to the end of the output data set. (If a BY statement is used, four extra observations are added to each BY group.)

The DATE= variable (or _DATE_) is extrapolated for the extra observations generated by the YRAHEAD-OUT option, while all other ID variables will have missing values.

If ARIMA processing is requested, and if both the OUTEXTRAP and YRAHEADOUT options are specified in the PROC X11 statement, an additional 12 (or 4) observations are added to the end of output data set for monthly (or quarterly) data after the ARIMA forecasts, using the same linear combination of past values as before.

Effect of Backcast and Forecast Length

Based on a number of empirical studies (Dagum 1982a, b, c; Dagum and Laniel 1987), one year of forecasts minimize revisions when new data become available. Two and three years of forecasts show only small gains.

Backcasting improves seasonal adjustment but introduces permanent revisions at the beginning of the series and also at the end for series of length 8, 9, or 10 years. For series shorter than 7 years, the advantages of backcasting outweigh the disadvantages (Dagum 1988).

Other studies (Pierce 1980; Bobbit and Otto 1990; Buszuwski 1987) suggest “full forecasting”—that is, using enough forecasts to allow symmetric weights for the seasonal moving averages for the most current data. For example, if a 3×9 seasonal moving average was specified for one or more months by using the MACURVES statement, five years of forecasts would be required. This is because the seasonal moving averages are performed on calendar months separately, and the 3×9 is an 11-term centered moving average, requiring five observations before and after the current observation. Thus

```
macurves dec='3x9';
```

would require five additional December values to compute the seasonal moving average.

Details of Model Selection

If an ARIMA statement is present but no MODEL= is given, PROC X11 estimates and forecasts five predefined models and selects the best. This section describes the details of the selection criteria and the selection process.

The five predefined models used by PROC X11 are the same as those used by X11ARIMA/88 from Statistics Canada. These particular models, shown in Table 36.2, were chosen on the basis of testing a large number of economics series (Dagum 1988) and should provide reasonable forecasts for most economic series.

Table 36.2 Five Predefined Models

Model #	Specification	Multiplicative	Additive
1	(0,1,1)(0,1,1)s	log transform	no transform
2	(0,1,2)(0,1,1)s	log transform	no transform
3	(2,1,0)(0,1,1)s	log transform	no transform
4	(0,2,2)(0,1,1)s	log transform	no transform
5	(2,1,2)(0,1,1)s	no transform	no transform

The selection process proceeds as follows. The five models are estimated and one-step-ahead forecasts are produced in the order shown in Table 36.2. As each model is estimated, the following three criteria are checked:

- The mean absolute percent error (MAPE) for the last three years of the series must be less than 15%.
- The significance probability for the Box-Ljung chi-square for up to lag 24 for monthly (8 for quarterly) must greater than 0.05.
- The over-differencing criteria must not exceed 0.9.

The descriptions of these three criteria are given in the section “[Criteria Details](#)” on page 2435. The default values for these criteria are those used by X11ARIMA/88 from Statistics Canada; these defaults can be changed by the MAPECR=, CHICR=, and OVDIFCR= options.

A model that fails any one of these three criteria is excluded from further consideration. In addition, if the ARIMA estimation fails for a given model, a warning is issued, and the model is excluded. The final set of all models considered consists of those that pass all three criteria and are estimated successfully. From this set, the model with the smallest MAPE for the last three years is chosen.

If all five models fail, ARIMA processing is skipped for the variable being processed, and the standard X-11 seasonal adjustment is performed. A note is written to the log with this information.

The chosen model is then used to forecast the series one or more years (determined by the FORECAST= option in the ARIMA statement). These forecasts are appended to the original data (or the prior and calendar-adjusted data).

If a BACKCAST= option is specified, the chosen model form is used, but the parameters are reestimated using the reversed series. Using these parameters, the reversed series is forecast for the number of years specified by the BACKCAST= option. These forecasts are then reversed and appended to the beginning of the original series, or the prior and calendar-adjusted series, to produce the backcasts.

Note that the final selection rule (the smallest MAPE using the last three years) emphasizes the quality of the forecasts at the end of the series. This is consistent with the purpose of the X-11-ARIMA methodology, which is to improve the estimates of seasonal factors and thus minimize revisions to recent past data as new data become available.

Criteria Details

Mean Absolute Percent Error (MAPE)

For the MAPE criteria testing, only the last three years of the original series (or prior and calendar adjusted series) is used in computing the MAPE.

Let y_t , $t = 1, \dots, n$, be the last three years of the series, and denote its one-step-ahead forecast by \hat{y}_t , where $n = 36$ for a monthly series and $n = 12$ for a quarterly series.

With this notation, the MAPE criteria are computed as

$$MAPE = \frac{100}{n} \sum_{t=1}^n \frac{|y_t - \hat{y}_t|}{|y_t|}$$

Box-Ljung Chi-Square

The Box-Ljung chi-square is a lack-of-fit test based on the model residuals. This test statistic is computed using the Ljung-Box formula

$$\chi_m^2 = n(n+2) \sum_{k=1}^m \frac{r_k^2}{(n-k)}$$

where n is the number of residuals that can be computed for the time series, and

$$r_k = \frac{\sum_{t=1}^{n-k} a_t a_{t+k}}{\sum_{t=1}^n a_t^2}$$

where the a_t 's are the residual sequence. This formula has been suggested by Ljung and Box (1978) as yielding a better fit to the asymptotic chi-square distribution. Some simulation studies of the finite sample properties of this statistic are given by Davies, Triggs, and Newbold (1977) and by Ljung and Box (1978).

For monthly series, $m = 24$, while for quarterly series, $m = 8$.

Over-Differencing Test

From Table 36.2 you can see that all models have a single seasonal MA factor and at most two nonseasonal MA factors. Also, all models have seasonal and nonseasonal differencing. Consider model 2 applied to a monthly series y_t with $E(y_t) = \mu$:

$$(1 - B^1)(1 - B^{12})(y_t - \mu) = (1 - \theta_1 B - \theta_2 B^2)(1 - \theta_3 B^{12})a_t$$

If $\theta_3 = 1.0$, then the factors $(1 - \theta_3 B^{12})$ and $(1 - B^{12})$ will cancel, resulting in a lower-order model.

Similarly, if $\theta_1 + \theta_2 = 1.0$,

$$(1 - \theta_1 B - \theta_2 B^2) = (1 - B)(1 - \alpha B)$$

for some $\alpha \neq 0.0$. Again, this results in cancellation and a lower-order model.

Since the parameters are not exact, it is not reasonable to require that

$$\theta_3 < 1.0 \text{ and } \theta_1 + \theta_2 < 1.0$$

Instead, an approximate test is performed by requiring that

$$\theta_3 \leq 0.9 \text{ and } \theta_1 + \theta_2 \leq 0.9$$

The default value of 0.9 can be changed by the OVDIFCR= option. Similar reasoning applies to the other models.

ARIMA Statement Options for the Five Predefined Models

Table 36.3 lists the five predefined models and gives the equivalent MODEL= parameters in a PROC X11 ARIMA statement.

In all models except the fifth, a log transformation is performed before the ARIMA estimation for the multiplicative case; no transformation is performed for the additive case. For the fifth model, no transformation is done for either case.

The multiplicative case is assumed in the following table. The indicated seasonality s in the specification is either 12 (monthly) or 4 (quarterly). The MODEL statement assumes a monthly series.

Table 36.3 ARIMA Statements Options for Predefined Models

Model	ARIMA Statement Options
(0,1,1)(0,1,1) s	MODEL=(Q=1 SQ=1 DIF=1 SDIF=1) TRANSFORM=LOG
(0,1,2)(0,1,1) s	MODEL=(Q=2 SQ=1 DIF=1 SDIF=1) TRANSFORM=LOG
(2,1,0)(0,1,1) s	MODEL=(P=2 SQ=1 DIF=1 SDIF=1) TRANSFORM=LOG
(0,2,2)(0,1,1) s	MODEL=(Q=2 SQ=1 DIF=2 SDIF=1) TRANSFORM=LOG
(2,1,2)(0,1,1) s	MODEL=(P=2 Q=2 SQ=1 DIF=1 SDIF=1)

OUT= Data Set

The OUT= data set specified in the OUTPUT statement contains the BY variables, if any; the ID variables, if any; and the DATE= variable if the DATE= option is given, or _DATE_ if the DATE= option is not specified.

In addition, the variables specified by the option

tablename =var1 var2 ... varn

are placed in the OUT= data set. A list of tables available for monthly and quarterly series is given later, in Table 36.4.

The OUTSPAN= Data Set

The OUTSPAN= option is specified in the PROC statement, and writes the sliding spans results to the specified output data set. The OUTSPAN= data set contains the following variables:

- A1, a numeric variable that is a copy of the original series truncated to the current span. Note that overlapping spans will contain identical values for this variable.
- C18, a numeric variable that contains the trading-day factors for the seasonal adjustment for the current span
- D10, a numeric variable that contains the seasonal factors for the seasonal adjustment for the current span
- D11, a numeric variable that contains the seasonally adjusted series for the current span
- DATE, a numeric variable that contains the date within the current span
- SPAN, a numeric variable that contains the current span. The first span is the earliest span—that is the one with the earliest starting date.
- VARNAME, a character variable containing the name of each variable in the VAR list. A separate sliding spans analysis is performed on each variable in the VAR list.

OUTSTB= Data Set

The output data set produced by the OUTSTB= option of the PROC X11 statement contains the information in the analysis of variance on table D8 (Final Unmodified S-I Ratios). This analysis of variance, following table D8 in the printed output, tests for stable seasonality (Shiskin, Young, and Musgrave 1967, Appendix A). These data contain the following variables:

- VARNAME, a character variable containing the name of each variable in the VAR list
- TABLE, a character variable specifying the table from which the analysis of variance is performed. When ARIMA processing is requested, and two passes of X11 are required (when TDREGR=PRINT, TEST, or ADJUST), Table D8 and the stable seasonality test are computed twice: once in the initial pass, then again in the final pass. Both of these computations are put in the OUTSTB data set and are identified by D18.1 and D18.2, respectively.
- SOURCE, a character variable corresponding to the “source” column in the analysis of variance table following Table D8
- SS, a numeric variable containing the sum of squares associated with the corresponding source term
- DF, a numeric variable containing the degrees of freedom associated with the corresponding source term
- MS, a numeric variable containing the mean square associated with the corresponding source term. MS is missing for the source term “Total”
- F, a numeric variable containing the F statistic for the “Between” source term. F is missing for all other source terms.
- PROBF, a numeric variable containing the significance level for the F statistic. PROBF is missing for the source terms “Total” and “Error.”

OUTTDR= Data Set

The trading-day regression results (tables B15 and C15) are written to the OUTTDR= data set, which contains the following variables:

- VARNAME, a character variable containing the name of the VAR variable being processed
- TABLE, a character variable containing the name of the table. It can have only the value B15 (Preliminary Trading-Day Regression) or C15 (Final Trading-Day Regression).
- _TYPE_, a character variable whose value distinguishes the three distinct table format types. These types are (a) the regression, (b) the listing of the standard error associated with length-of-month, and (c) the analysis of variance. The first seven observations in the OUTTDR data set correspond to the

regression on days of the week; thus the `_TYPE_` variable is given the value “REGRESS” (day-of-week regression coefficient). The next four observations correspond to 31-, 30-, 29-, and 28-day months and are given the value `_TYPE_=LOM_STD` (length-of-month standard errors). Finally, the last three observations correspond to the analysis of variance table, and `_TYPE_=ANOVA`.

- `PARM`, a character variable, further identifying the nature of the observation. `PARM` is set to blank for the three `_TYPE_=ANOVA` observations.
- `SOURCE`, a character variable containing the source in the regression. This variable is missing for all `_TYPE_=REGRESS` and `LOM_STD`.
- `CWGT`, a numeric variable containing the combined trading-day weight (prior weight + weight found from regression). The variable is missing for all `_TYPE_=LOM_STD` and `_TYPE_=ANOVA`.
- `PRWGT`, a numeric variable containing the prior weight. The prior weight is 1.0 if `PDWEIGHTS` are not specified. This variable is missing for all `_TYPE_=LOM_STD` and `_TYPE_=ANOVA`.
- `COEFF`, a numeric variable containing the calculated regression coefficient for the given day. This variable is missing for all `_TYPE_=LOM_STD` and `_TYPE_=ANOVA`.
- `STDERR`, a numeric variable containing the standard errors. For observations with `_TYPE_=REGRESS`, this is the standard error corresponding to the regression coefficient. For observations with `_TYPE_=LOM_STD`, this is standard error for the corresponding length-of-month. This variable is missing for all `_TYPE_=ANOVA`.
- `T1`, a numeric variable containing the t statistic corresponding to the test that the combined weight is different from the prior weight. This variable is missing for all `_TYPE_=LOM_STD` and `_TYPE_=ANOVA`.
- `T2`, a numeric variable containing the t statistic corresponding to the test that the combined weight is different from 1.0. This variable is missing for all `_TYPE_=LOM_STD` and `_TYPE_=ANOVA`.
- `PROBT1`, a numeric variable containing the significance level for t statistic `T1`. The variable is missing for all `_TYPE_=LOM_STD` and `_TYPE_=ANOVA`.
- `PROBT2`, a numeric variable containing the significance level for t statistic `T2`. The variable is missing for all `_TYPE_=LOM_STD` and `_TYPE_=ANOVA`.
- `SS`, a numeric variable containing the sum of squares associated with the corresponding source term. This variable is missing for all `_TYPE_=REGRESS` and `LOM_STD`.
- `DF`, a numeric variable containing the degrees of freedom associated with the corresponding source term. This variable is missing for all `_TYPE_=REGRESS` and `LOM_STD`.
- `MS`, a numeric variable containing the mean square associated with the corresponding source term. This variable is missing for the source term ‘Total’ and for all `_TYPE_=REGRESS` and `LOM_STD`.
- `F`, a numeric variable containing the F statistic for the ‘Regression’ source term. The variable is missing for the source terms ‘Total’ and ‘Error’, and for all `_TYPE_=REGRESS` and `LOM_STD`.
- `PROBF`, a numeric variable containing the significance level for the F statistic. This variable is missing for the source term ‘Total’ and ‘Error’ and for all `_TYPE_=REGRESS` and `LOM_STD`.

Printed Output

The output from PROC X11, both printed tables and the series written to the OUT= data set, depends on whether the data are monthly or quarterly. For the printed tables, the output depends further on the value of the PRINTOUT= option and the TABLE statement, along with other options specified.

The printed output is organized into tables identified by a part letter and a sequence number within the part. The seven major parts of the X11 procedure are as follows:

A	prior adjustments (optional)
B	preliminary estimates of irregular component weights and regression trading-day factors
C	final estimates of irregular component weights and regression trading-day factors
D	final estimates of seasonal, trend cycle, and irregular components
E	analytical tables
F	summary measures
G	charts

Table 36.4 describes the individual tables and charts. Most tables apply both to quarterly and monthly series. Those that apply only to a monthly time series are indicated by an “M” in the notes section, while “P” indicates the table is not a time series, and is only printed, not output to the OUT= data set.

Table 36.4 Table Names and Descriptions

Table	Description	Notes
A1	original series	M
A2	prior monthly adjustment factors	M
A3	original series adjusted for prior monthly factors	M

G1	chart of final seasonally adjusted series and trend cycle	P
G2	chart of S-I ratios with extremes, S-I ratios without extremes, and final seasonal factors	P
G3	chart of S-I ratios with extremes, S-I ratios without extremes, and final seasonal factors in calendar order	P
G4	chart of final irregular and final modified irregular series	P

The PRINTOUT= Option

The PRINTOUT= option controls printing for groups of tables. See the “[TABLES Statement](#)” on page 2422 for details on specifying individual tables. The following list gives the tables printed for each value of the PRINTOUT= option:

STANDARD (26 tables)	A1–A4, B1, C13–C19, D8–D13, E1–E6, F1, F2
LONG (40 tables)	A1–A5, A13–A15, B1, B2, B7, B10, B13–B15, C1, C7, C10, C13–C19, D1, D7–D11, D13, E1–E6, F1, F2
FULL (62 tables)	A1–A5, A13–A15, B1–B11, B13–B19, C1–C11, C13–C19, D1, D2, D4–D12, E1–E6, F1, F2

The actual number of tables printed depends on the options and statements specified. If a table is not computed, it is not printed. For example, if TDREGR=NONE is specified, none of the tables associated with the trading-day are printed.

The CHARTS= Option

Of the four charts listed in [Table 36.4](#), G1 and G2 are printed by default (CHARTS=STANDARD). Charts G3 and G4 are printed when CHARTS=FULL is specified. See the “[TABLES Statement](#)” on page 2422 for details on specifying individual charts.

Stable, Moving, and Combined Seasonality Tests on the Final Unmodified SI Ratios (Table D8)

PROC X11 displays four tests used to identify stable seasonality and moving seasonality and to measure identifiable seasonality. These tests are displayed after Table D8. They are “Stable Seasonality Test,” “Moving Seasonality Test,” “Nonparametric Test for the Presence of Seasonality Assuming Stability,” and “Summary of Results and Combined Test for the Presence of Identifiable Seasonality.” The motivation, interpretation, and statistical details of all these tests are now given.

Motivation

The seasonal component of this time series, S_t , is defined as the intrayear variation that is repeated constantly (stable) or in an evolving fashion from year to year (moving seasonality). If the increase in the seasonal factors from year to year is too large, then the seasonal factors will introduce distortion into the model. It is important to determine if seasonality is identifiable without distorting the series.

To determine if stable seasonality is present in a series, PROC X11 computes a one-way analysis of variance by using the seasons (months or quarters) as the factor on the Final Unmodified SI Ratios (Table D8). This is the appropriate table to use because the removal of the trend cycle is equivalent to detrending. PROC X11 prints this test, labeled “Stable Seasonality Test,” immediately after the Table D8.

The X11 seasonal adjustment method tests for moving seasonality. Moving seasonality can be a source of distortion when seasonal factors are used in the model. PROC X11 computes and prints a test for moving seasonality. The test is a two-way analysis of variance that uses months (or quarters) and years. As in the “Stable Seasonality Test,” this analysis of variance is performed on the Final Unmodified SI Ratios (Table D8). PROC X11 prints this test, labeled “Moving Seasonality Test,” after the “Stable Seasonality Test.”

PROC X11 next computes a nonparametric Kruskal-Wallis chi-squared test for stable seasonality, “Nonparametric Test for the Presence of Seasonality Assuming Stability.” The Kruskal-Wallis test is performed on the ranks of the Final Unmodified SI Ratios (Table D8). For further details about the Kruskal-Wallis test, see Lehmann (1998, pp. 204–210).

The results of the preceding three tests are combined into a joint test to measure identifiable seasonality, “Summary of Results and Combined Test for the Presence of Identifiable Seasonality.” This test combines the two F tests previously described, along with the Kruskal-Wallis chi-squared test for stable seasonality, to determine “identifiable” seasonality. This test is printed after “Nonparametric Test for the Presence of Seasonality Assuming Stability.”

Interpretation and Statistical Details

The “Stable Seasonality Test” is a one-way analysis of variance on the “Final Unmodified SI Ratios” with seasons (months or quarters) as the factor.

To determine whether stable seasonality is present in a series, PROC X11 computes a one-way analysis of variance by using the seasons (months or quarters) as the factor on the Final Unmodified SI Ratios (Table D8). This is the appropriate table to use because the removal of the trend cycle is similar to detrending.

A large F statistic and a small significance level are evidence that a significant amount of variation in the SI-ratios is due to months or quarters, which in turn is evidence of seasonality; the null hypothesis of no month/quarter effect is rejected.

Conversely, a small F statistic and a large significance level (close to 1.0) are evidence that variation due to month or quarter could be due to random error, and the null hypothesis of no month/quarter effect is not rejected. The interpretation and utility of seasonal adjustment are problematic under such conditions.

The F test for moving seasonality is performed by a two-way analysis of variance. The two factors are seasons (months or quarters) and years. The years effect is tested separately; the null hypothesis is no effect due to years after accounting for variation due to months or quarters. For further details about the moving seasonality test, see Lothian (1984a, b, 1978) and Higginson (1975).

The significance level reported in both the moving and stable seasonality tests are only approximate. Table D8, the Final Unmodified SI Ratios, is constructed from an averaging operation that induces a correlation in the residuals from which the F test is computed. Hence the computed F statistic differs from an exact F statistic; see Cleveland and Devlin (1980) for details.

The test for identifiable seasonality is performed by combining the F tests for stable and moving seasonality, along with a Kruskal-Wallis test for stable seasonality. The following description is based on Lothian and Morry (1978b); other details can be found in Dagum (1988, 1983).

Let F_s and F_m denote the F value for the stable and moving seasonality tests, respectively. The combined test is performed as shown in Table 36.5 and as follows:

1. If the null hypothesis of no stable seasonality is not rejected at the 0.10% significance level ($P_S \geq 0.001$), then the series is considered to be nonseasonal. PROC X11 returns the conclusion, “Identifiable Seasonality Not Present.”
2. If the null hypothesis in step 1 is rejected, then PROC X11 computes the following quantities:

$$T_1 = \frac{7}{F_m}$$

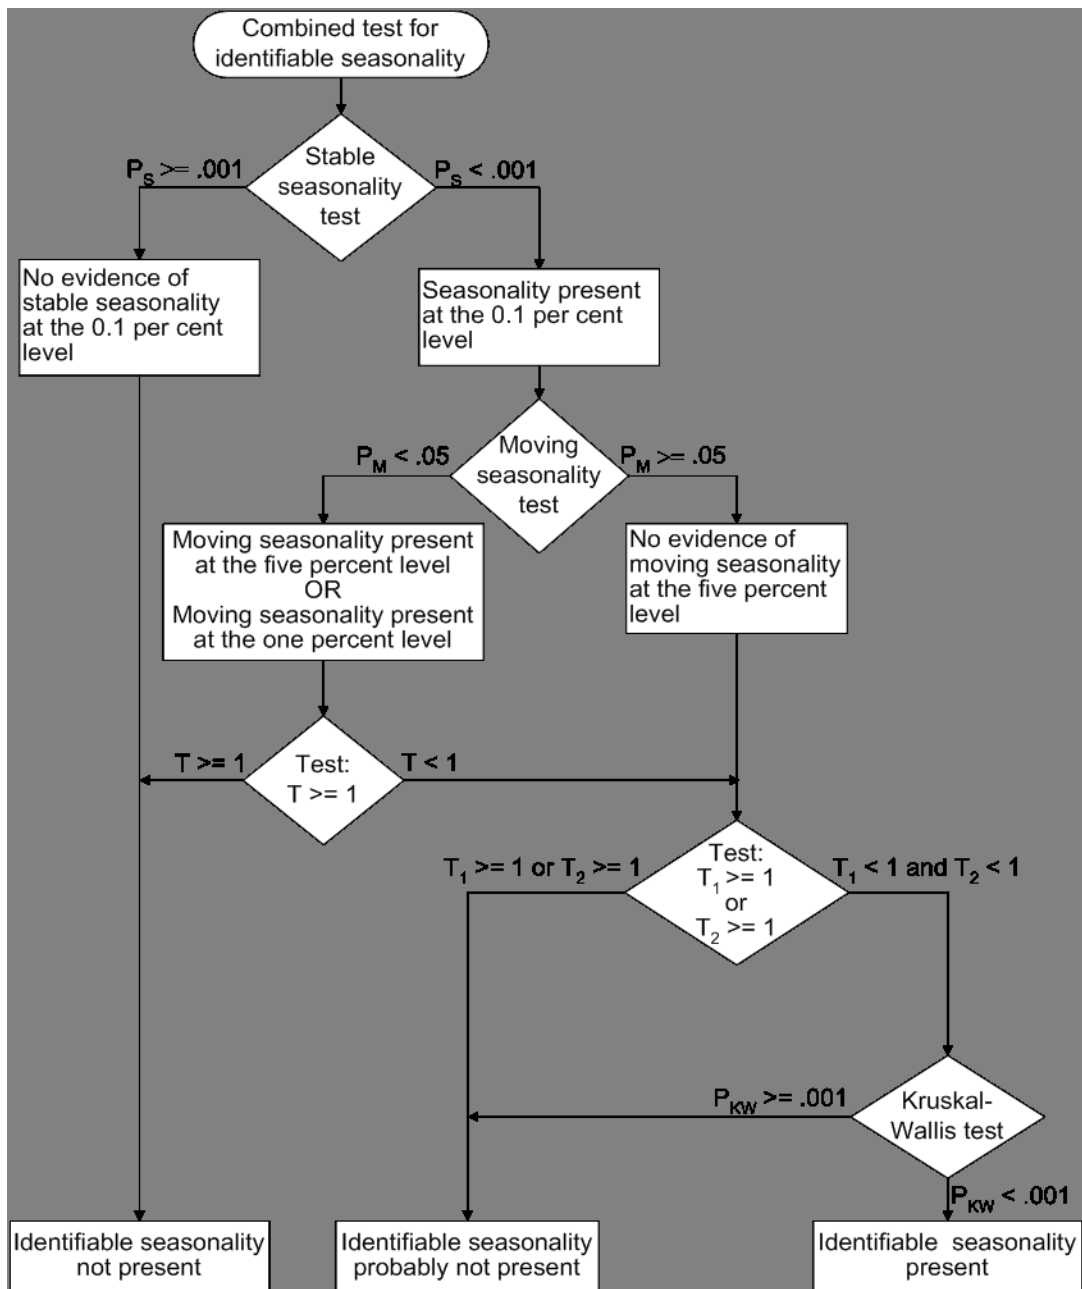

$$T_2 = \frac{3F_m}{F_s}$$

Let T denote the simple average of T_1 and T_2 :

$$T = \frac{(T_1 + T_2)}{2}$$

If the null hypothesis of no moving seasonality is rejected at the 5.0% significance level ($P_M < 0.05$) and if $T \geq 1.0$, the null hypothesis of identifiable seasonality *not* present is not rejected and PROC X11 returns the conclusion, “Identifiable Seasonality Not Present.”

3. If the null hypothesis of identifiable seasonality *not* present has not been accepted, but $T_1 \geq 1.0$, $T_2 \geq 1.0$, or the Kruskal-Wallis chi-squared test fails to reject at the 0.10% significance level ($P_{KW} \geq 0.001$), then PROC X11 returns the conclusion “Identifiable Seasonality Probably Not Present.”
4. If the null hypotheses of no stable seasonality associated with the F_s and Kruskal-Wallis chi-squared tests are rejected and if none of the combined measures described in steps 2 and 3 fail, then the null hypothesis of identifiable seasonality *not* present is rejected and PROC X11 returns the conclusion “Identifiable Seasonality Present.”

Figure 36.5 Combined Seasonality Test Flowchart

Tables Written to the OUT= Data Set

All tables that are time series can be written to the OUT= data set. However, depending on the specified options and statements, not all tables are computed. When a table is not computed, but is requested in the OUTPUT statement, the resulting variable has all missing values.

For example, if the PMFACTOR= option is not specified, Table A2 is not computed, and requesting this table in the OUTPUT statement results in the corresponding variable having all missing values.

The trading-day regression results, Tables B15 and C15, although not written to the OUT= data set, can be written to an output data set; see the OUTTDR= option for details.

Printed Output Generated by Sliding Spans Analysis

Table S 0.A

Table S 0.A gives the variable name, the length and number of spans, and the beginning and ending dates of each span.

Table S 0.B

Table S 0.B gives the summary of the two F tests performed during the standard X11 seasonal adjustments for stable and moving seasonality on Table D8, the final SI ratios. These tests are described in the section “Printed Output” on page 2440.

Table S 1.A

Table S 1.A gives the range analysis of seasonal factors. This includes the means for each month (or quarter) within a span, the maximum percentage difference across spans for each month, and the average. The minimum and maximum within a span are also indicated.

For example, for a monthly series and an analysis with four spans, the January row would contain a column for each span, with the value representing the average seasonal factor (Table D10) over all January calendar months occurring within the span. Beside each span column is a character column with either a MIN, MAX, or blank value, indicating which calendar month had the minimum and maximum value over that span.

Denote the average over the j th calendar month in span k , $k = 1, \dots, 4$, by $\bar{S}_j(k)$; then the maximum percent difference (MPD) for month j is defined by

$$MPD_j = \frac{\max_{k=1,\dots,4} \bar{S}_j(k) - \min_{k=1,\dots,4} \bar{S}_j(k)}{\min_{k=1,\dots,4} \bar{S}_j(k)}$$

The last numeric column of Table S 1.A is the average value over all spans for each calendar month, with the minimum and maximum row flagged as in the span columns.

Table S 1.B

Table S 1.B gives a summary of range measures for each span. The first column, Range Means, is calculated by computing the maximum and minimum over all months or quarters in a span, then taking the difference. The next column is the range ratio means, which is simply the ratio of the previously described maximum and minimum. The next two columns are the minimum and maximum seasonal factors over the entire span, while the range sf column is the difference of these. Finally, the last column is the ratio of the Max SF and Min SF columns.

Breakdown Tables

Table S 2.A.1 begins the breakdown analysis for the various series considered in the sliding spans analysis. The key concept here is the MPD described above in the section “Table S 1.A” on page 2446 and in the section “Computational Details for Sliding Spans Analysis” on page 2428. For a month or quarter that appears in two or more spans, the maximum percentage difference is computed and tested against a cutoff level. If it exceeds this cutoff, it is counted as an instance of exceeding the level. It is of interest to see if such instances fall disproportionately in certain months and years. Tables S 2.A.1 through S 6.A.3 display this breakdown for all series considered.

Table S 2.A.1

Table S 2.A.1 gives the monthly (quarterly) breakdown for the seasonal factors (table D10). The first column identifies the month or quarter. The next column is the number of times the MPD for D10 exceeded 3.0%, followed by the total count. The last is the average maximum percentage difference for the corresponding month or quarter.

Table S 2.A.2

Table S 2.A.2 gives the same information as Table S 2.A.1, but on a yearly basis.

Table S 2.A.3

The description of Table S 2.A.3 requires the definition of “Sign Change” and “Turning Point.”

First, some motivation. Recall that for a highly stable series, adding or deleting a small number of observations should not affect the estimation of the various components of a seasonal adjustment procedure.

Consider Table D10, the seasonal factors in a sliding spans analysis that uses four spans. For a given observation t , looking across the four spans, we can easily pick out large differences if they occur. More subtle differences can occur when estimates go from above to below (or vice versa) a base level. In the case of multiplicative model, the seasonal factors have a base level of 100.0. So it is useful to enumerate those instances where both a large change occurs (an MPD value exceeding 3.0%) and a change of sign (with respect to the base) occur.

Let B denote the base value (which in general depends on the component being considered and the model type, multiplicative or additive). If, for span 1, $S_t(1)$ is below B (i.e., $S_t(1) - B$ is negative) and for some subsequent span k , $S_t(k)$ is above B (i.e., $S_t(k) - B$ is positive), then a positive “Change in Sign” has occurred at observation t . Similarly, if, for span 1, $S_t(1)$ is above B , and for some subsequent span k , $S_t(k)$

is below B , then a negative “Change in Sign” has occurred. Both cases, positive or negative, constitute a “Change in Sign”; the actual direction is indicated in tables S 7.A through S 7.E, which are described below.

Another behavior of interest occurs when component estimates increase then decrease (or vice versa) across spans for a given observation. Using the preceding example, the seasonal factors at observation t could first increase, then decrease across the four spans.

This behavior, combined with an MPD exceeding the level, is of interest in questions of stability.

Again, consider Table D10, the seasonal factors in a sliding spans analysis that uses four spans. For a given observation t (containing at least three spans), note the level of D10 for the first span. Continue across the spans until a difference of 1.0% or greater occurs (or no more spans are left), noting whether the difference is up or down. If the difference is up, continue until a difference of 1.0% or greater occurs downward (or no more spans are left). If such an up-down combination occurs, the observation is counted as an up-down turning point. A similar description occurs for a down-up turning point. Tables S 7.A through S 7.E, described below, show the occurrence of turning points, indicating whether up-down or down-up. Note that it requires at least three spans to test for a turning point. Hence Tables S 2.A.3 through S 6.A.3 show a reduced number in the “Turning Point” row for the “Total Tested” column, and in Tables S 7.A through S 7.E, the turning points symbols can occur only where three or more spans overlap.

With these descriptions of sign change and turning point, we now describe Table S 2.A.3. The first column gives the type or category, the second column gives the total number of observations falling into the category, the third column gives the total number tested, and the last column gives the percentage for the number found in the category.

The first category (row) of the table is for flagged observations—that is, those observations where the MPD exceeded the appropriate cutoff level (3.0% is default for the seasonal factors). The second category is for level changes, while the third category is for turning points. The fourth category is for flagged sign changes—that is, for those observations that are sign changes, how many are also flagged. Note the total tested column for this category equals the number found for sign change, reflecting the definition of the fourth category.

The fifth column is for flagged turning points—that is, for those observations that are turning points, how many are also flagged.

The footnote to Table S 2.A.3 gives the U.S. Census Bureau recommendation for thresholds, as described in the section “Computational Details for Sliding Spans Analysis” on page 2428.

Table S 2.B

Table S 2.B gives the histogram of flagged for seasonal factors (Table D10) using the appropriate cutoff value (default 3.0%). This table looks at the spread of the number of times the MPD exceeded the corresponding level. The range is divided up into four intervals: 3.0%–4.0%, 4.0%–5.0%, 5.0%–6.0%, and greater than 6.0%. The first column shows the symbol used in Table S 7.A, the second column gives the range in interval notation, and the last column gives the number found in the corresponding interval. Note that the sum of the last column should agree with the “Number Found” column of the “Flagged MPD” row in Table S 2.A.3.

Table S 2.C

Table S 2.C gives selected percentiles for the MPD for the seasonal factors (Table D10).

Tables S 3.A.1 through S 3.A.3

These tables relate to the trading-day factors (Table C18) and follow the same format as Tables S 2.A.1 through S 2.A.3. The only difference between these tables and Tables S 2.A.1 through S 2.A.3 is the default cutoff value of 2.0% instead of the 3.0% used for the seasonal factors.

Tables S 3.B, S 3.C

These tables, applied to the trading-day factors (Table C18), are the same format as Tables S 2.B through S 2.C. The default cutoff value is different, with corresponding differences in the intervals in S 3.B.

Tables S 4.A.1 through S 4.A.3

These tables relate to the seasonally adjusted series (Table D11) and follow the same format as Tables S 2.A.1 through S 2.A.3. The same default cutoff value of 3.0% is used.

Tables S 4.B, S 4.C

These tables, applied to the seasonally adjusted series (Table D11), are the same format as tables S 2.B through S 2.C.

Tables S 5.A.1 through S 5.A.3

These tables relate to the month-to-month (or quarter-to-quarter) differences in the seasonally adjusted series, and follow the same format as Tables S 2.A.1 through S 2.A.3. The same default cutoff value of 3.0% is used.

Tables S 5.B, S 5.C

These tables, applied to the month-to-month (or quarter-to-quarter) differences in the seasonally adjusted series, are the same format as tables S 2.B through S 2.C. The same default cutoff value of 3.0% is used.

Tables S 6.A.1 through S 6.A.3

These tables relate to the year-to-year differences in the seasonally adjusted series, and follow the same format as Tables S 2.A.1 through S 2.A.3. The same default cutoff value of 3.0% is used.

Tables S 6.B, S 6.C

These tables, applied to the year-to-year differences in the seasonally adjusted series, are the same format as tables S 2.B through S 2.C. The same default cutoff value of 3.0% is used.

Table S 7.A

Table S 7.A gives the entire listing of the seasonal factors (Table D10) for each span. The first column gives the date for each observation included in the spans. Note that the dates do not cover the entire original data set. Only those observations included in one or more spans are listed.

The next N columns (where N is the number of spans) are the individual spans starting at the earliest span. The span columns are labeled by their beginning and ending dates.

Following the last span is the “Sign Change” column. As explained in the description of Table S 2.A.3, a sign change occurs at a given observation when the seasonal factor estimates go from above to below, or below to above, a base level. For the seasonal factors, 100.0 is the base level for the multiplicative model, 0.0 for the additive model. A blank value indicates no sign change, a “U” indicates a movement “upward” from the base level and a “D” indicates a movement “downward” from the base level.

The next column is the “Turning Point” column. As explained in the description of Table S 2.A.3, a turning point occurs when there is an upward then downward movement, or downward then upward movement, of sufficient magnitude. A blank value indicates no turning point, a “U-D” indicates a movement “upward then downward,” and a “D-U” indicates a movement “downward then upward.”

The next column is the maximum percentage difference (MPD). This quantity, described in the section “Computational Details for Sliding Spans Analysis” on page 2428, is the main computation for sliding spans analysis. A measure of how extreme the MPD value is given in the last column, the “Level of Excess” column. The symbols used and their meaning are described in Table S 2.A.3. If a given observation has exceeded the cutoff, the level of excess column is blank.

Table S 7.B

Table S 7.B gives the entire listing of the trading-day factors (Table C18) for each span. The format of this table is exactly like that of Table S 7.A.

Table S 7.C

Table S 7.C gives the entire listing of the seasonally adjusted data (Table D11) for each span. The format of this table is exactly like that of Table S 7.A except for the “Sign Change” column, which is not printed. The seasonally adjusted data have the same units as the original data; there is no natural base level as in the case of a percentage. Hence the sign change is not appropriate for D11.

Table S 7.D

Table S 7.D gives the entire listing of the month-to-month (or quarter-to-quarter) changes in seasonally adjusted data for each span. The format of this table is exactly like that of Table S 7.A.

Table S 7.E

Table S 7.E gives the entire listing of the year-to-year changes in seasonally adjusted data for each span. The format of this table is exactly like that of Table S 7.A.

Printed Output from the ARIMA Statement

The information printed by default for the ARIMA model includes the parameter estimates, their approximate standard errors, t ratios, and variances, the standard deviation of the error term, and the AIC and SBC statistics for the model. In addition, a criteria summary for the chosen model is given that shows the values for each of the three test criteria and the corresponding critical values.

If the PRINTALL option is specified, a summary of the nonlinear estimation optimization and a table of Box-Ljung statistics is also produced. If the automatic model selection is used, this information is printed for each of the five predefined models. Finally, a model selection summary is printed, showing the final model chosen.

ODS Table Names

PROC X11 assigns a name to each table it creates. You can use these names to reference the table when using the Output Delivery System (ODS) to select tables and create output data sets. These names are listed in the following table.

NOTE: For monthly and quarterly tables, use the ODS names MonthlyTables and QuarterlyTables; For brevity, only the MonthlyTables are listed here; the QuarterlyTables are simply duplicates. Printing of individual tables can be specified by using the TABLES table_name, which is not listed here. Printing groups of tables is specified in the MONTHLY and QUARTERLY statements by specifying the option PRINTOUT=NONE|STANDARD|LONG|FULL. The default is PRINTOUT=STANDARD.

Examples: X11 Procedure

Example 36.1: Component Estimation—Monthly Data

This example computes and plots the final estimates of the individual components for a monthly series. In the first plot ([Output 36.1.1](#)), an overlaid plot of the original and seasonally adjusted data is produced. The trend in the data is more evident in the seasonally adjusted data than in the original data. This trend is even more clear in [Output 36.1.3](#), the plot of Table D12, the trend cycle. Note that both the seasonal factors and the irregular factors vary around 100, while the trend cycle and the seasonally adjusted data are in the scale of the original data.

From [Output 36.1.2](#) the seasonal component appears to be slowly increasing, while no apparent pattern exists for the irregular series in [Output 36.1.4](#).

X-11 Seasonal Adjustment Program

U. S. Bureau of the Census

Economic Research and Analysis Division

November 1, 1968

The X-11 program is divided into seven major parts.

Part	Description
A.	Prior adjustments, if any
B.	Preliminary estimates of irregular component weights and regression trading day factors
C.	Final estimates of above
D.	Final estimates of seasonal, trend-cycle and irregular components
E.	Analytical tables
F.	Summary measures
G.	Charts

Series - fy35rr

Period covered - 1st Quarter 1971 to 4th Quarter 1976

Year	B1 Original Series				Total
	1st	2nd	3rd	4th

Example 36.3: Outlier Detection and Removal

PROC X11 can be used to detect and replace outliers in the irregular component of a monthly or quarterly series.

The weighting scheme used in measuring the “extremeness” of the irregulars is developed iteratively; thus the statistical properties of the outlier adjustment method are unknown.

In this example, the data are simulated by generating a trend plus a random error. Two periods in the series were made “extreme” by multiplying one generated value by 2.0 and another by 0.10. The additive model is appropriate based on the way the data were generated. Note that the trend in the generated data was modeled automatically by the trend cycle component estimation.

The detection of outliers is accomplished by considering Table D9, the final replacement values for extreme S-I ratios. This table indicates which observations had irregular component values more than FULLWEIGHT= standard deviation units from 0.0 (1.0 for the multiplicative model). The default value of the FULLWEIGHT= option is 1.5; a larger value would result in fewer observations being declared extreme.

In this example, FULLWEIGHT=3.0 is used to isolate the extreme inflated and deflated values generated in the DATA step. The value of ZEROWEIGHT= must be greater than FULLWEIGHT; it is given a value of 3.5.

A plot of the original and modified series, [Output 36.3.2](#), shows that the deviation from the trend line for the modified series is greatly reduced compared with the original series.

```

data a;
  retain seed 99831;
  do kk = 1 to 48;
    x = kk + 100 + rannor( seed );
    date = intnx( 'month', '01jan1970'd, kk-1 );
    if kk = 20 then x = 2 * x;
    else if kk = 30 then x = x / 10;
    output;
  end;
run;

Overview: X12 Procedure

The X12 procedure is an adaptation of the U.S. Bureau of the Census X-12-ARIMA Seasonal Adjustment program (U.S. Bureau of the Census 2010). The X-12-ARIMA program was developed by the Time Series Staff of the Statistical Research Division, U.S. Census Bureau. The X-12-ARIMA seasonal adjustment program contains components developed from Statistics Canada's X-11-ARIMA program. The X-12-ARIMA automatic modeling method is based on the work of Gomez and Maravall (1997a, b).

The version of PROC X12 documented here was produced by converting the U.S. Census Bureau's FORTRAN code to the SAS development language and adding typical SAS procedure syntax. This conversion work was performed by SAS and resulted in the X12 procedure. Although several features were added during the conversion, credit for the statistical aspects and general methodology of the X12 procedure belongs to the U.S. Census Bureau.

The X12 procedure seasonally adjusts monthly or quarterly time series. The procedure makes additive or multiplicative adjustments and creates an output data set that contains the adjusted time series and intermediate calculations.

The X-12-ARIMA program combines the capabilities of the X-11 program (Shiskin, Young, and Musgrave 1967) and the X-11-ARIMA/88 program (Dagum 1988) and also introduces some new features (Findley et al. 1998). One of the main enhancements involves the use of a regARIMA model, a regression model with ARIMA (autoregressive integrated moving average) errors. Thus, the X-12-ARIMA program contains methods developed by both the U.S. Census Bureau and Statistics Canada. In addition, the X-12-ARIMA automatic modeling routine is based on the TRAMO (time series regression with ARIMA noise, missing values, and outliers) method (Gomez and Maravall 1997a, b). The four major components of the X-12-ARIMA program are regARIMA modeling, model diagnostics, seasonal adjustment that uses enhanced X-11 methodology, and post-adjustment diagnostics. Statistics Canada's X-11 method fits an ARIMA model to the original series, and then uses the model forecasts to extend the original series. This extended series is then seasonally adjusted by the standard X-11 seasonal adjustment method. The extension of the series improves the estimation of the seasonal factors and reduces revisions to the seasonally adjusted series as new data become available.

Seasonal adjustment of a series is based on the assumption that seasonal fluctuations can be measured in the original series, O_t , $t = 1, \dots, n$, and separated from trend cycle, trading day, and irregular fluctuations. The seasonal component of this time series, S_t , is defined as the intrayear variation that is repeated consistently or in an evolving fashion from year to year. The trend cycle component, C_t , includes variation due to the long-term trend, the business cycle, and other long-term cyclical factors. The trading day component, D_t , is the variation that can be attributed to the composition of the calendar. The irregular component, I_t , is the residual variation. Many economic time series are related in a multiplicative fashion ($O_t = S_t C_t D_t I_t$). Other economic series are related in an additive fashion ($O_t = S_t + C_t + D_t + I_t$). A seasonally adjusted time series, $C_t I_t$ or $C_t + I_t$, consists of only the trend cycle and irregular components. For more details about seasonal adjustment with the X-11 method, see Ladiray and Quenneville (2001).

Graphics are now available with the X12 procedure. For more information, see the section “[ODS Graphics](#)” on page 2523.

Getting Started: X12 Procedure

The most common use of the X12 procedure is to produce a seasonally adjusted series. Eliminating the seasonal component from an economic series facilitates comparison among consecutive months or quarters. A plot of the seasonally adjusted series is often more informative about trends or location in a business cycle than a plot of the unadjusted series.

The following example shows how to use PROC X12 to produce a seasonally adjusted series, $C_t I_t$, from an original series $O_t = S_t C_t D_t I_t$.

In the multiplicative model, the trend cycle component C_t keeps the same scale as the original series O_t , while S_t , D_t , and I_t vary around 1.0. In all displayed tables, these latter components are expressed as percentages and thus vary around 100.0 (in the additive case, they vary around 0.0). However, in the output data set, the data displayed as percentages in the displayed output are expressed as the decimal equivalent and thus vary around 1.0 in the multiplicative case.

The naming convention used in PROC X12 for the tables follows the convention used in the Census Bureau’s X-12-ARIMA program; see *X-12-ARIMA Reference Manual* (U.S. Bureau of the Census 2009c), *X-12-ARIMA Quick Reference for Windows (PC)* (U.S. Bureau of the Census 2009b), and *X-12-ARIMA Quick Reference for UNIX/Linux* (U.S. Bureau of the Census 2009a). Also see the section “[Displayed Output, ODS Table Names, and OUTPUT Tablename Keywords](#)” on page 2519. The table names are outlined in [Table 37.12](#).

The tables that correspond to parts A through C are intermediate calculations. The final estimates of the individual components are found in the D tables: Table D10 contains the final seasonal factors, Table D12 contains the final trend cycle, and Table D13 contains the final irregular series. If you are primarily interested in seasonally adjusting a series without consideration of intermediate calculations or diagnostics, you need to look only at Table D11, the final seasonally adjusted series. Tables in part E contain information about extreme values and changes in the original and seasonally adjusted series. The tables in part F are seasonal adjustment quality measures. Spectral analysis is performed in part G. For further information about the tables produced by the X11 statement, see Ladiray and Quenneville (2001).

Basic Seasonal Adjustment

Suppose that you have monthly retail sales data starting in September 1978 in a SAS data set named SALES. At this point, you do not suspect that any calendar effects are present, and there are no prior adjustments that need to be made to the data.

In this simplest case, you need only specify the DATE= variable in the PROC X12 statement and request seasonal adjustment in the X11 statement as shown in the following statements:

```
data sales;
    set sashelp.air;
    sales = air;
    date = intnx( 'month', '01sep78'd, _n_-1 );
    format date monyy.;
run;

proc x12 data=sales date=date;
    var sales;
    x11;
    ods select d11;
run;
```

The results of the seasonal adjustment are in Table D11 (the final seasonally adjusted series) in the displayed output shown in [Figure 37.1](#).

Figure 37.1 Basic Seasonal Adjustment

[illegible]

You can compare the original series (Table A1) and the final seasonally adjusted series (Table D11) by plotting them together as shown in [Figure 37.2](#). These tables are requested in the OUTPUT statement and are written to the OUT= data set. Note that the default variable name used in the output data set is the input variable name followed by an underscore and the corresponding table name.

```
proc x12 data=sales date=date noprint;
  var sales;
  x11;
  output out=out a1 d11;
run;

proc sgplot data=out;
  series x=date y=sales_A1 / name = "A1" markers
    markerattrs=(color=red symbol='asterisk')
    lineattrs=(color=red);
  series x=date y=sales_D11 / name= "D11" markers
    markerattrs=(symbol='circle')
    lineattrs=(color=blue);
  yaxis label='Original and Seasonally Adjusted Time Series';
run;
```

Figure 37.2 Plot of Original and Seasonally Adjusted Data

Syntax: X12 Procedure

The X12 procedure uses the following statements:

```
PROC X12 options ;  
  VAR variables ;  
  BY variables ;  
  ID variables ;  
  EVENT variables ;  
  USERDEFINED variables ;  
  TRANSFORM options ;  
  ADJUST options ;  
  IDENTIFY options ;  
  AUTOMDL options ;  
  OUTLIER options ;  
  REGRESSION options ;  
  INPUT variables ;  
  ARIMA options ;  
  ESTIMATE options ;  
  X11 options ;  
  FORECAST options ;  
  CHECK options ;  
  OUTPUT options ;  
  TABLES options ;
```

The PROC X12 statements perform basically the same function as the Census Bureau's X-12-ARIMA specs. *Specs* (specifications) are used in X-12-ARIMA to control the computations and output. The PROC X12 statement performs some of the same functions as the Series spec in the Census Bureau's X-12-ARIMA software. The ADJUST statement performs some of the same functions as the Transform spec. The TRANSFORM, IDENTIFY, AUTOMDL, OUTLIER, REGRESSION, ARIMA, ESTIMATE, X11, FORECAST, and CHECK statements are designed to perform the same functions as the corresponding X-12-ARIMA specs, although full compatibility is not yet available. The Census Bureau documentation *X-12-ARIMA Reference Manual* (U.S. Bureau of the Census 2009c) can provide added insight to the functionality of these statements.

Functional Summary

Table 37.1 summarizes the statements and options that control the X12 procedure.

Table 37.1 X12 Syntax Summary

Description	Statement	Option
Data Set Options		
Specifies the auxiliary data set	PROC X12	AUXDATA=
Specifies the input data set	PROC X12	DATA=
Specifies the user-defined event definition data set	PROC X12	INEVENT=

Table 37.1 *continued*

Description	Statement	Option
Specifies the critical values for outlier detection	OUTLIER	CV=
Specifies the critical values for AO outlier detection	OUTLIER	AOCV=
Specifies the critical values for LS outlier detection	OUTLIER	LSCV=
Specifies the critical values for TC outlier detection	OUTLIER	TCCV=
Specifying the Regression Model		
Specifies predefined regression variables	REGRESSION	PREDEFINED=
Specifies user-defined regression variables	REGRESSION	USERVAR=
Specifies user-defined regression variables	INPUT	
Specifies user defined event regression variables	EVENT	
Specifying the ARIMA Model		
Uses the X-12-ARIMA TRAMO-based method to choose a model	AUTOMDL	
Specifies the ARIMA part of the model	ARIMA	MODEL=
Specifying Automatic Model Detection Options		
Specifies the maximum orders of ARMA polynomials	AUTOMDL	MAXORDER=
Specifies the maximum orders of differencing	AUTOMDL	MAXDIFF=
Specifies the fixed orders of differencing	AUTOMDL	DIFFORDER=
Suppresses fitting of a constant parameter	AUTOMDL	NOINT
Specifies the preference for balanced models	AUTOMDL	BALANCED
Specifies Hannan-Rissanen initial estimation	AUTOMDL	HRINITIAL
Specifies default model acceptance based on Ljung-Box Q	AUTOMDL	ACCEPTDEFAULT
Specifies the acceptance value for Ljung-Box Q	AUTOMDL	LJUNGBOXLIMIT=
Specifies the percentage by which to reduce the outlier critical value	AUTOMDL	REDUCECV=
Specifies the critical value for ARMA coefficients	AUTOMDL	ARMACV=
Model Diagnostics		
Examines the regARIMA model residuals	CHECK	
Specifying Seasonal Adjustment Options		
Specifies seasonal adjustment	X11	

Table 37.1 *continued*

Description	Statement	Option
Specifies the mode of seasonal adjustment decomposition	X11	MODE=
Specifies the seasonal filter	X11	SEASONALMA=
Specifies the sigma limits	X11	SIGMALIM=
Specifies the Henderson trend filter	X11	TRENDMA=
Specifies the D11 calculation method	X11	TYPE=
Specifies the adjustment factors to remove from final seasonally adjusted series	X11	FINAL=
Specifies a method for reconciling the seasonally adjusted series to the original series	X11	FORCE=

PROC X12 Statement

PROC X12 options ;

The PROC X12 statement provides information about the time series to be processed by PROC X12. Either the DATE= or the START= option must be specified. If both options are specified, then a syntax error results and the X12 procedure is not executed.

The original series is displayed in Table A1. If there are missing values in the original series and a re-gARIMA model is specified or automatically selected, then Table MV1 is displayed. Table MV1 contains the original series with missing values replaced by the predicted values from the fitted model. If outliers are identified and Table A19 is added in the TABLES statement, then the outlier adjusted series is displayed in Table A19. Table B1 is displayed when the original data are altered (for example, through an ARIMA model estimation, prior adjustment factor, or regression) or the series is extended with forecasts.

Although the X-12-ARIMA method handles missing values, there are some restrictions. In order for PROC X12 to process the series, no month or quarter can contain missing values for all years. For instance, if the third quarter contained only missing values for all years, then processing is skipped for that series. In addition, if more than half the values for a month or a quarter are missing, then a warning message is displayed in the log file, and other errors might occur later in processing. If a series contains many missing values, other methods of missing value replacement should be considered prior to seasonally adjusting the series.

The following *options* can appear in the PROC X12 statement:

AUXDATA=SAS-data-set

specifies an auxiliary input data set that contains user-defined variables, which are specified in the INPUT statement, the USERVAR= option in the REGRESSION statement, or the USERDEFINED statement. The AUXDATA= data set can also contain the date variable, which is specified in the DATE= option in the PROC X12 statement. If the date variable is present, then the date variable is used to align the observations in the auxiliary data set to the observations in the series that is being

processed. The date values must be sorted in ascending order with no gaps or duplications, and the interval must match the interval of the series. If the date variable is not present or valid, then observations in the auxiliary data set are matched by observation number to the series that is being processed. The auxiliary data set does not support BY-group processing. The variables in the auxiliary data set are applied to all BY groups, where the dates of the BY group correspond to the dates of the auxiliary data set. [Example 37.10](#) shows the use of the `AUXDATA=` data set.

DATA=SAS-data-set

specifies the input SAS data set to use. If this option is omitted, the most recently created SAS data set is used.

DATE=variable

DATEVAR=variable

specifies a variable that gives the date for each observation. Unless specified in the `SPAN=` option, the starting and ending dates are obtained from the first and last values of the BY group for the `DATE=` variable, which must contain SAS date or datetime values. The procedure checks values of the `DATE=` variable to ensure that the input observations are sequenced correctly in ascending order. If the `INTERVAL=` option or the `SEASONS=` option is specified, the values of the date variable must be consistent with the specified seasonality or interval. If neither the `INTERVAL=` option nor the `SEASONS=` option is specified, then the procedure tries to determine the type of data from the values of the date variable. This variable is automatically added to the `OUT=` data set if a data set is requested in an `OUTPUT` statement, and the date values for the variable are extrapolated if necessary. If the `DATE=` option is not specified, the `START=` option must be specified.

INEVENT=SAS-data-set

specifies the input data set that defines any user-defined event variables. This option can be omitted if events are not specified or if only SAS predefined events are specified in an `EVENT` statement. For more information about the format of this data set, see the section “[INEVENT= Data Set](#)” on page 2528.

INTERVAL=interval

specifies the frequency of the input time series. If the input data consist of quarterly observations, then `INTERVAL=QTR` should be used. If the input data consist of monthly observations, then `INTERVAL=MONTH` should be used. If the `INTERVAL=` option is not specified and `SEASONS=4`, then `INTERVAL=QTR` is assumed; likewise, `SEASONS=12` implies `INTERVAL=MONTH`. If both the `INTERVAL=` option and the `SEASONS=` option are specified, the values should not be conflicting. If neither the `INTERVAL=` option nor the `SEASONS=` option is specified and the `START=` option is specified, then the data are assumed to be monthly. If a date variable is specified using the `DATE=` option, it is not necessary to specify the `INTERVAL=` option or the `SEASONS=` option; however, if specified, the values of the `INTERVAL=` option or the `SEASONS=` option should not be in conflict with the values of the date variable. See Chapter 4, “[Date Intervals, Formats, and Functions](#),” for more details about intervals.

MDLINFOIN=SAS-data-set

specifies an optional input data set that contains model information that can replace the information contained in the `TRANSFORM`, `REGRESSION`, `ARIMA`, and `AUTOMDL` statements. The `MDLINFOIN=` data set can contain BY-group and series names. It is useful for providing specific information about each series to be seasonally adjusted. See the section “[MDLINFOIN= and MDLINFOOUT= Data Sets](#)” on page 2526 for details.

MDLINFOOUT=SAS-data-set

specifies the optional output data set that contains the transformation, regression, and ARIMA information related to each seasonally adjusted series. The data set is sorted by the BY-group variables, if any, and by series names. The MDLINFOOUT= data set can be used as input for the MDLINFOIN= option. See the section “[MDLINFOIN= and MDLINFOOUT= Data Sets](#)” on page 2526 for details.

NOPRINT

suppresses any printed output.

NOTRIMMISS

suppresses the default, by which leading and trailing missing values are trimmed from the series. If NOTRIMMISS is used, PROC X12 automatically generates missing value regressors for any missing value within the span of the series, including leading and trailing missing values.

OUTSTAT=SAS-data-set

specifies an optional output data set which contains the summary statistics that related to each seasonally adjusted series. The data set is sorted by the BY-group variables, if any, and by series names. See the section “[OUTSTAT= Data Set](#)” on page 2530 for details.

PERIODOGRAM

specifies that the PERIODOGRAM rather than the spectrum of the series be plotted in the G tables and plots. If PERIODOGRAM is not specified, then the spectrum is plotted in the G tables.

PLOTS<(global-plot-options)> <= plot-request <(options)>>

PLOTS<(global-plot-options)> <= (plot-request <(options)> <... plot-request <(options)>>>

controls the plots that are produced through ODS Graphics. When you specify only one plot request, you can omit the parentheses around the plot request.

Following are some examples of the PLOTS= option:

```
plots=none
plots=all
plots=residual(none)
plots(only)=(series(acf pacf) residual(hist))
```

ODS Graphics must be enabled before you request plots. For example:

```
ods graphics on;

proc x12 data=sales date=date;
  var sales;
  identify diff=(0,1) sdiff=(0,1);
run;
```

Since no specific plot is requested in this program, the default plots associated with the PROC X12 and IDENTIFY statements are produced.

For general information about ODS Graphics, see Chapter 21, “[Statistical Graphics Using ODS](#)” (*SAS/STAT User's Guide*). If you have enabled ODS Graphics but do not specify any specific plot

request, then the default plots that are associated with each of the PROC X12 statements used in the program are produced. Line printer plots are suppressed when ODS Graphics is enabled.

If NONE is specified in an option, then no plots are produced for that option. If ALL is specified without NONE in an option, then all plots are produced for that option.

Global Plot Options:

The *global-plot-options* apply to all relevant plots that are generated by the X12 procedure. The following *global-plot-option* is supported:

ONLY

suppresses the default plots. Only the plots specifically requested are produced.

Specific Plot Options:

The following list describes the specific plots and their *options*:

ALL

produces all plots that are appropriate for the particular analysis.

NONE

suppresses all plots.

ADJUSTED(< *sa-plot-options* >)

SA(< *sa-plot-options* >)

produces plots of the seasonally adjusted series that results from the decomposition specified in the [X11](#) statement. The SPECTRUM plot is produced by default.

The following *sa-plot-options* are available:

ALL

produces all seasonally adjusted plots.

NONE

suppresses all seasonally adjusted plots.

SPECTRUM

produces the spectral plot of Table G1. Table G1 is calculated based on the modified seasonally adjusted series (Table E2). The data is first-differenced and transformed as specified in the [TRANSFORM](#) statement. By default, the type of spectral estimate used to calculate the spectral plot is the spectrum. If the [PERIODOGRAM](#) option is specified in the PROC X12 statement, then the periodogram of the series is used to calculate the spectral plot.

FORECAST(< *forecast-plot-options* >)

produces the regARIMA model forecast plots if the [FORECAST](#) statement is specified. The FORECAST plot is produced by default. The following *forecast-plot-options* are available:

ALL

produces all the forecast plots that are appropriate for the particular analysis.

FORECAST

plots the actual time series and its one-step-ahead forecast over the historical period, and plots the forecast and its confidence bands over the forecast horizon. The **OUT1STEP** option must be specified in the FORECAST statement in order for the X12 procedure to calculate the one-step-ahead forecasts.

FORECASTONLY

plots the forecast and its confidence bands over the forecast horizon only.

MODELFORECASTS

plots the one-step-ahead model forecast and its confidence bands in the historical period; plots the forecast and its confidence bands over the forecast horizon. The **OUT1STEP** option must be specified in the FORECAST statement in order for the X12 procedure to calculate the one-step-ahead forecasts.

MODELS

plots the one-step-ahead model forecast and its confidence bands in the historical period. The **OUT1STEP** option must be specified in the FORECAST statement in order for the X12 procedure to calculate the one-step-ahead forecasts.

NONE

suppresses all the forecast plots.

TRANSFORECAST

plots the transformed time series and its one-step-ahead forecast over the historical period; plots the forecast and its confidence bands over the forecast horizon. The **OUT1STEP** option must be specified in the FORECAST statement in order for the X12 procedure to calculate the one-step-ahead forecasts. The TRANSFORECAST plot is available only if the data have been transformed using the **TRANSFORM** statement.

TRANSFORECASTONLY

plots the forecast of the transformed series and its confidence bands over the forecast horizon only. The TRANSFORECASTONLY plot is available only if the data have been transformed using the **TRANSFORM** statement.

TRANSMODELFORECASTS

plots the one-step-ahead model forecast of the transformed series and its confidence bands in the historical period; plots the forecast and its confidence bands over the forecast horizon. The **OUT1STEP** option must be specified in the FORECAST statement in order for the X12 procedure to calculate the one-step-ahead forecasts. The TRANSMODELFORECASTS plot is available only if the data have been transformed using the **TRANSFORM** statement.

TRANSMODELS

plots the one-step-ahead model forecast of the transformed series and its confidence bands in the historical period. The **OUT1STEP** option must be specified in the FORECAST statement in order for the X12 procedure to calculate the one-step-ahead forecasts. The TRANSMODELS plot is available only if the data have been transformed using the **TRANSFORM** statement.

IRREGULAR(< ic-plot-options >)**IC(< ic-plot-options >)**

produces plots of the irregular series that results from the decomposition specified in the [X11](#) statement. The SPECTRUM plot is produced by default.

The following *ic-plot-options* are available:

ALL

produces all irregular plots.

NONE

suppresses all irregular plots.

SPECTRUM

produces the spectral plot of Table G2. Table G2 is calculated based on the modified irregular series (Table E3). The data is first-differenced and transformed as specified in the [TRANSFORM](#) statement. By default, the type of spectral estimate used to calculate the spectral plot is the spectrum. If the [PERIODOGRAM](#) option is specified in the PROC X12 statement, then the periodogram of the series is used to calculate the spectral plot.

RESIDUAL(< residual-plot-options >)

produces the regARIMA model residual series plots if the [CHECK](#) statement is specified. The ACF, PACF, HIST, SQACF, and SPECTRUM plots are produced by default. The following *residual-plot-options* are available:

ACF

produces the plot of residual autocorrelations.

ALL

produces all the residual diagnostics plots that are appropriate for the particular analysis.

HIST

produces the histogram of the residuals and also the residual outliers and residual statistics tables that describe the residual histogram.

NONE

suppresses all the residual diagnostics plots.

PACF

produces the plot of residual partial-autocorrelations if PRINT=PACF is specified in the CHECK statement.

SPECTRUM

produces the spectral plot of Table GRs. Table GRs is calculated based on the regARIMA model residual series. By default, the type of spectral estimate used to calculate the spectral plot is the spectrum. If the [PERIODOGRAM](#) option is specified in the PROC X12 statement, then the periodogram of the series is used to calculate the spectral plot.

SQACF

produces the plot of squared residual autocorrelations.

SERIES(*< series-plot-options >*)

produces plots that are associated with the identification stage of the modeling. The ACF, PACF, and SPECTRUM plots are produced by default. The following *series-plot-options* are available:

ACF

produces the plot of autocorrelations.

ALL

produces all the plots that are associated with the identification stage.

NONE

suppresses all plots that are associated with the identification stage.

PACF

produces the plot of partial-autocorrelations.

SPECTRUM

produces the spectral plot of Table G0. Table G0 is calculated based on either Table A1, A19, B1 or E1, as specified by the **SPECTRUMSERIES=** option. The original data is first-differenced and transformed as specified in the **TRANSFORM** statement. By default, the type of spectral estimate that is used to calculate the spectral plot is the spectrum. If the **PERIODOGRAM** option is specified in the PROC X12 statement, then the periodogram of the series is used to calculate the spectral plot.

SEASONS=*number*

specifies the number of observations in a seasonal cycle. If the SEASONS= option is not specified and INTERVAL=QTR, then SEASONS=4 is assumed. If the SEASONS= option is not specified and INTERVAL=MONTH, then SEASONS=12 is assumed. If the SEASONS= option is specified, its value should not conflict with the values of the INTERVAL= option or the values of the date variable. See the preceding descriptions for the START=, DATE=, and INTERVAL= options for more details.

SPAN=(*mmmyy ,mmmyy*)**SPAN=**(*'yyQq' , 'yyQq'*)

specifies the dates of the first and last observations to define a subset for processing. A single date in parentheses is interpreted to be the starting date of the subset. To specify only the ending date, use SPAN=(*,mmmyy*). If the starting or ending date is omitted, then the first or last date, respectively, of the input data set or BY group is assumed. Because the dates are input as strings and the quarterly dates begin with a numeric character, the specification for a quarterly date must be enclosed in quotation marks. A four-digit year can be specified; if a two-digit year is specified, the value specified in the YEARCUTOFF= SAS system option applies.

SPECTRUMSERIES=*table-name*

specifies the table name of the series that is used in the spectrum of the original series (Table G0). The table names that can be specified are A1, A19, B1, or E1. The default is B1.

START=*mmmyy***START=***'yyQq'***STARTDATE=***mmmyy***STARTDATE=***'yyQq'*

specifies the date of the first observation. Unless the SPAN= option is used, the starting and ending dates are the dates of the first and last observations, respectively. Either this option or the DATE= option is required. When using this option, use either the INTERVAL= option or the SEASONS= option to specify monthly or quarterly data. If neither the INTERVAL= option nor the SEASONS= option is present, monthly data are assumed. Because the dates are input as strings and the quarterly dates begin with a numeric character, the specification for a quarterly date must be enclosed in quotation marks. A four-digit year can be specified; if a two-digit year is specified, the value specified in the YEARCUTOFF= SAS system option applies. When using the START= option with BY processing, the start date is applied to the first observation in each BY group.

ADJUST Statement

ADJUST *option* ;

The ADJUST statement adjusts the series for leap year and length-of-period factors prior to estimating a regARIMA model. The “Prior Adjustment Factors” table is associated with the ADJUST statement.

The following *option* can appear in the ADJUST statement:

PREDEFINED=LOM | LOQ | LPYEAR

specifies length-of-month adjustment, length-of-quarter adjustment, or leap year adjustment. PREDEFINED=LOM and PREDEFINED=LOQ are equivalent because the actual adjustment is determined by the interval of the time series. Also, because leap year adjustment is a limited form of length-of-period adjustment, only one type of predefined adjustment can be specified. The PREDEFINED= option should not be used in conjunction with PREDEFINED=TD or PREDEFINED=TD1COEF in the REGRESSION statement or MODE=ADD or MODE=PSEUDOADD in the X11 statement. PREDEFINED=LPYEAR cannot be specified unless the series is log transformed.

If the series is to be transformed by using a Box-Cox or logistic transformation, the series is first adjusted according to the ADJUST statement, and then it is transformed.

In the case of a length-of-month adjustment for the series with observations Y_t , each observation is first divided by the number of days in that month, m_t , and then multiplied by the average length of month (30.4375), resulting in $(30.4375 \times Y_t)/m_t$. Length-of-quarter adjustments are performed in a similar manner, resulting in $(91.3125 \times Y_t)/q_t$, where q_t is the length in days of quarter t .

Forecasts of the transformed and adjusted data are transformed and adjusted back to the original scale for output.

ARIMA Statement

ARIMA *option* ;

The ARIMA statement specifies the ARIMA part of the regARIMA model. This statement defines a pure ARIMA model if no [REGRESSION statements](#), [INPUT statements](#), or [EVENT statements](#) are specified. The ARIMA part of the model can include multiplicative seasonal factors.

The following *option* can appear in the ARIMA statement:

MODEL=((*p d q*) (*P D Q*)*s*)

specifies the ARIMA model. The format follows standard Box-Jenkins notation (Box, Jenkins, and Reinsel 1994). The nonseasonal AR and MA orders are given by *p* and *q*, respectively, while the seasonal AR and MA orders are given by *P* and *Q*. The number of differences and seasonal differences are given by *d* and *D*, respectively. The notation (*p d q*) and (*P D Q*) can also be specified as (*p, d, q*) and (*P, D, Q*). The maximum lag of any AR or MA parameter is 36. The maximum value of a difference order, *d* or *D*, is 144. All values for *p*, *d*, *q*, *P*, *D*, and *Q* should be nonnegative integers. The seasonality parameter, *s*, should be a positive integer. If *s* is omitted, it is set equal to the value that is specified in the SEASONS= option in the PROC X12 statement.

For example, the following statements specify an ARIMA (2,1,1)(1,1,0)12 model:

```
proc x12 data=ICMETI seasons=12 start=jan1968;
    arima model=((2,1,1) (1,1,0));
```

AUTOMDL Statement

AUTOMDL *options* ;

The AUTOMDL statement invokes the automatic model selection procedure of the X-12-ARIMA method. This method is based largely on the TRAMO (time series regression with ARIMA noise, missing values, and outliers) method by Gomez and Maravall (1997a, b). If the AUTOMDL statement is used without the OUTLIER statement, then only missing values regressors are included in the regARIMA model. If both the AUTOMDL and the OUTLIER statements are used, then both missing values regressors and regressors for automatically identified outliers are included in the regARIMA model. For more information about missing value regressors, see the section “[Missing Values](#)” on page 2512.

If both the AUTOMDL statement and the ARIMA statement are present, the ARIMA statement is ignored. The ARIMA statement specifies the model, but the AUTOMDL statement allows the X12 procedure to select the model. If the AUTOMDL statement is specified and a data set is specified in the MDLINFOIN= option in the PROC X12 statement, then the AUTOMDL statement is ignored if the specified data set contains a model specification for the series. If no model for the series is specified in the MDLINFOIN= data set, the AUTOMDL or ARIMA statement is used to determine the model. Thus, it is possible to give a specific model for some series and automatically identify the model for other series by using both the MDLINFOIN= option and the AUTOMDL statement.

When the AUTOMDL statement is specified, the X12 procedure compares a model selected using a TRAMO method to a default model. The TRAMO method is implemented first, and involves two parts: identifying the orders of differencing and identifying the ARIMA model. The table “ARIMA Estimates for Unit Root Identification” provides details about the identification of the orders of differencing, and the table “Results of Unit Root Test for Identifying Orders of Differencing” shows the orders of differencing selected by TRAMO. The table “Models Estimated by Automatic ARIMA Model Selection Procedure” provides details regarding the TRAMO automatic model selection, and the table “Best Five ARIMA Models Chosen by Automatic Modeling” ranks the best five models estimated using the TRAMO method. The “Comparison of Automatically Selected Model and Default Model” table compares the model selected by the TRAMO method to a default model. At this point in the processing, if the default model is selected over the TRAMO model, then PROC X12 displays a note. No note is displayed if the TRAMO model is selected. PROC X12 then performs checks for unit roots, over-differencing, and insignificant ARMA coefficients. If the model is changed due to any of these tests, a note is displayed. The last table, “Final Automatic Model Selection,” shows the results of the automatic model selection.

The following *options* can appear in the AUTOMDL statement:

ACCEPTDEFAULT

specifies that the default model be chosen if its Ljung-Box Q is acceptable.

ARMACV=value

specifies the threshold value for the t statistics that are associated with the highest-order ARMA coefficients. As a check of model parsimony, the parameter estimates and t statistics of the highest-order ARMA coefficients are examined to determine whether the coefficient is insignificant. An ARMA coefficient is considered to be insignificant if the t value that is displayed in the table “Exact ARMA Maximum Likelihood Estimation” is below the value specified in the ARMACV= option and the absolute value of the parameter estimate is reliably close to zero. The absolute value is considered to be *reliably close to zero* if it is below 0.15 for 150 or fewer observations or is below 0.1 for more than 150 observations. If the highest-order ARMA coefficient is found to be insignificant, then the order of the ARMA model is reduced. For example, if AUTOMDL identifies a (3 1 1)(0 0 1) model and the parameter estimate of the seasonal MA lag of order 1 is -0.09 and its t value is -0.55 , then the ARIMA model is reduced to at least (3 1 1)(0 0 0). After the model is reestimated, the check for insignificant coefficients is performed again. If ARMACV=0.54 is specified in the preceding example, then the coefficient is not found to be insignificant and the model is not reduced.

If a constant is allowed in the model and if the t value associated with the constant parameter estimate is below the ARMACV= critical value, then the constant is considered to be insignificant and is removed from the model. Note that if a constant is added to or removed from the model and then the ARIMA model changes, then the t statistic for the constant parameter estimate also changes. Thus, changing the ARMACV= value does not necessarily add or remove a constant term from the model.

The value specified in the ARMACV= option should be greater than zero. The default value is 1.0.

BALANCED

specifies that the automatic modeling procedure prefer balanced models over unbalanced models. A balanced model is one in which the sum of the AR, seasonal AR, differencing, and seasonal differencing orders equals the sum of the MA and seasonal MA orders. Specifying BALANCED gives the same preference as the TRAMO program. If BALANCED is not specified, all models are given equal consideration.

DIFFORDER=(nonseasonal-order, seasonal-order)

specifies the fixed orders of differencing to be used in the automatic ARIMA model identification procedure. When the DIFFORDER= option is used, only the AR and MA orders are automatically identified. Acceptable values for the regular (nonseasonal) differencing orders are 0, 1, and 2; acceptable values for the seasonal differencing orders are 0 and 1. If the MAXDIFF= option is also specified, then the DIFFORDER= option is ignored. There are no default values for DIFFORDER. If neither the DIFFORDER= option nor the MAXDIFF= option is specified, then the default is MAXDIFF=(2,1).

HRINITIAL

specifies that Hannan-Rissanen estimation be done before exact maximum likelihood estimation to provide initial values. If the HRINITIAL option is specified, then models for which the Hannan-Rissanen estimation has an unacceptable coefficient are rejected.

LJUNGBOXLIMIT=value

specifies acceptance criteria for the confidence coefficient of the Ljung-Box Q statistic. If the Ljung-Box Q for a final model is greater than this value, the model is rejected, the outlier critical value is reduced, and outlier identification is redone with the reduced value. See the [REDUCECV](#) option for more information. The value specified in the LJUNGBOXLIMIT= option must be greater than 0 and less than 1. The default value is 0.95.

MAXDIFF=(nonseasonal-order, seasonal-order)

specifies the maximum orders of regular and seasonal differencing for the automatic identification of differencing orders. When MAXDIFF is specified, the differencing orders are identified first, and then the AR and MA orders are identified. Acceptable values for the regular differencing orders are 1 and 2. The only acceptable value for the seasonal differencing order is 1. If both the MAXDIFF= option and the DIFFORDER option= are specified, then the DIFFORDER= option is ignored. If neither the DIFFORDER= nor the MAXDIFF= option is specified, the default is MAXDIFF=(2,1).

MAXORDER=(nonseasonal-order, seasonal-order)

specifies the maximum orders of nonseasonal and seasonal ARMA polynomials for the automatic ARIMA model identification procedure. The maximum order for the nonseasonal ARMA parameters is 4, and the maximum order for the seasonal ARMA is 2.

NOINT

suppresses the fitting of a constant or intercept parameter in the model.

PRINT=(value-list)

specifies the tables to be displayed in the output. You can specify the following values in *value-list*:

NONE	suppresses all automatic modeling output.
ALL	includes all automatic modeling tables in the output if NONE is not specified.
ONLY	specifies that only the listed tables be output.
AUTOCHOICE	displays the tables titled “Comparison of Automatically Selected Model and Default Model” and “Final Automatic Model Selection.” The “Comparison of Automatically Selected Model and Default Model” table compares a default model to the model chosen by the TRAMO-based automatic modeling method. The “Final Automatic Model Selection” table indicates which model has been chosen automatically. These tables are output by default unless NONE or ONLY is specified in the PRINT= option.
AUTOCHOICEMDL	displays the table “Models Estimated by Automatic ARIMA Model Selection Procedure.” This table summarizes the various models that were considered by the TRAMO automatic model selection method and their measures of fit.
BEST5MODEL	displays the table “Best Five ARIMA Models Chosen by Automatic Modeling.” This table ranks the five best models that were considered by the TRAMO automatic modeling method.
UNITROOTTEST	causes the table titled “Results of Unit Root Test for Identifying Orders of Differencing” to be printed. This table displays the orders that were automatically selected by the AUTOMDL statement. Unless the nonseasonal and seasonal differences are specified using the DIFFORDER= option, the AUTOMDL statement automatically identifies the orders of differencing. These tables are output by default unless NONE or ONLY is specified in the PRINT= option.
UNITROOTTESTMDL	displays the table titled “ARIMA Estimates for Unit Root Identification.” This table summarizes the various models that were considered by the TRAMO automatic selection method while identifying the orders of differencing and the statistics associated with those models. The unit root identification method first attempts to obtain the coefficients by using the Hannan-Rissanen method. If Hannan-Rissanen estimation cannot be performed, the algorithm attempts to obtain the coefficients by using conditional likelihood estimation.

The default output tables are the tables specified by the AUTOCHOICE and UNITROOTTEST options.

REDUCECV=value

specifies the percentage by which the outlier critical value be reduced when a final model is found to have an unacceptable confidence coefficient for the Ljung-Box Q statistic. This value should be between 0 and 1. The default value is 0.14286.

BY Statement

BY *variables* ;

A BY statement can be used with PROC X12 to obtain separate analyses on observations in groups defined by the BY variables. When a BY statement appears, the procedure expects the input DATA= data set to be sorted in order of the BY variables.

CHECK Statement

CHECK *options* ;

The CHECK statement produces statistics for diagnostic checking of residuals from the estimated regARIMA model.

The following tables that are associated with diagnostic checking are displayed in the output: “Autocorrelation of regARIMA Model Residuals,” “Partial Autocorrelation of regARIMA Model Residuals,” “Autocorrelation of Squared regARIMA Model Residuals,” “Outliers of the Unstandardized Residuals,” “Summary Statistics for the Unstandardized Residuals,” “Normality Statistics for regARIMA Model Residuals,” and “Table G Rs: 10*LOG(SPECTRUM) of the regARIMA Model Residuals.” If ODS graphics is enabled, the following plots that are associated with diagnostic checking output are produced: the autocorrelation function (ErrorACF) plot of the residuals, the partial autocorrelation function (ErrorPACF) plot of the residuals, the autocorrelation function (SqErrorACF) plot of the squared residuals, a histogram (ResidualHistogram) of the residuals, and a spectral plot (SpectralPlot) of the residuals. See the **PLOTS=RESIDUAL** option in the PROC X12 statement for further information about controlling the display of plots.

The residual histogram displayed by the X12 procedure shows the distribution of the unstandardized, uncentered regARIMA model residuals; the residual histogram displayed by the U.S. Census Bureau’s X-12-ARIMA seasonal adjustment program displays standardized and mean-centered residuals.

The following *options* can appear in the CHECK statement:

MAXLAG=*value*

specifies the number of lags for the residual sample autocorrelation function (ACF) and partial autocorrelation function (PACF). The default is 36 for monthly series and 12 for quarterly series. The minimum value for MAXLAG= is 1.

For the table “Autocorrelation of Squared regARIMA Model Residuals” and the corresponding SqErrorACF plot, the maximum number of lags calculated is 12 for monthly series and 4 for quarterly series. The MAXLAG= option can only reduce the number of lags for this table and plot.

PRINT=ALL | NONE**PRINT=ACF | ACFSQUARED | NORM | PACF****PRINT=RESIDUALOUTLIER | RESIDUALSTATISTICS | SPECRESIDUAL****PRINT=(options)**

specifies the diagnostic checking tables to be displayed. If the PRINT= option is not specified, the default is equivalent to specifying PRINT=(ACF ACFSQUARED NORM RESIDUALOUTLIER RESIDUALSTATISTICS SPECRESIDUAL). If PRINT=NONE is specified and no other PRINT= option is specified, then none of the tables that are associated with diagnostic checking are displayed. However, PRINT=NONE has no effect if other PRINT= options are specified in the CHECK statement. PRINT=ALL specifies that all tables related to diagnostic checking be displayed.

PRINT=ACF displays the table titled “Autocorrelation of regARIMA Model Residuals.”

PRINT=ACFSQUARED displays the table titled “Autocorrelation of Squared regARIMA Model Residuals.”

PRINT=NORM displays the table titled “Normality Statistics for regARIMA Model Residuals”. Measures of normality included in this table are skewness, Geary’s a statistic, and kurtosis.

PRINT=PACF displays the table titled “Partial Autocorrelation of regARIMA Model Residuals.”

PRINT=RESIDUALOUTLIER or PRINT=RESOUTLIER displays the table “Outliers of the Unstandardized Residuals” if the residuals contain outliers.

PRINT=RESIDUALSTATISTICS or PRINT=RESSTAT displays the table titled “Summary Statistics for the Unstandardized Residuals.”

ESTIMATE Statement

ESTIMATE *options* ;

The ESTIMATE statement estimates the regARIMA model. The regARIMA model is specified by the REGRESSION, INPUT, EVENT, and ARIMA statements or by the MDLINFOIN= data set in the PROC X12 statement. Estimation output includes point estimates and standard errors for all estimated AR, MA, and regression parameters; the maximum likelihood estimate of the variance σ^2 ; t statistics for individual regression parameters; χ^2 statistics for assessing the joint significance of the parameters associated with certain regression effects (if included in the model); and likelihood-based model selection statistics (if the exact likelihood function is used). The regression effects for which χ^2 statistics are produced are fixed seasonal effects.

Tables displayed in the output associated with estimation are “Exact ARMA Likelihood Estimation Iteration Tolerances,” “Average Absolute Percentage Error in within-Sample Forecasts,” “ARMA Iteration History,” “AR/MA Roots,” “Exact ARMA Likelihood Estimation Iteration Summary,” “Regression Model Parameter Estimates,” “Chi-Squared Tests for Groups of Regressors,” “Exact ARMA Maximum Likelihood Estimation,” and “Estimation Summary.”

The following *options* can appear in the ESTIMATE statement:

ITPRINT

specifies that the “Iteration History” table be displayed. This table includes detailed output for estimation iterations, including log-likelihood values, parameters, counts of function evaluations, and iterations. It is useful to examine the “Iteration History” table when errors occur within estimation iterations. By default, only successful iterations are displayed, unless the PRINTERR option is specified. An unsuccessful iteration is an iteration that is restarted due to a problem such as a root inside the unit circle. Successful iterations have a status of 0. If restarted iterations are displayed, a note at the end of the table gives definitions for status codes that indicate a restarted iteration. For restarted iterations, the number of function evaluations and the number of iterations is –1, which is displayed as missing. If regression parameters are included in the model, then both IGLS and ARMA iterations are included in the table. The number of function evaluations is a cumulative total.

MAXITER=*value*

specifies the maximum number of iterations used in estimating the AR and MA parameters. For models with regression variables, this limit applies to the total number of ARMA iterations over all iterations of the iterative generalized least squares (IGLS) algorithm. For models without regression variables, this is the maximum number of iterations allowed for the set of ARMA iterations. The default is MAXITER=200.

PRINTERR

causes restarted iterations to be included in the “Iteration History” table if ITPRINT is specified; creates the “Restarted Iterations” table if ITPRINT is not specified. Whether or not PRINTERR is specified, a WARNING message is printed to the log file if any iteration is restarted during estimation.

TOL=*value*

specifies the convergence tolerance for the nonlinear estimation. Absolute changes in the log-likelihood are compared to the TOL= value to check convergence of the estimation iterations. For models with regression variables, the TOL= value is used to check convergence of the IGLS iterations (where the regression parameters are reestimated for each new set of AR and MA parameters). For models without regression variables, there are no IGLS iterations, and the TOL= value is then used to check convergence of the nonlinear iterations that are used to estimate the AR and MA parameters. The default value is TOL=0.00001. The minimum tolerance value is a positive value based on the machine precision and the length of the series. If a tolerance less than the minimum supported value is specified, an error message is displayed and the series is not processed.

EVENT Statement

EVENT *variables* < / *options* > ;

The EVENT statement specifies events to be included in the regression portion of the regARIMA model. Multiple EVENT statements can be specified. If a MDLINFOIN= data set is not specified in the PROC X12 statement, then all variables specified in the EVENT statements are applied to all BY groups and all time series that are processed. If a MDLINFOIN= data set is specified, then the EVENT statements apply only if no regression information for the BY group and series is available in the MDLINFOIN= data set. The

events specified in the EVENT statements either must be SAS predefined events or must be defined in the data set specified in the **INEVENT=SAS-data-set** option in the PROC X12 statement. For a summary of SAS predefined events, see the section “[SAS Predefined Events](#)” on page 2512.

The EVENT statement can also be used to include outlier, level shift, and temporary change regressors that are available as predefined U.S. Census Bureau variables in the X-12-ARIMA program. For example, the following statements specify an additive outlier in January 1970 and a level shift that begins in July 1971:

```
proc x12 data=ICMETI seasons=12 start=jan1968;
  event AO01JAN1970D CBLS01JUL1971D;
```

The following statements specify an additive outlier in the second quarter 1970 and a temporary change that begins in the fourth quarter 1971:

```
proc x12 data=ICMETI seasons=4 start='1970q1';
  event AO01APR1970D TC01OCT1971D;
```

The following *options* can appear in the EVENT statement:

B=(value <F> ...)

specifies initial or fixed values for the EVENT parameters. For details about the B= option, see **B=(value <F> ...)** in the section “[REGRESSION Statement](#)” on page 2499.

USERTYPE=(value)

enables a user-defined variable to be processed in the same manner as a U.S. Census predefined variable. *value* can be AO, CONSTANT, EASTER, HOLIDAY, LABOR, LOM, LOMSTOCK, LOQ, LPYEAR, LS, RP, SCEASTER, SEASONAL, TC, TD, TDSTOCK, THANKS, or USER. For details about the USERTYPE= option, see the **USERTYPE=** option in the section “[REGRESSION Statement](#)” on page 2499.

FORECAST Statement

FORECAST *options* ;

The FORECAST statement uses the estimated model to forecast the time series. The output contains point forecasts and forecast statistics for the transformed and original series. Whenever forecasts or backcasts (or both) are generated and seasonal adjustment is performed, the forecasts and backcasts are appended to the original series, and the seasonal adjustment procedures are applied to the forecast or backcast (or both) extended series. If the FORECAST statement is not specified, but a regARIMA model is specified using either the ARIMA or AUTOMDL statement, then the series is extended one year ahead by default.

Tables that contain forecasts, standard errors, and confidence limits are displayed in association with the FORECAST statement. If the data is transformed, then two tables are displayed: one table for the original data, and one table for the transformed data. Data from these tables can be output to a SAS data set using ODS. The auxiliary variable **_SCALE_** is included in forecast data sets that are output using ODS. The value of **_SCALE_** is “Original” or “Transformed” to indicate the scale of the data. The auxiliary variable can

also be used in ODS SELECT and ODS OUTPUT statements. For example, you can specify the following statements to output the forecasts on the original scale to a data set forecasts and the forecasts on the transformed scale to a data set Tforecasts:

```
ods output Original.ForecastCL=forecasts;
ods output Transformed.ForecastCL=Tforecasts;
```

The following *options* can appear in the FORECAST statement:

LEAD=value

specifies the number of periods ahead to forecast for regARIMA extension of the series. The default is the number of periods in a year (4 or 12), and the maximum is 60. Setting LEAD=0 specifies that the series not be extended by forecasts for seasonal adjustment. The LEAD= value also controls the number of forecasts that are displayed in Table D10.A. However, if the series is not extended by forecasts (LEAD=0), then the default year of forecasts is displayed in Table D10.A. Forecast values in Table D10.A are calculated using the method shown on page 148 of Ladiray and Quenneville (2001) based on values that are displayed in Table D10. The regARIMA forecasts affect the D10.A forecasts only indirectly through the impact of the regARIMA forecasts on the seasonal factors that are shown in Table D10.

NBACKCAST=value

BACKCAST=value

NBACK=value

specifies the number of periods to backcast for regARIMA extension of the series. The default is NBACKCAST=0, which specifies that the series not be extended with backcasts. The maximum number of backcasts is 60. The NBACKCAST= value also controls the number of backcasts that are output to the OUT= data set specified in the OUTPUT statement when the OUTBACKCAST option is specified.

OUT1STEP

specifies that the one-step-ahead forecasts be computed and displayed in addition to the multistep forecasts. The default is to compute and display only the multistep forecasts beginning at the forecast horizon.

OUTBACKCAST

OUTBKCAST

determines whether backcasts are included in certain tables sent to the output data set. If OUTBACKCAST is specified, then backcast values are included in the output data set for tables A6, A7, A8, A9, A10, B1, D10, D10B, D10D, D16, D16B, and D18. The default is not to include backcasts.

OUTFCST

OUTFORECAST

determines whether forecasts are included in certain tables sent to the output data set. If OUTFORECAST is specified, then forecast values are included in the output data set for tables A6, A7, A8, A9, A10, B1, D10, D10B, D10D, D16, D16B, and D18. The default is not to include forecasts. The OUTFORECAST option can be specified in either the [X11](#) statement or the FORECAST statement with identical results.

ID Statement

ID *variables* ;

If you are creating an output data set, use the ID statement to copy values of the ID variables, in addition to the table values, into the output data set. Or, if the VAR statement is omitted, all numeric variables that are not identified as BY variables, ID variables, the DATE= variable, or user-defined regressors are processed as time series. The ID statement has no effect when a VAR statement is specified and an output data set is not created. If the DATE= variable is specified in the PROC X12 statement, this variable is included automatically in the OUTPUT data set. If no DATE= variable is specified, the variable `_DATE_` is added.

The date variable (or `_DATE_`) values outside the range of the actual data (from forecasting) are extrapolated, while all other ID variables are missing in the forecast horizon.

IDENTIFY Statement

IDENTIFY *options* ;

The IDENTIFY statement produces plots of the sample autocorrelation function (ACF) and partial autocorrelation function (PACF) for identifying the ARIMA part of a regARIMA model. The sample ACF and PACF are produced for all combinations of the nonseasonal and seasonal differences of the data specified by the DIFF= and SDIFF= options.

The original series is first transformed as specified in the **TRANSFORM** statement.

If the model includes a regression component (specified using the REGRESSION, INPUT, and EVENT statements or the MDLINFOIN= data set in the PROC X12 statement), both the transformed series and the regressors are differenced at the highest order that is specified in the DIFF= and SDIFF= option. The parameter estimates are calculated using the differenced data. Then the undifferenced regression effects (with the exception of a constant term) are removed from the undifferenced data to produce undifferenced regression residuals. The ACFs and PACFs are calculated for the specified differences of the undifferenced regression residuals.

If the model does not include a regression component, then the ACFs and PACFs are calculated for the specified differences of the transformed data.

Tables displayed in association with identification are “Autocorrelation of Model Residuals” and “Partial Autocorrelation of Model Residuals.” If the model includes a regression component (specified using the REGRESSION, INPUT, and EVENT statements or the MDLINFOIN= data set in the PROC X12 statement), then the “Regression Model Parameter Estimates” table is also displayed if the PRINTREG option is specified.

The following *options* can appear in the IDENTIFY statement:

DIFF=(order, order, order)

specifies orders of nonseasonal differencing to use in model identification. The value 0 specifies no differencing, the value 1 specifies one nonseasonal difference $(1 - B)$, the value 2 specifies two nonseasonal differences $(1 - B)^2$, and so forth. The ACFs and PACFs are produced for all orders of nonseasonal differencing specified, in combination with all orders of seasonal differencing that are specified in the SDIFF= option. The default is DIFF=(0). You can specify up to three values for nonseasonal differences.

MAXLAG=value

specifies the number of lags for the sample autocorrelation function (ACF) and partial autocorrelation function (PACF) of the regression residuals for model identification. The default is 36 for monthly series and 12 for quarterly series. MAXLAG applies to both tables and plots. The minimum value for MAXLAG= is 1.

PRINTREG

causes the “Regression Model Parameter Estimates” table to be printed if the REGRESSION statement is present. By default, this table is not printed.

SDIFF=(order, order, order)

specifies orders of seasonal differencing to use in model identification. The value 0 specifies no seasonal differencing, the value 1 specifies one seasonal difference $(1 - B^s)$, the value 2 specifies two seasonal differences $(1 - B^s)^2$, and so forth. The value for s corresponds to the period specified in the SEASONS= option in the PROC X12 statement. The value of the SEASONS= option is supplied explicitly or is implicitly supplied through the INTERVAL= option or the values of the DATE= variable. The ACFs and PACFs are produced for all orders of seasonal differencing specified, in combination with all orders of nonseasonal differencing specified in the DIFF= option. The default is SDIFF=(0). You can specify up to three values for seasonal differences.

For example, the following statement produces ACFs and PACFs for two levels of differencing: $(1 - B)$ and $(1 - B)(1 - B^s)$:

```
identify diff=(1) sdiff=(0, 1);
```

INPUT Statement

INPUT *variables* < / *options* > ;

The INPUT statement specifies variables in the PROC X12 DATA= or AUXDATA= data set that are to be used as regressors in the regression portion of the regARIMA model. The variables in the data set should contain the values for each observation that define the regressor. Future values of regression variables should also be included in the DATA= data set if the time series listed in the VAR statement is to be extended with regARIMA forecasts. Multiple INPUT statements can be specified. If a MDLINFOIN= data set is not specified in the PROC X12 statement, then all variables listed in the INPUT statements are applied to all BY groups and all time series that are processed. If a MDLINFOIN= data set is specified, then the INPUT statements apply only if no regression information for the BY group and series is available in the MDLINFOIN= data set.

The following *options* can appear in the INPUT statement:

B=(value <F> ...)

specifies initial or fixed values for the INPUT variable parameters. For details about the B= option, see the **B=(value <F> ...)** option in the section “[REGRESSION Statement](#)” on page 2499.

USERTYPE=(value)

enables a user-defined variable to be processed in the same manner as a U.S. Census predefined variable. *value* can be AO, CONSTANT, EASTER, HOLIDAY, LABOR, LOM, LOMSTOCK, LOQ, LPYEAR, LS, RP, SCEASTER, SEASONAL, TC, TD, TDSTOCK, THANKS, or USER. For details about the USERTYPE= option, see the **USERTYPE=** option in the section “[REGRESSION Statement](#)” on page 2499.

OUTLIER Statement

OUTLIER *options* ;

The OUTLIER statement specifies that the X12 procedure perform automatic detection of additive point outliers, temporary change outliers, level shifts, or any combination of the three when using the specified model. After outliers are identified, the appropriate regression variables are incorporated into the model as “Automatically Identified Outliers,” and the model is reestimated. This procedure is repeated until no additional outliers are found.

The OUTLIER statement also identifies potential outliers and lists them in the table “Potential Outliers” in the displayed output. Potential outliers are identified by decreasing the critical value by 0.5.

In the output, the default initial critical values used for outlier detection in a given analysis are displayed in the table “Critical Values to Use in Outlier Detection.” Outliers that are detected and incorporated into the model are displayed in the output in the table “Regression Model Parameter Estimates,” where the regression variable is listed as “Automatically Identified.”

The following *options* can appear in the OUTLIER statement:

AOCV=value

specifies a critical value to use for additive point outliers. If AOCV is specified, this value overrides any default critical value for AO outliers. See the [CV= option](#) for more details.

CV=value

specifies an initial critical value to use for detection of all types of outliers. The absolute value of the *t* statistic associated with an outlier parameter estimate is compared with the critical value to determine the significance of the outlier. If the CV= option is not specified, then the default initial critical value is computed using a formula presented by Ljung (1993), which is based on the number of observations or model span used in the analysis. [Table 37.2](#) gives default critical values for various series lengths. Increasing the critical value decreases the sensitivity of the outlier detection routine and can reduce the number of observations treated as outliers. The automatic model identification process might lower the critical value by a certain percentage if the automatic model identification process fails to identify an acceptable model.

Table 37.2 Default Critical Values for Outlier Identification

Number of Observations	Outlier Critical Value
1	1.96
2	2.24
3	2.44
4	2.62
5	2.74
6	2.84
7	2.92
8	2.99
9	3.04
10	3.09
11	3.13
12	3.16
24	3.42
36	3.55
48	3.63
72	3.73
96	3.80
120	3.85
144	3.89
168	3.92
192	3.95
216	3.97
240	3.99
264	4.01
288	4.03
312	4.04
336	4.05
360	4.07

LSCV=*value*

specifies a critical value to use for level shift outliers. If LSCV is specified, this value overrides any default critical value for LS outliers. See the [CV= option](#) for more details.

SPAN=(*mmmyy* ,*mmmyy*)**SPAN=**('yyQq' ,*'yyQq'*)

specifies the dates of the first and last observations to define a subset for searching for outliers. A single date in parentheses is interpreted to be the starting date of the subset. To specify only the ending date, use SPAN=(*mmmyy*) or SPAN=('yyQq'). If the starting or ending date is omitted, then the first or last date, respectively, of the input data set or BY group is assumed. Because the dates are input as strings and the quarterly dates begin with a numeric character, the specification for a quarterly date must be enclosed in quotation marks. A four-digit year can be specified. If a two-digit year is specified, the value specified in the YEARCUTOFF= SAS system option applies.

TCCV=value

specifies a critical value to use for temporary change outliers. If TCCV is specified, this value overrides any default critical value for TC outliers. See the [CV= option](#) for more details.

TYPE=NONE**TYPE=(outlier types)**

lists the outlier types to be detected by the automatic outlier identification method. TYPE=NONE turns off outlier detection. The valid outlier types are AO, LS, and TC. The default is TYPE=(AO LS).

OUTPUT Statement

OUTPUT OUT= *SAS-data-set* < **YEARSEAS** > *tablename1 tablename2 ...* ;

The OUTPUT statement creates an output data set that contains specified tables. The data set is named by the OUT= option.

OUT=SAS-data-set

names the data set to contain the specified tables. If the OUT= option is omitted, the data set is named using the default DATA*n* convention.

YEARSEAS**YRSEAS**

specifies that two additional variables be added to the OUT= data set. The two additional variables are the variables `_YEAR_` and `_SEASON_`. The variable `_YEAR_` contains the year of the date identifying the observation. The variable `_SEASON_` contains the month for monthly data, or quarter for quarterly data, of the date that identifies the observation. For monthly data, the value of `_SEASON_` is between 1 and 12. For quarterly data, the value of `_SEASON_` is between 1 and 4. The `_YEAR_` and `_SEASON_` variables are useful when creating seasonal plots.

tablename1 tablename2 ...

For each table to be included in the output data set, you must specify the X12 *tablename* keyword. The keyword corresponds to the title label used by the U.S. Census Bureau X12-ARIMA software. Currently available tables are A1, A2, A6, A7, A8, A8AO, A8LS, A8TC, A9, A10, A19, B1, C17, C20, D1, D7, D8, D9, D10, D10B, D10D, D11, D11A, D11F, D11R, D12, D13, D16, D16B, D18, E1, E2, E3, E5, E6, E6A, E6R, E7, E8, and MV1. If no table is specified in the OUTPUT statement, Table A1 is output to the OUT= data set by default.

The *tablename* keywords that can be used in the OUTPUT statement are listed in the section “[Displayed Output, ODS Table Names, and OUTPUT Tablename Keywords](#)” on page 2519. The following is an example of a VAR statement and an OUTPUT statement:

```
var sales costs;
output out=out_x12 b1 d11;
```

The default variable name used in the output data set is the input variable name followed by an underscore and the corresponding table name. The variable `sales_B1` contains the Table B1 values

for the variable `sales`, the variable `costs_B1` contains the Table B1 values for the variable `costs`, the variable `sales_D11` contains the Table D11 values for the variable `sales`, and the variable `costs_D11` contains the Table D11 values for the variable `costs`. If necessary, the variable name is shortened so that the table name can be added. If the `DATE=` variable is specified in the PROC X12 statement, then that variable is included in the output data set; otherwise, a variable named `_DATE_` is written to the `OUT=` data set as the date identifier.

REGRESSION Statement

REGRESSION PREDEFINED= *variables* < / **B=**(*value* < **F**>) > ;

REGRESSION USERVAR= *variables* < / **B=**(*value* < **F**>) **USERTYPE=***option* > ;

The REGRESSION statement includes regression variables in a regARIMA model or specifies regression variables whose effects are to be removed by the IDENTIFY statement to aid in ARIMA model identification. Predefined regression variables are selected with the PREDEFINED= option. User-defined regression variables are specified with the USERVAR= option. The currently available predefined variables are listed in Table 37.3. Table A6 in the displayed output generated by the X12 procedure provides information related to trading day effects. Table A7 provides information related to holiday effects. Tables A8, A8AO, A8LS, and A8TC provide information related to outlier factors. Ramps and level shifts are combined in the A8LS table. The A8AO, A8LS, and A8TC tables are available only when more than one outlier type is present in the model. Table A9 provides information about user-defined regression effects. Table A10 provides information about the user-defined seasonal component. Missing values in the span of an input series automatically create missing value regressors. See the NOTRIMMISS option in the PROC X12 statement and the section “Missing Values” on page 2512 for further details about missing values. Combining your model with additional predefined regression variables can result in a singularity problem. If a singularity occurs, then you might need to alter either the model or the choices of the predefined regressors in order to successfully perform the regression.

In order to seasonally adjust a series that uses a regARIMA model, the factors derived from regression are used as multiplicative or additive factors based on the mode of seasonal decomposition. Therefore, regressors should be defined that are appropriate to the mode of the seasonal decomposition, so that meaningful combined adjustment factors can be derived and adjustment diagnostics can be generated. For example, if a regARIMA model is applied to a log-transformed series, then the regression factors are expressed as ratios, which match the form of the seasonal factors that are generated by the multiplicative or log-additive adjustment modes. Conversely, if a regARIMA model is fit to the original series, then the regression factors are measured on the same scale as the original series, which matches the scale of the seasonal factors that are generated by the additive adjustment mode. Note that the default transformation (no transformation) and the default seasonal adjustment mode (multiplicative) are in conflict. Thus when you specify the X11 statement and any of the REGRESSION, INPUT, or EVENT statements, you must also specify either a transformation by using the TRANSFORM statement or a different mode by using the MODE= option in the X11 statement in order to seasonally adjust the data that uses the regARIMA model.

According to Ladiray and Quenneville (2001), “X-12-ARIMA is based on the same principle [as the X-11 method] but proposes, in addition, a complete module, called Reg-ARIMA, that allows for the initial series to be corrected for all sorts of undesirable effects. These effects are estimated using regression models with ARIMA errors (Findley et al. [23]).” The REGRESSION, INPUT, and EVENT statements specify these

regression effects. Predefined effects that can be corrected in this manner are listed in the **PREDEFINED=** option. You can create your own definitions to remove other effects by using the **USERVAR=** option and the **EVENT** statement.

Either the **PREDEFINED=** option or the **USERVAR=** option can be specified in a single **REGRESSION** statement, but not both. Multiple **REGRESSION** statements can be used.

The following *options* can appear in the **REGRESSION** statement.

PREDEFINED=CONSTANT

PREDEFINED=EASTER(*value*)

PREDEFINED=LABOR(*value*)

PREDEFINED=LOM

PREDEFINED=LOMSTOCK

PREDEFINED=LOQ

PREDEFINED=LPYEAR

PREDEFINED=SCEASTER(*value*)

PREDEFINED=SEASONAL

PREDEFINED=SINCOS(*value* ...)

PREDEFINED=TD

PREDEFINED=TD1COEF

PREDEFINED=TD1NOLPYEAR

PREDEFINED=TDNOLPYEAR

PREDEFINED=TDSTOCK(*value*)

PREDEFINED=THANK(*value*)

lists the predefined regression variables to be included in the model. Data values for these variables are calculated by the program, mostly as functions of the calendar. [Table 37.3](#) gives definitions for the available predefined variables. The values **LOM** and **LOQ** are equivalent: the actual regression is controlled by the **SEASONS=** option in the **PROC X12** statement. Multiple predefined regression variables can be used. The syntax for using both a length-of-month and a seasonal regression can be in one of the following forms:

```
regression predefined=lom seasonal;
```

```
regression predefined=(lom seasonal);
```

```
regression predefined=lom predefined=seasonal;
```

Certain restrictions apply when you use more than one predefined regression variable. Only one of **TD**, **TDNOLPYEAR**, **TD1COEF**, or **TD1NOLPYEAR** can be specified. **LPYEAR** cannot be used with **TD**, **TD1COEF**, **LOM**, **LOMSTOCK**, or **LOQ**. **LOM** or **LOQ** cannot be used with **TD** or **TD1COEF**.

The following restriction also applies to the **SINCOS** predefined regression variable. If **SINCOS** is specified, then the **INTERVAL=** option or the **SEASONS=** option in the **PROC X12** statement must also be specified because there are restrictions to this regression variable based on the frequency of the data.

The predefined regression variables TDSTOCK, SCEASTER, EASTER, LABOR, THANK, and SINCOS require extra parameters. Only one TDSTOCK regressor can be implemented in the regression model. If multiple TDSTOCK variables are specified, PROC X12 uses the last TDSTOCK variable specified. For SCEASTER, EASTER, LABOR, THANK, and SINCOS, multiple regressors can be implemented in the model by specifying the variables with different parameters. For example, the following statement specifies two EASTER regressors with widths 7 and 14:

```
regression predefined=easter(7) easter(14);
```

For SINCOS, specifying a parameter includes both the sine and the cosine regressor except for the highest order allowed (2 for quarterly data and 6 for monthly data.) The most common use of the SINCOS variable for quarterly data is

```
regression predefined=sincos(1,2);
```

and for monthly data is

```
regression predefined=sincos(1,2,3,4,5,6);
```

These statements include 3 and 11 regressors in the model, respectively.

Table 37.3 Predefined Regression Variables in X-12-ARIMA

Regression Effect	Variable Definitions
Trend constant CONSTANT	$(1 - B)^{-d}(1 - B^s)^{-D}I(t \geq 1),$ where $I(t \geq 1) = \begin{cases} 1 & \text{for } t \geq 1 \\ 0 & \text{for } t < 1 \end{cases}$
Easter holiday EASTER(<i>w</i>)	$E(w, t) = \frac{1}{w} \times n_t$ and n_t is the number of the <i>w</i> days before Easter that fall in month (or quarter) <i>t</i> . (Note: This variable is 0 except in February, March, and April (or first and second quarter). It is nonzero in February only for $w > 22$.) Restriction: $1 \leq w \leq 25$.
Labor Day LABOR(<i>w</i>)	$L(w, t) = \frac{1}{w} \times [\text{no. of the } w \text{ days before Labor Day that fall in month } t]$ (Note: This variable is 0 except in August and September.) Restriction: $1 \leq w \leq 25$.
Length-of-month (monthly flow) LOM	$m_t - \bar{m}$ where m_t = length of month <i>t</i> (in days) and $\bar{m} = 30.4375$ (average length of month)

Table 37.3 continued

Regression Effect	Variable Definitions
Stock length-of-month LOMSTOCK	$SLOM_t = \begin{cases} m_t - \bar{m} - \mu(l) & \text{for } t = 1 \\ SLOM_{t-1} + m_t - \bar{m} & \text{otherwise} \end{cases}$ <p>where \bar{m} and m_t are defined in LOM and</p> $\mu(l) = \begin{cases} 0.375 & \text{when first February in series is a leap year} \\ 0.125 & \text{when second February in series is a leap year} \\ -0.125 & \text{when third February in series is a leap year} \\ -0.375 & \text{when fourth February in series is a leap year} \end{cases}$
Length-of-quarter (quarterly flow) LOQ	$q_t - \bar{q}$ where q_t = length of quarter t (in days) and $\bar{q} = 91.3125$ (average length of quarter)
Leap year (monthly and quarterly flow) LPYEAR	$LY_t = \begin{cases} 0.75 & \text{in leap year February (first quarter)} \\ -0.25 & \text{in other Februaries (first quarter)} \\ 0 & \text{otherwise} \end{cases}$
Statistics Canada Easter (monthly or quarterly flow) SCEASTER(w)	<p>If Easter falls before April w, let n_E be the number of the w days on or before Easter that fall in March. Then:</p> $E(w, t) = \begin{cases} n_E/w & \text{in March} \\ -n_E/w & \text{in April} \\ 0 & \text{otherwise} \end{cases}$ <p>If Easter falls on or after April w, then $E(w, t) = 0$. (Note: This variable is 0 except in March and April (or first and second quarter).) Restriction: $1 \leq w \leq 24$.</p>
Fixed seasonal SEASONAL	$M_{1,t} = \begin{cases} 1 & \text{in January} \\ -1 & \text{in December} \\ 0 & \text{otherwise} \end{cases}$ $, \dots, M_{11,t} = \begin{cases} 1 & \text{in November} \\ -1 & \text{in December} \\ 0 & \text{otherwise} \end{cases}$
Fixed seasonal SINCOS(j) SINCOS(j_1, \dots, j_n)	$\sin(w_j t), \cos(w_j t)$, where $w_j = 2\pi j/s$, $1 \leq j \leq s/2$ and s is the seasonal period (drop $\sin(w_j t) \equiv 0$ for $j = s/2$) Restrictions: $1 \leq j_i \leq s/2$, $1 \leq n \leq s/2$.

Table 37.3 continued

Regression Effect	Variable Definitions
Trading day TD, TDNOLPYEAR	$T_{1,t} = (\text{number of Mondays}) - (\text{number of Sundays})$ $, \dots, T_{6,t} = (\text{number of Saturdays}) - (\text{number of Sundays})$
One coefficient trading day TD1COEF, TD1NOLPYEAR	$(\text{number of weekdays}) - \frac{5}{2}(\text{number of Saturdays and Sundays})$
Stock trading day TDSTOCK(w)	$D_{1,t} = \begin{cases} 1 & \tilde{w}^{th} \text{ day of month } t \text{ is a Monday} \\ -1 & \tilde{w}^{th} \text{ day of month } t \text{ is a Sunday} \\ 0 & \text{otherwise} \end{cases}$ $, \dots, D_{6,t} = \begin{cases} 1 & \tilde{w}^{th} \text{ day of month } t \text{ is a Saturday} \\ -1 & \tilde{w}^{th} \text{ day of month } t \text{ is a Sunday} \\ 0 & \text{otherwise} \end{cases}$ <p>where \tilde{w} is the smaller of w and the length of month t. For end-of-month stock series, set w to 31; that is, specify TDSTOCK(31). Restriction: $1 \leq w \leq 31$.</p>
Thanksgiving THANK(w)	$ThC(w, t) = \text{proportion of days from } w \text{ days before Thanksgiving through December 24 that fall in month } t$ (negative values of w indicate days after Thanksgiving). (Note: This variable is 0 except in November and December.) Restriction: $-8 \leq w \leq 17$.

USERVAR=(variables)

specifies variables in the PROC X12 DATA= or AUXDATA= data set that are to be used as regressors. The variables in the data set should contain the values for each observation that define the regressor. Regression variables should also include future values in the data set for the forecast horizon if the time series is to be extended with regARIMA forecasts. Missing values are not permitted within the data span, including forecasts, of the user-defined regressors. [Example 37.6](#) shows how to create an input data set that contains both the series to be seasonally adjusted and a user-defined input variable. All regression variables in the USERVAR= option apply to all time series to be seasonally adjusted unless the MDLINFOIN= data set specifies different regression information. The PREDEFINED= option and the USERVAR= option cannot be specified in the same REGRESSION statement; however, multiple REGRESSION statements can be specified.

The following *options* can be specified with the PREDEFINED= and USERVAR= options after the slash.

B=(value <F> ...)

specifies initial or fixed values for the regression parameters in the order in which they appear in a PREDEFINED= or USERVAR= option. Each B= list applies to the PREDEFINED= or USERVAR= variable list that immediately precedes the slash.

For example, the following statements set an initial value for the user-defined regressor, x, of 1:

```
regression predefined=LOM ;
regression uservar=x / b=1 2 ;
```

In this example, the B= option applies only to the USERVAR= statement. The value 2 is discarded since there is only one variable in the USERVAR= list.

To assign an initial value of 1 to the LOM regressor and 2 to the x regressor, use the following statements:

```
regression predefined=LOM / b=1;
regression uservar=x / b=2 ;
```

An F immediately following the numerical value indicates that this is not an initial value, but a fixed value. See [Example 37.8](#) for an example that uses fixed parameters. In PROC X12, individual parameters can be fixed while other parameters in the same model are estimated.

USERTYPE=(value)

enables a user-defined variable to be processed in the same manner as a U.S. Census predefined variable. *value* can be AO, CONSTANT, EASTER, HOLIDAY, LABOR, LOM, LOMSTOCK, LOQ, LPYEAR, LS, RP, SCEASTER, SEASONAL, TC, TD, TDSTOCK, THANKS, or USER. For example, the U.S. Census Bureau EASTER(*w*) regression effects are included the “RegARIMA Holiday Component” table (A7). Specify USERTYPE=EASTER to include a user-defined variable that is processed exactly as the U.S. Census predefined EASTER(*w*) variable, including inclusion in the A7 table. Each USERTYPE= list applies to the USERVAR= variable list that immediately precedes the slash. USERTYPE= does not apply to U.S. Census predefined variables.

The same rules for assigning B= values to regression variables apply for USERTYPE= options. For example, the following statements specify that the user-defined regressor in the variable MyEaster be processed exactly as the U.S. Census predefined LOM variable:

```
regression uservar=MyLOM;
regression uservar=MyEaster / usertype=LOM EASTER;
```

In this example, the USERTYPE= option applies only to the MyEaster variable in the second REGRESSION statement. The USERTYPE value EASTER is discarded since there is only one variable in the USERVAR= list.

To assign the USERTYPE value LOM to the MyLOM variable and EASTER to the MyEaster variable, use the following statements:

```
regression uservar=MyLOM / usertype=LOM;
regression uservar=MyEaster / usertype=EASTER;
```

TABLES Statement

TABLES *tablename1 tablename2 ... options ;*

The TABLES statement enables you to alter the display of the PROC X12 tables. You can specify the display of tables that are not displayed by default by PROC X12, and the NOSUM option enables you to suppress the printing of the period summary line in the time series tables.

tablename1 tablename2 ...

are keywords that correspond to the title label used by the U.S. Census Bureau X12-ARIMA software. For each table to be included in the displayed output, you must specify the X12 *tablename* keyword. Currently available tables are A19, C20, D1, D7, E1, E2, and E3. Although these tables are not displayed by default, their values are sometimes useful in understanding the X-12-ARIMA method. For further description of the available tables, see the section “[Displayed Output, ODS Table Names, and OUTPUT Table Name Keywords](#)” on page 2519.

NOSUM

NOSUMMARY

NOSUMMARYLINE

applies to the tables available for output in the [OUTPUT Statement](#). By default, these tables include a summary line that gives the average, total, or standard deviation for the historical data by period. The NOSUM option suppresses the display of the summary line in the listing. Also, if the tables are output with ODS, the summary line is not an observation in the data set. Thus, the output to the data set is only the time series, both the historical data and the forecast data, if available.

TRANSFORM Statement

TRANSFORM *options ;*

The TRANSFORM statement transforms or adjusts the series prior to estimating a regARIMA model. With this statement, the series can be Box-Cox (power) transformed. The “Prior Adjustment Factors” table is associated with the TRANSFORM statement.

Only one of the following *options* can appear in the TRANSFORM statement:

POWER=*value*

transforms the input series, Y_t , by using a Box-Cox power transformation,

$$Y_t \rightarrow y_t = \begin{cases} \log(Y_t) & \lambda = 0 \\ \lambda^2 + (Y_t^\lambda - 1)/\lambda & \lambda \neq 0 \end{cases}$$

The power λ must be specified (for example, POWER=0.33). The default is no transformation ($\lambda = 1$); that is, POWER=1. The log transformation (POWER=0), square root transformation (POWER=0.5), and the inverse transformation (POWER=-1) are equivalent to the corresponding FUNCTION= option.

Table 37.4 Power Values Related to the Census Bureau Function Argument

FUNCTION=	Transformation	Range for Y_t	Equivalent Power Argument
NONE	Y_t	All values	POWER=1
LOG	$\log(Y_t)$	$Y_t > 0$ for all t	POWER=0
SQRT	$2(\sqrt{Y_t} - 0.875)$	$Y_t \geq 0$ for all t	POWER=0.5
INVERSE	$2 - \frac{1}{Y_t}$	$Y_t \neq 0$ for all t	POWER=-1
LOGISTIC	$\log(\frac{Y_t}{1-Y_t})$	$0 < Y_t < 1$ for all t	No equivalent

FUNCTION=NONE | LOG | SQRT | INVERSE | LOGISTIC | AUTO

specifies the transformation to be applied to the series prior to estimating a regARIMA model. The transformation used by FUNCTION=NONE, LOG, SQRT, INVERSE, or LOGISTIC is related to the POWER= option as shown in Table 37.4. FUNCTION=AUTO uses selection based on Akaike's information criterion (AIC) to decide between a log transformation and no transformation. The default is FUNCTION=NONE.

However, the FUNCTION= and POWER= options are not completely equivalent. In some cases, using the FUNCTION= option causes the program to automatically select other options. For example, FUNCTION=NONE causes the default mode to be MODE=ADD in the X11 statement. Also, the choice of transformation invoked by the FUNCTION=AUTO option can impact the default mode of the X11 statement.

There are restrictions on the value used in the POWER= and FUNCTION= options when preadjustment factors for seasonal adjustment are generated from a regARIMA model. When seasonal adjustment is requested with the X11 statement, any value of the POWER option can be used for the purpose of forecasting the series with a regARIMA model. However, this is not the case when factors generated from the regression coefficients are used to adjust either the original series or the final seasonally adjusted series. In this case, the only accepted transformations are the log transformation, which can be specified as POWER=0 for multiplicative or log-additive seasonal adjustments, and no transformation, which can be specified as POWER=1 for additive seasonal adjustments. If no seasonal adjustment is performed, any POWER transformation can be used. The preceding restrictions also apply when FUNCTION=NONE and FUNCTION=LOG are specified.

USERDEFINED Statement

USERDEFINED *variables* ;

The USERDEFINED statement is used to identify the variables in the input data set or auxiliary data set that are available for user-defined regression. Only numeric variables can be specified. Specifying variables in the USERDEFINED statement does not include the variables as regressors. If a variable is specified in the INPUT statement or USERVAR= option in the REGRESSION statement, it is not necessary to include that variable in the USERDEFINED statement. However, if a variable is specified in the MDLINFOIN= data set in the PROC X12 statement and is not specified in an INPUT statement or in the USERVAR= option in the REGRESSION statement, then the variable should be specified in the USERDEFINED statement in order to make the variable available for regression.

VAR Statement

VAR *variables* ;

The VAR statement specifies the variables in the input data set that are to be analyzed by the procedure. Only numeric variables can be specified. If the VAR statement is omitted, all numeric variables are analyzed except those that appear in a BY statement, ID statement, INPUT statement, USERDEFINED statement, in the USERVAR= option in the REGRESSION statement, or the variable named in the DATE= option in the PROC X12 statement.

X11 Statement

X11 *options* ;

The X11 statement is an optional statement for invoking seasonal adjustment by an enhanced version of the methodology of the U.S. Census Bureau X-11 and X-11Q programs. You can control the type of seasonal adjustment decomposition calculated with the MODE= option. The output includes the final tables and diagnostics for the X-11 seasonal adjustment method listed in [Table 37.5](#). Tables E1, E2, E3, C20, D1, and D7 are not displayed by default; however, you can display these tables by requesting them in the [TABLES](#) statement.

Table 37.5 Tables Related to X11 Seasonal Adjustment

Table Name	Description
B1	Original series, adjusted for prior effects and forecast extended
C17	Final weights for the irregular component
C20	Final extreme value adjustment factors
D1	Modified original data, D iteration
D7	Preliminary trend cycle, D iteration
D8	Final unmodified SI ratios (differences)
D8A	<i>F</i> tests for stable and moving seasonality, D8
D9	Final replacement values for extreme SI ratios (differences), D iteration
D9A	Moving seasonality ratios for each period
SeasonalFilter	Seasonal filter statistics for Table D10
D10	Final seasonal factors
D10B	Seasonal factors, adjusted for user-defined seasonal
D10D	Final seasonal difference
D11	Final seasonally adjusted series
D11A	Final seasonally adjusted series with forced yearly totals
D11R	Rounded final seasonally adjusted series (with forced yearly totals)
TrendFilter	Trend filter statistics for Table D12
D12	Final trend cycle
D13	Final irregular component
D16	Combined seasonal and trading day factors
D16B	Final adjustment differences
D18	Combined calendar adjustment factors
E1	Original data modified for extremes
E2	Modified seasonally adjusted series
E3	Modified irregular series
E4	Ratio of yearly totals of original and seasonally adjusted series
E5	Percent changes (differences) in original series
E6	Percent changes (differences) in seasonally adjusted series
E6A	Percent changes (differences) in seasonally adjusted series with forced yearly totals (D11.A)
E6R	Percent changes (differences) in rounded seasonally adjusted series (D11.R)
E7	Percent changes (differences) in final trend component series
E8	Percent changes (differences) in original series adjusted for calendar factors (A18)
F2A–F2I	X11 diagnostic summary
F3	Monitoring and quality assessment statistics
F4	Day of the week trading day component factors
G	Spectral plots

For more details about the X-11 seasonal adjustment diagnostics, see Shiskin, Young, and Musgrave (1967), Lothian and Morry (1978a), and Ladiray and Quenneville (2001).

The following *options* can appear in the X11 statement:

FINAL=AO | LS | TC | USER | ALL

FINAL=(options)

lists the types of prior adjustment factors, obtained from the EVENT, REGRESSION, and OUTLIER statements, that are to be removed from the final seasonally adjusted series. Additive outliers are removed by specifying FINAL=AO. Level change and ramp outliers are removed by specifying FINAL=LS. Temporary change outliers are removed by specifying FINAL=TC. User-defined regressors or events (USERTYPE=USER) are removed by specifying FINAL=USER. All the preceding are removed by specifying FINAL=ALL or by specifying all the options in parentheses, FINAL=(AO LS TC USER). If this option is not specified, the final seasonally adjusted series contains these effects.

FORCE=TOTALS | ROUND | BOTH

specifies that the seasonally adjusted series be modified to: (a) force the yearly totals of the seasonally adjusted series and the original series to be the same (FORCE=TOTALS), (b) adjust the seasonally adjusted values for each calendar year so that the sum of the rounded seasonally adjusted series for any year equals the rounded annual total (FORCE=ROUND), or (c) first force the yearly totals, then round the adjusted series (FORCE=BOTH). When FORCE=TOTALS is specified, the differences between the annual totals is distributed over the seasonally adjusted values in a way that approximately preserves the month-to-month (or quarter-to-quarter) movements of the original series. For more details, see Huot (1975) and Cholette (1979). This forcing procedure is not recommended if the seasonal pattern is changing or if trading day adjustment is performed. Forcing the seasonally adjusted totals to be the same as the original series annual totals can degrade the quality of the seasonal adjustment, especially when the seasonal pattern is undergoing change. It is not natural if trading day adjustment is performed because the aggregate trading day effect over a year is variable and moderately different from zero.

MODE=ADD | MULT | LOGADD | PSEUDOADD

determines the mode of the seasonal adjustment decomposition to be performed. The four option choices correspond to additive, multiplicative, log-additive, and pseudo-additive decomposition, respectively. If this option is omitted, the procedure performs multiplicative adjustments. Table 37.6 shows the values of the MODE= option and the corresponding models for the original (O) and the seasonally adjusted (SA) series.

Table 37.6 Modes of Seasonal Adjustment and Their Models

Value of Mode Option	Name	Model for <i>O</i>	Model for <i>SA</i>
MULT	Multiplicative	$O = C \times S \times I$	$SA = C \times I$
ADD	Additive	$O = C + S + I$	$SA = C + I$
PSEUDOADD	Pseudo-additive	$O = C \times [S + I - 1]$	$SA = C \times I$
LOGADD	Log-additive	$Log(O) = C + S + I$	$SA = exp(C + I)$

OUTFORECAST**OUTFCST**

determines whether forecasts are included in certain tables sent to the output data set. If **OUTFORECAST** is specified, then forecast values are included in the output data set for tables A6, A7, A8, A9, A10, B1, D10, D10B, D10D, D16, D16B, and D18. The default is not to include forecasts. The **OUTFORECAST** option can be specified in either the **X11** statement or the **FORECAST** statement with identical results.

SEASONALMA=S3X1 | S3X3 | S3X5 | S3X9 | S3X15 | STABLE | X11DEFAULT | MSR

specifies which seasonal moving average (also called seasonal “filter”) is used to estimate the seasonal factors. These seasonal moving averages are $n \times m$ moving averages, meaning that an n -term simple average is taken of a sequence of consecutive m -term simple averages. **X11DEFAULT** is the method used by the U.S. Census Bureau’s X-11-ARIMA program. The default for **PROC X12** is **SEASONALMA=MSR**, which is the methodology of Statistic Canada’s X-11-ARIMA/88 program.

Table 37.7 describes the seasonal filter options available for the entire series:

Table 37.7 X-12-ARIMA Seasonal Filter Options and Descriptions

Filter Name	Description of Filter
S3X1	A 3×1 moving average
S3X3	A 3×3 moving average
S3X5	A 3×5 moving average
S3X9	A 3×9 moving average
S3X15	A 3×15 moving average
STABLE	Stable seasonal filter. A single seasonal factor for each calendar month or quarter is generated by calculating the simple average of all the values for each month or quarter (taken after detrending and outlier adjustment).
X11DEFAULT	A 3×3 moving average is used to calculate the initial seasonal factors in each iteration, and a 3×5 moving average to calculate the final seasonal factors
MSR	Filter chosen automatically by using the moving seasonality ratio of X-11-ARIMA/88 (Dagum 1988)

SIGMALIM=(*lower limit, upper limit*)

SIGMALIM=(*lower limit*)

SIGMALIM=(, *upper limit*)

specifies the lower and upper sigma limits in standard deviation units which are used to identify and down-weight extreme irregular values in the internal seasonal adjustment computations. One or both limits can be specified. The lower limit must be greater than 0 and not greater than the upper limit. If the lower sigma limit is not specified, then it defaults to a value of 1.5. The default upper sigma limit is 2.5. The comma must be used if the upper limit is specified.

Table 37.8 shows the effect of the SIGMALIM= option on the weights that are applied to the internal irregular values.

Table 37.8 Weights for Irregular Values

Weight	Sigma Limit
0	If $\frac{ I_t - \mu }{\sigma_{1,I_t}} \geq \text{upper limit}$
Partial weight	If $\text{lower limit} < \frac{ I_t - \mu }{\sigma_{2,I_t}} < \text{upper limit}$
1	If $\frac{ I_t - \mu }{\sigma_{2,I_t}} \leq \text{lower limit}$

In Table 37.8, μ is the theoretical mean of the irregular component, and σ_{1,I_t} and σ_{2,I_t} are the respective estimates of the standard deviation of the irregular component before and after extreme values are removed. The estimates of the standard deviation σ_{1,I_t} and σ_{2,I_t} vary with respect to t , and they are the same if no extreme values are removed. If they are different ($\sigma_{2,I_t} < \sigma_{1,I_t}$), then the first line in Table 37.8 is reevaluated with σ_{2,I_t} . In the special case where the lower limit equals the upper limit, the weight is 1 for $\frac{|I_t - \mu|}{\sigma_{2,I_t}} \leq \text{lower limit}$, and 0 otherwise. For more information about how extreme irregular values are handled in the X11 computations, see Ladiray and Quenneville 2001, pp. 53–68, 122–125.

TRENDMA=*value*

specifies which Henderson moving average is used to estimate the final trend cycle. Any odd number greater than one and less than or equal to 101 can be specified (for example, TRENDMA=23). If the TRENDMA= option is not specified, the program selects a trend moving average based on statistical characteristics of the data. For monthly series, a 9-, 13-, or 23-term Henderson moving average is selected. For quarterly series, the program chooses either a 5- or a 7-term Henderson moving average.

TYPE=SA | SUMMARY | TREND

specifies the method used to calculate the final seasonally adjusted series (Table D11). The default method is TYPE=SA. This method assumes that the original series has not been seasonally adjusted. For method TYPE=SUMMARY, the trend cycle, irregular, trading day, and holiday factors are calculated, but not removed from the seasonally adjusted series. Thus, for TYPE=SUMMARY, Table D11 is the same as the original series. For TYPE=TREND, trading day, holiday, and prior adjustment factors are removed from the original series to calculate the seasonally adjusted series (Table D11) and also are used in the calculation of the final trend (Table D12).

Details: X12 Procedure

Missing Values

PROC X12 can process a series with missing values.

Types of Missing Values

Missing values in a series are considered to be one of two types:

- One type of missing value is a leading or trailing missing value, which occurs before the first nonmissing value or after the last nonmissing value, respectively, in the span of a series. The span of a series can be determined either explicitly by the SPAN= option or implicitly by the START= or DATE= option in the PROC X12 statement. By default, leading and trailing missing values are ignored. If you specify the NOTRIMMISS option in the PROC X12 statement, PROC X12 processes leading and trailing missing values according to the X-12-ARIMA missing value method.
- The second type of missing value is an embedded missing value. These missing values occur between the first nonmissing value and the last nonmissing value in the span of the series. PROC X12 processes embedded missing values according to the X-12-ARIMA missing value method.

X-12-ARIMA Missing Value Method

When the X-12-ARIMA method encounters a missing value, it inserts an additive outlier for the missing observation into the set of regression variables for the model of the series and then replaces the missing observation with a value large enough to be considered an outlier during model estimation. After the regARIMA model is estimated, the X-12-ARIMA method adjusts the original series by using factors generated from these missing value outlier regressors. The adjusted values are estimates of the missing values, and the adjusted series is displayed in Table MV1.

SAS Predefined Events

SAS predefined events are summarized in this section. For complete details about SAS predefined events, see the section “EVENTKEY Statement” in Chapter 8, “[The HPFEVENTS Procedure](#)” (*SAS High-Performance Forecasting User’s Guide*).

[Table 37.9](#) shows a summary of the SAS predefined event keywords. [Table 37.10](#) lists the holiday date keywords that can be used as SAS predefined events. [Table 37.11](#) lists the seasonal date keywords that can be used as SAS predefined events.

Table 37.9 Definitions for EVENTKEY Predefined Event Keywords

Variable Name or Variable Name Format	Description	Qualifier Options
AO<obs>OBS AO<date>D AO<datetime>DT	Outlier	TYPE=POINT VALUE=1 BEFORE=(DURATION=0) AFTER=(DURATION=0)
LS<obs>OBS LS<date>D LS<datetime>DT	Level shift	TYPE=LS VALUE=1 BEFORE=(DURATION=0) AFTER=(DURATION=ALL)

<seasonal keywords>	Seasonal	TYPE=POINT PULSE= depends on keyword VALUE=1 BEFORE=(DURATION=0) AFTER=(DURATION=0) Timing values are based on keyword.

Table 37.10 Holiday Date Keywords and Definitions

Date Keyword	Definition
BOXING	December 26th
CANADA	July 1st
CANADAOBSERVED	July 1st, or July 2nd if July 1st is a Sunday
CHRISTMAS	December 25th
COLUMBUS	Second Monday in October
EASTER	Easter Sunday
FATHERS	Third Sunday in June
HALLOWEEN	October 31st
LABOR	First Monday in September
MLK	Third Monday in January
MEMORIAL	Last Monday in May
MOTHERS	Second Sunday in May
NEWYEAR	January 1st
THANKSGIVING	Fourth Thursday in November
THANKSGIVINGCANADA	Second Monday in October
USINDEPENDENCE	July 4th
USPRESIDENTS	Third Monday in February (since 1971)
VALENTINES	February 14th
VETERANS	November 11th
VETERANSUSG	Veterans Day date that is observed by U.S. government for Monday–Friday schedule
VETERANSUSPS	Veterans Day date that is observed by U.S. government for Monday–Saturday schedule (U.S. Post Office)
VICTORIA	Monday on or preceding May 24th

Table 37.11 Seasonal Date Keywords and Definitions

Date Keyword	Definition
SECOND_1, ..., SECOND_60	Specified second
MINUTE_1, ..., MINUTE_60	Beginning of the specified minute
HOUR_1, ..., HOUR_24	Beginning of the specified hour
SUNDAY, ..., SATURDAY	All Sundays, and so on, in the time series
WEEK_1, ..., WEEK_53	First day of the n th week of the year (PULSE=WEEK. n shifts this date for $n \neq 1$)
TENDAY_1, TENDAY_4, ..., TENDAY_34	The 1st of the month
TENDAY_2, TENDAY_5, ..., TENDAY_35	The 11th of the month
TENDAY_3, TENDAY_6, ..., TENDAY_36	The 21st of the month
SEMIMONTH_1, SEMIMONTH_3, ..., SEMIMONTH_23	The 1st of the month
SEMIMONTH_2, SEMIMONTH_4, ..., SEMIMONTH_24	The 16th of the month
JANUARY, ..., DECEMBER	The 1st of the specified month
QTR_1, QTR_2, QTR_3, QTR_4	The first date of the quarter indicated after the underscore (PULSE=QTR. n shifts this date for $n \neq 1$)
SEMIYEAR_1, SEMIYEAR_2	The first date of the semiyear (PULSE=SEMIYEAR. n shifts this date for $n \neq 1$)

Combined Test for the Presence of Identifiable Seasonality

The seasonal component of a time series, S_t , is defined as the intrayear variation that is repeated constantly (stable) or in an evolving fashion from year to year (moving seasonality). If the increase in the seasonal factors from year to year is too large, then the seasonal factors introduce distortion into the model. It is important to determine whether seasonality is identifiable without distorting the series.

For seasonality to be identifiable, the series should be identified as seasonal by using the “Test for the Presence of Seasonality Assuming Stability” and “Nonparametric Test for the Presence of Seasonality Assuming Stability.” Also, since the presence of moving seasonality can cause distortion, it is important to evaluate the moving seasonality in conjunction with the stable seasonality to determine whether the seasonality is identifiable. The results of these tests are displayed in “ F tests for Seasonality” (Table D8.A) in the X12 procedure.

The test for identifiable seasonality is performed by combining the F tests for stable and moving seasonality, along with a Kruskal-Wallis test for stable seasonality. The following description is based on Lothian and Morry (1978b). Other details can be found in Dagum (1988, 1983).

Let F_s and F_m denote the F value for the stable and moving seasonality tests, respectively. The combined test is performed as follows (see also Figure 37.3):

1. If the null hypothesis of no stable seasonality is not rejected at the 0.10% significance level ($P_S \geq 0.001$), then the series is considered to be nonseasonal. PROC X12 returns the conclusion, “Identifiable Seasonality Not Present.”
2. If the null hypothesis in step 1 is rejected, then PROC X12 computes the following quantities:

$$T_1 = \frac{7}{F_m}$$

$$T_2 = \frac{3F_m}{F_s}$$

Let T denote the simple average of T_1 and T_2 :

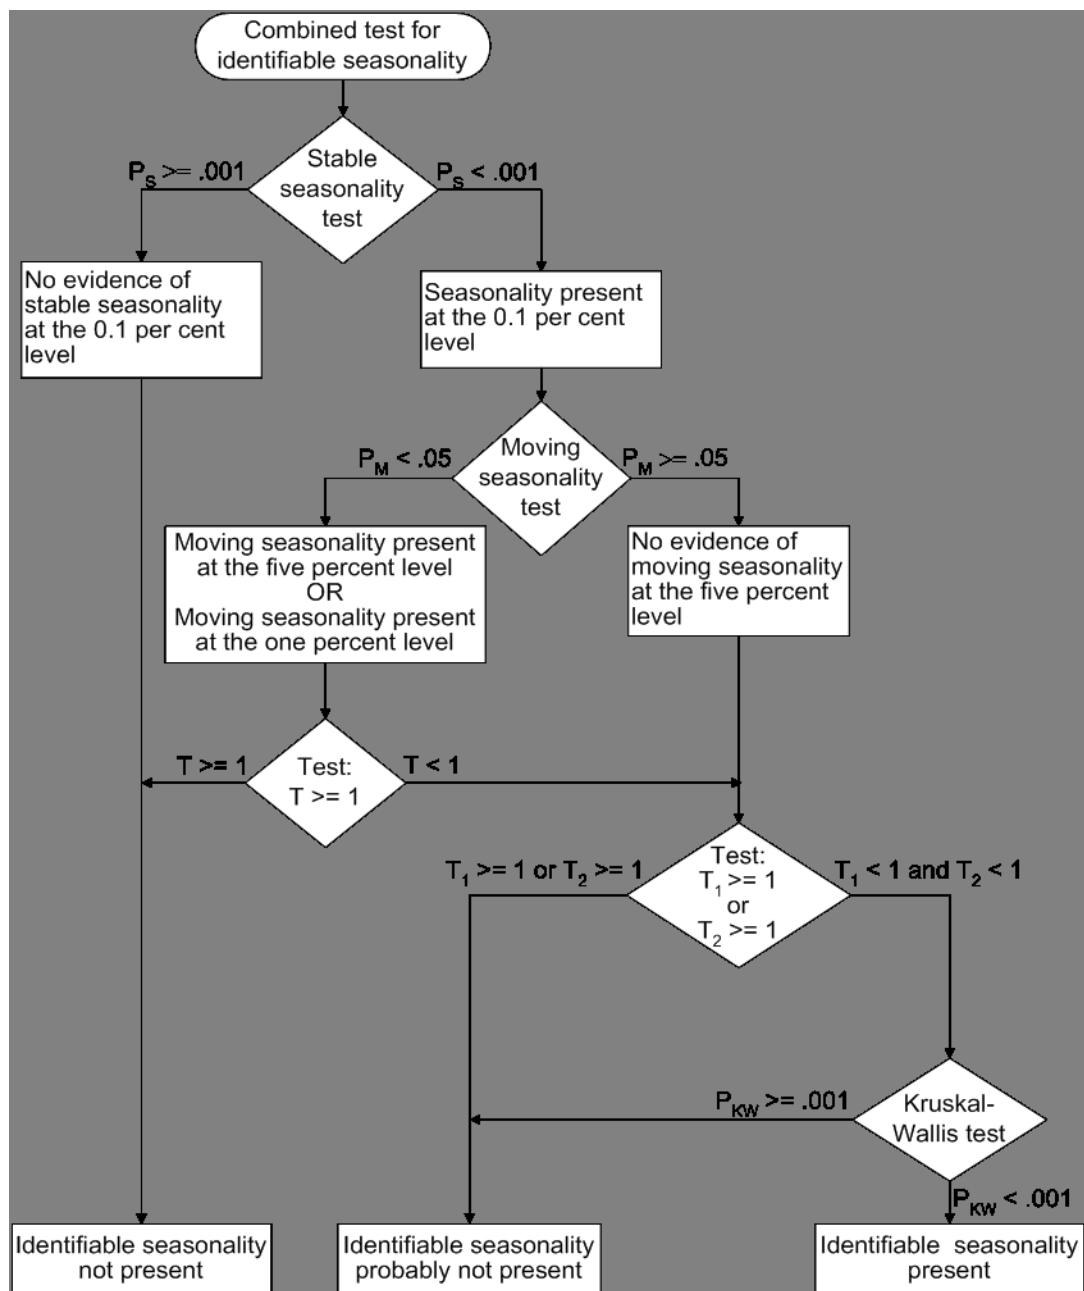

$$T = \frac{(T_1 + T_2)}{2}$$

If the null hypothesis of no moving seasonality is rejected at the 5.0% significance level ($P_M < 0.05$) and if $T \geq 1.0$, the null hypothesis of identifiable seasonality *not* present is not rejected and PROC X12 returns the conclusion, “Identifiable Seasonality Not Present.”

3. If the null hypothesis of identifiable seasonality *not* present has not been accepted, but $T_1 \geq 1.0$, $T_2 \geq 1.0$, or the Kruskal-Wallis chi-squared test fails to reject at the 0.10% significance level ($P_{KW} \geq 0.001$), then PROC X12 returns the conclusion “Identifiable Seasonality Probably Not Present.”
4. If the null hypotheses of no stable seasonality associated with the F_S and Kruskal-Wallis chi-squared tests are rejected and if none of the combined measures described in steps 2 and 3 fail, then the null hypothesis of identifiable seasonality *not* present is rejected and PROC X12 returns the conclusion “Identifiable Seasonality Present.”

Included in the displayed output of Table D8A is the table “Summary of Results and Combined Test for the Presence of Identifiable Seasonality.” This table displays the T_1 , T_2 , and T values and the significance levels for the stable seasonality test, the moving seasonality test, and the Kruskal-Wallis test. The last item in the table is the result of the combined test for identifiable seasonality.

Figure 37.3 Combined Seasonality Test Flowchart

Computations

For more details about the computations used in PROC X12, see the *X-12-ARIMA Reference Manual* (U.S. Bureau of the Census 2009c).

For more details about the X-11 method of decomposition, see *Seasonal Adjustment with the X-11 Method* (Ladiray and Quenneville 2001).

Displayed Output, ODS Table Names, and OUTPUT Tablename Keywords

The options specified in PROC X12 control both the tables produced by the procedure and the tables available for output to the OUT= data set specified in the OUTPUT statement.

The displayed output is organized into tables identified by a part letter and a sequence number within the part. The seven major parts of the X12 procedure are as follows:

- A prior adjustments and regARIMA components (optional)
- B preliminary estimates of irregular component weights and trading day regression factors (X-11 method)
- C final estimates of irregular component weights and trading day regression factors
- D final estimates of seasonal, trend cycle, and irregular components
- E analytical tables
- F summary measures
- G charts

Table 37.12 describes the individual tables and charts. “P” indicates that the table is only displayed and is not available for output to the OUT= data set. Data from displayed tables can be extracted into data sets by using the Output Delivery System (ODS). For more information about the SAS Output Delivery System, see the *SAS Output Delivery System: User’s Guide*. For more information about the features of the ODS Graphics system, including the many ways that you can control or customize the plots that are produced by SAS procedures, see Chapter 21, “Statistical Graphics Using ODS” (*SAS/STAT User’s Guide*).

When tables available through the **OUTPUT statement** are output using ODS, the summary line is included in the ODS output by default. The summary line gives the average, standard deviation, or total by each period. The value –1 for YEAR indicates that the summary line is a total; the value –2 for YEAR indicates that the summary line is an average; and the value –3 for YEAR indicates that the line is a standard deviation. The value of YEAR for historical and forecast values is greater than or equal to zero. Thus, a negative value indicates a summary line. You can suppress the summary line altogether by specifying the **NOSUM** option in the TABLES statement. However, the NOSUM option also suppresses the display of the summary line in the displayed table.

“T” indicates that the table is available using the OUTPUT statement, but is not displayed by default; you must request that these tables be displayed by using the **TABLES Statement**. If there is no notation in the

“Notes” column, then the table is available directly using the OUTPUT statement, without specifying the TABLES statement. If a table is not computed, then it is not displayed; if it is requested in the OUTPUT statement, then the variable in the OUT= data set contains missing values. The actual number of tables displayed depends on the options and statements specified.

Table 37.12 Table Names and Descriptions

Table	Description	Notes
Tables Associated with Model Order Identification		
ModelDescription	Regression model used in ARIMA model identification	P
ACF	Autocorrelation function	P
PACF	Partial autocorrelation function	P
Tables Associated with Automatic Modeling		
UnitRootTestModel	ARIMA estimates for unit root identification	P
UnitRootTest	Results of unit root test for identifying orders of differencing	P
AutoChoiceModel	Models estimated by automatic ARIMA model selection procedure	P
Best5Model	Best five ARIMA models chosen by automatic modeling	P
AutomaticModelChoice	Comparison of automatically selected model and default model	P
FinalModelChoice	Final automatic model choice	P
Diagnostic Tables		
ErrorACF	Autocorrelation of regARIMA model residuals	P
ErrorPACF	Partial autocorrelation of regARIMA model residuals	P
SqErrorACF	Autocorrelation of squared regARIMA model residuals	P
ResidualOutliers	Outliers of the unstandardized residuals	P
ResidualStatistics	Summary statistics for the unstandardized residuals	P
NormalityStatistics	Normality statistics for regARIMA model residuals	P
G	Spectral analysis of regARIMA model residuals	P
Modeling Tables		
MissingExtreme	Extreme or missing values	P
ARMAIterationTolerances	Exact ARMA likelihood estimation iteration tolerances	P
IterHistory	ARMA iteration history	P
OutlierDetection	Critical values to use in outlier detection	P
PotentialOutliers	Potential outliers	P
ARMAIterationSummary	Exact ARMA likelihood estimation iteration summary	P
ModelDescription	Model description for regARIMA model estimation	P
RegParameterEstimates	Regression model parameter estimates	P
RegressorGroupChiSq	Chi-squared tests for groups of regressors	P

Table 37.12 *continued*

Table	Description	Notes
ARMAParameterEstimates	Exact ARMA maximum likelihood estimation	P
AvgFcstErr	Average absolute percentage error in within-sample or without-sample forecasts or backcasts	P
Roots	Seasonal or nonseasonal AR or MA roots	P
MLESummary	Estimation summary	P
ForecastCL	Forecasts, standard errors, and confidence limits	P
MV1	Original series adjusted for missing value regressors	
Sequenced Tables		
A1	Original series	
A2	Prior-adjustment factors	
A6	RegARIMA trading day component	
A7	RegARIMA holiday component	
A8	RegARIMA combined outlier component	
A8AO	RegARIMA AO outlier component	
A8LS	RegARIMA level change outlier component	
A8TC	RegARIMA temporary change outlier component	
A9	RegARIMA user-defined regression component	
A10	RegARIMA user-defined seasonal component	
A19	RegARIMA outlier adjusted original data	T
B1	Prior-adjusted or original series	
C17	Final weight for irregular components	
C20	Final extreme value adjustment factors	T
D1	Modified original data, D iteration	T
D7	Preliminary trend cycle, D iteration	T
D8	Final unmodified S-I ratios	
D8A	Seasonality tests	P
D9	Final replacement values for extreme S-I ratios	
D9A	Moving seasonality ratio	P
SeasonalFilter	Seasonal filter statistics for table D10	P
D10	Final seasonal factors	
D10B	Seasonal factors, adjusted for user-defined seasonal	
D10D	Final seasonal difference	
D11	Final seasonally adjusted series	
D11A	Final seasonally adjusted series with forced yearly totals	
D11F	Factors applied to get adjusted series with forced yearly totals	
D11R	Rounded final seasonally adjusted series (with forced yearly totals)	
TrendFilter	Trend filter statistics for table D12	P
D12	Final trend cycle	
D13	Final irregular series	
D16	Combined adjustment factors	
D16B	Final adjustment differences	

Table 37.12 *continued*

Table	Description	Notes
D18	Combined calendar adjustment factors	
E1	Original data modified for extremes	
E2	Modified seasonally adjusted series	
E3	Modified irregular series	
E4	Ratios of annual totals	P
E5	Percent changes in original series	
E6	Percent changes in final seasonally adjusted series	
E6A	Percent changes (differences) in seasonally adjusted series with forced yearly totals (D11.A)	
E6R	Percent changes (differences) in rounded seasonally adjusted series (D11.R)	
E7	Differences in final trend cycle	
E8	Percent changes (differences) in original series adjusted for calendar factors (A18)	
F2A-I	Summary measures	P
F3	Quality assessment statistics	P
F4	Day of the week trading day component factors	P
G	Spectral analysis	P

Using Auxiliary Variables to Subset Output Data Sets

The X12 procedure can produce more than one table with the same name. For example, the following **IDENTIFY** statement produces ACF and PACF tables for two levels of differencing:

```
identify diff=(1) sdiff=(0, 1);
```

Auxiliary variables in the output data can be used to subset the data. In this example, the auxiliary variables Diff and SDiff specify the levels of regular and seasonal differencing that are used to compute the ACF. The following statements show how to retrieve the ACF results for the first differenced series:

```
ods select acf;
ods output acf=acf;
proc x12 data=sashelp.air date=date;
    identify diff=(1) sdiff=(0,1);
run;
title "Regular Difference=1 Seasonal Difference=0";
data acfd1D0;
    set acf(where=(Diff=1 and Sdiff=0));
run;
```

In addition to any BY variables, the auxiliary variables in the ACF and PACF data sets are `_NAME_`, `_TYPE_`, `Transform`, `Adjust`, `Regressors`, `Diff` and `SDiff`. Auxiliary variables can be related to the group as shown in the Results Viewer (for example, BY variables, `_NAME_`, and `_TYPE_`). However, they can also be variables in the template where printing is suppressed by using `PRINT=OFF`. Auxiliary variables such as `Transform`, `Adjust`, and `Regressors` are not displayed in the ACF and PACF tables because similar information is displayed in the `ModelDescription` table that immediately precedes the ACF and PACF tables. The variables `Diff` and `SDiff` are not displayed because the levels of differencing are included in the title of the ACF and PACF tables.

The BY variables and the `_NAME_` variable are available for all ODS OUTPUT data sets that are produced by the X12 procedure. The `_TYPE_` variable is available for all ODS OUTPUT data sets that are produced during the model identification and model estimation stages. The `_TYPE_` variable enables you to determine whether data in a table, such as the `ModelDescription` table, originated from the model identification stage or the model estimation stage.

The forecast data sets contain the auxiliary variable `_SCALE_`. The value of `_SCALE_` is “Original” or “Transformed” to indicate the scale of the data. The auxiliary variable `_SCALE_` is the same as the group in the Results Viewer. It is not displayed in the forecast tables because the table titles indicate the scale of the data.

ODS Graphics

Statistical procedures use ODS Graphics to create graphs as part of their output. ODS Graphics is described in detail in Chapter 21, “[Statistical Graphics Using ODS](#)” (*SAS/STAT User’s Guide*).

Before you create graphs, ODS Graphics must be enabled (for example, with the `ODS GRAPHICS ON` statement). For more information about enabling and disabling ODS Graphics, see the section “Enabling and Disabling ODS Graphics” in that chapter.

The overall appearance of graphs is controlled by ODS styles. Styles and other aspects of using ODS Graphics are discussed in the section “A Primer on ODS Statistical Graphics” in that chapter.

This section describes the use of ODS for creating graphics with the X12 procedure.

The graphs available through ODS Graphics are ACF plots, PACF plots, a residual histogram, spectral graphs, and forecasting plots. ACF and PACF plots for regARIMA model identification are not available unless the `IDENTIFY` statement is used. ACF plots, PACF plots, the residual histogram, and the residual spectral graph for diagnosis of the regARIMA model residuals are not available unless the `CHECK` statement is used. Forecasting plots are not available unless the `FORECAST` statement is used. A spectral plot of the original series is always available; however, additional spectral plots are provided when the `X11` statement and `CHECK` statement are used. When ODS Graphics is not enabled, the ACF, PACF, and spectral analysis are displayed as columns of a table. The residual histogram is available only when ODS Graphics is enabled. To obtain a table that contains values related to the residual histogram, use the `ODS OUTPUT` statement.

ODS Graph Names

PROC X12 assigns a name to each graph it creates by using ODS. You can use these names to selectively reference the graphs. The names are listed in [Table 37.13](#).

Table 37.13 ODS Graphs Produced by PROC X12

ODS Graph Name	Plot Description	PROC X12 PLOTS= Option
ACFPlot	Autocorrelation of regression residuals	SERIES(ACF)
ErrorACFPlot	Autocorrelation of regARIMA model residuals	RESIDUAL(ACF)
ErrorPACFPlot	Partial autocorrelation of regARIMA model residuals	RESIDUAL(PACF)
ForecastsOnlyPlot	Forecasts only of the original series	FORECAST(FORECASTONLY)
ForecastsOnlyPlot	Forecasts only of the transformed series	FORECAST(TRANSFORECASTONLY)
ForecastsPlot	Forecasts of the original series	FORECAST(FORECAST)
ForecastsPlot	Forecasts of the transformed series	FORECAST(TRANSFORECAST)
ModelForecastsPlot	Model and forecasts of the original series	FORECAST(MODELFORECASTS)
ModelForecastsPlot	Model and forecasts of the transformed series	FORECAST(TRANSMODELFORECASTS)
ModelPlot	Model of the original series	FORECAST(MODELS)
ModelPlot	Model of the transformed series	FORECAST(TRANSMODELS)
PACFPlot	Partial autocorrelation of regression residuals	SERIES(PACF)
ResidualHistogram	Distribution of regARIMA residuals	RESIDUAL(HIST)
SpectralPlot	Spectral plot of the seasonally adjusted series	ADJUSTED(SPECTRUM)
SpectralPlot	Spectral plot of irregular series	IRREGULAR(SPECTRUM)
SpectralPlot	Spectral plot of the regARIMA model residuals	RESIDUAL(SPECTRUM)
SpectralPlot	Spectral plot of the original series	SERIES(SPECTRUM)
SqErrorACFPlot	Autocorrelation of squared regARIMA model residuals	RESIDUAL(SQACF)

OUT= Data Set

You can use the OUTPUT statement to output the component series computed in the X-12-ARIMA decomposition.

The OUT= data set specified in the OUTPUT statement contains the BY variables, if any; the ID variables, if any; and the DATE= variable if the DATE= option is given, or the variable `_DATE_` if the DATE= option is not specified. If user-defined regressor variables or EVENT variables are specified, they are included. In addition, the various components specified by the table names in the OUTPUT statement are included in the OUT= data set.

The OUTPUT OUT= data set can contain the following variables:

BY variables	are the BY variables used to subset the series by BY groups. The BY variables included in this data set match the BY variables, if any, used to process the series in the DATA= data set.
ID variables	enable the series observations to be identified using further information. The ID variables included in this data set match the ID variables, if any, specified in the ID statement and input from the DATA= data set.
DATE variable	is the time ID variable used to process the time series. It is either the variable specified in the DATE= option in the PROC X12 statement or the variable <code>_DATE_</code> generated by the START= option in the PROC X12 statement.
<code>_YEAR_</code> variable	contains a value for the year of the date variable for the observation. This variable is included in the OUT= data set if YEARSEAS is specified in the OUTPUT statement.
<code>_SEASON_</code> variable	contains a value for the month or quarter of the date variable for the observation. This variable is included in the OUT= data set if YEARSEAS is specified in the OUTPUT statement.
User-defined variables	are variables specified in the INPUT statement or the USERVAR= option in the REGRESSION statement. The values of these variables are copied from the DATA= data set or from the AUXDATA= data set.
EVENT variables	variables specified in the EVENT statement. The values of these variables are computed based on the event definition and the dates of the time series observations.
Table variables	contains the data from the X-12-ARIMA decomposition tables: A1, A2, A6, A7, A8, A8AO, A8LS, A8TC, A9, A10, A19, B1, C17, C20, D1, D7, D8, D9, D10, D10B, D10D, D11, D11A, D11F, D11R, D12, D13, D16, D16B, D18, E1, E2, E3, E5, E6, E6A, E6R, E7, E8, and MV1. The variable name used in the output data set is the input variable name followed by an underscore and the corresponding table name.

Special Data Sets

The X12 procedure can input the MDLINFOIN= and output the MDLINFOOUT= data sets. The structure of both of these data sets is the same. The difference is that when the MDLINFOIN= data set is read, only information relative to specifying a model is processed, whereas the MDLINFOOUT= data set contains the results of estimating a model. The X12 procedure can also read data sets that contain event definition data. The structure of these data sets is the same as in the SAS[®] High Performance Forecasting system.

MDLINFOIN= and MDLINFOOUT= Data Sets

The MDLINFOIN= and MDLINFOOUT= data sets can contain the following variables:

BY variables	enable the model information to be specified by BY groups. BY variables can be included in this data set that match the BY variables used to process the series. If no BY variables are included, then the models specified by <code>_NAME_</code> in the MDLINFOIN= data set apply to all BY groups in the DATA= data set.
<code>_NAME_</code>	should contain the variable name of the time series to which a particular model is to be applied. Omit the <code>_NAME_</code> variable if you are specifying the same model for all series in a BY group.
<code>_MODELTYPE_</code>	specifies whether the observation contains regression or ARIMA information. The value of <code>_MODELTYPE_</code> should be either REG to supply regression information or ARIMA to supply model information. If valid regression information exists in the MDLINFOIN= data set for a BY group and series being processed, then the REGRESSION, INPUT, and EVENT statements are ignored for that BY group and series. Likewise, if valid ARIMA model information exists in the data set, then the AUTOMDL, ARIMA, and TRANSFORM statements are ignored. Valid values for the other variables in the data set depend on the value of the <code>_MODELTYPE_</code> variable. Although other values of <code>_MODELTYPE_</code> might be permitted in other SAS procedures, PROC X12 recognizes only REG and ARIMA.
<code>_MODELPART_</code>	further qualifies the regression information in the observation. For <code>_MODELTYPE_=REG</code> , valid values of <code>_MODELPART_</code> are INPUT, EVENT, and PREDEFINED. A value of INPUT indicates that this observation refers to the user-defined variable whose name is given in <code>_DSVAR_</code> . Likewise, a value of EVENT indicates that the observation refers to the SAS or user-defined event whose name is given in <code>_DSVAR_</code> . PREDEFINED indicates that the name given in <code>_DSVAR_</code> is a predefined U.S. Census Bureau variable. If only ARIMA model information is included in the data set (that is, all observations have <code>_MODELTYPE_=ARIMA</code>), then the <code>_MODELPART_</code> variable can be omitted. For observations where <code>_MODELTYPE_=ARIMA</code> , valid values for <code>_MODELPART_</code> are FORECAST, “.”, or blank.
<code>_COMPONENT_</code>	further qualifies the regression or ARIMA information in the observation. For <code>_MODELTYPE_=REG</code> , the only valid value of <code>_COMPONENT_</code> is SCALE. For <code>_MODELTYPE_=ARIMA</code> , the valid values of <code>_COMPONENT_</code> are TRANSFORM, CONSTANT, NONSEASONAL, and SEASONAL. TRANSFORM indicates that the observation contains the information that would be supplied in the TRANSFORM statement. CONSTANT is specified to control the constant term in the model. NONSEASONAL and SEASONAL refer to the AR, MA, and differencing terms in the ARIMA model.

<code>_PARMTYPE_</code>	further qualifies the regression or ARIMA information in the observation. For <code>_MODELTYPE_=REG</code> , the value of <code>_PARMTYPE_</code> is the same as the value of the <code>USER-TYPE=</code> option in the REGRESSION statement. Since the <code>USER-TYPE=</code> option applies only to user-defined events and variables, the value of <code>_PARMTYPE_</code> does not alter processing in observations where <code>_MODELPART_=PREDEFINED</code> . However, it is consistent to use a value for <code>_PARMTYPE_</code> that matches the U.S. Census Bureau predefined variable. For the constant term in the model information, <code>_PARMTYPE_</code> should be SCALE. For transformation information, the value of <code>_PARMTYPE_</code> should be NONE, LOG, LOGIT, SQRT, or BOXCOX. For <code>_MODELTYPE_=ARIMA</code> , valid values of <code>_PARMTYPE_</code> are AR, MA, and DIF.
<code>_DSVAR_</code>	specifies the variable name associated with the current observation. For <code>_MODELTYPE_=REG</code> , the value of <code>_DSVAR_</code> is the name of the user-defined variable, the event, or the U.S. Census Bureau predefined variable. For <code>_MODELTYPE_=ARIMA</code> , <code>_DSVAR_</code> should match the name of the series being processed. If the ARIMA model information applies to more than one series, then <code>_DSVAR_</code> can be blank or “.”, equivalently.
<code>_VALUE_</code>	contains a numerical value that is used as a parameter for certain types of information. For example, the <code>PREDEFINED=EASTER(6)</code> option in the REGRESSION statement is implemented in the MDLINFOIN= data set by using <code>_DSVAR_=EASTER</code> and <code>_VALUE_=6</code> . For a BOXCOX transformation, <code>_VALUE_</code> is set equal to the λ parameter value. For <code>_COMPONENT_=SEASONAL</code> , if <code>_VALUE_</code> is nonmissing, then <code>_VALUE_</code> is used as the seasonal period. If <code>_VALUE_</code> is missing for <code>_COMPONENT_=SEASONAL</code> , then the seasonal period is determined by the interval of the series.
<code>_FACTOR_</code>	applies only to the AR and MA portions of the ARIMA model. The value of <code>_FACTOR_</code> identifies the factor of the given AR or MA term. Therefore, the value of <code>_FACTOR_</code> is the same for all observations that are related to the same factor.
<code>_LAG_</code>	identifies the degree for differencing and AR and MA lags. If <code>_COMPONENT_=SEASONAL</code> , then the value in <code>_LAG_</code> is multiplied by the seasonal period indicated by the value of <code>_VALUE_</code> .
<code>_SHIFT_</code>	contains the shift value for transfer functions. This value is not processed by PROC X12, but it might be processed by other procedures in which transfer functions can be specified.
<code>_NOEST_</code>	indicates whether a parameter associated with the observation is to be estimated. For example, the NOINT option is indicated by <code>_COMPONENT_=CONSTANT</code> with <code>_NOEST_=1</code> and <code>_EST_=0</code> . <code>_NOEST_=1</code> indicates that the value in <code>_EST_</code> is a fixed value. <code>_NOEST_</code> pertains to the constant term, to AR and MA parameters, and to regression parameters.
<code>_EST_</code>	contains an initial or fixed value for a parameter associated with the observation that is to be estimated. <code>_NOEST_=1</code> indicates the value in <code>_EST_</code> is a fixed value. <code>_EST_</code> pertains to the constant term, to AR and MA parameters, and to regression parameters.

<code>_STDERR_</code>	contains output information about estimated parameters. The variable <code>_STDERR_</code> is not processed by the <code>MDLINFOIN=</code> data set for PROC X12. In the <code>MDLINFOOUT=</code> data set, <code>_STDERR_</code> contains the standard error that pertains to the estimated parameter in the variable <code>_EST_</code> .
<code>_TVALUE_</code>	contains output information about estimated parameters. The variable <code>_TVALUE_</code> is not processed by the <code>MDLINFOIN=</code> data set for PROC X12. In the <code>MDLINFOOUT=</code> data set, <code>_TVALUE_</code> contains the t value that pertains to the estimated parameter in the variable <code>_EST_</code> .
<code>_PVALUE_</code>	contains output information about estimated parameters. The variable <code>_PVALUE_</code> is not processed by the <code>MDLINFOIN=</code> data set for PROC X12. In the <code>MDLINFOOUT=</code> data set, <code>_PVALUE_</code> contains the p -value that pertains to the estimated parameter in the variable <code>_EST_</code> .

INEVENT= Data Set

The `INEVENT=` data set can contain the following variables. When a variable is omitted from the data set, that variable is assumed to have the default value for all observations. The default values are specified in the list.

<code>_NAME_</code>	specifies the event variable name. <code>_NAME_</code> is displayed with the case preserved. Since <code>_NAME_</code> is a SAS variable name, the event can be referenced by using any case. The <code>_NAME_</code> variable is required; there is no default.
<code>_CLASS_</code>	specifies the class of event: <code>SIMPLE</code> , <code>COMBINATION</code> , <code>PREDEFINED</code> . The default for <code>_CLASS_</code> is <code>SIMPLE</code> .
<code>_KEYNAME_</code>	contains either a date keyword (<code>SIMPLE EVENT</code>), a predefined event variable name (<code>PREDEFINED EVENT</code>), or an event name (<code>COMBINATION EVENT</code>). All <code>_KEYNAME_</code> values are displayed in upper case. However, if the <code>_KEYNAME_</code> value refers to an event name, then the actual name can be of mixed case. The default for <code>_KEYNAME_</code> is no keyname, designated by “.”.
<code>_STARTDATE_</code>	contains either the date timing value or the first date timing value to use in a do-list. The default for <code>_STARTDATE_</code> is no date, designated by a missing value.
<code>_ENDDATE_</code>	contains the last date timing value to use in a do-list. The default for <code>_ENDDATE_</code> is no date, designated by a missing value.
<code>_DATEINTRVL_</code>	contains the interval for the date do-list. The default for <code>_DATEINTRVL_</code> is no interval, designated by “.”.
<code>_STARTDT_</code>	contains either the datetime timing value or the first datetime timing value to use in a do-list. The default for <code>_STARTDT_</code> is no datetime, designated by a missing value.
<code>_ENDDT_</code>	contains the last datetime timing value to use in a do-list. The default for <code>_ENDDT_</code> is no datetime, designated by a missing value.
<code>_DTINTRVL_</code>	contains the interval for the datetime do-list. The default for <code>_DTINTRVL_</code> is no interval, designated by “.”.
<code>_STARTOBS_</code>	contains either the observation number timing value or the first observation number timing value to use in a do-list. The default for <code>_STARTOBS_</code> is no observation number, designated by a missing value.

<code>_ENDOBS_</code>	contains the last observation number timing value to use in a do-list. The default for <code>_ENDOBS_</code> is no observation number, designated by a missing value.
<code>_OBSINTRVL_</code>	contains the interval length of the observation number do-list. The default for <code>_OBSINTRVL_</code> is no interval, designated by “.”.
<code>_TYPE_</code>	specifies the type of event. The valid values of <code>_TYPE_</code> are POINT, LS, RAMP, TR, TEMPRAMP, TC, LIN, LINEAR, QUAD, CUBIC, INV, INVERSE, LOG, and LOGARITHMIC. The default for <code>_TYPE_</code> is POINT.
<code>_VALUE_</code>	specifies the value for nonzero observation. The default for <code>_VALUE_</code> is 1.0.
<code>_PULSE_</code>	specifies the interval that defines the units for the duration values. The default for <code>_PULSE_</code> is no interval, designated by “.”.
<code>_DUR_BEFORE_</code>	specifies the number of durations before the timing value. The default for <code>_DUR_BEFORE_</code> is 0.
<code>_DUR_AFTER_</code>	specifies the number of durations after the timing value. The default for <code>_DUR_AFTER_</code> is 0.
<code>_SLOPE_BEF_</code>	determines whether the curve is GROWTH or DECAY before the timing value for <code>_TYPE_=RAMP</code> , <code>_TYPE_=TEMPRAMP</code> , and <code>_TYPE_=TC</code> . Valid values are GROWTH and DECAY. The default for <code>_SLOPE_BEF_</code> is GROWTH.
<code>_SLOPE_AFT_</code>	determines whether the curve is GROWTH or DECAY after the timing value for <code>_TYPE_=RAMP</code> , <code>_TYPE_=TEMPRAMP</code> , and <code>_TYPE_=TC</code> . Valid values are GROWTH and DECAY. The default for <code>_SLOPE_AFT_</code> is GROWTH unless <code>_TYPE_=TC</code> ; then the default is DECAY.
<code>_SHIFT_</code>	specifies the number of <code>_PULSE_</code> intervals to shift the timing value. The shift can be positive (forward in time) or negative (backward in time). If <code>_PULSE_</code> is not specified, then the shift is in observations. The default for <code>_SHIFT_</code> is 0.
<code>_TCPARM_</code>	specifies the parameter for EVENT of TYPE=TC. The default for <code>_TCPARM_</code> is 0.5.
<code>_RULE_</code>	specifies the rule to use when combining events or when timing values of an event overlap. The valid values of <code>_RULE_</code> are ADD, MAX, MIN, MINNZ, MINMAG, and MULT. The default for <code>_RULE_</code> is ADD.
<code>_PERIOD_</code>	specifies the frequency interval at which the event should be repeated. If this value is missing, then the event is not periodic. The default for <code>_PERIOD_</code> is no interval, designated by “.”.
<code>_LABEL_</code>	specifies the label or description for the event. If a label is not specified, then the default label value is displayed as “.”. For events that produce dummy variables, either the user-supplied label or the default label is used. For COMPLEX events, the <code>_LABEL_</code> value is merely a description of the group of events.

OUTSTAT= Data Set

The OUTSTAT= data set can contain the following variables:

BY variables	sorts the statistics into BY groups. BY variables are included in this data set that match the BY variables used to process the series.
NAME	specifies the variable name of the time series to which the statistics apply.
STAT	describes the statistic that is stored in VALUE or CVALUE. STAT takes on the following values:
Period	the period of the series, 4 or 12.
Mode	the mode of the seasonal adjustment from the X11 statement. Possible values are ADD, MULT, LOGADD, and PSEUDOADD.
Start	the beginning of the model span expressed as <i>monyyyy</i> for monthly series or <i>yyyyQq</i> for quarterly series.
End	the end of the model span expressed as <i>monyyyy</i> for monthly series or <i>yyyyQq</i> for quarterly series.
NbFcst	the number of forecast observations.
SigmaLimLower	the lower sigma limit in standard deviation units.
SigmaLimUpper	the upper sigma limit in standard deviation units.
pLBQ_24	the Ljung-Box Q statistic of the residuals at lag 24, for monthly series. Note that lag 12 (pLBQ_12) and lag 16 (pLBQ_16) are included in the data set for quarterly series.
D8Fs	the stable seasonality <i>F</i> test value from Table D8.
D8Fm	the moving seasonality <i>F</i> test value from Table D8.
ISRatio	the final irregular-to-seasonal ratio from Table F 2.H.
SMA_ALL	the final seasonal moving average filter for all periods.
RSF	the residual seasonality <i>F</i> test value for Table D11 for the entire series.
RSF3	the residual seasonality <i>F</i> test value for Table D11 for the last three years.
RSFA	the residual seasonality <i>F</i> test value for Table D11.A for the entire series.
RSF3A	the residual seasonality <i>F</i> test value for Table D11.A for the last three years.
RSFR	the residual seasonality <i>F</i> test value for Table D11.R for the entire series.
RSF3R	the residual seasonality <i>F</i> test value for Table D11.R for the last three years.
TMA	the Henderson trend moving average filter selected.
ICRatio	the final irregular-to-trend cycle ratio from Table F 2.H.

E5sd	the standard deviation from Table E5.
E6sd	the standard deviation from Table E6.
E6Asd	the standard deviation from Table E6.A.
MCD	months of cyclical dominance.
Q	the overall level Q from Table F3.
Q2	Q overall level without M2 from Table F3.
FMT	indicates whether the format is numeric or character. FMT="NUM" if the value is numeric and stored in the VALUE variable. FMT="CHAR" if the value is a string and stored in the CVALUE variable.
VALUE	contains the numerical value of the statistic or missing if the statistic is of type character.
CVALUE	contains the character value of the text statistic or blank if the statistic is of type numeric.

Examples: X12 Procedure

Example 37.1: ARIMA Model Identification

This example shows typical PROC X12 statements that are used for ARIMA model identification. This example invokes the X12 procedure and uses the TRANSFORM and IDENTIFY statements. It specifies the time series data, takes the logarithm of the series (TRANSFORM statement), and generates ACFs and PACFs for the specified levels of differencing (IDENTIFY statement). The ACFs and PACFs for DIFF=1 and SDIFF=1 are shown in [Output 37.1.1](#), [Output 37.1.2](#), [Output 37.1.3](#), and [Output 37.1.4](#). The data set is the same as in the section “[Basic Seasonal Adjustment](#)” on page 2470.

The graphical displays are available when ODS Graphics is enabled. For more information about the graphics available in the X12 procedure, see the section “[ODS Graphics](#)” on page 2523.

```
proc x12 data=sales date=date;
  var sales;
  transform power=0;
  identify diff=(0,1) sdiff=(0,1);
run;
```

Output 37.1.1 ACFs (Nonseasonal Order=1 Seasonal Order=1)

Example 37.2: Model Estimation

After studying the output from [Example 37.1](#) and identifying the ARIMA part of the model as, for example, (0 1 1)(0 1 1) 12, you can replace the IDENTIFY statement with the ARIMA and ESTIMATE statements as follows:

```
proc x12 data=sales date=date;
  var sales;
  transform power=0;
  arima model= ( 0,1,1 ) (0,1,1) );
  estimate;
run ;
```

The parameter estimates and estimation summary statistics are shown in [Output 37.2.1](#).

Output 37.2.1 Estimation Data

Example 37.3: Seasonal Adjustment

Assuming that the model in [Example 37.2](#) is satisfactory, a seasonal adjustment that uses forecast extension can be performed by adding the X11 statement to the procedure. By default, the data is forecast one year ahead at the end of the series.

```
ods output D8A#1=SalesD8A_1;

         print=unitroottest unitroottestmdl autochoicemdl best5model;
  estimate;
  x11;
  output out=out(obs=23) a1 a2 a6 b1 c17 c20 d1 d7 d8 d9 d10
         d11 d12 d13 d16 d18;
run;
proc print data=out(obs=23);
  title 'Output Variables Related to Trading Day Regression';
run;

```

The automatic model selection output is shown in [Output 37.4.1](#), [Output 37.4.2](#), and [Output 37.4.3](#). The first table, “ARIMA Estimate for Unit Root Identification,” gives details of the method that TRAMO uses to automatically select the orders of differencing. The second table, “Results of Unit Root Test for Identifying Orders of Differencing,” shows that a regular difference order of 1 and a seasonal difference order of 1 has been determined by TRAMO. The third table, “Models Estimated by Automatic ARIMA Model Selection Procedure,” shows all the models examined by the TRAMO-based method. The fourth table, “Best Five ARIMA Models Chosen by Automatic Modeling,” shows the top five models in order of rank and their BIC2 statistic. The fifth table, “Comparison of Automatically Selected Model and Default Model,” compares the model selected by the TRAMO model to the default X-12-ARIMA model. The sixth table, “Final Automatic Model Selection,” shows which model was actually selected.

Table 37.14 and Output 37.4.4 illustrate the regARIMA modeling method. Table 37.14 shows the relationship between the output variables in PROC X12 that results from a regARIMA model. Note that some of these formulas apply only to this example. Output 37.4.4 shows the values of these variables for the first 23 observations in the example.

Table 37.14 regARIMA Output Variables and Descriptions

Table	Title	Type	Formula
A1	Time series data (for the span analyzed)	Data	Input
A2	Prior-adjustment factors leap year (from trading day regression) adjustments	Factor	Calculated from regression
A6	RegARIMA trading day component leap year prior adjustments included from Table A2	Factor	Calculated from regression
B1	Original series (prior adjusted) (adjusted for regARIMA factors)	Data	$B1 = A1/A6 *$ * because only TD specified
C17	Final weights for irregular component	Factor	Calculated using moving standard deviation
C20	Final extreme value adjustment factors	Factor	Calculated using C16 and C17
D1	Modified original data, D iteration	Data	$D1 = B1/C20 **$ $D1 = C19/C20$ ** C19=B1 in this example
D7	Preliminary trend cycle, D iteration	Data	Calculated using Henderson moving average
D8	Final unmodified SI ratios	Factor	$D8 = B1/D7 ***$ $D8 = C19/D7$ *** TD specified in regression
D9	Final replacement values for SI ratios	Factor	If C17 shows extreme values, $D9 = D1/D7$; $D9 = .$ otherwise
D10	Final seasonal factors	Factor	Calculated using moving averages
D11	Final seasonally adjusted data (also adjusted for trading day)	Data	$D11 = B1/D10 ****$ $D11 = C19/D10$ **** $B1 = C19$ for this example
D12	Final trend cycle	Data	Calculated using Henderson moving average
D13	Final irregular component	Factor	$D13 = D11/D12$
D16	Combined adjustment factors (includes seasonal, trading day factors)	Factor	$D16 = A1/D11$
D18	Combined calendar adjustment factors (includes trading day factors)	Factor	$D18 = D16/D10$ $D18 = A6 *****$ ***** regression TD is the only calendar adjustment factor in this example

Example 37.5: Automatic Outlier Detection

This example demonstrates the use of the OUTLIER statement to automatically detect and remove outliers from a time series to be seasonally adjusted. The data set is the same as in the section “Basic Seasonal Adjustment” on page 2470 and the previous examples. Adding the OUTLIER statement to Example 37.3 requests that outliers be detected by using the default critical value as described in the section “OUTLIER Statement” on page 2496. The tables associated with outlier detection for this example are shown in Output 37.5.1. The first table shows the critical values; the second table shows that a single potential outlier was identified; the third table shows the estimates for the ARMA parameters. Since no outliers are included in the regression model, the “Regression Model Parameter Estimates” table is not displayed. Because only a potential outlier was identified, and not an actual outlier, in this case the A1 series and the B1 series are identical.

```
title 'Automatic Outlier Identification';
proc x12 data=sales date=date;
  var sales;
  transform function=log;
  arima model=( 0,1,1) (0,1,1) );
  outlier;
  estimate;
  x11;
  output out=nooutlier a1 b1 d10;
run ;
```

Output 37.5.1 PROC X12 Output When Potential Outliers Are Identified

Automatic Outlier Identification			
The X12 Procedure			
Critical Values to use in Outlier Detection For Variable sales			
Begin	SEP1978		
End	AUG1990		
Observations	144		
Method	Add One		
AO Critical Value	3.889838		
LS Critical Value	3.889838		
<p>NOTE: The following time series values might later be identified as outliers when data are added or revised. They were not identified as outliers in this run either because their test t-statistics were slightly below the critical value or because they were eliminated during the backward deletion step of the identification procedure, when a non-robust t-statistic is used.</p>			
Potential Outliers For Variable sales			
Type of Outlier	Date	t Value for AO	t Value for LS
AO	NOV1989	-3.48	-1.51

Output 37.5.1 *continued*

Exact ARMA Maximum Likelihood Estimation For Variable sales					
Parameter	Lag	Estimate	Standard Error	t Value	Pr > t
Nonseasonal MA	1	0.40181	0.07887	5.09	<.0001
Seasonal MA	12	0.55695	0.07626	7.30	<.0001

In the next example, reducing the critical value to 3.3 causes the outlier identification routine to more aggressively identify outliers as shown in [Output 37.5.2](#). The first table shows the critical values. The second table shows that three additive outliers and a level shift have been included in the regression model. The third table shows how the inclusion of outliers in the model affects the ARMA parameters.

```
proc x12 data=sales date=date;
  var sales;
  transform function=log;
  arima model=((0,1,1) (0,1,1));
  outlier cv=3.3;
  estimate;
  x11;
  output out=outlier(obs=50) a1 a8 a8ao a8ls b1 d10;
run;
proc print data=outlier(obs=50);
run;
```

Output 37.5.2 PROC X12 Output When Outliers Are Identified

Seasonal MA	12	0.49647	0.07676	6.47	<.0001	

The first 50 observations of the A1, A8, A8AO, A8LS, B1, and D10 series are displayed in [Output 37.5.3](#). You can confirm the following relationships from the data:

$$A8 = A8AO \times A8LS$$

$$B1 = A1/A8$$

The seasonal factors are stored in the variable sales_D10.

From the two previous examples, you can examine how outlier detection affects the seasonally adjusted series. [Output 37.5.4](#) shows a plot of A1 versus B1 in the series where outliers are detected. B1 has been adjusted for the additive outliers and the level shift.

```
proc sgplot data=outlier;
  series x=date y=sales_A1 / name='A1' markers
        markerattrs=(color=red symbol='circle')
        lineattrs=(color=red);
  series x=date y=sales_B1 / name='B1' markers
        markerattrs=(color=black symbol='asterisk')
        lineattrs=(color=black);
  yaxis label='Original and Outlier Adjusted Time Series';
run;
```

Output 37.5.4 Original Series and Outlier Adjusted Series

Output 37.5.5 compares the seasonal factors (table D10) of the series unadjusted for outliers to the series adjusted for outliers. The seasonal factors are based on the B1 series.

```
data both;
  merge nooutlier(rename=(sales_D10=unadj_D10)) outlier;
run;

title 'Results of Outlier Identification on Final Seasonal Factors';
proc sgplot data=both;
  series x=date y=unadj_D10 / name='unadjusted' markers
    markerattrs=(color=red symbol='circle')
    lineattrs=(color=red)
    legendlabel='Unadjusted for Outliers';
  series x=date y=sales_D10 / name='adjusted' markers
    markerattrs=(color=blue symbol='asterisk')
    lineattrs=(color=blue)
    legendlabel='Adjusted for Outliers';
  yaxis label='Final Seasonal Factors';
run;
```

Output 37.5.5 Seasonal Factors Based on Original and Outlier Adjusted Series

Example 37.6: User-Defined Regressors

This example demonstrates the use of the `USERVAR=` option in the `REGRESSION` statement to include user-defined regressors in the `regARIMA` model. The user-defined regressors must be defined as nonmissing values for the span of the series being modeled plus any forecast values. Suppose you have the data set `SALESdata` with 132 monthly observations beginning in January of 1949.

```
title 'Data Set to be Seasonally Adjusted';
data salesdata;
    set sashelp.air(obs=132);
run;
```

Since the `regARIMA` model forecasts one year ahead, the user-defined regressor must be defined for 144 observations that start in January of 1949. You can construct a simple length-of-month regressor by using the following `DATA` step:

```
title 'User-defined Regressor for Data to be Seasonally Adjusted';
data regressors(keep=date LengthOfMonth);
    set sashelp.air;
    LengthOfMonth = INTNX('MONTH',date,1) - date;
run;
```

In this example, the two data sets are merged in order to use them as input to `PROC X12`. You can also use the `AUXDATA=` data set to input user-defined regressors. See [Example 37.10](#) for more information. The `BY` statement is used to align the regressors with the time series by the time ID variable `DATE`.

```
title 'Data Set Containing Series and Regressors';
data datain;
    merge regressors salesdata;
    by date;
run;
proc print data=datain(firstobs=121);
run;
```

The last 24 observations of the input data set are displayed in [Output 37.6.1](#). Note that the regressor variable is defined for one year (12 observations) beyond the span of the time series to be seasonally adjusted.

Output 37.6.1 PROC X12 Input Data Set with User-Defined Regressor

Data Set Containing Series and Regressors				
Obs	DATE	Length OfMonth	AIR	
121	JAN59	31	360	
122	FEB59	28	342	
123	MAR59	31	406	
124	APR59	30	396	
125	MAY59	31	420	
126	JUN59	30	472	
127	JUL59	31	548	
128	AUG59	31	559	
129	SEP59	30	463	
130	OCT59	31	407	
131	NOV59	30	362	
132	DEC59	31	405	
133	JAN60	31	.	
134	FEB60	29	.	
135	MAR60	31	.	
136	APR60	30	.	
137	MAY60	31	.	
138	JUN60	30	.

Example 37.8: Setting Regression Parameters

This example illustrates the use of fixed regression parameters in PROC X12. Suppose that you have the same data set as in the section “Basic Seasonal Adjustment” on page 2470. You can specify the following statements to use TRAMO to automatically identify a model that includes a U.S. Census Bureau Easter(25) regressor:

```
title 'Estimate Easter(25) Parameter';
proc x12 data=sales date=date MdlInfoOut=mdlout1;
  var sales;
  regression predefined=easter(25);
  automdl;
run ;
```

The displayed results are shown in [Output 37.8.1](#).

Output 37.8.1 Automatic Model ID with Easter(25) Regression

Estimate Easter(25) Parameter

To fix the Easter(25) parameter while adding a regressor that is weighted according to the number of Saturdays in a month, either use the REGRESSION and EVENT statements or create a MDLINFOIN= data set. The following statements show the method for using the REGRESSION statement to fix the EASTER parameter and the EVENT statement to add the SATURDAY regressor. The output is shown in [Output 37.8.3](#).

```

title 'Use SAS Statements to Alter Model';
proc x12 data=sales date=date MdlInfoOut=mdlout2grm;
  var sales;
  regression predefined=easter(25) / b=-5.029298 F;
  event Saturday;
  automdl;
run ;

```

Output 37.8.3 Automatic Model ID with Fixed Easter(25) and Saturday Regression

Use SAS Statements to Alter Model						
The X12 Procedure

To fix the EASTER regressor and add the new SATURDAY regressor by using a DATA step, you can create the data set mdlin2 as shown. The data set mdlin2 is displayed in [Output 37.8.4](#).

```

title 'Use a SAS DATA Step to Create a MdlInfoIn= Data Set';
data plusSaturday;
  _NAME_ = 'sales';
  _MODELTYPE_ = 'REG';
  _MODELPART_ = 'EVENT';
  _COMPONENT_ = 'SCALE';
  _PARMTYPE_ = 'USER';
  _DSVAR_ = 'SATURDAY';
run;

data mdlin2;
  set mdlout1;
  if ( _DSVAR_ = 'EASTER' ) then do;
    _NOEST_ = 1;
    _EST_ = -5.029298;
  end;
run;

proc append base=mdlinfo data=plusSaturday force;
run;

proc print data=mdlinfo;
run;

```

Output 37.8.4 MDLINFOIN= Data Set, Fixed Easter(25) and Added Saturday Regression, Previously Identified Model

The data set `mdlin2` can be used to replace the regression and model information contained in the `REGRESSION`, `EVENT`, and `AUTOMDL` statements. Note that the model specified in the `mdlin2` data set is the same model as the automatically identified model. The following example uses the `mdlin2` data set as input; the results are displayed in [Output 37.8.5](#).

```
title 'Use Updated Data Set to Alter Model';
proc x12 data=sales date=date MdlInfoIn=mdlin2 MdlInfoOut=mdlout2DS;
  var sales;
  estimate;
run ;
```

Output 37.8.5 Estimate MDLINFOIN= File for Model with Fixed Easter(25) and Saturday Regression, Previously Identified Model

Use Updated Data Set to Alter Model						
The X12 Procedure						
Regression Model Parameter Estimates For Variable sales

The MDLINFOOUT= data set provides a method for comparing the results of the model identification. The data set mdlout3grm that results from using the MODEL= option in the ARIMA statement can be compared to the data set mdlout2DS that results from using the MDLINFOIN= data set with initial values for the AR and MA parameters. The mdlout2DS data set is shown in [Output 37.8.7](#), and the results of the comparison are shown in [Output 37.8.8](#). The slight difference in the estimated parameters can be attributed to the difference in the initial values for the AR and MA parameters.

```
proc print data=mdlout2DS;
run;
```

Example 37.9: Illustration of ODS Graphics

This example illustrates the use of ODS Graphics. Using the same data set as in the section “[Basic Seasonal Adjustment](#)” on page 2470 and the previous examples, a spectral plot of the original series is displayed in [Output 37.9.1](#).

The graphical displays are available when ODS Graphics is enabled. For specific information about the graphics available in the X12 procedure, see the section “[ODS Graphics](#)” on page 2523.

```
proc x12 data=sales date=date;
    var sales;
run;
```

Output 37.9.1 Spectral Plot for Original Data

Example 37.10: AUXDATA= Data Set

This example demonstrates the use of the AUXDATA= data set to input user-defined regressors for use in the regARIMA model. User-defined regressors are often economic indicators, but in this example a user-defined regressor is generated in the following statements:

```
data auxreg(keep=date lengthofmonth);
  set sales;
  lengthofmonth = (INTNX('MONTH',date,1) - date) - (365/12);
  format date monyy.;
run;
```

When you use the AUXDATA= data set, it is not necessary to merge the user-defined regressor data set with the DATA= data set. The following statements input the regressor lengthofmonth in the data set auxreg. The regressor lengthofmonth is specified in the REGRESSION statement, and the data set auxreg is specified in the AUXDATA= option in the PROC X12 statement.

```
title 'Align lengthofmonth Regressor from Auxreg to First Three Years';
ods select regParameterEstimates;
proc x12 data=sales(obs=36) date=date auxdata=auxreg;
  var sales;
  regression uservar=lengthofmonth;
  arima model=((0 1 1) (0 1 1));
  estimate;
run;

title 'Align lengthofmonth Regressor from Auxreg to Second Three Years';
ods select regParameterEstimates;
proc x12 data=sales(firstobs=37 obs=72) date=date auxdata=auxreg;
  var sales;
  regression uservar=lengthofmonth;
  arima model=((0 1 1) (0 1 1));
  estimate;
run;
```

Output 37.10.1 and Output 37.10.2 display the parameter estimates for the two series.

Output 37.10.1 Using Regressors in the AUXDATA= Data for the First Three Years of Series

Align lengthofmonth Regressor from Auxreg to First Three Years						
The X12 Procedure						
Regression Model Parameter Estimates						
For Variable sales						
Type	Parameter	NoEst	Estimate	Standard Error	t Value	Pr > t
User Defined	lengthofmonth	Est	2.98046	5.36251	0.56	0.5840

Output 37.10.2 Using Regressors in the AUXDATA= Data for the Second Three Years of Series

Align lengthofmonth Regressor from Auxreg to Second Three Years						
The X12 Procedure						
Regression Model Parameter Estimates For Variable sales						
Type	Parameter	NoEst	Estimate	Standard Error	t Value	Pr > t
User Defined	lengthofmonth	Est	-0.51215	8.43145	-0.06	0.9521

The X12 procedure uses the date variable in the sales data set and the auxreg data set to align the user-defined regressors.

In the following example, the DATA= data set salesby contains BY groups. The X12 procedure aligns the regressor in the auxreg data set to each BY group in the salesby data set according to the variable date that is specified by the DATE= option in the PROC X12 statement. The variable date must be present in the auxreg data set to align the values.

```
data salesby;
  set sales(obs=72);
  if ( _n_ < 37 ) then by=1;
  else by=2;
run;
ods select regParameterEstimates;
title 'Align lengthofmonth Regressor from Auxreg to BY Groups';
proc x12 data=salesby date=date auxdata=auxreg;
  var sales;
  by by;
  regression uservar=lengthofmonth;
  arima model=((0 1 1) (0 1 1));
  estimate;
run;
```

The results in [Output 37.10.3](#) match the previous results in [Output 37.10.1](#) and [Output 37.10.2](#).

Output 37.10.3 Using Regressors in the AUXDATA= Data with BY Groups

Align lengthofmonth Regressor from Auxreg to BY Groups						
----- by=1 -----						
The X12 Procedure						
Regression Model Parameter Estimates For Variable sales						
Type	Parameter	NoEst	Estimate	Standard Error	t Value	Pr > t
User Defined	lengthofmonth	Est	2.98046	5.36251	0.56	0.5840

Output 37.10.3 *continued*

Align lengthofmonth Regressor from Auxreg to BY Groups						
----- by=2 -----						
The X12 Procedure						
Regression Model Parameter Estimates						
For Variable sales						
Type	Parameter	NoEst	Estimate	Standard Error	t Value	Pr > t
User Defined	lengthofmonth	Est	-0.51215	8.43145	-0.06	0.9521

Overview: SASECRSP Interface Engine

Introduction

The SASECRSP interface engine enables SAS users to access and process time series, events, portfolios, and group data that reside in CRSPAccess databases. It also provides a seamless interface between CRSP, COMPUSTAT, and SAS data processing. Currently, SASECRSP supports access of CRSP Stock databases, CRSP Indices databases and CRSP/Compustat Merged databases.

Opening a Database

The SASECRSP engine uses the LIBNAME statement to enable you to specify which CRSPAccess database you would like to access and how you would like to perform selection on that database.

To specify the database, you supply the combination of a physical path to indicate the location of the CRSPAccess data files and a set identifier (SETID) to identify the database desired from those available at the physical path. Specify one SETID from [Table 38.1](#). Note that the CRSP environment variable CRSPDB_SASCAL must be defined before the SASECRSP engine can access the CRSPAccess database calendars that provide the time ID variables and enable the LIBNAME to successfully assign. If your database setid is 250, use the SASEXCCM interface to access your data. For more information on the SASEXCCM interface see the chapter on SASEXCCM in *SAS/ETS User's Guide*.

Table 38.1 CRSPAccess Databases SETIDs

SETID	Data Set
10	CRSP Stock, daily data
20	CRSP Stock, monthly data
200	CRSP/Compustat Merged (CCM) data
400	CRSP Indices data, monthly index groups
420	CRSP Indices data, monthly index series
440	CRSP Indices data, daily index groups
460	CRSP Indices data, daily index series

Usually you do not want to open the entire CRSPAccess database, so for efficiency purposes and ease of use, SASECRSP supports a variety of options for performing data selection on your CRSPAccess database with the LIBNAME statement. These options enable you to open and retrieve data for only the portion of the database you desire. The availability of some of these options depends on the type of database being opened.

CRSP Stock Databases

When accessing the CRSP Stock databases, you can select which securities you want to access by specifying their *PERMNO*s with the PERMNO= option. *PERMNO*TM is CRSP's unique permanent issue identification

number and the primary key for their stock databases. Alternatively, a number of secondary keys can also be used to select stock data. For example, you could use the `PERMCO=` option to read selected securities based on CRSP's unique permanent company identification number, *PERMCO*TM. A full list of possible keys for accessing CRSP Stock data is shown in [Table 38.2](#).

Table 38.2 Keys for Accessing CRSP Stock Data

Key	Access By
PERMNO	CRSP's unique permanent issue identification number This is the primary key for CRSP Stock databases.
PERMCO	CRSP's unique permanent company identification number
CUSIP	CUSIP number
HCUSIP	historical CUSIP
SICCD	standard industrial classification (SIC) code
TICKER	TICKER symbol (for active companies only)

CRSP/Compustat Merged Databases

Experimental support for Xpressfeed CCM data access is provided by the new SASEXCCM engine. SASEXCCM provides data item handling access methods using CRSPAccess 3.14. For a detailed description of this new ETS interface engine, see the chapter on SASEXCCM in *SAS/ETS User's Guide*. A description of the legacy CCM data access methods using the SASECRSP engine follows.

When accessing Compustat data via the CCM database using SASECRSP, you can select which companies you want to access by specifying their *GVKEY*s. *GVKEY*TM is Compustat's unique identifier and primary key. You can specify a *GVKEY* to include with the `GVKEY=` option. Two secondary keys, *PERMNO* and *PERMCO*, are also supported for access via their respective `PERMNO=` and `PERMCO=` options. A full list of possible keys for accessing CCM data is shown in [Table 38.3](#).

Table 38.3 Keys for Accessing CCM Data

Key	Access By
GVKEY	Compustat's unique identifier and primary key for CCM database
PERMNO	CRSP's unique permanent issue identification number
PERMCO	CRSP's unique permanent company identification number

CRSP Indices Databases

When accessing CRSP Indices data, you can select which indices you want to access by specifying their *INDNO*s. *INDNO*TM is the primary key for CRSP Indices databases. You can specify which *INDNO* to use with the `INDNO=` option. No secondary key access is supported for CRSP Indices. A full list of possible keys for accessing CRSP Indices data is shown in [Table 38.4](#).

Table 38.4 Keys for Accessing Indices Data

Key	Access By
INDNO	CRSP's unique permanent index identifier number. This is the primary key for CRSP Indices databases and enables you to specify which index series or groups you want to select.

Regardless of the database you are accessing, you can always use the INSET= and RANGE= options for subsetting and selection. The RANGE= option subsets the data timewise. The INSET= option enables you to specify which issues or companies you want to select from the CRSP database by using an input SAS data set.

Using Your Opened Database

Once the LIBNAME is assigned, the database is opened. You can retrieve data for any member you want in the opened database. For a complete description of available data sets and their fields, see the section “Data Elements Reference: SASECRSP Interface Engine” on page 2599. You can also use the SAS DATA Step to perform further subsetting and to store the resulting time series in a SAS data set. Since CRSP and SAS use three different date representations, you can make use of the engine-provided CRSP date formats, informats, and functions for your data processing needs. See the section “Understanding CRSP Date Formats, Informats, and Functions” on page 2595, as well as Example 38.6 later in this chapter for more information about dates with SASECRSP.

SASECRSP for SAS 9.2 supports Linux, Solaris (SUNOS5.9), and 32-bit Windows. SASECRSP for SAS 9.3 supports Linux, Solaris (SUNOS5.10), and 32-bit Windows.

Getting Started: SASECRSP Interface Engine

Structure of a SAS Data Set That Contains Time Series Data

SAS requires time series data to be in a specific form that is recognizable by the SAS System. This form is a two-dimensional array, called a SAS data set, whose columns correspond to series variables and whose rows correspond to measurements of these variables at certain points in time. The time at which observations are recorded can be included in the data set as a time ID variable. Note that CRSP sets the date to the end of a time period as opposed to the beginning, and SASECRSP follows this convention. For example, the time ID variable for any particular month in a monthly time series occurs on the last trading day of that month.

The SASECRSP engine provides several different time ID variables depending on the data member opened. For most members, a time ID variable called CALDT is provided. CALDT provides a day-based calendar

date and is in a CRSP date format. This means dates are stored as an offset in an array of trading days or a trading day calendar. There are five different CRSP trading day calendars and the one used depends on the frequency of the data member. For example, the CRSP date for a daily time series refers to a daily trading day calendar.

The five trading day calendars are: annual, quarterly, monthly, weekly and daily. For your convenience, the format and informat for this field is set so the CRSP date is automatically converted to an Integer date representation when viewed or printed. For data programming, the SASECRSP engine provides 23 different user functions for date conversions between CRSP, SAS, and integer dates.

The CCM database contains members whose dates are based on the fiscal calendar of the corresponding company, so a comprehensive set of time ID variables are provided. CRSPDT, RCALDT and FISCALDT provide day-based dates, each with its own format.

CRSPDT This time ID variable provides a date in CRSP date format similar to CALDT. CRSPDT differs only in that its format and informat are not set for automatic conversion to integer dates because this is already provided by FISCALDT and RCALDT. For fiscal members, CRSPDT is one based on the fiscal calendar of the company.

FISCALDT This time ID variable provides the same date CRSPDT does, but in integer format. It is the result of performing a CRSP-to-Integer date conversion on CRSPDT. Since the date CRSPDT holds is fiscal, FISCALDT is also fiscal.

RCALDT This time ID variable is also an integer date, just like FISCALDT, but it has been shifted so the date is on calendar time as opposed to being fiscal.

For example, Microsoft's fiscal year ends in June, so if you look at its annual period descriptor for the 2002 fiscal year, its time ID variables are 78 for CRSPDT, 20021231 for its FISCALDT, and 20020628 for RCALDT. In summary, a total of three time ID variables are provided for fiscal time series members. One is in CRSP date format, and the other two are in integer format with the only difference between the two integer formats being that one of them is based on the fiscal calendar of the company while the other is not.

For more information about how CALDT, CRSPDT, and date conversions are handled, see the section "[Understanding CRSP Date Formats, Informats, and Functions](#)" on page 2595.

The CCM database also contains fiscal array members, which are all the segment data members. They are unlike the fiscal time series in that they are not associated with a calendar and also have their time ID variables embedded in the data as a data field. Generally both fiscal and calendar time ID variables are embedded. However, segment members *segsr*, *segcur*, and *segitm* have only one fiscal time ID variable embedded. For your convenience, SASECRSP calculates and provides CALYR, the calendar version of the embedded fiscal time ID variable for these three segment members. Note that due to limitations of the data, all segment member time ID variables are year-based.

Reading CRSP Data Files

The SASECRSP engine supports reading time series, events, portfolios and group data from CRSPAccess databases. The SETID you specify determines the database that is read. See [Table 38.1](#) for a list of possible

databases. The CRSP environment variable CRSPDB_SASCAL must be defined before the SASECRSP engine can access the CRSPAccess database calendars that provide the time ID variables and enable the LIBNAME to successfully assign.

Using the SAS DATA Step

If desired, you can store the selected series in a SAS data set by using the SAS DATA step. You can also perform other operations on your data inside the DATA step. Once the data is in a SAS data set you can use it as you would any other SAS data set.

Using SAS Procedures

You can print the output SAS data set by using the PRINT procedure, and you can report information concerning the contents of your data set by using the CONTENTS procedure.

You can also create a view of the CRSPAccess database by using the SQL procedure in conjunction with a SASECRSP *libref*. See [Example 38.11](#) later in this chapter for an example with PROC SQL.

Viewtable enables you to view your data by double-clicking on a SASECRSP *libref* in the LIBNAME window of the SAS Display Manager.

Using CRSP Date Formats, Informats, and Functions

Historically, CRSP has used two different methods to represent dates, and SAS has used a third. The SASECRSP engine provides 23 functions, 15 informats, and 10 formats to enable you to easily translate the dates from one internal representation to another. See the section “[Understanding CRSP Date Formats, Informats, and Functions](#)” on page 2595 for details.

Syntax: SASECRSP Interface Engine

The SASECRSP engine uses standard engine syntax. Options used by SASECRSP are summarized in [Table 38.5](#).

Table 38.5 Summary of LIBNAME libref

Option	Description
SETID=	specifies which CRSP database subset to open This option is required. See Table 38.1 for complete list of supported SETIDs.
PERMNO=	specifies a CRSP PERMNO to be selected for access
PERMCO=	specifies a CRSP PERMCO to be selected for access
CUSIP=	specifies a current CUSIP to be selected for access
HCUSIP=	specifies a historic CUSIP to be selected for access
TICKER=	specifies a TICKER to be selected for access (for active companies only)
SICCD=	specifies a SIC Code to be selected for access
GVKEY=	specifies a Compustat GVKEY to be selected for access
INDNO=	specifies a CRSP INDNO to be selected for access
RANGE=	specifies the range of data to keep in format 'YYYYMMDD-YYYYMMDD'
INSET=	uses a SAS data set named <i>setname</i> as input for issues
CRSPLINKPATH=	specifies location of the CRSP link history. This option is required for accessing CRSP data with Compustat's GVKEY.

The LIBNAME libref SASECRSP Statement

LIBNAME libref SASECRSP 'physical name' options ;

The physical name required by the LIBNAME statement should point to the directory of CRSPAccess data files where the CRSP database you want to open is located. Note that the physical name **must** end in a slash for UNIX environments and a backslash for Windows environments.

The CRSP environment variable CRSPDB_SASCAL must be defined before the SASECRSP engine can access the CRSPAccess database calendars. The CRSP environment variable CRSPDB_SASCAL is necessary for the SASECRSP LIBNAME to assign successfully. This necessary environment variable should be defined automatically by either the CRSP software installation or, in later versions, the CRSP data installation. Since occasional instances occur where the variable is not set properly, always check to ensure the CRSPDB_SASCAL environment variable is set to the location where your most recent CRSP data resides. Remember to include the final slash or backslash required.

After the LIBNAME is assigned, you can access any of the available data sets/members within the opened database. For a complete description of available data sets and their fields, see the section “[Data Elements Reference: SASECRSP Interface Engine](#)” on page 2599.

The following options can be used in the LIBNAME libref SASECRSP statement:

SETID=*crsp_setidnumber*

Specifies the CRSP database you want to read from. SETID is a required option. Choose one SETID

from seven possible values in Table 38.1. The SETID limits the frequency selection of time series that are included in the SAS data set.

As an example, to access monthly CRSP Stock data, you would use the following statements:

```
LIBNAME myLib sasecrsp 'physical-name'
      SETID=20;
```

PERMNO=*crsp_permnumber*

By default, the SASECRSP engine reads all keys for the CRSPAccess database that you specified in your SASECRSP *libref*. The PERMNO= option enables you to select data from your CRSP database by the *PERMNO*(s) (or other keys) you specify. *PERMNO*s are CRSP's unique permanent issue identification number. There is no limit to the number of *crsp_permnumber* options that you can use.

From a performance standpoint, the PERMNO= option does efficient random access and reads *only* the data for the *PERMNO*s specified.

The following LIBNAME statement reads data only for Microsoft Corporation (PERMNO=10107) and International Business Machines Corporation (PERMNO=12490) using the primary PERMNO key, and thus is very efficient.

```
LIBNAME myLib sasecrsp 'physical-name'
      SETID=20
      PERMNO=10107
      PERMNO=12490;
```

The PERMCO=, CUSIP=, HCUSIP=, SICCD=, TICKER=, GVKEY=, and INDNO= options behave similarly and you can use them in conjunction with or in place of the PERMNO= option. For example you could have used the following statement to access monthly data for Microsoft and IBM:

```
LIBNAME myLib sasecrsp 'physical-name'
      SETID=20
      TICKER='MSFT'
      CUSIP=59491810;
```

Details on the use of other key selection options are described separately later.

*PERMNO*s specified by this option can select the companies or issues to keep for CRSP Stock or for CRSP/Compustat Merged databases, but *PERMNO* is not a supported option for CRSP Indices databases. Use the INDNO= option for the CRSP Indices database and use the PERMNO= option with CRSP US Stock and with CRSP/Compustat Merged databases. Details on the use of key selection options for each type of database follows.

STK Databases

PERMNO is the primary key for CRSP Stock databases. Every valid *PERMNO* you specify with the PERMNO= option keeps exactly one issue.

CCM Databases

PERMNO can be used as a secondary key for the CCM database through *CRSPLink*[™]. Linking between the CRSP and Compustat databases is a complex, many-to-many relationship between *PERMNO*/*PERMCO*s and *GVKEY*s. When accessing CCM data by *PERMNO*, all *GVKEY*s that link to the given *PERMNO* are amalgamated to provide seamless access to all linked data. However, note that accessing CCM data by *PERMNO* is logically different than accessing it by its linked *GVKEY*(s).

In particular, when the *PERMNO* you specify is linked to several different *GVKEY*s, one link is designated as the primary link. This designation is set by CRSP and its researchers, and serves in a specific role for the link information in the CCM database. Only data for the primary link is retrieved for the header. For other members, including all time series members, all links are examined, but data is extracted only for the active period of the links and only if the data is within any possible user-specified date restriction. If two or more *GVKEY*-to-*PERMNO* links overlap in time, data from the later (more recent) *GVKEY* is used. For more information about CRSP links, see “Link Used Array” in the *CRSP/Compustat Merged Database Guide*.

For example, *PERMNO*=10083 is CRSP’s unique issue identifier for Teknowledge Incorporated, and later (due to a name change) Cimflex Teknowledge Corporation. To access CCM data for IBM Corporation, Teknowledge Inc., and Cimflex Teknowledge Corp., you can use the following statement:

```
LIBNAME myLib1 sasecrsp 'physical-name'
                        SETID=200
                        GVKEY=6066      /* IBM */
                        PERMNO=10083;    /* Teknowledge and Cimflex */
```

Teknowledge Inc. and Cimflex Corp. have separate *GVKEY*s in the CCM database, so the previous statement is actually an example of using one *PERMNO* to access data for several (linked) *GVKEY*s. The first link to *GVKEY*=11947 spans March 5, 1986, to December 31, 1988, and the second link to *GVKEY*=15495 spans February 2, 1989, to September 9, 1993.

An alternate way of accessing the data is by using the linked *GVKEY*s directly as seen in this statement.

```
LIBNAME myLib2 sasecrsp 'physical-name'
                        SETID=200
                        GVKEY=6066
                        GVKEY=11947
                        GVKEY=15495;
```

These two LIBNAME statements look similar, but do not perform the same operation. **myLib1** assumes you are selecting the issue data for *PERMNO*=10083, so only observations from the CCM database that are **within** the time period of the used links are accessed. In the previous example for **myLib1**, only data ranging from March 5, 1986, to December 31, 1988, are extracted for *GVKEY*=11947 and only data ranging from February 28, 1989, to September 9, 1993, are extracted for *GVKEY*=15496.

Furthermore, while both *GVKEY*s 11947 and 15495 are linked to the *PERMNO*, *GVKEY* 15495 is the primary link, and when accessing the header, only 15495 is used. If the two links overlap, the data from the later (more recent) *GVKEY* of 15495 is used.

In contrast, **myLib2** uses an open range for all three specified keys. If there are data overlapping in time between *GVKEY* 11947 and 15495, data for both are reported. Similarly, when accessing the header, data for both 11947 and 15497 are retrieved.

IND Databases

INDNO is the primary key for accessing CRSP Indices databases. *PERMNO* is not available as a key for the IND (CRSP Indices) database; use *INDNO* for efficient access of IND database.

GVKEY=*crsp_gvkey*

The **GVKEY=** option is similar to the **PERMNO=** option. It enables you to use the Compustat's Permanent SPC Identifier key (*GVKEY*) to select the companies or issues to keep. There is no limit to the number of *crsp_gvkey* options that you can use.

STK Databases

GVKEY can serve as a secondary key for accessing CRSP Stock databases. This requires the additional use of the **CRSPLINKPATH=** option. Linking between the Compustat and CRSP databases is a complex, many-to-many relationship between *GVKEY*s and *PERMNO*/*PERMCO*s. When accessing CRSP data by *GVKEY*, all links of the specified *GVKEY* are followed and processed. No additional logic is applied, and link ranges are ignored. Accessing CRSP data by *GVKEY* is identical to accessing CRSP data by all of its linked *PERMNO*s.

For example, Wolverine Exploration Co. and Amerac Energy Corp have different *PERMNO*s but the same *GVKEY*, and there are two *identical* ways of accessing CRSP Stock data on these two entities.

```
LIBNAME myLib1 sasecrsp 'physical-name'
      SETID=10
      PERMNO=13638 /* Wolverine Exploration */
      PERMNO=84641; /* Amerac Energy */

LIBNAME myLib2 sasecrsp 'physical-name'
      SETID=10
      CRSPLINKPATH='physical-name'
      GVKEY=1544;
```

The **CRSPLINKPATH=** option is required when accessing CRSP Stock databases by *GVKEY*. See the discussion later in this section on the **CRSPLINKPATH=** option.

CCM Databases

GVKEY is the primary key for accessing the CCM database. Every valid *GVKEY* you specify keeps exactly one company.

IND Databases

INDNO is the primary key for accessing CRSP Indices databases; use *INDNO* instead of *GVKEY* for IND databases. *GVKEY* is not available as a key for accessing CRSP Indices databases.

PERMCO=*crsp_permcompany*

The PERMCO= option is similar to the PERMNO= option. It enables you to use the CRSP's unique permanent company identification key (*PERMCO*) to select the companies or issues to keep. There is no limit to the number of *crsp_permcompany* options that you can use.

STK Databases

PERMCO is a secondary key for accessing CRSP Stock databases. One *PERMCO* can map to multiple *PERMNOs*. Access by *PERMCO* is equivalent to access by all mapped *PERMNOs*.

CCM Databases

PERMCO can also be used as a secondary key for accessing the CCM database. Linking between the CRSP and CCM databases is a complex, many-to-many relationship. When accessing CCM data by *PERMCO*, all linking *GVKEYs* are amalgamated and processed. Link active ranges are respected. Only data for the primary link is returned for the header. In cases when the active ranges of various links overlap, the most recent link is used. See PERMNO= option for more details.

IND Databases

Use *INDNO* for accessing CRSP Indices databases. *PERMCO* is not available as a key for accessing CRSP Indices databases; use *INDNO* instead.

CUSIP=*crsp_cusip*

The CUSIP= option is similar to the PERMNO= option. It enables you to use the *CUSIP* key to select the companies or issues to keep. There is no limit to the number of *crsp_cusip* options that you can use.

STK Databases

CUSIP is a secondary key for accessing CRSP Stock databases. One *CUSIP* maps to one *PERMNO*.

CCM Databases

CUSIP is not available as a key for accessing CCM databases.

IND Databases

Use *INDNO* for accessing CRSP Indices databases. *CUSIP* is not available as a key for accessing CRSP Indices databases; use *INDNO* instead.

HCUSIP=*crsp_hcusip*

The HCUSIP= option is similar to the PERMNO= option. It enables you to use the historical CUSIP key, *HCUSIP*, to select the companies or issues to keep. There is no limit to the number of *crsp_hcusip* options that you can use.

STK Databases

HCUSIP is a secondary key for accessing CRSP Stock databases. One *HCUSIP* maps to one *PERMNO*.

CCM Databases

HCUSIP is not available as a key for accessing CCM databases.

IND Databases

Use *INDNO* for accessing CRSP Indices databases. *HCUSIP* is not available as a key for accessing CRSP Indices databases; use *INDNO* instead.

TICKER=crsp_ticker

The **TICKER=** option is similar to the **PERMNO=** option. It enables you to use the *TICKER* key to select the companies or issues to keep. There is no limit to the number of *crsp_ticker* options that you can use.

STK Databases

TICKER is a secondary key for accessing CRSP Stock databases. One *TICKER* maps to one *PERMNO*. Note that some *PERMNO*s are inaccessible by *TICKER*.

CCM Databases

TICKER is not available as a key for accessing CCM databases.

IND Databases

Use *INDNO* for accessing CRSP Indices databases. *TICKER* is not available as a key for accessing CRSP Indices databases; use *INDNO* instead.

SICCD=crsp_siccd

The **SICCD=** option is similar to the **PERMNO=** option. It enables you to use the Standard Industrial Classification (SIC) Code (*SICCD*) to select the companies or issues to keep. There is no limit to the number of *crsp_siccd* options that you can use.

STK Databases

SICCD is a secondary key for accessing CRSP Stock databases. One *SICCD* can map to multiple *PERMNO*s. All *PERMNO*s that have been classified once under the specified *SICCD* are mapped and data for them is retrieved. Access by *SICCD* is equivalent to access by all *PERMNO*s that have ever been classified under the specified *SICCD*.

CCM Databases

SICCD is not available as a key for accessing CCM databases.

IND Databases

Use *INDNO* for accessing CRSP Indices databases. *SICCD* is not available as a key for accessing CRSP Indices databases; use *INDNO* instead.

INDNO=crsp_indno

The **INDNO=** option is similar to the **PERMNO=** option. It enables you to use CRSP's permanent index number *INDNO* to select the companies or issues to keep. There is no limit to the number of *crsp_indno* options that you can use.

STK Databases

INDNO is not available as a key for accessing CRSP Stock databases, but it can be used in the combined CRSP Stock and Indices databases.

CCM Databases

INDNO is not available as a key for accessing CCM databases; use *GVKEY* instead.

IND Databases

INDNO is the primary key for accessing CRSP Indices databases. Every *INDNO* you specify keeps exactly one index series or group.

For example, you can use the following statement to access the CRSP NYSE Value-Weighted and Equal-Weighted daily market indices:

```
LIBNAME myLib3 sasecrsp 'physical-name'
               SETID=460
               INDNO=1000000 /* Value-Weighted */
               INDNO=1000001; /* Equal-Weighted */
```

CRSPLINKPATH='crsp_linkpath'

To access CRSP Stock data with *GVKEY*s, use the *CRSPLINKPATH=* option. *CRSPLINKPATH=* specifies the physical location where your CCM database resides. **NOTE:** The physical name must end in a slash for UNIX environments and a backslash for Windows environments.

RANGE='crsp_begdt-crsp_enddt'

To limit the time range of data read from your CRSPAccess database, specify the *RANGE=* option in your *SASECRSP libref*, where *crsp_begdt* is the beginning date in YYYYMMDD format and *crsp_enddt* is the ending date of the range in YYYYMMDD format.

As an example, to access monthly stock data for Microsoft Corporation and for International Business Machines Corporation for the first quarter of 1999, you can use the following statement:

```
LIBNAME myLib sasecrsp 'physical-name'
               SETID=20
               PERMNO=10107
               PERMNO=12490
               RANGE='19990101-19990331';
```

The given beginning and ending dates are interpreted as calendar dates by default. If you want these dates to be interpreted as fiscal dates, you must prepend the character 'f' to the range.

For example, the following statement extracts data for the 1994 fiscal year of both Microsoft and IBM.

```
LIBNAME myLib sasecrsp 'physical-name'
               SETID=20
               PERMNO=10107
               PERMNO=12490
               RANGE='f19940101-19941231';
```

The result of the previous statement is that data from actual calendar date July 1, 1993, to June 30, 1994, is extracted for Microsoft because its fiscal year end month is June. Data from January 1, 1994,

to December 31,1994, is extracted for IBM because its fiscal year end month is December. See [Example 38.10](#) for a more detailed example.

The RANGE= option can be used on all CRSP Stock, Indices, and CCM members. When this option is applied to segment data members however, the behavior is slightly different in the following ways.

- Dates associated with segment member data records are in years and can resolve only to years. This is unique to segment members. All other CRSP data members have a date resolution to the day. For example, monthly time series, though monthly, resolve to the last trading day of the month. However, segment members have a maximum resolution of years because they are not mapped to a calendar in the CRSP/Compustat database. Hence, when range restrictions are applied to segment members, only the 'YYYY' year portion of the range is considered.
- Multiple dates are sometimes associated with a particular segment member record. In such cases, the preferred date for use in determining the date range restriction is the data year as opposed to the source year. This multiple date behavior is unique only to segment members. All other CRSP data members are associated with only one date.

INSET='setname[,keyfieldname,keyfieldtype,date1field,date2field,datatype]'

When you specify a SAS data set named *setname* as input for issues, the SASECRSP engine assumes that a default PERMNO field that contains selected CRSP PERMNOs is present in the data set. If optional parameters are used, they must all be specified. The only acceptable shorthand for dropping the parameters is to drop those at the very end, assuming they are all being omitted. Dropped parameters use their defaults.

The optional parameters are explained below:

keyfieldname	label of the field that contains the keys to be selected. If unspecified, the default is "PERMNO".
keyfieldtype	specifies the CRSPAccess key type of the provided keys. Possible key types are: <i>PERMNO</i> , <i>PERMCO</i> , <i>CUSIP</i> , <i>HCUSIP</i> , <i>TICKER</i> , <i>SICCD</i> , <i>GVKEY</i> or <i>INDNO</i> . If unspecified, the default is "PERMNO".
date1field	beginning date of the specific date range restriction being applied to this key. If either <i>date1field</i> or <i>date2field</i> is omitted, the default is for there to be no date range restriction.
date2field	ending date of the specific date range restriction being applied to this key. If either <i>date1field</i> or <i>date2field</i> is omitted, the default is for there to be no date range restriction.
datatype	indicates whether the provided beginning and ending dates are calendar dates or fiscal dates. A fiscal date type means the dates given are based on the fiscal calendar of the respective company or GVKEY. A calendar date means the dates are based on the standard Julian calendar. The strings 'calendar' and 'fiscal' are used to indicate the respective date types. If unspecified, the default type is calendar. It is important to note that fiscal dates are applicable only to members with fiscal data. Fiscal members consists of all period descriptors, items, and segment members of the CCM database. If a fiscal date range is applied to nonfiscal members, it is ignored.

Individual date range restrictions specified by the inset can be used in combination with the RANGE= option on the LIBNAME. In such a case, only data from the intersection of the individual date restriction and the global RANGE= option date restriction are read.

Details: SASECRSP Interface Engine

Using the Inset Option

To better illustrate the use of the INSET= option, some examples follow:

Basic Inset Use: Providing a List of PERMNOs

This example uses the INSET= option to extract monthly data for a portfolio of three companies. No date range restriction is used.

```
data testin1;
    permno = 10107; output;
    permno = 12490; output;
    permno = 14322; output;
run;

LIBNAME mstk sasecrsp 'physical-name'
        SETID=20
        INSET='testin1';

proc print data=mstk.stkhead (keep=permno permco begdt enddt hcomnam htick);
run;
```

General Use of Inset for Specifying Lists of Keys

The following example illustrates the use of the INSET= option to select a few Index Series from the Indices database, companies from the CCM database, and securities from the Stock database. Libref **ind2** is used for accessing the Indices database with the two specified INDNOs. Libref **comp2** is used to access the CCM database with the two specified PERMCOs. Libref **sec3** is used to access the Stock database with the three specified TICKERs. Note the use of shorthand in specifying the INSET= option. The *date1field*, *date2field*, and *datatype* fields are all omitted, thereby using the default of no range restriction (though the range restriction set by the RANGE= on the LIBNAME statement still applies). For details including sample output, see [Example 38.4](#)

```
data indices;
    indno=1000000; output; /* NYSE Value-Weighted Market Index */
    indno=1000001; output; /* NYSE Equal-Weighted Market Index */
run;

libname ind2 sasecrsp "%sysget(CRSP_MSTK)" setid=420
        inset='indices,INDNO,INDNO' range='19990101-19990401';

title2 'Total Returns for NYSE Value and Equal Weighted Market Indices';
proc print data=ind2.tret label;
run;
```

```

data companies;
    permco=8045; output; /* Oracle */
    permco=20483; output; /* Citigroup */
run;

libname comp2 sasecrsp "%sysget(CRSP_CST)" setid=200
                    inset='companies,PERMCO,PERMCO'
                    range='20040101-20040531';

title2 'Link Info of Selected PERMCOs';
proc print data=comp2.link label; run;

title3 'Dividends Per Share for Oracle and Citigroup';
proc print data=comp2.div label; run;

data securities;
    ticker='BAC'; output; /* Bank of America */
    ticker='DUK'; output; /* Duke Energy */
    ticker='GSK'; output; /* GlaxoSmithKline */
run;

libname sec3 sasecrsp "%sysget(CRSP_MSTK)" setid=20
                    inset='securities,TICKER,TICKER'
                    range='19970820-19970920';

title2 'PERMNOs and General Header Info of Selected TICKERs';
proc print data=sec3.stkhead (keep=permno htick htsymbol) label;
run;

title3 'Average Price for Bank of America, Duke and GlaxoSmithKline';
proc print data=sec3.prc label; run;

```

Key-Specific Date Range Restriction with Insets

Suppose you not only want to select keys with your inset, but also want to specify a date range restriction for each key individually. The following example shows how to do this. Again, shorthand enables you to omit the datatype field. The provided dates default to a calendar interpretation. For details including the sample output, see [Example 38.5](#).

```

title2 'INSET=testin2 uses date ranges along with PERMNOs:';
title3 '10107, 12490, 14322, 25788';
title4 'Begin dates and end dates for each permno are used in the INSET';

data testin2;
    permno = 10107; date1 = 19980731; date2 = 19981231; output;
    permno = 12490; date1 = 19970101; date2 = 19971231; output;
    permno = 14322; date1 = 19950731; date2 = 19960131; output;
    permno = 25778; date1 = 19950101; date2 = 19950331; output;
run;

libname mstk2 sasecrsp "%sysget(CRSP_MSTK)" setid=20
                    inset='testin2,PERMNO,PERMNO,DATE1,DATE2';

```

```
data b;
    set mstk2.prc;
run;

proc print data=b;
run;
```

Fiscal Date Range Restrictions with Insets

You can use fiscal dates on the date range restrictions inside insets by specifying the date type. The following example shows two identical accesses, except one inset uses the date range restriction in fiscal terms, and the other inset uses the date range restriction in calendar terms. For details including sample output, see [Example 38.10](#).

```
data comp_fiscal;

    /* Crude Petroleum & Natural Gas */
    compkey=2416;
    begdate=19860101; enddate=19861231;
    datatype='fiscal';
    output;

    /* Commercial Intertech */
    compkey=3248;
    begdate=19940101; enddate=19941231;
    datatype='fiscal';
    output;
run;

data comp_calendar;

    /* Crude Petroleum & Natural Gas */
    compkey=2416;
    begdate=19860101; enddate=19861231;
    datatype='calendar';
    output;

    /* Commercial Intertech */
    compkey=3248;
    begdate=19940101; enddate=19941231;
    datatype='calendar';
    output;
run;

libname fisclib sasecrsp "%sysget(CRSP_CST)"
    SETID=200
    INSET='comp_fiscal, compkey, gvkey, begdate, enddate, datatype';

libname callib sasecrsp "%sysget(CRSP_CST)"
    SETID=200
    INSET='comp_calendar, compkey, gvkey, begdate, enddate, datatype';

title2 'Quarterly Period Descriptors with Fiscal Date Range';
```

```
proc print data=fisclib.qperdes(drop = peftnt1 peftnt2 peftnt3 peftnt4
    peftnt5 peftnt6 peftnt7 peftnt8 candxc flowcd spbond spdebt sppaper);
run;

title2 'Quarterly Period Descriptors with Calendar Date Range';
proc print data=callib.qperdes(drop = peftnt1 peftnt2 peftnt3 peftnt4
    peftnt5 peftnt6 peftnt7 peftnt8 candxc flowcd spbond spdebt sppaper);
run;
```

Inset Ranges in Conjunction with the LIBNAME Range

Suppose you want to specify individual date restrictions but also impose a common range. This example demonstrates two companies, each with its own date range restriction, but both companies are also subject to a common range set in the LIBNAME by the RANGE= option. As a result, data from August 1, 1999, to February 1, 2000, is retrieved for IBM, and data from January 1, 2001, to April 21, 2002, is retrieved for Microsoft. For details including sample output see [Example 38.11](#).

```
data two_companies;
    gvkey=6066; date1=19800101; date2=20000201; output;
    gvkey=12141; date1=20010101; date2=20051231; output;
run;

libname mylib sasecrsp "%sysget(CRSP_CST)"
    SETID=200
    INSET='two_companies,gvkey,gvkey,date1,date2'
    RANGE='19990801-20020421';

proc sql;
    select prcc.gvkey,prcc.caldt,prcc.ern
    from mylib.prcc as prcc, mylib.ern as ern
    where prcc.caldt = ern.caldt and
        prcc.gvkey = ern.gvkey;
quit;
```

The SAS Output Data Set

You can use the SAS DATA step to write the selected CRSP or Compustat data to a SAS data set. This enables you to easily analyze the data using SAS. When you specify the name of the output data set on the DATA statement, it causes the engine supervisor to create a SAS data set using the specified name in either the SAS WORK library or, if specified, the USER library.

The contents of the SAS data set include the DATE of each observation, the series name of each series read from the CRSPAccess database, event variables, and the label or description of each series/event or array.

You can use PROC PRINT and PROC CONTENTS to print your output data set and its contents. Alternatively, you can view your SAS output observations by opening the desired output data set in the SAS Explorer. You can also use PROC SQL with your SASECRSP libref to create a custom view of your data.

In general, CRSP missing values are represented as ‘.’ in the SAS data set. When accessing the CRSP STOCK data, SASECRSP uses the mapping shown in [Table 38.6](#) for converting CRSP missing values into SAS missing codes.

Table 38.6 Mapping of CRSP Stock Missing Values to SAS Missing Codes

CRSP Stock	SAS	Condition
–99	.	No valid price
–88	.A	Out of range
–77	.B	Off-exchange
–66	.C	No valid previous price
–55	.D	No delisting information
–44	.E	No valid comparison for an excess return

When accessing the CCM database, CRSP uses certain Compustat missing codes which SASECRSP then converts into SAS missing codes. [Table 38.7](#) shows the mapping of Compustat missing codes for the CCM database.

Table 38.7 Mapping of Compustat and SAS Missing Codes

Compustat	SAS	Condition
0.0001	.	No data for data item
0.0002	.S	Data is only on a semi-annual basis
0.0003	.A	Data is only on an annual basis
0.0004	.C	Combined into other item
0.0007	.N	Data is not meaningful
0.0008	.I	Reported as insignificant

Missing value codes conform with Compustat’s Strategic Insight and binary conventions for missing values. See *Notes on Missing Values* in the second chapter of the *CRSP/Compustat Merged Database Guide* for more information about how CRSP handles Compustat missing codes.

Understanding CRSP Date Formats, Informats, and Functions

CRSP has historically used two different methods to represent dates, while SAS has used a third. The three formats are SAS dates, CRSP dates, and integer dates. The SASECRSP engine provides 23 functions, 15 informats, and 10 formats to enable you to easily translate the dates from one internal representation to another. A SASECRSP LIBNAME assign must be active to use these date access methods. See [Example 38.6](#), “Converting Dates Using the CRSP Date Functions.”

SAS dates are stored internally as the number of days since January 1, 1960. The SAS method is an industry standard and provides a great deal of flexibility, including a wide variety of informats, formats, and functions.

CRSP dates are designed to ease time series storage and access. Internally, the dates are stored as an offset into an array of trading days or trading day calendar. Note that there are five different CRSP trading day calendars: Annual, Quarterly, Monthly, Weekly, and Daily. In this sense, there are five different types of

CRSP dates, one for each frequency of calendar it references. The CRSP method provides fewer missing values and makes trading period calculations very easy. However, there are also many valid calendar dates that are not available in the CRSP trading calendars, and care must be taken when using other dates.

Integer dates are a way to represent dates that are platform independent and maintain the correct sort order. However, the distance between dates is not maintained.

The best way to illustrate these formats is with some sample data. Table 38.8 shows date representations for CRSP daily and monthly data.

Table 38.8 Date Representations for Daily and Monthly Data

Date	SAS Date	CRSP Date (Daily)	CRSP Date (Monthly)	Integer Date
July 31, 1962	942	21	440	19620731
August 31, 1962	973	44	441	19620831
Dec. 30, 1998	14,243	9190	NA*	19981230
Dec. 31, 1998	14,244	9191	877	19981231

* Not available if an exact match is requested.

Having an understanding of the internal differences in representing SAS dates, CRSP dates, and CRSP integer dates helps you use the SASECRSP formats, informats, and functions effectively. Always keep in mind the frequency of the CRSP calendar that you are accessing when you specify a CRSP date.

The CRSP Date Formats

There are two types of formats for CRSP dates, and five frequencies are available for each of the two types. The two types are exact dates (CRSPDT*) and range dates (CRSPDR*), where the '*' can be A for annual, Q for quarterly, M for monthly, W for weekly, or D for daily. The ten types are: CRSPDTA, CRSPDTQ, CRSPDTM, CRSPDTW, CRSPDTD, CRSPDRA, CRSPDRQ, CRSPDRM, CRSPDRW, and CRSPDRD.

Table 38.9 shows some samples that use the monthly and daily calendar as examples. The Annual (CRSPDTA and CRSPDRA), Quarterly (CRSPDTQ and CRSPDRQ), and the Weekly (CRSPDTW and CRSPDRW) formats work analogously.

Table 38.9 Sample CRSPDT Formats for Daily and Monthly Data

Date	CRSP Date Daily, Monthly	CRSPDTD Daily Date	CRSPDRD Daily Range	CRSPDTM Monthly Date	CRSPDRM Monthly Range
July 31,1962	21, 440	19620731	19620731 +	19620731	19620630, 19620731
August 31,1962	44, 441	19620831	19620831 +	19620831	19620801, 19620831
Dec. 30,1998	9190, NA *	19981230	19981230 +	NA*	NA*
Dec. 31,1998	9191, 877	19981231	19981231 +	19981231	19981201, 19981231

+ Daily ranges look similar to Monthly Ranges if they are Mondays or immediately following a trading holiday.

* When working with exact matches, no CRSP monthly date exists for December 30, 1998.

The @CRSP Date Informats

There are three types of informats for CRSP dates, and five frequencies are available for each of the three types. The three types are exact (@CRSPDT*), range (@CRSPDR*), and backward (@CRSPDB*) dates, where the '*' can be A for annual, Q for quarterly, M for monthly, W for weekly, or D for daily. The fifteen formats are: @CRSPDTA, @CRSPDTQ, @CRSPDTM, @CRSPDTW, @CRSPDTD, @CRSPDRA, @CRSPDRQ, @CRSPDRM, @CRSPDRW, @CRSPDRD, @CRSPDBA, @CRSPDBQ, @CRSPDBM, @CRSPDBW, and @CRSPDBD.

The five CRSPDT* informats find exact matches only. The five CRSPDR* informats look for an exact match, and if an exact match is not found, they go forward, matching the CRSPDR* formats. The five CRSPDB* informats look for an exact match, and if an exact match is not found, they go backward.

Table 38.10 shows a sample that uses only the CRSP monthly calendar as an example. The daily, weekly, quarterly, and annual frequencies work analogously.

Table 38.10 Sample @CRSP Date Informats Using Monthly Data

Input Date (Integer Date)	CRSP Date CRSPDTM	CRSP Date CRSPDRM	CRSP Date CRSPDBM	CRSPDTM Monthly Date	CRSPDRM Monthly Range
19620731	440	440	440	19620731	19620630 to 19620731
19620815	.(missing)	441	440	See below+	See below*
19620831	441	441	441	19620831	19620801 to 19620831

+ If missing, then missing. If 441, then 19620831. If 440, then 19620731.

* If missing, then missing. If 441, then 19620801 to 19620831. If 440, then 19620630 to 19620731.

The CRSP Date Functions

Table 38.11 shows the 23 date functions provided with the SASECRSP engine. These functions are used internally by the engine, but also are available to the end users. There are seven groups of functions. The first four have five functions each, one for each CRSP calendar frequency. The next two are for converting between SAS and Integer date formats. The last function does not convert between formats, but is a shifting function for shifting integer dates based on a fiscal calendar to normal calendar time. In this shift function, the second argument holds the fiscal year-end month of the fiscal calendar used.

Table 38.11 CRSP Date Functions

Function Group	Function Name	Argument One	Argument Two	Return Value
CRSP dates to integer dates for December 31, 1998				
Annual	crspdcia	74	None	19981231
Quarterly	crspdciq	293	None	19981231
Monthly	crspdcim	877	None	19981231
Weekly	crspdciw	1905	None	19981231
Daily	crspdcid	9191	None	19981231
CRSP dates to SAS dates for December 31, 1998				
Annual	crspdcsa	74	None	14,244
Quarterly	crspdcsq	293	None	14,244
Monthly	crspdcsm	877	None	14,244
Weekly	crspdcsw	1905	None	14,244
Daily	crspdcscd	9191	None	14,244
Integer dates to CRSP dates exact is illustrated, but can be forward or backward				
Annual	crspdica	19981231	0	74
Quarterly	crspdicq	19981231	0	293
Monthly	crspdicm	19981231	0	877
Weekly	crspdicw	19981231	0	1905
Daily	crspdicd	19981231	0	9191
SAS dates to CRSP dates exact is illustrated, but can be forward or backward				
Annual	crspdsca	14,244	0	74
Quarterly	crspdsq	14,244	0	293
Monthly	crspdscm	14,244	0	877
Weekly	crspdscw	14,244	0	1905
Daily	crspdsd	14,244	0	9191
Integer dates to SAS dates for December 31, 1998				
Integer to SAS	crspdi2s	19981231	None	14,244
SAS dates to integer dates for December 31, 1998				
SAS to Integer	crspds2i	14,244	None	19981231
Fiscal to calendar shifting of integer dates for December 31, 1998				
Fiscal to Calendar Shift	crspdf2c	20021231	8	20020831

Data Elements Reference: SASECRSP Interface Engine

Data sets are made available based on the type of CRSP database opened. [Table 38.12](#), [Table 38.13](#), and [Table 38.14](#) show summary views of the three types of CRSP databases (Stock, CCM, and Indices) and the data sets they make available. Details on the data sets including their specific fields can be found in sections immediately following the summary tables. You can also see the available data sets for an opened database via the SAS Explorer by opening a SASECRSP libref that you have previously assigned.

Examples: SASECRSP Interface Engine

Example 38.1: Specifying PERMNOs and RANGE on the LIBNAME Statement

The following statements show how to set up a LIBNAME statement for extracting data for certain selected PERMNOs during a specific time period. The result is shown in [Output 38.1.1](#).

```
title2 'Define a range inside the data range';
title3 'My range is ( 19950101-19960630 )';

libname _all_ clear;
libname testit1 sasecrsp "%sysget(CRSP_MSTK) "
    setid=20
    permno=81871      /* Desired PERMNOs are selected */
    permno=82200      /* via the libname PERMNO= option */
    permno=82224
    permno=83435
    permno=83696
    permno=83776
    permno=84788
    range='19950101-19960630';

proc print data=testit1.ask;
run;
```

Output 38.1.1 ASK Monthly Time Series Data with RANGE

Define a range inside the data range
 My range is (19950101-19960630)

36	83435	19960628	21.00000
37	83696	19960628	19.12500

Example 38.2: Using the LIBNAME Statement to Access All Keys

To set up the libref to access all keys, no key options such as PERMNO=, TICKER=, or GVKEY= are specified on the LIBNAME statement, and no INSET= option is used. Use of any of these options causes the engine to limit access to only specified keys or specified insets. When no such options are specified, the engine correctly defaults to selecting all keys in the database. Other LIBNAME options such as the RANGE= option can still be used normally to limit the time span of the data, in other words, to define the date range of observations.

In this example, no key-specifying options are used. This forces the engine to default to all PERMNOs in the monthly STK database. The range given on the LIBNAME behaves normally, and data is limited to the first two months of 1995.

```
title2 'Define a range inside the data range ';
title3 'My range is ( 19950101-19950228 )';

libname _all_ clear;
libname testit2 sasexrsp "%sysget(CRSP_MSTK) "
    setid=20
    range='19950101-19950228';
data a;
    set testit2.ask(obs=30);
run;

proc print data=a;
run;
```

The result is shown in [Output 38.2.1](#).

Output 38.2.1 All PERMNOs of ASK Monthly with RANGE

Define a range inside the data range
 My range is (19950101-19950228)

Obs	PERMNO	CALDT	ASK

Example 38.3: Accessing One PERMNO Using No RANGE

SASECRSP defaults to providing access to the entire range of available data when no range restriction is specified via the RANGE= option.

This example shows access of the entire range of available data for one particular PERMNO extracted from the monthly data set.

```
title2 'Select only PERMNO = 81871';
title3 'Valid trading dates (19890131--19981231)';
title4 'No range option, leave wide open';

libname _all_ clear;
libname testit3 sasecrsp "%sysget(CRSP_MSTK) "
    setid=20
    permno=81871;

data c;
    set testit3.ask;
run;

proc print data=c;
run;
```

The result is shown in [Output 38.3.1](#).

Output 38.3.1 PERMNO=81871 of ASK Monthly without RANGE

Select only PERMNO = 81871
 Valid trading dates (19890131--19981231)
 No range option, leave wide open

Example 38.4: Specifying Keys Using the INSET= Option

The INSET= option enables you to select any companies and/or issues you want data for. This example selects two CRSP Index Series from the Indices database, two companies from the CCM database, and four

securities from the Stock database for data extraction. Note that because each CRSP database might be in a different location and has to be opened separately, a total of three different librefs are used, one for each database.

```
data indices;
    indno=1000000; output; /* NYSE Value-Weighted Market Index */
    indno=1000001; output; /* NYSE Equal-Weighted Market Index */
run;

libname _all_ clear;
libname ind2 sasocrsp "%sysget(CRSP_MSTK)"
    setid=420
    inset='indices,INDNO,INDNO'
    range='19990101-19990401';

title2 'Total Returns for NYSE Value and Equal Weighted Market Indices';
proc print data=ind2.tret label;
run;
```

Output 38.4.1 shows the result of selecting two CRSP Index Series from the Indices database.

Output 38.4.1 IND Data Extracted Using INSET= Option

Total Returns for NYSE Value and Equal Weighted Market Indices				
Obs	INDNO	Calendar Trading Date	Total Returns	
1	1000000	19990129	0.012419	
2	1000000	19990226	-0.024179	
3	1000000	19990331	0.028591	
4	1000001	19990129	-0.007822	
5	1000001	19990226	-0.041127	
6	1000001	19990331	0.015204	

This example selects two companies from the CCM database.

```
data companies;
    permco=8045; output; /* Oracle */
    permco=20483; output; /* Citigroup */
run;

libname comp2 sasocrsp "%sysget(CRSP_CST)"
    setid=200
    inset='companies,PERMCO,PERMCO'
    range='20040101-20040531';

Example 38.7: Comparing Different Ways of Accessing CCM Data

You can use three different ways to select CCM data: by the primary key, *GVKEY*, or by either of the two secondary keys *PERMNO* and *PERMCO*. This section demonstrate the three different ways.

This example retrieves data on Cimflex Teknowledge Corporation which was previously known as Teknowledge Inc. This company is considered a single entity by the CRSP Stock database and is identified by *PERMNO*=10083 and *PERMCO*=8026. The Compustat database, however, considers Teknowledge Inc. and Cimflex Teknowledge Corporation as two separate entities, and each has its own *GVKEY*. Thus, *PERMNO*=10083 maps to *GVKEY*s 11947 and 15495, and *PERMCO*=8026 has the identical relationship. Access by *PERMNO* and *PERMCO* are equivalent in this case, but differ from access by *GVKEY*. *PERMNO*/*PERMCO* access retrieves data only within the active period of the links, and only the primary linked *GVKEY* is used for header access. In contrast, *GVKEY* access provides wide-open, full data for both *GVKEY*s. See *PERMNO*= option for more details.

```

title1 'Comparing various access methods for CCM data';

```

Example 38.8: Comparing PERMNO and GVKEY Access of CRSP Stock Data

You can access CRSP data using *GVKEYs*. Access in this manner requires the use of the *CRSPLINKPATH=* option, and is identical to access by its corresponding *PERMNO(s)*. Links between *PERMNOs* and *GVKEYs* are used without reference to their active period. Link information is used solely for finding corresponding *GVKEYs*. This example shows two ways of accessing CRSP Stock data: one by *PERMNOs* and the other by its corresponding *GVKEY*. Several members are compared, showing they are equivalent.

```

```

Example 38.9: Using Fiscal Date Range Restriction

Fiscal date ranges give you the flexibility of selecting company data by using fiscal year range specifications instead of calendar year range specifications. This example shows how to use this feature to extract data such as the ‘Earnings Per Share’ time series for several companies for the 1994 fiscal year.

```

title 'Extract data for fiscal year 1994 for several companies';

libname _all_ clear;
libname crsp1 sasecrsp "%sysget(CRSP_CST) "
      setid=200
      gvkey=6066 gvkey=12141 gvkey=10107
      range='f19940101-19941231';

data rnd_eps (keep = gvkey rcaldt fiscaldt iq4 iq9 iq19 iq69);
  set crsp1.iqitems;
run;

proc print data=rnd_eps label;
run;

```

Output 38.9.1 shows Earnings Per Share for several companies for the 1994 fiscal year.

Output 38.9.1 Earnings Per Share by GVKEY Access for the 1994 Fiscal Year.

Extract data for fiscal year 1994 for several companies				
Obs	GVKEY	Raw Calendar Trading Date	Fiscal Trading Date	Research and Development Expense

11	0.7600	0.7600	18.8070
12	0.5400	0.5400	13.4190

Note how two time ID variables are kept. Raw Calendar Trading Date provides the actual calendar date. Fiscal Trading Date provides the date according to the company's fiscal calendar which is dependent upon when its fiscal year-end month is. For example, Observation 8 is Microsoft's fourth fiscal quarter, hence a Fiscal Trading Date of December 30, 1994. Since Microsoft's fiscal year ends in June, its fourth fiscal quarter corresponds to the second calendar quarter of the year, so the Raw Calendar Trading Date shows June 30, 1994. The shift calculation of six months (in this case) required to compute the Raw Calendar Trading Date is done automatically by the SASECRSP engine. Keep in mind that fiscal date ranges are applicable only to fiscal members. When fiscal date range restrictions are applied to nonfiscal members, they are ignored. The missing value 'A' seen in observations 9 through 12 indicate that the data is reported only on an annual basis.

Example 38.10: Using Different Types of Range Restrictions in the INSET

You can specify both calendar and fiscal date range restrictions with the INSET= option. This example shows how to use both types of date range restrictions.

Two *INSETs*, nearly identical except for the type of their date range restriction, are used for accessing the same database. Despite the many similarities, the different date range restriction types result in dissimilar output.

Note that the specification of the datatype in the INSET= option for *comp_calendar* is not required. The datatype default is the calendar type.

```
data comp_fiscal;

    /* Crude Petroleum & Natural Gas */
    compkey=2416;
    begdate=19860101; enddate=19861231;
    datatype='fiscal';
    output;

    /* Commercial Intertech */
    compkey=3248;
    begdate=19940101; enddate=19941231;
    datatype='fiscal';
    output;
run;

data comp_calendar;

    /* Crude Petroleum & Natural Gas */
    compkey=2416;
    begdate=19860101; enddate=19861231;
    datatype='calendar';    output;

    /* Commercial Intertech */
    compkey=3248;
    begdate=19940101; enddate=19941231;
    datatype='calendar';
    output;
run;

libname _all_ clear;
libname fisclib sasecrsp "%sysget (CRSP_CST) "
    SETID=200
    INSET='comp_fiscal, compkey, gvkey, begdate, enddate, datatype';

libname callib sasecrsp "%sysget (CRSP_CST) "
    SETID=200
    INSET='comp_calendar, compkey, gvkey, begdate, enddate, datatype';

title1 'Quarterly Period Descriptors';
title2 'Using the Fiscal Date Range';
```

```
proc print data=fisclib.qperdes(drop = peftnt1 peftnt2 peftnt3 peftnt4
                                peftnt5 peftnt6 peftnt7 peftnt8
                                candxc flowcd spbond spdebt sppaper);
run;
```

Output 38.10.1 shows quarterly period descriptors for the 1986 and 1994 fiscal years.

Output 38.10.1 Using Inset with Fiscal Date Range

Quarterly Period Descriptors Using the Fiscal Date Range							
Obs	GVKEY	CRSPDT	RCALDT	FISCALDT	DATYR	DATQTR	FISCYR
1	2416	242	19860630	19860331	1986	1	3

5	1993	4	3	53	16	0	0	1994054
6	1994	1	3	53	16	0	0	1994146
7	1994	2	3	53	16	0	0	1994236
8	1994	3	3	53	16	0	0	1994349

The next PRINT procedure uses the calendar datatype in its INSET= option instead of the fiscal datatype, producing different results for the Crude Petroleum and Natural Gas Company when the report is based on calendar dates instead of fiscal dates. The differences shown in observations 1 through 4 are due to Crude Petroleum and Natural Gas Company's fiscal year ending in March instead of December.

Since Commercial Intertech does not shift its fiscal year, but uses a fiscal year ending in December, the fiscal report and the calendar report match exactly for the company's corresponding observations 5 through 8 in Output 38.10.1 and Output 38.10.2 respectively.

```
title1 'Quarterly Period Descriptors';
title2 'Using the Calendar Date Range';
proc print data=callib.qperdes(drop = peftnt1 peftnt2 peftnt3 peftnt4
                                peftnt5 peftnt6 peftnt7 peftnt8
                                candxc flowcd spbond spdebt sppaper);
run;
```

Output 38.10.2 shows quarterly period descriptors for the designated calendar date range.

Output 38.10.2 Using Inset with Calendar Date Range

Quarterly Period Descriptors Using the Calendar Date Range							
Obs	GVKEY	CRSPDT	RCALDT	FISCALDT	DATYR	DATQTR	FISCYR

8	1994	3	3	53	16	0	0	1994349

Fiscal date range restrictions are valid only for fiscal members and can be used in either the INSET= option or the RANGE= option. Use calendar date ranges for nonfiscal members. **NOTE:** Fiscal date ranges are ignored when used with nonfiscal members.

Example 38.11: Using INSET Ranges with the LIBNAME RANGE Option

It is possible to specify both individual range restrictions with an INSET and a global date range restriction via the RANGE= option on the LIBNAME statement. In such cases, only observations that satisfy *both* date range restrictions are returned. The effective range restriction becomes the intersection of the two specified range restrictions. If this intersection is empty, no observations are returned.

This example extracts data for two companies, IBM and Microsoft. Each company has an individual range restriction specified in the inset. Furthermore, a global range restriction is set by the RANGE= option on the LIBNAME statement. As a result the effective date range restriction for IBM becomes August 1, 1999, to February 1, 2000, and the effective date range restriction for Microsoft becomes January 1, 2001, to April 21, 2002.

```
data two_companies;
    gvkey=6066; date1=19800101; date2=20000201; output;
    gvkey=12141; date1=20010101; date2=20051231; output;
run;

libname _all_ clear;
```

```

libname mylib sasecrsp "%sysget (CRSP_CST) "
      SETID=200
      INSET='two_companies,gvkey,gvkey,date1,date2'
      RANGE='19990801-20020421';

title1 'Two Companies, Two Range Selections';
title2 'Global RANGE Statement Used With Individual Inset Ranges';
title3 'Results Show Intersection of Both Range Restrictions';
proc sql;
  select prcc.gvkey,prcc.caldt,prcc.ern
    from mylib.prcc as prcc, mylib.ern as ern
   where prcc.caldt = ern.caldt and
         prcc.gvkey = ern.gvkey;
quit;

```

Output 38.11.1 shows the combined effect of both INSET and RANGE date restrictions on the closing prices and earnings per share for IBM and Microsoft.

Output 38.11.1 Mixing INSET Ranges with the RANGE= Option

Two Companies, Two Range Selections

Overview: SASEXCCM Interface Engine

The SASEXCCM interface engine enables SAS users to access the CRSP/Compustat Merged (CCM) Database created from data delivered via Compustat's Xpressfeed product, the CRSP US Stock (STK) Database, the CRSP US Stock and Indices (IND) Database, and the CRSP US Treasury (TRS) Database. SASEXCCM provides a seamless interface for CRSP, Compustat, and SAS data processing.

The SASEXCCM engine uses the LIBNAME statement to specify which database to open and what parts of the database to access.

To specify the database, you supply the combination of a physical path to indicate the location of the data files (CCM, STK, IND, or TRS data) and a set identifier (SETID) to identify the database that you want to access from those available at the physical path. SASEXCCM supports data-item-handling access methods for the SETIDs in [Table 39.1](#).

Use the SASECRSP engine for all legacy data access (CRSPAccess 299 and earlier) and for any other SETIDs that are not contained in [Table 39.1](#).

Table 39.1 CRSP Database SETIDs

SETID	Data Set
10	CRSP Stock, daily data
20	CRSP Stock, monthly data
100	CRSP US Treasury, monthly and daily data
250	CRSP/Compustat Merged data (CCM)
400	CRSP Indices data, monthly index groups
420	CRSP Indices data, monthly index series
440	CRSP Indices data, daily index groups
460	CRSP Indices data, daily index series

Getting Started: SASEXCCM Interface Engine

To specify what parts of the database to access, you supply two things: the appropriate keys for companies or securities you want to access, and the list of data items you want to retrieve.

When accessing CCM data, you select the companies you want to access by specifying the GVKEY for each company. GVKEY is Compustat's unique identifier and primary key. You use the GVKEY= option to specify which GVKEY to include. If no GVKEYs are specified, data for all companies are retrieved. You can use this feature to obtain a list of all companies (including their name and GVKEY) in the CCM database, as shown in [Example 39.5](#).

For example, the following statements access the CCM database for annual sales data for IBM (GVKEY=6066) and Microsoft (GVKEY=12141):

```
LIBNAME myLib sasexccm 'physical-name'
  SETID=250
  GVKEY=6066    /* IBM */
  GVKEY=12141  /* MSFT */
  ITEMLIST='SALE';
data yrlysale;
  set myLib.annitem;
run;
```

When accessing CRSP Stock (STK) data, you select the securities you want to access by specifying their PERMNOs. You specify a PERMNO to include with the PERMNO= option. If no PERMNOs are specified, data for all securities in the database are retrieved. You can use this feature to obtain a list of all PERMNOs in the STK database.

For example, the following statements access the STK database for monthly shares data for IBM (permno=12490) and Microsoft (permno=10107):

```
LIBNAME myLib sasexccm 'physical-name'
  SETID=20
  PERMNO=12490 /* IBM */
  PERMNO=10107 /* MSFT */
  ITEMLIST="MSHROUT.*;MSHRFLG.*";
data mshares_all;
  set myLib.mshares;
run;
```

When accessing CRSP Indices (IND) data, you select the security and indices data from the CRSP Daily or Monthly Stock and Indices database by specifying their INDNOs. You specify an INDNO to include with the INDNO= option. If no INDNOs are specified, data for all securities in the database are retrieved. You can use this feature to obtain a list of all INDNOs in the CRSP Stock Indices (IND) database.

For example, the following statements access the IND database for monthly consumer price index data (INDNO=1000709):

```
LIBNAME myLib sasexccm 'physical-name'
SETID=420
INDNO=1000709 /* Consumer Price Index */
ITEMLIST=
  "MREBAL.*;MRBBEGDT.*;MRBENDDT.*;MRUSDCNT.*;MMINID.*;MMAXID.*;MMINSTAT.*";

data mindts_all;
  set myLib.mindhdr;
  set myLib.mrebal;
run;
```

When accessing CRSP US Treasury (TRS) data, you select the securities you want to access by specifying their TREASNOs. You specify a TREASNO to include with the TREASNO= option. If no TREASNOs are specified, data for all securities in the database are retrieved. You can use this feature to obtain a list of all TREASNOs in the CRSP Treasuries (TRS) database.

For example, the following statements access the TRS database for monthly ASK and BID time series data for TREASNOs 202999 and 203666:

```
LIBNAME myLib sasexccm 'physical-name'
SETID=100
TREASNO=202999 TREASNO=203666
ITEMLIST="TMASK.*;TMBID.*";
data mtrsts_all;
  set myLib.trs_mth_ts;
run;
```

To specify the list of data items you want to retrieve, use the ITEMLIST= option. This option accepts a string that denotes a list of interested data items and the reporting format (for example, data format, population source, consolidation level, and so on) in standard CRSP notation using CRSP's unique mnemonic text name *itm_name* and the mnemonic tag *keyset*. For details about CRSP notation, see the section “[The LIBNAME libref SASEXCCM Statement](#)” on page 2680 under the ITEMLIST= option.

After the LIBNAME is assigned, the database is opened. The selected data are organized into groups such as ANNITEM for annual time series data or LINK for event based CRSP/Compustat link data. You can also use the SAS DATA step to perform further subsetting and to store the resulting time series in a SAS data set.

SASEXCCM supports Linux, Solaris, and 32-bit Windows.

Syntax: SASEXCCM Interface Engine

The SASEXCCM engine uses standard engine syntax. Options used by SASEXCCM are summarized in Table 39.2. The SETID= and ITEMLIST= options are required.

Table 39.2 Summary of LIBNAME *libref*

Option	Description
SETID=	Specifies which CRSP database at the physical path to open. See Table 39.1 for the complete list of supported SETIDs.
GVKEY=	Specifies a Compustat GVKEY for accessing CCM data. To select more than one GVKEY, use this option multiple times. See Example 39.1 and Example 39.2.
PERMNO=	Specifies a CRSP PERMNO for accessing STK data. To select more than one PERMNO, use this option multiple times.
INDNO=	Specifies a CRSP INDNO for accessing IND data. To select more than one INDNO, use this option multiple times.
TREASNO=	Specifies a CRSP TREASNO for accessing TRS data. To select more than one TREASNO, use this option multiple times.
TCUSIP=	Specifies a CRSP CUSIP for accessing TRS data. To select more than one TCUSIP, use this option multiple times.
ITEMLIST=	Specifies the selected data items for access. This option accepts a string in standard CRSP notation.

The LIBNAME *libref* SASEXCCM Statement

LIBNAME *libref* **SASEXCCM** '*physical-name*' **SETID=***crsp_setidnumber* *options* ;

The LIBNAME statement assigns a SAS library reference (*libref*) to the physical path of the directory of CRSP data files where the CRSP database you want to open is located. The required *physical-name* argument must end in a slash for UNIX environments and a backslash for Windows environments. The required *SETID=crsp_setidnumber* argument specifies the CRSP database you want to read from. Choose one SETID from eight possible values: 10, 20, 100, 250, 400, 420, 440 and 460.

For example, the following statement accesses the CCM database for annual sales data for IBM (GVKEY=6066):

```
LIBNAME myLib SASEXCCM 'physical-name' SETID=250
      GVKEY=6066 /* IBM */
      ITEMLIST='SALE';
```

After the LIBNAME is assigned, you can access any of the available groups (members) within the opened database:

- STK daily See section “[Daily STK Data Groups](#)” on page 2689 for more information about groups in the Daily Stock Database, SETID 10.
- STK mthly See section “[Monthly STK Data Groups](#)” on page 2691 for more information about groups in the Monthly Stock Database, SETID 20.
- TRS data See section “[US TRS Data Group Names](#)” on page 2694 for more information about groups in the US Treasury Database, SETID 100.
- CCM See section “[CCM Data Groups](#)” on page 2687 for more information about groups in the CRSP/Compustat Merged Databases, SETID 250.
- IND mthly grp See section “[Monthly IND Group Data Group Names](#)” on page 2692 for more information about groups in the Monthly Indices Group Data Database, SETID 400.
- IND mthly ts See section “[Monthly IND Time Series Data Group Names](#)” on page 2693 for more information about groups in the Monthly Indices Time Series Database, SETID 420.
- IND daily grp See section “[Daily IND Group Data Group Names](#)” on page 2692 for more information about groups in the Daily Indices Group Data Database, SETID 440.
- IND daily ts See section “[Daily IND Time Series Data Group Names](#)” on page 2693 for more information about groups in the Daily Indices Time Series Database, SETID 460.

The following *options* can be used in the LIBNAME *libref* SASEXCCM statement:

GVKEY=crsp_gvkey

selects the companies or issues whose data you want to retrieve. Specify the Compustat Permanent SPC Identifier for the *crsp_gvkey*. There is no limit to the number of GVKEY= options that you can use. If no GVKEY= options are specified, all GVKEYs in the database are selected.

For example, the following statement accesses the CCM database for annual sales data for IBM (GVKEY=6066) and Microsoft (GVKEY=12141):

```
LIBNAME myLib sasexccm 'physical-name'
SETID=250
GVKEY=6066 /* IBM */
GVKEY=12141 /* MSFT */
ITEMLIST='SALE' ;
```

PERMNO=crsp_permno

selects the companies or issues whose data you want to retrieve. Specify a CRSP company issue's PERMNO for the *crsp_permno*. There is no limit to the number of PERMNO= options that you can use. If no PERMNO= options are specified, all PERMNOs in the database are selected.

For example, the following statements access the STK database for monthly shares data for IBM (PERMNO=12490) and Microsoft (PERMNO=10107):

```

LIBNAME myLib sasexccm 'physical-name'
SETID=20
PERMNO=12490 /* IBM */
PERMNO=10107 /* MSFT */
ITEMLIST="MSHROUT.*;MSHRFLG.*";
data mshares_all;
  set myLib.mshares;
run;

```

INDNO=crsp_indno

selects the time series or the group data from the index whose data you want to retrieve. Specify a CRSP Index's INDNO for the *crsp_indno*. There is no limit to the number of INDNO= options that you can use. If no INDNO= options are specified, all INDNOs in the database are selected.

For example, the following statements access the IND database for monthly consumer price index data (INDNO=1000709):

```

LIBNAME myLib sasexccm 'physical-name'
SETID=420
INDNO=1000709 /* Consumer Price Index */
ITEMLIST=
  "MREBAL.*;MRBEGDT.*;MRBENDDT.*;MRUSDCNT.*;MMINID.*;MMAXID.*;MMINSTAT.*";

data mindts_all;
  set myLib.mindhdr;
  set myLib.mrebal;
run;

```

TREASNO=crsp_treasno

selects the treasury data items you want to retrieve by TREASNO. Specify a CRSP US Treasury's TREASNO for the *crsp_treasno*. There is no limit to the number of TREASNO= options that you can use. If no TREASNO= options are specified, all TREASNOS in the database are selected.

For example, the following statements access the TRS database for monthly ASK and BID time series data for TREASNOS 202999 and 203666:

```

LIBNAME myLib sasexccm 'physical-name'
SETID=100
TREASNO=202999 TREASNO=203666
ITEMLIST="TMASK.*;TMBID.*";
data mtrsts_all;
  set myLib.trs_mth_ts;
run;

```

TCUSIP=crsp_tcusip

selects the treasury data items you want to retrieve. Specify a CRSP US Treasury TCUSIP for the *crsp_tcusip*. There is no limit to the number of TCUSIP= options that you can use. If no TCUSIP= options are specified, all TCUSIPS in the database are selected.

For example, the following statements access the TRS database for monthly ASK and BID time series data for TCUSIPs 9128272B and 912795XK:

```
LIBNAME myLib sasexccm 'physical-name'
SETID=100
TCUSIP='9128272B' TCUSIP='912795XK'
ITEMLIST="TMASK.*;TMBID.*";
data mtrsts_all;
  set myLib.trs_mth_ts;
run;
```

ITEMLIST="crsp_itemlist"

specifies the items and groups of interest for selection based on keysets, which define the reporting format you want. Specify a string in CRSP standard notation for *crsp_itemlist*. See the section “Data Reference: Introduction” on page 2685 for overview information about items, groups, and reporting formats. Reference sections based on CRSP documentation follow the overview. For more information, see the *CRSP Access User Guide for the CRSP/Compustat Merged Database*, the *CRSP US Stock and Indices Database*, and the *CRSP US Treasury Database*.

The CRSP standard notation has the form:

```
[global_section:]list_section
```

The *list_section* consists of a semicolon-delimited string of list elements in the form:

```
list_element[;list_element]
```

Each *list_element* can be an item or group name. You can also specify a particular keyset for the item or group by appending a period and its keyset number. For example, “sale.2” selects the sales item with keyset 2, which contains the industrial format, consolidated information, and standardized summary data from the latest annual filing.

The optional *global_section* holds flags that modify all elements in the list section. The following flags are recognized:

- f Applicable and populated footnote items are added for every item selected. For example, “f:sale;at;ceq” selects sales, total assets, and common equity items with default keysets and available footnotes for the selected items.
- d Applicable and populated data code items are added for every item selected. For example, “d:sale;at;ceq” selects sales, total assets, and common equity items with default keysets and available data codes for the selected items.
- k.list Applies the list of keysets to all items in the list without a keyset already specified. The list can be either *** to select all available keysets, or *#-#*, *#...* to select keysets by their number. For example, “k.1:sale;at;ceq” selects the default keyset, keyset 1, for all items.

The following full LIBNAME example shows how to access the CCM database for annual sales data and quarterly total assets data for IBM (GVKEY=6066) and Microsoft (GVKEY=12141).

```
LIBNAME myLib sasexccm 'physical-name'
SETID=250
GVKEY=6066 /* IBM */
GVKEY=12141 /* MSFT */
ITEMLIST='f:sale;actq';
```

Details: SASEXCCM Interface Engine

SAS Output Data Set

You can use the SAS DATA step to write the selected CRSP or Compustat data to a SAS data set. This enables you to easily analyze the data using SAS software. Specifying the name of the output data set in the DATA statement causes the engine supervisor to create a SAS data set that has the specified name in either the SAS Work library or, if specified, the User library.

The contents of the SAS data set include the DATE of each observation, the series name of each series read from the CRSPAccess database, event variables, and the label or description of each series, event or array.

You can use the PRINT and CONTENTS procedures to print your output data set and its contents. Alternatively, you can view your SAS output observations by opening the desired output data set in the SAS Explorer window. You can also use the SQL procedure with your SASEXCCM *libref* to create a custom view of your data.

Missing Values

In general, CRSP missing values are represented as ‘.’ in the SAS data set. When accessing the CCM database, SASEXCCM interprets missing values according to the conditions and codes defined by Compustat, and represents them as SAS missing codes, as shown in Table 39.3.

Table 39.3 Mapping of Compustat and SAS Missing Codes

Missing Value	Missing Code	Condition
0.0001	.	No data for data item
0.0002	.S	Data is only on a semi-annual basis
0.0003	.A	Data is only on an annual basis
0.0004	.C	Combined into other item
0.0007	.N	Data is not meaningful
0.0008	.I	Reported as insignificant

Missing value codes conform with Compustat’s Strategic Insight and binary conventions for missing values. See the section "Notes on Missing Values" in the second chapter of the *CRSP/Compustat Merged Database Guide* for more information about how CRSP handles Compustat missing codes.

Data Reference: Introduction

Data reference details are presented for items, keysets, and groups available from four CRSPAccess databases in this order: CCM database, STK databases, IND databases, and TRS database. In addition to summary tables, sample SAS statements show how to generate a customized list of item names available from each group for a particular database.

CCM Data Items

The CRSP/Compustat Merged (CCM) database is organized by company and security according to Compustat's Permanent SPC Identifier, GVKEY. CCM data is broken down into items, and items can be further qualified by a set of secondary keys. CRSP calls these known collections of keys and values a keyset, and it assigns a numeric code and mnemonic tag to each unique collection. Each keyset represents different output series. Items are also organized into groups for selection and presentation. A group can include other groups, or a group can include items. Items can belong to more than one group.

For example, the Compustat data item SALE has secondary keys for industry format, data format, population source, and consolidation level. A different value of company sales can be available for any combination of these keys, such as a combination that represents the originally reported sales or the final restated sales from a later filing. The SALE data item is a part of the ANNITEM (Annual Time Series Items, including footnotes and data codes) group.

The CCM database contains data items provided by Compustat in addition to structures and supplementary data items provided by CRSP. All data items include a mnemonic and field name. This section provides a summary of Compustat data items whose mnemonic name differs in the CCM database, and a summary of the supplementary data items provided by CRSP. For more information about the Compustat data items, refer to your Compustat data documentation or see www.compustatresources.com/support/index.html. For more information about the supplementary CRSP data items, refer to your CCM Database Guide.

Table 39.4 Items with Different CRSP and Compustat Names

Compustat mnemonic	CRSP itm_name	Description	Definition
BETA	XPFBETA	Data item	Xpressfeed beta
DVPSXM	XDVPXSM	Data item	Index monthly dividend
PRC	XPFPRC	Data item	Participation rights certificates
PRCCM	XPRCCM	Data item	Index price close monthly
PRCHM	XPRCHM	Data item	Index price high monthly
PRCLM	XPRCLM	Data item	Index price low monthly
PRC_DC	XPFPRC_DC	Data code	Participation rights certificates data code
PRC_FN	XPFPRC_FN	Footnote	Participation rights certificates footnote
RET	XPFRET	Data item	Total real estate property
RET_DC	XPFRET_DC	Data code	Total real estate property data code
RET_FN	XPFRET_FN	Footnote	Total real estate property footnote
YEAR	YEARQ	Data item	Year quarterly

Supplemental CRSP data items are organized as groups. For a list of the supplemental data groups, see the section “[CCM Data Groups](#)” on page 2687.

CCM Keysets

Compustat items can be qualified by a set of secondary keys. This collection of secondary keys and values creates a keyset that assigns a numeric code and mnemonic tag to each unique collection. Each keyset represents different output series. For example, one keyset might represent originally reported sales while another might represent the final restated sales from a later filing. Full details about keysets can be found in the *CRSP/Compustat Merged Database Guide*. For your convenience, [Table 39.5](#) summarizes the keysets.

Table 39.5 Summary of CCM Keysets

Keyset	Tag	Keyset Description
0		Indices
1	STD	Industrial format, consolidated information, standardized presentation
2	SUMM	Industrial format, consolidated information, standardized summary data (StdSumData) from the latest annual filing
3	PRES	Industrial format, consolidated information, standardized summary data collected prior to company amendment
4	FS	Financial services format, consolidated information, standardized presentation
5	PFO	Industrial format, pro forma reporting, standardized presentation
6	PFAS	Pre-FASB reporting
7	SFAS	Industrial format, pre-FASB reporting, standardized presentation
8	PRE	Industrial format, consolidated information, standardized data collected from the latest annual filing
10	PDIV	Industrial format, pre-divestiture reporting, standardized presentation
11	DOM	Domestic
12	SUPF	Industrial format, pre-FASB reporting, standardized summary data from the latest annual filing
14	STD1	Industrial format, consolidated information, standardized presentation, rank 1
15	FSFO	Financial services format, pro-forma reporting, standardized presentation
16	FS1	Financial services format, consolidated information, standardized presentation, rank 1
17	FS2	Financial services format, consolidated information, standardized presentation, rank 2
18	SUFS	Industrial format, pro-forma reporting, standardized summary data from the latest annual filing
19	PDI1	Industrial format, pre-divestiture reporting, standardized presentation, rank 1
20	PFA1	Industrial format, pre-FASB reporting, standardized presentation, rank 1

Table 39.6 Summary of CCM Keysets (continued)

Keyset	Tag	Keyset Description
21	SUPD	Industrial format, pre-divestiture reporting, standardized summary data from the latest annual filing
22	FS3	Financial services format, consolidated information, standardized presentation, rank 3
23	PDI2	Industrial format, consolidated information, standardized presentation, rank 2
24	CONS	Consolidated information
25	STD2	Industrial format, consolidated information, standardized presentation, rank 2
26	STD3	Industrial format, consolidated information, standardized presentation, rank 3
27	STD4	Industrial format, consolidated information, standardized presentation, rank 4
28	STD5	Industrial format, consolidated information, standardized presentation, rank 5
29	PFA2	Industrial format, pre-FASB Reporting, standardized presentation, rank 2
30	PFA3	Industrial format, pre-FASB reporting, standardized presentation, rank 3
31	CUSD	Calendar-based reporting in US dollars
32	FUSD	Fiscal-based reporting in US dollars
33	CCAD	Calendar-based reporting in Canadian dollars
34	FCAD	Fiscal-based reporting in Canadian dollars
35	PFA4	Industrial format, pre-FASB reporting, standardized presentation, rank 4
36	PFO2	Industrial format, pro-forma reporting, standardized presentation, rank 2
37	PFO1	Industrial format, pro-forma reporting, standardized presentation, rank 1
38	PRE1	Industrial format, consolidated information, standardized data collected before company amendment, rank 1
39	FFO1	Financial services format, pro-forma reporting, standardized presentation, rank 1
40	FS4	Financial services format, consolidated information, standardized presentation, rank 4
41	GICS	Industry code type Global Industry Classification Standard
43	FORD	Pro-forma reporting
44	BSTD	Bank format, consolidated information, standardized presentation
45	BSUMM	Bank format, consolidated information, standardized summary data from the latest annual filing
46	BPFO	Bank format, pro-forma reporting, standard presentation
47	BASTD	Bank format, consolidated information, average standardized presentation
48	BASUMM	Bank format, consolidated information, average standardized summary presentation from the latest annual filing
49	BAPFO	Bank format, pro-forma reporting, average standardized presentation

CCM Data Groups

CCM items are organized into groups for ease of selection and presentation. Each group is given a group name. These names are unique and do not overlay with item names. A group can be made up of either items or other groups. Items can belong to more than one group. [Table 39.7](#) provides a summary of some groups. Refer to your *CCM Database Guide* for more information about CCM data groups.

Table 39.7 Selected Xpressfeed Primary and CRSP Supplemental Groups

Item Name	Description
MASTER	CCM company ID and range data
COMPANY	CCM company header information
IDX_INDEX	CCM idx_index header information
SPIND	Standard & Poor's (S&P) index header (pre-GICS)
COMPHIST	CCM company header history
CSTHIST	CST header history
LINK	Link history
LINKUSED	CCM company CRSP link used data
LINKRNG	CCM company CRSP link range data
ADJFACT	CCM company adjustment factor history
HGIC	CCM company GICS code history
OFFTITL	CCM company officer title data
CCM_FILEDATE	CCM company filing date data
CCM_IPCD	CCM industry presentation code data
SECURITY	CCM security header information
SECHIST	CCM security header history
SEC_MTHSPT	CCM security monthly split events
SEC_MSPT_FN	CCM security monthly split event footnotes
SEC_MDIV_FN	CCM security monthly dividend event footnotes
SEC_SPIND	CCM security S&P information events
IDXCST_HIS	CCM security historical index constituents
SPIDX_CST	CCM security S&P index constituent events
CCM_SEG_CUR	CCM operating segment currency rate data
CCM_SEG_SRC	CCM operating segment source data
CCM_SEG_PROD	CCM operating segment product data
CCM_SEG_CUST	CCM operating segment customer data
CCM_SEG_DTL	CCM operating segment detail data
CCM_SEG_ITM	CCM operating segment item data
CCM_SEG_NAICS	CCM operating segment NAICS data
CCM_SEG_GEO	CCM operating segment geographic data

Daily STK Data Items

You can generate a customized list of item names available in the daily stock database (SETID=10) by running the following sample statements for each group name in [Table 39.9](#):

```
libname dstock sasexccm
    "\\bb04smb01\thirdparty\lnx\crspdata\DI201006\"
    setid=10 permno=12490
    itemlist="group_name.*";

proc contents data=dstock.group_name; run;
```

The following statements generate an item list of all the item names available in the group named STKHDR_ID:

```
libname crsp sasexccm
    "\\bb04smb01\thirdparty\lnx\crspdata\DI201006\"
    setid=10 permno=12490
    itemlist="STKHDR_ID.*";

proc contents data=crsp.stkhdr_id; run;
```

The item names in group STKHDR_ID are listed in [Table 39.8](#).

Table 39.8 US Daily Stock Items in Group STKHDR_ID

Item Name	Description
BEGDT	Begdt
COMPNO	COMPNO
CUSIP	CUSIP
ENDDT	Enddt
HCOMNAM	Latest company name
HDLSTCD	DEL
HEXCD	EX
HPRIMEXCH	Ex1
HSECSTAT	Sst
HSHRCD	SH
HSICCD	SIC
HSNAICS	Naics
HSUBEXCH	Ex2
HTICK	Htick
HTRDSTAT	Tst
HTSYMBOL	Symbol
ISSUNO	Issuno
KYPERMNO	PERMNO
PERMCO	PERMCO
PERMNO	PERMNO

Daily STK Data Groups

Daily stock groups are shown in [Table 39.9](#).

Table 39.9 US Daily Stock Group Names

Group Name	Description
STKHDR_ID	Stock header (summary)
STKHDR_ALL	All stock headers
STKHDR_RNG	Stock header plus ranges
LSTKHDR_RNG	Stock header plus calendar index ranges
NAMES_SHORT	Name history (short list)
NAMES	Name history
NAMES_ALL	All names
DISTS	Distribution events
ADJDISTS	Daily adjusted distribution events
SHARES	Shares outstanding observations
RSHARES	Raw shares outstanding observations
ADJSHARES	Daily adjusted shares outstanding observations
DELIST	Delisting history
ADJDELIST	Adjusted delisting events
NASDIN	NASDAQ information history
DLY_DATA	Daily price summary time series
DLY_ADJDATA	Daily adjusted price summary time series
DSTK_TS	Daily time series
DLY_WGT	Daily price, shares, and returns
DLY_ADJ_WGT	Daily adjusted price, shares, and returns
DLY_LVL	Daily index level
DLY_RET	Daily returns
PORTF	Portfolio data
GROUP	Group membership data
DLY_TS_NAT	Daily time series (native only)
DSTK_VOLUME	Volume
DSTK_CAP	Capitalization

Monthly STK Data Items

You can generate a customized list of item names available in the monthly stock database by running the following sample statements for each group name in [Table 39.10](#):

```
libname crsp sasexccm
  "\\tappan\crsp1\data201008_little\MIZ201006\"
  setid=20 permno=12490
  itemlist="group_name.*";

proc contents data=crsp.group_name; run;
```

Monthly STK Data Groups

Monthly stock groups are shown in [Table 39.10](#).

Table 39.10 US Monthly Stock Group Names

Group Name	Description
MSTKHDR_ID	Stock header (summary)
MSTKHDR_RNG	Stock header plus ranges
LMSTKHDR_RNG	Stock header plus calendar index ranges
MNAMES_SHORT	Name history (short list)
MNAMES	Name history
MNAMES_ALL	All mnames
MDISTS	Distribution events
MADJDISTS	Monthly adjusted distribution events
MSHARES	Shares outstanding observations
RMSHARES	Raw shares outstanding observations
MADJSHARES	Monthly adjusted shares outstanding observations
MDELIST	Delisting history
MADJDELIST	Adjusted delisting events
MNASDIN	NASDAQ information history
MTH_DATA	Monthly price summary time series
MTH_ADJDATA	Monthly adjusted price summary time series
MTH_TS	Monthly time series
MTH_WGT	Monthly price, shares, and returns
MTH_ADJ_WGT	Monthly adjusted price, shares, and returns
MTH_LVL	Monthly index level
MTH_RET	Monthly returns
MPORTF	Portfolio data
MGROUP	Group membership data
MTH_TS_NAT	Monthly time series (native only)
MSTK_VOLUME	Volume
MSTK_CAP	Capitalization

IND Group Data Item Names

You can generate a customized list of available Indices group data item names by running the following sample statements for each daily or monthly group name from [Table 39.11](#) or [Table 39.12](#), and substituting the corresponding SETID, data path, and actual daily (or monthly) group name for the **group_name**.

```
libname crsp sasexccm
  "\\bb04smb01\thirdparty\lnx\crspdata\DI2201006\"
  setid=440
  indno=1000040
```

```

itemlist="group_name.*";

proc contents data=crsp.group_name; run;

```

Monthly IND Group Data Group Names

The monthly group indices data consists of the groups listed in [Table 39.11](#).

Table 39.11 US IND Monthly Group Data Group Names

Group Name	Description
MINDHDRG	Monthly index group header
MINDSUMMG	Monthly index group summary
MLISTG	Monthly index group list history
MREBALG	Monthly index group rebalancing history
MREBALG_ALL	Monthly index group rebalancing
MTHGIND_LVL	Monthly index group levels
MTHGIND_RET	Monthly index group returns
MTHGIND_TS	Monthly index group series
MTHGIND_VAL	Monthly index group values

Daily IND Group Data Group Names

The daily group indices data consists of the groups listed in [Table 39.12](#).

Table 39.12 US IND Daily Group Data Group Names

Group Name	Description
INDHDRG	Index group header
INDSUMMG	Index group summary
LISTG	Index group list history
REBALG	Index group rebalancing history
REBALG_ALL	Index group rebalancing
DLYGIND_LVL	Index group levels
DLYGIND_RET	Index group returns
DLYGIND_TS	Index group series
DLYGIND_VAL	Index group values

IND Time Series Data Item Names

You can generate a customized list of available item names by running the following sample statements for each daily or monthly time series group name from [Table 39.13](#) or [Table 39.14](#), and substituting the

corresponding SETID, data path, and actual daily (or monthly) time series group name for the **group_name**.

```
libname daycrsp sasexccm
    "\\bb04smb01\thirdparty\lnx\crspdata\DI201006\"
    setid=460
    indno=1000040
    itemlist="group_name.*";

proc contents data=daycrsp.group_name; run;
```

Monthly IND Time Series Data Group Names

The monthly indices data consists of the groups listed in [Table 39.13](#).

Table 39.13 US IND Monthly Series Data Group Names

Group Name	Description
MINDHDR	Monthly index header
MINDSUMM	Monthly index summary
MLIST	Monthly index list history
MREBAL	Monthly index rebalancing history
MREBAL_ALL	Monthly index rebalancing
MTHIND_LVL	Monthly index levels
MTHIND_RET	Monthly index returns
MTHIND_TS	Monthly index series
MTHIND_VAL	Monthly index values

Daily IND Time Series Data Group Names

The daily indices data consists of the groups listed in [Table 39.14](#).

Table 39.14 US IND Daily Time Series Data Group Names

Group Name	Description
INDHDR	Index header
INDSUMM	Index summary
LIST	Index list history
REBAL	Index rebalancing history
REBAL_ALL	Index rebalancing
DLYIND_LVL	Index levels
DLYIND_RET	Index returns
DLYIND_TS	Index series
DLYIND_VAL	Index values

Daily and Monthly TRS Data Item Names

You can generate a customized list of allowed item names by running the following sample statements for each daily or monthly group name in [Table 39.15](#), and substituting the actual daily or monthly group name for the `group_name`.

```
libname crsp sasexccm
    "\\tappan\crsp1\data201008_little\TRZ201008\"
    setid=100
    treasno=202999
    itemlist="group_name.*";

proc contents data=crsp.group_name; run;
```

US TRS Data Group Names

The US Treasury data consists of the groups listed in [Table 39.15](#).

Table 39.15 US Treasury Data Groupnames

Group Name	Description
TRS_MASTER	Master items
TRS_ISSUE	TREASNO properties
TRS_IDX	TREASNOX properties
TRS_PAY	Payments
TRS_DLY	Daily treasury
TRS_DLY_ISS	Issue items
TRS_DLY_FT	Fixed term
TRS_MTH	Monthly treasury
TRS_MTH_ISS	Monthly issue items
TRS_MTH_BP	Monthly bond portfolios
TRS_MTH_FB	Monthly Fama-Bliss
TRS_MTH_FT	Monthly fixed term
TRS_MTH_RF	Riskfree
TRS_MTH_TERM	Monthly term structure
TRS_RATE	Rates
TRS_MTH_TS	Monthly time series
TRS_DLY_TS	Daily time series

Examples: SASEXCCM Interface Engine

Example 39.1: Retrieving SALE Data for One GVKEY

This simple example shows how to retrieve SALE data for one particular GVKEY=6066 (IBM). Since the ITEMLIST= option does not specify a keyset, the default (standard) keyset, KEYSET_TAG=STD, is selected. For brevity, a subset of the data with the most recent figures is specified by the WHERE statement.

```

title 'Retrieve SALE data for IBM';
libname _all_ clear;

libname crsp sasexccm "%sysget(CRSP_CCM) "
    setid=250
    gvkey=6066
    itemlist="sale";

data recentsales;
    set crsp.annitem;
    where datadate >= '1jan2000'd;

proc print data=recentsales;
run;

```

Output 39.1.1 SALE Data for GVKEY=6066

Retrieve SALE data for IBM					
Obs	KYGVKEY	KEYSET_ TAG	DATADATE	SALE	
1	6066	STD	20001229	88396.0000	
2	6066	STD	20011231	85866.0000	
3	6066	STD	20021231	81186.0000

Example 39.2: Retrieving SALE Data for Multiple Companies

This example shows how to retrieve several data items for several GVKEYs. Note how the item `offtit1` is not an annual item and is stored in its own member. The default (standard) keyset is used for all items. For brevity, a subset of the data with the most recent figures is specified by the WHERE statement.

```

title 'Retrieve Sales, Revenue, Liabilities, and Officer data for IBM and MSFT';
libname _all_ clear;

libname crsp sasexccm "%sysget(CRSP_CCM) "
    setid=250
    gvkey=6066
    gvkey=12141
    itemlist="sale;revt;lct;offtitl";

data recentannitems;
    set crsp.annitem;
    where datadate >= '1jan2000'd;

proc print data=recentannitems;
proc print data=crsp.offtitl;
run;

```

Output 39.2.1 Data Items for IBM and Microsoft

Example 39.3: Retrieving Data in Different Keysets

This example shows how to retrieve several data items in different keysets. The ITEMLIST= option asks for data on research and development (R&D) expenses, XRD, and net income, NI, over all available keysets by using the `itm_name.*` syntax in the ITEMLIST= option. Note that data is not available for all items in all keysets. For brevity, a subset of the data with the most recent figures is specified by the WHERE statement.

```

title 'Retrieve R&D Expenses and Net Income for IBM';
libname _all_ clear;

libname crsp sasexccm "%sysget(CRSP_CCM) "
    setid=250
    gvkey=6066
    itemlist="xrd.*;ni.*";

data recent;
    set crsp.annitem;
    where datadate >= '1jan2001'd;

proc print data=recent;
run;
```

Output 39.3.1 R&D Expenses and Net Income for GVKEY=6066

Retrieve R&D Expenses and Net Income for IBM

Example 39.4: Retrieving Items with Global Options

This example shows how to retrieve data on total assets (ATQ) and after tax gain or loss (GLAQ) with the global option for turning on footnote items, which uses the following syntax:

```
ITEMLIST="f:itm_name1;itm_name2;...itm_nameN"
```

The default (standard) keyset is used for all items. For brevity, a subset of the data with the most recent figures is specified by the WHERE statement.

```
title 'Retrieve data for IBM with Footnotes';
libname _all_ clear;

libname crsp sasexccm "%sysget(CRSP_CCM) "
    setid=250
    gvkey=6066
    itemlist="f:atq;glaq";

data recent;
    set crsp.qtritem;
    where datadate >= '1jan2004'd;

proc print data=recent;
run;
```

Example 39.8: Retrieving Stock and Indices Daily Time Series by INDNO

This example shows how to retrieve daily time series by INDNO key access of the IND database. For brevity, the WHERE= option in the DATA step selects a recent range of CALDT.

```
title 'Retrieve Several Daily Time Series by INDNO Access';
libname _all_ clear;

libname crsp sasexccm
    "\\bb04smb01\thirdparty\lnx\crspdata\DIZ201006\"
    setid=460
    indno=1000040 indno=1000060 indno=1000080
    itemlist="TOTCNT.*;TOTVAL.*;TRET.*";

data dindts_all ( where=( caldt >= '15jun2010'd) );
    set crsp.dlyind_ts;
run;

proc print data=dindts_all; run;
```

Output 39.8.1 Daily Time Series by INDNO

Example 39.9: Retrieving Information for Availability of Group INDNOs

This example shows how to retrieve header information about group data and how to obtain a list of all the available INDNO keys in the IND database. The INDNO= option is intentionally omitted so that a default list is generated of all of the INDNOs in the database that are available for SETID 440.

```

title 'Retrieve Header Information for a Complete INDNO list';

Overview: SASEFAME Interface Engine

The SASEFAME interface engine provides a seamless interface between Fame and SAS data to enable SAS users to access and process time series, case series, and formulas that reside in a Fame database.

Fame is an integrated, front-to-back market data and historical database solution for storing and managing real-time and high-volume time series data that are used by leading institutions in the financial, energy, and public sectors, as well as by third-party content aggregators, software vendors, and individual investors. Fame provides real-time market data feeds and end-of-day data, a Web-based desktop solution, application hosting, data delivery components, and tools for performing analytic modeling.

The SASEFAME engine uses the LIBNAME statement to enable you to specify the time series you want to read from the Fame database and how you want to convert the selected time series to the same time scale. You can then use the SAS DATA step to perform further subsetting and to store the resulting time series in a SAS data set. You can perform more analysis (if desired) either in the same SAS session or in another session at a later time.

SASEFAME in SAS 8.2 supports 32-bit Windows, Solaris, AIX, and HP-UX hosts.

SASEFAME in SAS 9.2 supports 32-bit Windows, Solaris, AIX, Linux, Linux Opteron, and HP-UX hosts.

SASEFAME in SAS 9.22 supports 32-bit Windows, Solaris, Linux, and Linux Opteron hosts.

SASEFAME in SAS 9.3 supports 32-bit Windows, 64-bit Windows, Solaris, AIX, Linux, and Linux Opteron hosts.

Getting Started: SASEFAME Interface Engine

Structure of a SAS Data Set That Contains Time Series Data

The SAS System represents time series data in a two-dimensional array, called a SAS data set, whose columns correspond to series variables and whose rows correspond to measurements of these variables at certain time periods. The time periods at which observations are recorded can be included in the data set as a time ID variable. The SASEFAME engine provides a time ID variable named DATE. The DATE variable can be represented by any of the time intervals shown in the section “[Mapping Fame Frequencies to SAS Time Intervals](#)” on page 2726.

Reading and Converting Fame Database Time Series

The SASEFAME engine supports reading and converting time series that reside in Fame databases. The SASEFAME engine uses the Fame Work database to temporarily store the converted time series. All series specified by the Fame wildcard are written to the Fame Work database. For conversion of very large databases, you might want to define the FAME_TEMP environment variable to point to a location where there is ample space for the Fame Work database.

The SASEFAME engine provides seamless access to Fame databases via Fame's C host language interface (CHLI). Fame expressions that contain formulas and Fame functions can be input to the engine via the INSET= option.

The SASEFAME engine finishes the CHLI whenever a fatal error occurs. To restart the engine after a fatal error, terminate the current SAS session and bring up a new SAS session.

Using the SAS DATA Step

If desired, you can store the converted series in a SAS data set by using the SAS DATA step. You can also perform other operations on your data inside the DATA step. After your data is stored in a SAS data set, you can use it as you would any other SAS data set.

Using SAS Procedures

You can print the output SAS data set by using the PRINT procedure and report information concerning the contents of your data set by using the CONTENTS procedure, as in [Example 40.1](#). You can create a view of the FAME database by using the SQL procedure's USING clause to reference the SASEFAME engine in your *libref*. See [Example 40.5](#).

Using the SAS Windowing Environment

You can see the available data sets in the SAS LIBNAME window of the SAS windowing environment. To do so, select the SASEFAME *libref* in the LIBNAME window that you have previously defined in your LIBNAME statement. You can view your SAS output observations by double-clicking the desired output data set *libref* in the LIBNAME window of the SAS windowing environment. You can type **Viewtable** on the SAS command line to view any of your SASEFAME tables, views, or *librefs* both for input and output data sets.

Before you use **Viewtable**, it is recommended that you store your output data sets in a physical folder or library that is separate from the folder or library used for your input databases. (The default location for output data sets is the SAS Work library.)

Remote Fame Data Access

The remote access feature of the SASEFAME interface uses the Fame CHLI to communicate with your remote Fame server, and it is available to licensed CHLI customers who have Fame CHLI on both the remote and client machines.

As shown in [Example 40.7](#), you simply provide the `frdb_m` port number and node name of your Fame master server in your *libref*. For more details, see the section “Starting the Master Server” in the *Guide to Fame Database Servers*.

Creating Views of Time Series Using SASEFAME LIBNAME Options

You can perform selection based on names of your time series simply by using Fame wildcard specifications in your SASEFAME `WILDCARD=` option.

You can limit the time span of time series data by specifying a begin and end date range in your SASEFAME `RANGE=` option.

It is also easy to use the SAS input data set `INSET=` option to create a specific view of your Fame data. Multiple views can be created by using multiple `LIBNAME` statements with customized options tailored to the unique view that you want to create.

You can list the `INSET` variables that you want to keep in your SAS data set by using the `KEEPLIST` clause. When used in conjunction with the input data set that you specify in the `INSET=` option, SASEFAME can show any or all of your expression groups in the same view or in multiple views. The `INSET=` option defines the valid set of expression groups that you can reference in the `KEEPLIST=` clause, as shown in [Example 40.16](#).

The `INSET` variables define the `BY` variables that enable you to view cross sections (slices) of your data. When `INSET` variables are used in conjunction with the `WHERE` clause and the `CROSSLIST=` option, SASEFAME can show any or all of your `BY` groups in the same view or in multiple views. When the `INSET=` option is used with a `WHERE` clause that specifies the `BY` variables you want to use in your view, it must also use the `CROSSLIST=` option, as shown in [Example 40.10](#). The `CROSSLIST=` option can be used without using the `INSET=` option as shown in [Example 40.8](#) and [Example 40.9](#).

Syntax: SASEFAME Interface Engine

The SASEFAME engine uses standard engine syntax. [Table 40.1](#) summarizes the options used by SASEFAME.

Table 40.1 Summary of LIBNAME *libref* SASEFAME Statement

Option	Description
CONVERT=	Specifies the Fame frequency and the Fame technique
WILDCARD=	Specifies a Fame wildcard to match data object series names within the Fame database
RANGE=	Specifies the range of data to keep in format 'ddmm-myyy'd – 'ddmmmyyyy'd
INSET=	Uses a SAS data set named <i>setname</i> and KEEPLIST= <i>fame_expression_group</i> as selection input variables or WHERE= Fame <i>fame_bygroup</i> as selection input for BY variables
CROSSLIST=	Specifies a Fame crosslist <i>fame_namelist</i> to perform selection based on the crossproduct of two Fame namelists
FAMEOUT=	Specifies the Fame data object class/type you want output to the SAS data set
DBVERSION=	Echoes the present version number of the Fame Work data base in the SAS log
TUNEFAME=	Tunes the FAME database engine's use of memory to reduce I/O in favor of a bigger virtual memory for caching database objects
TUNECHLI=	Tunes the CHLI database engine's use of memory to reduce I/O in favor of a bigger virtual memory for caching database objects

LIBNAME *libref* SASEFAME Statement

LIBNAME *libref* **SASEFAME** '*physical name*' *options* ;

Since '*physical name*' specifies the location of the folder where your Fame database resides, it should end in a backslash if you are in a Windows environment or a forward slash if you are in a UNIX environment.

If you are accessing a remote Fame database by using the Fame CHLI, you can use the following syntax for '*physical name*':

```
'#port_number@hostname physical_path_name '
```

The following *options* can be used in the LIBNAME *libref* SASEFAME statement.

CONVERT=(**FREQ**=*fame_frequency* **TECH**=*fame_technique*)

CONV=(**FREQ**=*fame_frequency* **TECH**=*fame_technique*)

specifies the Fame frequency and the Fame technique just as you would in the Fame CONVERT function. There are four possible values for *fame_technique*: *Constant* (default), *Cubic*, *Discrete*, or *Linear*. Table 40.4 shows the Fame frequencies that are supported by the SASEFAME engine.

For a more complete discussion of Fame frequencies and SAS time intervals, see the section “[Mapping Fame Frequencies to SAS Time Intervals](#)” on page 2726. For all possible *fame_frequency* values, see the section “Understanding Frequencies” in the *User's Guide to Fame*. For example:

```
LIBNAME libref sasefame 'physical-name'
      CONVERT=(TECH=CONSTANT FREQ=TWICEMONTHLY);
```

WILDCARD="fame_wildcard"

WILD="fame_wildcard"

limits the time series read from the Fame database. By default, the SASEFAME engine reads all time series in the Fame database that you name in your SASEFAME *libref*. The *fame_wildcard* is a quoted string that contains the Fame wildcard you want to use. The wildcard is used for matching against the data object names of series you want to select from the Fame database that resides in the library you are assigning.

For more information about using wildcards, see the section “Specifying Wildcards” in the *User’s Guide to Fame*.

For example, to read all time series in the TEST library being accessed by the SASEFAME engine, you would specify the following statement:

```
LIBNAME test sasefame 'physical name of test database'
      WILDCARD="?";
```

To read series with names such as A_DATA, B_DATA, or C_DATA, you could specify the following statement:

```
LIBNAME test sasefame 'physical name of test database'
      WILDCARD="^_DATA";
```

When you use the WILDCARD= option, you limit the number of series that are read and converted to the desired frequency. This option can help you save resources when processing large databases or when processing a large number of observations, such as daily or hourly frequencies. Since the SASEFAME engine uses the Fame WORK database to store the converted time series, using wildcards is recommended to prevent your WORK space from getting too large. When the FAMEOUT= option is also specified, the wildcard is applied to the type of data object series you specify in the FAMEOUT= option.

RANGE='fame_begdt'd-'fame_enddt'd

DATERANGE='fame_begdt'd-'fame_enddt'd

DATE='fame_begdt'd-'fame_enddt'd

DATECASE='fame_begdt'd-'fame_enddt'd

limits the time range of data read from your Fame database. The string *fame_begdt* is the beginning date in ddmmyyyy format, and the string *fame_enddt* is the ending date of the range in ddmmyyyy format; both strings must be surrounded by single quotation marks followed by the letter d.

As an example, to read a series with a date range that spans the first quarter of 1999, you could use the following statement:

```
LIBNAME test sasefame 'physical name of test database'
      RANGE='01jan1999'd - '31mar1999'd;
```

INSET=(setname KEEP=fame_expression_group)

INSET=(setname KEEPLIST=fame_expression_group)

specifies the name of a SAS data set (*setname*) and selects series that are generated by the expressions defined in *fame_expression_group*. You can define *fame_expression_group* by using Fame functions and Fame expressions. It is important to specify the length of the longest expression, or expressions might be truncated since the default length is the first defined variable in the data step. The INSET (input data set) must output each expression statement as a character string ending with a semicolon, surrounded by single quotation marks, and followed by another semicolon and an output statement. The following statements create an input data set, INSETA, and print it.

```
data inseta; /* Use this for training data base */
  length express $52;
  express='{ibm.high,ibm.low,ibm.close}'; output;
  express='crosslist({gm,f,c},{volume})'; output;
  express='cvx.close'; output;
  express='mave(ibm.close,30)'; output;
  express='cvx.close+ibm.close'; output;
  express='ibm.close'; output;
  express='close * shares/sum(close * shares)'; output;
  express='sum(pep.volume)'; output;
  express='mave(pep.close,20)'; output;
run;

proc print
  data=inseta;
run;
```

Next you can name the input data set you want to use in the INSET= option, followed by the KEEP= variable that specifies the expression group you want to keep. Only series variables that are defined in the selected expression group are output to the output data set. You can define up to eight different expression groups in an INSET= option.

```
libname lib5 sasefame "C:\PROGRA~1\FAME10\util"
  wildcard="?"
  convert=(frequency=business technique=constant)
  range='23jul1997'd - '25jul1997'd
  inset=( inseta KEEP=express)
  ;

data trout;
  set lib5.trainten;
run;

title1 'TRAINING DB, Pricing Timeseries for Expressions in INSET=';
title2 'OUT=TROUT from the PRINT Procedure';
proc print data=trout;
run;
```

Table 40.2 shows the eight expressions that are defined in INSETA.

Table 40.2 SAS Input Data Set, INSETA, Defined for Use in the INSET= Option

Observation	Express
1	cvx.close;
2	ibm.high,ibm.low,ibm.close;
3	mave(ibm.close,30);
4	crosslist(gm,f,c,volume);
5	cvx.close+ibm.close;
6	ibm.close;
7	sum(pep.volume);
8	mave(pep.close,20);

Table 40.3 shows the output data set, TROUT. The output data set names each derived variable ‘SASTEMPn’ by appending the number, n, to match the observation number of the input data set’s expression for that variable. For example, SASTEMP1 names the series derived by ‘cvx.close’ in observation 1, and SASTEMP3 names the series derived by the expression ‘mave(ibm.close,30);’ in observation 3. Since SASTEMP2 is a simple name list of three series, the original series names are used.

Table 40.3 TRAINING DB, Pricing Timeseries for Expressions in INSETA for OUT=TROUT from the PRINT Procedure

DATE	C.VOLUME	VOLUME	GM.VOLUME	IBM.CLOSE	IBM.HIGH
23JUL1997	33791.88	45864.05	37392	52.5625	53.5000
24JUL1997	41828.85	29651.34	27771	53.9063	54.2188
25JUL1997	46979.83	36716.77	24969	53.5000	54.2188
IBM.LOW	SASTEMP1	SASTEMP3	SASTEMP5	SASTEMP6	SASTEMP8
51.5938	38.4063	.	90.9688	52.5625	.
52.2500	38.4375	.	92.3438	53.9063	.
52.8125	39.0000	.	92.5000	53.5000	.

Note that SASTEMP3 and SASTEMP8 have no observations in the date range July 23, 1997, to July 25, 1997, so the missing value symbol ‘.’ appears for those observations.

INSET=(setname WHERE=fame_bygroup)

specifies a SAS data set (*setname*) as input for a BY group such as a ticker, and uses the *fame_bygroup* to select time series that are named using the following convention. Selected variable names are glued together by the BY group name (such as a ticker symbol) concatenated with the glue character (such as DOT) to the series name that is specified in the CROSSLIST= option or in the *fame_bygroup*.

For more information, see the section “Performing the Crosslist Selection Function” on page 2728.

CROSSLIST=(< *fame_namelist1*, > *fame_namelist2*)

CROSS=(< *fame_namelist1*, > *fame_namelist2*)

performs a crossproduct of the members of the first namelist with the members of the second namelist, using a glue symbol “.” to join the two. If one of the time series listed in *fame_namelist2* does not exist, the SASEFAME engine stops processing the remainder of the namelist. For more information, see the section “[Performing the Crosslist Selection Function](#)” on page 2728.

FAMEOUT=*fame_data_object_class_type*

specifies the class and type of the Fame data series objects you want in your SAS output data set. The possible values for *fame_data_object_class_type* are FORMULA, TIME, BOOLEAN, CASE, DATE, and STRING. Case series can be numeric, boolean, string, and date, or they can be generated using formulas that resolve to series. SASEFAME resolves all formulas that belong to the type of series data object that you specify in your FAMEOUT= option. If the FAMEOUT= option is not specified, numeric time series are output to the SAS data set. FAMEOUT=CASE defaults to case series of numeric type. If you want another type of case series in your output, then you must specify it. Scalar data objects are not supported.

DBVERSION=ON | OFF

specifies whether to display the version number of the Fame Work database. DBVERSION=ON specifies that the SAS log show the version number (3 or 4) of the Fame Work database. The default is OFF.

TUNEFAME=NODES *fameengine_size_virtual_memory_MB*

specifies the number of megabytes you want to use for the cache size for the FAME engine. The *fameengine_size_virtual_memory_MB* can range from a minimum of 0.1 MB (100 KB) to a maximum of 17,592,186,000,000 MB. See [Example 40.17](#) for more details.

TUNECHLI=NODES *famechliengine_size_virtual_memory_MB*

specifies the number of megabytes you want to use for your cache size for the FAMECHLI engine. The *famechliengine_size_virtual_memory_MB* can range from a minimum of 0.1 MB (100 KB) to a maximum of 17,592,186,000,000 MB. See [Example 40.17](#) for more details.

Details: SASEFAME Interface Engine

SAS Output Data Set

You can use the SAS DATA step to write the selected time series from your Fame database to a SAS data set. This enables you to easily analyze the data by using the SAS System. You can specify the name of the output data set in the DATA statement. This causes the engine supervisor to create a SAS data set by using the specified name in either the SAS Work library or, if specified, the Sasuser library. For more information about naming your SAS data set, see the section “SAS Data Sets: Data Set Names” in the *SAS Language Reference: Concepts*.

The contents of the SAS data set that contains time series include the date of each observation, the name of each series read from the Fame database as specified by the WILDCARD= option, and the label or Fame description of each series. Missing values are represented as ‘.’ in the SAS data set. You can see the available data sets in the SAS LIBNAME window of the SAS windowing environment by selecting the SASEFAME *libref* in the LIBNAME window that you have previously used in your LIBNAME statement. You can use PROC PRINT and PROC CONTENTS to print your output data set and its contents. You can use PROC SQL and the SASEFAME engine to create a view of your SAS data set. You can view your SAS output observations by double-clicking the desired output data set *libref* in the LIBNAME window of the SAS windowing environment.

The DATE variable in the SAS data set contains the date of the observation. For Fame weekly intervals that end on a Friday, Fame reports the date on the Friday that ends the week, whereas the SAS System reports the date on the Saturday that begins the week.

A more detailed discussion of how to map Fame frequencies to SAS time intervals follows. For other types of data such as Boolean case series, numeric case series, date case series, string case series, and extracting source for formulas, see [Example 40.11](#), [Example 40.12](#), [Example 40.13](#), [Example 40.14](#), and [Example 40.15](#), respectively.

Mapping Fame Frequencies to SAS Time Intervals

Table 40.4 summarizes the mapping of Fame frequencies to SAS time intervals. Fame frequencies often have a sample unit in parentheses following the keyword frequency. This sample unit is an end-of-interval unit. SAS dates are represented by beginning-of-interval notation.

For more information about SAS time intervals, see Chapter 4, “[Date Intervals, Formats, and Functions](#).”

For more information about Fame frequencies, see the section “Understanding Frequencies” in the *User’s Guide to Fame*.

Table 40.4 Mapping Fame Frequencies

Performing the Crosslist Selection Function

There are two methods for performing the crosslist selection function. The first method uses two Fame namelists, and the second method uses one namelist and one BY group specified in the WHERE= clause of the INSET= option.

For example, suppose that your Fame database has a string case series named TICKER, so that when the Fame NL function is used on TICKER, it returns the namelist

```
Ticker = {AOL, C, CVX, F, GM, HPQ, IBM, INDUA, INTC, SPX, SUNW, XOM}
```

and your time series are named in *fame_namelist2* as

```
{adjust, close, high, low, open, volume, uclose, uhigh, ulow, uopen, uvolume}
```

When you specify the following statements, then the 132 variables shown in [Table 40.5](#) are selected by the CROSSLIST= option.

```
LIBNAME test sasefame 'physical name of test database'
RANGE='01jan1999'd - '31mar1999'd
CROSSLIST=(nl(ticker),
           {adjust, close, high, low, open, volume,
            uclose, uhigh, ulow, uopen, uvolume})
;
```

Table 40.5 SAS Variables Selected by CROSSLIST= Option

AOL.ADJUST	C.ADJUST	CVX.ADJUST	F.ADJUST
AOL.CLOSE	C.CLOSE	CVX.CLOSE	F.CLOSE
AOL.HIGH	C.HIGH	CVX.HIGH	F.HIGH
AOL.LOW	C.LOW	CVX.LOW	F.LOW
AOL.OPEN	C.OPEN	CVX.OPEN	F.OPEN
AOL.UCLOSE	C.UCLOSE	CVX.UCLOSE	F.UCLOSE
AOL.UHIGH	C.UHIGH	CVX.UHIGH	F.UHIGH
AOL.ULOW	C.ULOW	CVX.ULOW	F.ULOW
AOL.UOPEN	C.UOPEN	CVX.UOPEN	F.UOPEN
AOL.UVOLUME	C.UVOLUME	CVX.UVOLUME	F.UVOLUME

Table 40.5 continued

AOL.VOLUME	C.VOLUME	CVX.VOLUME	F.VOLUME
GM.ADJUST	HPQ.ADJUST	IBM.ADJUST	INDUA.ADJUST
GM.CLOSE	HPQ.CLOSE	IBM.CLOSE	INDUA.CLOSE
GM.HIGH	HPQ.HIGH	IBM.HIGH	INDUA.HIGH
GM.LOW	HPQ.LOW	IBM.LOW	INDUA.LOW
GM.OPEN	HPQ.OPEN	IBM.OPEN	INDUA.OPEN
GM.UCLOSE	HPQ.UCLOSE	IBM.UCLOSE	INDUA.UCLOSE
GM.UHIGH	HPQ.UHIGH	IBM.UHIGH	INDUA.UHIGH
GM.ULOW	HPQ.ULOW	IBM.ULOW	INDUA.ULOW
GM.UOPEN	HPQ.UOPEN	IBM.UOPEN	INDUA.UOPEN
GM.UVOLUME	HPQ.UVOLUME	IBM.UVOLUME	INDUA.UVOLUME
GM.VOLUME	HPQ.VOLUME	IBM.VOLUME	INDUA.VOLUME
INTC.ADJUST	SPX.ADJUST	SUNW.ADJUST	XOM.ADJUST
INTC.CLOSE	SPX.CLOSE	SUNW.CLOSE	XOM.CLOSE
INTC.HIGH	SPX.HIGH	SUNW.HIGH	XOM.HIGH
INTC.LOW	SPX.LOW	SUNW.LOW	XOM.LOW
INTC.OPEN	SPX.OPEN	SUNW.OPEN	XOM.OPEN
INTC.UCLOSE	SPX.UCLOSE	SUNW.UCLOSE	XOM.UCLOSE
INTC.UHIGH	SPX.UHIGH	SUNW.UHIGH	XOM.UHIGH
INTC.ULOW	SPX.ULOW	SUNW.ULOW	XOM.ULOW
INTC.UOPEN	SPX.UOPEN	SUNW.UOPEN	XOM.UOPEN
INTC.UVOLUME	SPX.UVOLUME	SUNW.UVOLUME	XOM.UVOLUME
INTC.VOLUME	SPX.VOLUME	SUNW.VOLUME	XOM.VOLUME

Instead of using two namelists, you can use the WHERE= clause in an INSET= option to perform the crossproduct of the BY variables specified in your input data set via the WHERE= clause, with the members named in your namelist. The following statements define a SAS input data set named INSETA to use as input for the CROSSLIST= option instead of using the Fame namelist:

```
DATA INSETA;
  LENGTH tick $5;
  /* AOL, C, CVX, F, GM, HPQ, IBM, INDUA, INTC, SPX, SUNW, XOM */
  tick='AOL'; output;
  tick='C'; output;
  tick='CVX'; output;
  tick='F'; output;
  tick='GM'; output;
  tick='HPQ'; output;
  tick='IBM'; output;
  tick='INDUA'; output;
  tick='INTC'; output;
  tick='SPX'; output;
  tick='SUNW'; output;
  tick='XOM'; output;
RUN;
```

```
LIBNAME test sasefame 'physical name of test database'
      RANGE='01jan1999'd - '31mar1999'd
      INSET=(inseta, where=tick)
      CROSSLIST=(
          {adjust, close, high, low, open, volume,
            uclose, uhigh, ulow, uopen, uvolume})
      ;
```

Whether you use a SAS INSET statement with a WHERE clause or you use a Fame namelist in the CROSSLIST= statement, the two methods are equivalent ways of performing the same selection function. In the preceding example, the Fame ticker namelist corresponds to the SAS input data set's BY variable named TICK.

Note that the WHERE=*fame_bygroup* must match the BY variable name used in your input data set in order for the CROSSLIST= option to perform the desired selection. If one of the time series listed in *fame_namelist2* does not exist, the SASEFAME engine stops processing the remainder of the namelist. For complete results, make sure that your *fame_namelist2* is accurate and does not name unknown variables. The same holds true for *fame_namelist1* and the BY variable values named in your input data set and used in your WHERE= clause.

Examples: SASEFAME Interface Engine

In this section, the examples were run on Windows, so the physical names used in the LIBNAME *libref* SASEFAME statement reflect the syntax necessary for that platform. In general, the Windows environments use backslashes in their pathname, and the UNIX environments use forward slashes.

Example 40.1: Converting an Entire Fame Database

To enable conversion of all time series no wildcard is specified, so the default “?” wildcard is used. Always consider both the number of time series and the number of observations generated by the conversion process. The converted series reside in the Fame Work database during the SAS DATA step. You can further limit your resulting SAS data set by using KEEP, DROP, or WHERE statements inside your DATA step.

The following statements convert a Fame database and print out its contents:

```
options pagesize=60 linesize=80 validvarname=any ;
%let FAME=%sysget(FAME);
%put (&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put (&FAMETEMP);

libname famedir sasefame "%sysget(FAME_DATA)"
      convert=(freq=annual technique=constant);
```

```

libname mydir "%sysget (FAME_TEMP) ";

data mydir.a; /* add data set to mydir */
    set famedir.oecd1;
    /* Read in oecd1.db data from the Organization */
    /* For Economic Cooperation and Development */
    where date between '01jan88'd and '31dec93'd;
run;

proc print data=mydir.a;
run;

```

In the preceding example, the Fame database is called oecd1.db and it resides in the famedir directory. The DATA statement names the SAS output data set 'a', that will reside in mydir. All time series in the Fame oecd1.db database will be converted to an annual frequency and reside in the mydir.a SAS data set. Since the time series variable names contain the special glue symbol '.', the SAS option statement specifies VALIDVARNAME=ANY. See the *SAS System Options: Reference* for more information about this option. The Fame environment variable is the location of the Fame installation. On Windows, the log would look like this:

```

1          options validvarname=any;

2          %let FAME=%sysget (FAME);
3          %put (&FAME);
(C:\PROGRA~1\FAME)
4          %let FAMETEMP=%sysget (FAME_TEMP);
5          %put (&FAMETEMP);
(\\ge\U11\saskff\fametemp\
6
7          libname famedir sasefame "&FAME\util"
8          convert=(freq=annual technique=constant);
NOTE: Libref FAMEDIR was successfully assigned as follows:
      Engine:          FAMECHLI
      Physical Name: C:\PROGRA~1\FAME\util
9
10         libname mydir '\\dntsrc\usrtmp\saskff';
NOTE: Libref MYDIR was successfully assigned as follows:
      Engine:          V9
      Physical Name: \\dntsrc\usrtmp\saskff
11
12         data mydir.a; /* add data set to mydir */
13         set famedir.oecd1;
AUS.DIRDES -- SERIES (NUMERIC by ANNUAL)
AUS.DIRDES copied to work data base as AUS.DIRDES.

```

For more about the glue DOT character, refer to “Gluing Names Together” in the *User’s Guide to Fame*. In the preceding log, the variable name AUS.DIRDES uses the glue DOT between AUS and DIRDES.

The PROC PRINT statement creates [Output 40.1.1](#) which shows all of the observations in the mydir.a SAS data set.

Output 40.1.1 Listing of OUT=MYDIR.A of the OECD1 Fame Data

Example 40.2: Reading Time Series from the Fame Database

This example uses the Fame wildcard option to limit the number of series converted. The following statements show how to read only series that start with WSPCA.

```
options validvarname=any;

%let FAME=%sysget(FAME);
%put (&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put (&FAMETEMP);

libname lib1 sasefame "%sysget(FAME_DATA)"
           wildcard="wspca?"
           convert=(technique=constant freq=twicemonthly );

libname lib2 "%sysget(FAME_TEMP)";

data lib2.twild(label='Annual Series from the FAMEECON.db');
  set lib1.subecon;
  where date between '01jan93'd and '31dec93'd;
  /* keep only */
  keep date wspca;
run;

proc contents data=lib2.twild;
run;

proc print data=lib2.twild;
run;
```

Output 40.2.1 and Output 40.2.2 show the results of using WILDCARD="WSPCA?".

Output 40.2.1 Contents of OUT=LIB2.TWILD of the SUBECON Fame Data

The CONTENTS Procedure					
Alphabetic List of Variables and Attributes					
#	Variable	Type	Len	Format	Informat Label
1	DATE	Num	8	DATE9.	9. Date of Observation
2	WSPCA	Num	8		STANDARD & POOR'S WEEKLY BOND YIELD: COMPOSITE, A

The WILDCARD="WSPCA?" option limits reading to only those series whose names begin with WSPCA. The KEEP statement further restricts the SAS data set to include only the series named WSPCA and the DATE variable. The time interval used for the conversion is TWICEMONTHLY.

Output 40.2.2 Listing of OUT=LIB2.TWILD of the SUBECON Fame Data

Obs	DATE	WSPCA
1	01JAN1993	8.59400
2	16JAN1993	8.50562

Example 40.3: Writing Time Series to the SAS Data Set

The following statements use the DROP statement to exclude certain time series from the SAS data set. (You can also use the KEEP statement to include certain series in the SAS data set.)

```
options validvarname=any;

%let FAME=%sysget(FAME);
%put (&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put (&FAMETEMP);

libname famedir sasefame "%sysget(FAME_DATA)"
        convert=(freq=annual technique=constant);

libname mydir "%sysget(FAME_TEMP)";

data mydir.a; /* add data set to mydir */
    set famedir.oecd1;
    drop 'ita.dirdes'n--'jpn.herd'n 'tur.dirdes'n--'usa.herd'n;
    where date between '01jan88'd and '31dec93'd;
run;

title1 "OECD1: TECH=Constant, FREQ=Annual";
title2 "Drop Using N-literals";

proc print data=mydir.a;
run;
```

Output 40.3.1 shows the results.

Output 40.3.1 Listing of OUT=MYDIR.A of the OECD1 Fame Data

OECD1: TECH=Constant, FREQ=Annual Drop Using N-literals

Note that the SAS option VALIDVARNAME=ANY was used at the beginning of this example because special characters are present in the time series names. SAS variables that contain certain special characters are called *n-literals* and are referenced in SAS code as shown in this example.

You can rename your SAS variables by using the RENAME statement. The following statements show how to use *n-literals* when selecting variables you want to keep, and how to rename some of your kept variables:

```
options validvarname=any;
```

```
%let FAME=%sysget(FAME);
```

```
%put (&FAME);
```

```

%let FAMETEMP=%sysget (FAME_TEMP);
%put (&FAMETEMP);

libname famedir sasefame "%sysget (FAME_DATA) "
        convert=(freq=annual technique=constant);

libname mydir "%sysget (FAME_TEMP) ";

data mydir.a; /* add data set to mydir */
    set famedir.oecd1;
    /* keep and rename */
    keep date 'ita.dirdes'n--'jpn.herd'n 'tur.dirdes'n--'usa.herd'n;
    rename 'ita.dirdes'n='italy.dirdes'n
           'jpn.dirdes'n='japan.dirdes'n
           'tur.dirdes'n='turkey.dirdes'n
           'usa.dirdes'n='united.states.of.america.dirdes'n ;

run;

title1 "OECD1: TECH=Constant, FREQ=Annual";
title2 "keep statement using n-literals";
title3 "rename statement using n-literals";

proc print data=mydir.a;
run;

```

Output 40.3.2 shows the results.

Output 40.3.2 Listing of OUT=MYDIR.A of the OECD1 Fame Data

Example 40.4: Limiting the Time Range of Data

You can also limit the time range of the data in the SAS data set by using the RANGE= option in the LIBNAME statement or the WHERE statement in the DATA step to process the time ID variable DATE only when it falls in the range you are interested in.

All data for 1988, 1989, and 1990 are included in the SAS data set that is generated by using the RANGE='01JAN1988'D - '31DEC1990'D option or the WHERE DATE BETWEEN '01JAN88'D AND '31DEC90'D statement. The difference is that the range option uses less space in your Fame Work database. If you have a very large database and you want to use less space in your Fame Work database while you are processing the oecd1 database, you should use the RANGE= option as shown in the following statements:

```
options validvarname=any;

%let FAME=%sysget(FAME);
%put (&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put (&FAMETEMP);

libname famedir SASEFAME "%sysget(FAME_DATA)"
        convert=(freq=annual technique=constant)
        range='01jan1988'd - '31dec1990'd;

libname mydir "%sysget(FAME_TEMP)";

data mydir.a; /* add data set to mydir */
    set famedir.oecd1;
    /* range on the libref restricts the dates *
    * read from famedir's oecd1 database      */
run;

title1 "OECD1: TECH=Constant, FREQ=Annual";
proc print data=mydir.a;
run;
```

Output 40.4.1 shows the results.

Output 40.4.1 Listing of OUT=MYDIR.A of the OECD1 Fame Data Using RANGE= Option

28	1986	106	.
29	1987	107	.
30	1988	109	.
31	1989	111	.

The following statements create a view of the Data Resources Incorporated (DRI) economic database by using the SQL procedure's FROM and USING clauses:

```

title2 'DRIECON: Dual Embedded Library Allocations with FAME Option';
options validvarname=any;

%let FAME=%sysget(FAME);
%put (&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put (&FAMETEMP);

proc sql;
  create view fameview as
    select date, husts
    from lib1.driecon
    using libname lib1 sasefame "%sysget(FAME_DATA)"

```

```

                                convert=(tech=constant freq=annual)
                                range='01jan1980'd - '01jan2006'd ,
                                libname temp "%sysget(FAME_TEMP)";
quit;

title2 'DRIECON: Print of View from Embedded Library with FAME Option';
proc print data=fameview;
run;

```

The SAS option VALIDVARNAME=ANY is used at the beginning of this example because special characters are present in the time series names. The output from this example shows how each Fame view is the output of the SASEFAME engine's processing. Different engine options could have been used in the USING LIBNAME clause if desired. [Output 40.5.4](#) shows the results.

Output 40.5.4 Printout of the Fame View of DRI Basic Economic Data

```

famesql5: PROC SQL Dual Embedded Libraries w/ FAME option
DRIECON: Print of View from Embedded Library with FAME Option

```

Example 40.6: Reading Other Fame Data Objects with the FAMEOUT= Option

This example shows how you can designate the data objects that are output to your SAS data set by using the FAMEOUT= option. In this example, the FAMEOUT=FORMULA option selects the formulas and their source definitions to be output. The RANGE= option is ignored since no time series are selected when

FAMEOUT=FORMULA is specified.

```
options validvarname=any ls=90;

%let FAME=%sysget(FAME);
%put (&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put (&FAMETEMP);

libname lib6 sasefame "%sysget(FAME_DATA)"
    fameout=formula
    convert=(frequency=business technique=constant)
    range='02jan1995'd - '25jul1997'd
    wildcard="?YIELD?" ;

data crout;
    set lib6.training;
    keep 'S.GM.YIELD.A'n -- 'S.XON.YIELD.A'n ;
run;

title1 'Formulas from the TRAINING DB, FAMEOUT=FORMULA Option';
title2 'Using WILDCARD="?YIELD?"';
proc contents
    data=crout;
run;
```

Output 40.6.1 shows the results.

Output 40.6.1 Contents of OUT=CROUT from the FAMEOUT=FORMULA Option of the Training Fame Data

Formulas from the TRAINING DB, FAMEOUT=FORMULA Option Using WILDCARD="?YIELD?"			
The CONTENTS Procedure			
Alphabetic List of Variables and Attributes			
#	Variable	Type	Len
1	S.GM.YIELD.A	Char	82
2	S.GM_PP.YIELD.A	Char	82
3	S.HWP.YIELD.A	Char	82
4	S.IBM.YIELD.A	Char	82
5	S.INDUT.YIELD.A	Char	82
6	S.SPAL.YIELD.A	Char	82
7	S.SPALN.YIELD.A	Char	82
8	S.SUNW.YIELD.A	Char	82
9	S.XOM.YIELD.A	Char	82
10	S.XON.YIELD.A	Char	82

The FAMEOUT=FORMULA option restricts the SAS data set to include only formulas. The WILDCARD="?YIELD?" option further limits the selection of formulas to those whose names contain "YIELD".

```

options validvarname=any linesize=79;

title1 'Formulas from the TRAINING DB, FAMEOUT=FORMULA Option';
title2 'Using WILDCARD="?YIELD?"';
proc print
    data=crouit noobs;
run;

```

Output 40.6.2 shows the results.

Output 40.6.2 Listing of OUT=CROUT from the FAMEOUT=FORMULA Option of the TRAINING Fame Data

(%SPLC2TF(C30231G10X01, IAD_DATE.H, IAD.H)/C30231G10X01.CLOSE)*C30231G10X01.ADJ

```

Additional examples of the FAMEOUT= option are shown in [Example 40.11](#), [Example 40.12](#), [Example 40.13](#), [Example 40.14](#), and [Example 40.15](#).

Example 40.7: Remote Fame Access Using Fame CHLI

When you run Fame in a client/server environment and also have Fame CHLI capability enabling access to the server, you can access Fame remote data. Access the remote data by specifying the port number of the TCP/IP service that is defined for the frdb_m and the node name of the Fame master server in the physical path. In this example, the Fame server node name is STONES, and the port number is 5555, as was designated in the Fame master command. See the section “Starting the Master Server” in the *Guide to Fame Database Servers* for more information about starting your Fame master server.

```
options ls=78;
title1 "DRIECON Database, Using FAME with Remote Access Via CHLI";

libname test1 sasefame '#5555@stones $FAME/util';

data a;
    set test1.driecon;
    keep YP ZA ZB;
    where date between '01jan98'd and '31dec03'd;
run;

proc means data=a n;
run;
```

[Output 40.7.1](#) shows the results.

Output 40.7.1 Summary Statistics for the Remote FAME Data

DRIECON Database, Using FAME with Remote Access Via CHLI		
The MEANS Procedure		
Variable	Label	N
YP	PERSONAL INCOME	5
ZA	CORPORATE PROFITS AFTER TAX EXCLUDING IVA	4
ZB	CORPORATE PROFITS BEFORE TAX EXCLUDING IVA	4

Example 40.8: Selecting Time Series Using CROSSLIST= Option and KEEP Statement

This example shows how to use two Fame namelists to perform selection. Note that *fame_namelist1* could be easily generated using the Fame WILDLIST function. For more about WILDLIST, see the section “The WILDLIST Function” in the *Fame Command Reference Volume 2, Functions*. In the following statements, four tickers are selected in *fame_namelist1*, but when you use the KEEP statement, the resulting data set contains only the desired IBM ticker.

```
libname lib8 sasefame "%sysget(FAME_DATA) "
      convert=(frequency=business technique=constant)
      crosslist=(
        { IBM, SPALN, SUNW, XOM },
        { adjust, close, high, low, open, volume,
          uclose, uhigh, ulow, uopen, uvolume }
      );

data trout;
  /* eleven companies, keep only the IBM ticker this time */
  set lib8.training;
  where date between '01mar02'd and '20mar02'd;
  keep IBM: ;
run;

title1 'TRAINING DB, Pricing Timeseries for IBM Ticker in CROSSLIST=';
proc contents
  data=trout;
run;

proc print
  data=trout;
run;
```

Output 40.8.1 and Output 40.8.2 show the results.

Output 40.8.1 Contents of the IBM Time Series in the Training Fame Data

Example 40.9: Selecting Time Series Using CROSSLIST= Option and Fame Namelist

This example demonstrates selection by using the CROSSLIST= option. Only the ticker “IBM” is specified in the KEEP statement from the 11 companies in the Fame ticker namelist.

```
libname lib9 sasefame "%sysget(FAME_DATA)"
  convert=(frequency=business technique=constant)
  range='07jul1997'd - '25jul1997'd
  crosslist=( nl(ticker),
    { adjust, close, high, low, open, volume,
      uclose, uhigh, ulow, uopen, uvolume }
  );
```

```
data crout;
  /* eleven companies in the FAME ticker namelist */
  set lib9.training;
  keep IBM: ;
run;

title1 'TRAINING DB, Pricing Timeseries for Eleven Tickers in CROSSLIST=';
title2 'Using TICKER namelist.';
proc print data=crout;
run;

proc contents data=crout;
run;
```

Output 40.9.1 and Output 40.9.2 show the results.

Output 40.9.1 Listing of OUT=CROUT Using CROSSLIST= Option in the Training Fame Data

TRAINING DB, Pricing Timeseries for Eleven Tickers in CROSSLIST= Using TICKER namelist.

Example 40.10: Selecting Time Series Using CROSSLIST= Option and WHERE=TICK

Instead of having a Fame namelist with the ticker symbols for companies whose data you are interested in, you can designate an input SAS data set (INSETA) that specifies the tickers to select. Specify your selection by using the WHERE clause in the INSET= option as shown in the following example:

```
data inseta;
  length tick $5;
  /* need $5 so SPALN is not truncated */

  tick='AOL';    output;
  tick='C';      output;
  tick='CPQ';    output;
  tick='CVX';    output;
  tick='F';      output;
  tick='GM';     output;
  tick='HWP';    output;
  tick='IBM';    output;
  tick='SPALN';  output;
  tick='SUNW';   output;
  tick='XOM';    output;
run;

libname lib10 sasefame "%sysget(FAME_DATA)"
  convert=(frequency=business technique=constant)
  range='07jul1997'd - '25jul1997'd
  inset=( inseta where=tick )
  crosslist=
    ( {adjust, close, high, low, open, volume,
      uclose, uhigh, ulow, uopen, uvolume} );
```

```

data trout;
  /* eleven companies with unique TICKs specified in INSETA */
  set lib10.training;
  keep IBM: ;
run;

title1 'TRAINING DB, Pricing Timeseries for Eleven Tickers in CROSSLIST=';
title2 'Using INSET with WHERE=TICK.';
proc print data=trout;
run;

proc contents data=trout;
run;

```

Example 40.11: Selecting Boolean Case Series with the FAMEOUT= Option

This example shows how to extract all Boolean case series from the ALLTYPES Fame data base. The following statements write all Boolean case series to the BOOOOUT SAS data set.

```

title1 '***famallt: FAMEOUT Option, Different Type Values***';
options validvarname=any;

%let FAME=%sysget(FAME);
%put (&FAME);
%let FAMETEMP=%sysget(FAME_TEMP);
%put (&FAMETEMP);

libname lib4 sasefame "%sysget(FAME_DATA) "
    fameout=boolcase wildcard="?" ;

data booout;
    set lib4.alltypes;
run;

title1 'ALLTYPES FAMEOUT=BOOLCASE for Boolean Case Series';
title2 'Using FAMEOUT=CASE BOOLEAN Option without Range';
proc contents
    data=booout;
run;

proc print
    data=booout;
run;

```

Output 40.11.1 and Output 40.11.2 show the results for the Boolean case.

Example 40.12: Selecting Numeric Case Series with the FAMEOUT= Option

This example extracts numeric case series. In addition to the already existing numeric case series in the Fame database, you can also have formulas that expand out to numeric case series. SASEFAME resolves all formulas that belong to the class and type of series data object that you specify in your FAMEOUT= option.

The following statements write all numeric case series to your SAS data set.

```
libname lib5 sasefame "%sysget(FAME_DATA) "
    fameout=case wildcard="?" ;

data csout;
    set lib5.alltypes;
run;

title1 'Using FAMEOUT=CASE Option without Range';
title2 'ALLTYPES, FAMEOUT=CASE and Open Wildcard for Numeric Case Series';
proc contents
    data=csout;
run;

proc print
    data=csout;
run;
```

Output 40.12.1 and Output 40.12.2 show the results.

If you want all series of every type, you can merge the resulting data sets together. For more information about merging SAS data sets, see *SAS Language Reference: Concepts*.

Example 40.16: Reading Time Series by Defining Fame Expression Groups in the INSET= Option with the KEEP= Clause

To keep all the numeric time series that are listed in the expressions given in the input data set, INSETA, use the INSET=(*setname* KEEPLIST=*fame_expression_group*) and the WILDCARD="?" options. The following statements show how to select time series that are specified in a KEEP expression group and are written to the SAS output data set.

```

data inseta; /* Use this for d8690 training data base */
  length express $52;
  express='cvx.close'; output;
  express='{ibm.high,ibm.low,ibm.close}'; output;
  express='mave(ibm.close,30)'; output;

```

```

    express='crosslist({gm,f,c},{volume});'; output;
    express='cvx.close+ibm.close;'; output;
    express='ibm.close;'; output;
    express='sum(pep.volume);'; output;
    express='mave(pep.close,20);'; output;
run;

title1 'TRAINING DB, Pricing Timeseries for Expressions in INSET=';
proc print
    data=inseta;
run;

```

Output 40.16.1 shows the expressions that are stored as observations in INSETA.

Output 40.16.1 Listing of INSETA Defining Fame Expression Group

TRAINING DB, Pricing Timeseries for Expressions in INSET=	
Obs	express
1	cvx.close;
2	{ibm.high,ibm.low,ibm.close};

Example 40.17: Optimizing Cache Sizes with the TUNEFAME= and TUNECHLI= Options

The following statements show how to use the TUNEFAME= option, the TUNECHLI= option, and a RANGE= option for selecting pricing time series in the TRAJTEN database. The selected time series are written to the SAS output data set. The Fame database engine's virtual memory is given in megabytes (MB), so this example sets the cache size to 100 MB. The Fame CHLI engine's virtual memory is also given in megabytes (MB), so this example sets the CHLI cache size to 100 MB. These two settings correspond to the default settings. Both the Fame 4GL engine and the Fame CHLI engine can use a cache size ranging from 0.1 MB to 17,592,186,000 MB.

```
libname lib5 sasefame "%sysget(FAME_DATA) "
wildcard="?UHIGH"
```

```

tunefame=nodes 100

Overview: SASEHAVR Interface Engine

The SASEHAVR interface engine is a seamless interface between Haver and SAS data processing that enables SAS users to read economic and financial time series data that reside in a Haver Analytics DLX (Data Link Express) database. The Haver Analytics DLX economic and financial database offerings include U.S. economic indicators, specialized databases, financial indicators, industry, industrial countries, emerging markets, international organizations, forecasts and as-reported data, and U.S. regional service. For more details, see “[Data Elements Reference: Haver Analytics DLX Database Profile](#)” on page 2782.

The SASEHAVR engine uses the LIBNAME statement to enable you to specify how you want to subset your Haver data and how you want to aggregate the selected time series to the same frequency. You can then use the SAS DATA step to perform further subsetting and to store the resulting time series in a SAS data set. You can perform more analysis (if desired) either in the same SAS session or in another session at a later time.

SASEHAVR for SAS 9.3 supports both 32-bit and 64-bit Windows hosts.

Getting Started: SASEHAVR Interface Engine

Structure of a SAS Data Set That Contains Time Series Data

SAS represents time series data in a two-dimensional array called a SAS data set whose columns correspond to series variables and whose rows correspond to measurements of these variables at certain time periods. The time periods at which observations are recorded can be included in the data set as a time ID variable. The SASEHAVR engine provides a time ID variable called DATE. The DATE variable can be represented in any of the time intervals shown in the section “[Mapping Haver Frequencies to SAS Time Intervals](#)” on page 2777.

Reading and Converting Haver DLX Time Series

The SASEHAVR engine supports reading and converting all selected time series that reside in Haver DLX databases. The SASEHAVR engine enables you to limit the range of data with the START= and END= options in the LIBNAME statement. Start dates and end dates are recommended to help save resources when processing large databases or when processing a large number of observations.

The SASEHAVR engine enables you to convert or aggregate all selected time series to a desired frequency. By default, SASEHAVR selects the time series variables that match the frequency of the first selected variable. To select variables of one specific frequency, use the FREQ= option. If no selection criteria are specified, the first selected variable is the first physical DLX record read from the Haver database. To force

aggregation of all selected variables to the frequency specified by the FREQ= option, use the FORCE=FREQ option. The AGGMODE= option enables you to specify a STRICT or RELAXED aggregation method. AGGMODE=RELAXED is the default setting. Aggregation is supported only from a more frequent time interval to a less frequent time interval, such as from weekly to monthly. If a conversion to a more frequent frequency is attempted, all missing values are returned by the Haver DLX API (application programming interface). See the section “[Aggregating to Quarterly Frequency Using the FORCE=FREQ Option](#)” on page 2781. The FORCE= option is ignored if the FREQ= option is not specified.

Using the SAS DATA Step

If desired, you can store your selected time series in a SAS data set by using the SAS DATA step. You can further subset your data by using the WHERE, KEEP, or DROP statements in your DATA step.

For more efficient subsetting of time series by Haver variables, by Haver groups, by Haver sources, by Haver short sources, by Haver long sources, or by Haver geographic codes, you can use the corresponding KEEP=, GROUP=, SOURCE=, SHORTSOURCE=, LONGSOURCE=, GEOGCODE1=, or GEOGCODE2= option in the LIBNAME *libref* SASEHAVR statement. To see the available Haver selection key values including geographic codes, short sources, and long sources for your database, use the OUTSELECT=ON option. From the OUTSELECT output, you can use convenient wildcard symbols to create the selection list for your next LIBNAME *libref* SASEHAVR statement.

There are three wildcard symbols: ‘*’, ‘?’ and ‘#’. The ‘*’ wildcard corresponds to any character string and includes any string pattern that corresponds to that position in the matching variable name. The ‘?’ stands for any single alphanumeric character. Lastly, the ‘#’ wildcard corresponds to a single numeric character.

You can also deselect time series by Haver variables, by Haver groups, by Haver sources, by Haver short sources, by Haver long sources, or by Haver geographic codes, by using the corresponding DROP=, DROPGROUP=, DROPSOURCE=, DROPSHORT=, DROPLONG=, DROPGEOG1=, or DROPGEOG2= option. These options also support wildcards.

After your selected data is stored in a SAS data set, you can use it as you would any other SAS data set.

Using the SAS Windowing Environment

You can see the available data sets in the SAS LIBNAME window of the SAS windowing environment by selecting the SASEHAVR *libref* in the LIBNAME window that you have previously defined in your LIBNAME statement. You can view your SAS output observations by double-clicking on the desired output data set *libref* in the LIBNAME window of the SAS windowing environment. You can type **Viewtable** on the SAS command line to view your SASEHAVR tables, views, or librefs.

Before you use **Viewtable**, it is recommended that you store your output data sets in a physical folder or library that is separate from the folder or library used for your input databases. (The default location for output data sets is the SAS Work library.) If you do not follow this guideline, you will receive the following error message for each input database that does not have the selected options in the SASEHAVR *libref* that you double-clicked:

ERROR: No variable selected with current options.

Syntax: SASEHAVR Interface Engine

The SASEHAVR engine uses standard engine syntax. Table 41.1 summarizes the options used in the LIBNAME *libref* SASEHAVR statement.

Table 41.1 Summary of LIBNAME *libref* SASEHAVR Statement Options

Option	Description
FREQUENCY=	Specifies the Haver frequency
START=	Specifies a Haver start date to limit the selection of time series to those that begin with the specified date
END=	Specifies a Haver end date to limit the selection of time series to those that end with the specified date
KEEP=	Specifies a list of comma-delimited Haver variables to keep in the output SAS data set
DROP=	Specifies a list of comma-delimited Haver variables to drop from the output SAS data set
GROUP=	Specifies a list of comma-delimited Haver groups to keep in the output SAS data set
DROPGROUP=	Specifies a list of comma-delimited Haver groups to drop from the output SAS data set
SOURCE=	Specifies a list of comma-delimited Haver sources to keep in the output SAS data set
DROPSOURCE=	Specifies a list of comma-delimited Haver sources to drop from the output SAS data set
SHORT=	Specifies a list of comma-delimited Haver short sources to keep in the output SAS data set
DROPSHORT=	Specifies a list of comma-delimited Haver short sources to drop from the output SAS data set
LONG=	Specifies a list of comma-delimited Haver long sources to keep in the output SAS data set
DROPLONG=	Specifies a list of comma-delimited Haver long sources to drop from the output SAS data set
GEOG1=	Specifies a list of comma-delimited Haver geography1 codes to keep in the output SAS data set
DROPGEOG1=	Specifies a list of comma-delimited Haver geography1 codes to drop from the output SAS data set
GEOG2=	Specifies a list of comma-delimited Haver geography2 codes to keep in the output SAS data set
DROPGEOG2=	Specifies a list of comma-delimited Haver geography2 codes to drop from the output SAS data set
OUTSELECT=	Specifies what values the output data is to contain

Table 41.1 *continued*

Option	Description
FORCE=FREQ	Specifies that all selected time series variables be aggregated to the frequency specified in the FREQ= option
AGGMODE=	Specifies the aggregation method used for aggregating time series (STRICT or RELAXED)

LIBNAME libref SASEHAVR Statement

LIBNAME libref sasehavr *‘physical name’ options* ;

The *‘physical name’* specifies the location of the folder where your Haver DLX database resides.

You can use the following options in the LIBNAME libref SASEHAVR statement:

FREQ=*haver_frequency*

FREQUENCY=*haver_frequency*

INTERVAL=*haver_frequency*

specifies the Haver frequency. All Haver frequencies are supported by the SASEHAVR engine. Accepted frequency values are annual, year, yearly, quarter, quarterly, qtr, monthly, month, mon, week.1, week.2, week.3, week.4, week.5, week.6, week.7, weekly, week, daily, and day.

START=*start_date*

STARTDATE=*start_date*

STDATE=*start_date*

BEGIN=*start_date*

specifies the start date for the time series in the form YYYYMMDD.

END=*end_date*

ENDDATE=*end_date*

ENDATE=*end_date*

specifies the end date for the time series in the form YYYYMMDD.

KEEP=*“haver_variable_list”*

specifies the list of Haver variables to be included in the output SAS data set. This list is comma-delimited and must be surrounded by quotes “”.

DROP=*“haver_variable_list”*

specifies the list of Haver variables to be excluded from the output SAS data set. This list is comma-delimited and must be surrounded by quotes “”.

GROUP=*“haver_group_list”*

KEEPGROUP=*“haver_group_list”*

specifies the list of Haver groups to be included in the output SAS data set. This list is comma-delimited and must be surrounded by quotes “”.

DROPGROUP=*“haver_group_list”*

specifies the list of Haver groups to be excluded from the output SAS data set. This list is comma-delimited and must be surrounded by quotes *“”*.

SOURCE=*“haver_source_list”***KEEPSOURCE=***“haver_source_list”*

specifies the list of Haver sources to be included in the output SAS data set. This list is comma-delimited and must be surrounded by quotes *“”*.

DROPSOURCE=*“haver_source_list”*

specifies the list of Haver sources to be excluded from the output SAS data set. This list is comma-delimited and must be surrounded by quotes *“”*.

SHORT=*“haver_shortsource_list”***KEEPSHORT=***“haver_shortsource_list”***SHORTSOURCE=***“haver_shortsource_list”*

specifies the list of Haver short sources to be included in the output SAS data set. This list is comma-delimited and must be surrounded by quotes *“”*.

DROPSHORT=*“haver_shortsource_list”***DROPSHORTSOURCE=***“haver_shortsource_list”*

specifies the list of Haver short sources to be excluded from the output SAS data set. This list is comma-delimited and must be surrounded by quotes *“”*.

LONG=*“haver_longsource_list”***KEEPLONG=***“haver_longsource_list”***LONGSOURCE=***“haver_longsource_list”*

specifies the list of Haver long sources to be included in the output SAS data set. This list is comma-delimited and must be surrounded by quotes *“”*.

DROPLONG=*“haver_longsource_list”***DROPLONGSOURCE=***“haver_longsource_list”*

specifies the list of Haver long sources to be excluded from the output SAS data set. This list is comma-delimited and must be surrounded by quotes *“”*.

GEOG1=*“haver_geographycode1_list”***KEEPGEOG1=***“haver_geographycode1_list”***GEOGCODE1=***“haver_geographycode1_list”*

specifies the list of Haver geography1 codes to be included in the output SAS data set. This list is comma-delimited and must be surrounded by quotes *“”*.

DROPGEOG1=*“haver_geographycode1_list”***DROPGEOGCODE1=***“haver_geographycode1_list”*

specifies the list of Haver geography1 codes to be excluded from the output SAS data set. This list is comma-delimited and must be surrounded by quotes *“”*.

GEOG2=*“haver_geographycode2_list”***KEEPGEOG2=***“haver_geographycode2_list”*

GEOGCODE2=*“haver_geographycode2_list”*

specifies the list of Haver geography2 codes to be included in the output SAS data set. This list is comma-delimited and must be surrounded by quotes “”.

DROPGEOG2=*“haver_geographycode2_list”***DROPGEOGCODE2=***“haver_geographycode2_list”*

specifies the list of Haver geography2 codes to be excluded from the output SAS data set. This list is comma-delimited and must be surrounded by quotes “”.

OUTSELECT=ON | OFF

specifies what the output data set shows. OUTSELECT=ON specifies that the output data set show values of selection keys (such as geography codes, groups, sources, short sources, and long sources) for each selected variable name (time series) in the database. OUTSELECT=OFF specifies that the output data set show the observations in the range for all selected time series. The default is OUTSELECT=OFF.

AGGMODE=STRICT | RELAXED

specifies whether the SASEHAVR engine uses a strict or relaxed aggregation method when converting time series from a higher to lower frequency.

A strict aggregation method returns a missing value whenever there is a missing observation in a time period. For instance, if a monthly time series has a missing value for the month of February, 2005, then attempting to aggregate to a quarterly frequency results in a missing value for the first quarter of 2005. The SAS log reports the status of this option.

When a relaxed aggregation method is used, some observations can be missing, but the relaxed method returns an aggregated value calculated from the nonmissing data points according to the series aggregation type (average, sum, or end of period). Average type only needs one valid (nonmissing) data point to calculate the average. Sum type needs all the data points to be available in order to sum the values. End of period type calculates the end of period value if there is at least one valid (nonmissing) data point in the aggregated span. It returns the last available valid data point in the aggregated span. The default is AGGMODE=RELAXED.

FORCE=FREQ

specifies that the selected variables be aggregated to the frequency in the FREQ= option. Aggregation is supported only from a more frequent time interval to a less frequent time interval, such as from weekly to monthly. See the section [“Aggregating to Quarterly Frequency Using the FORCE=FREQ Option”](#) on page 2781 for sample output and suggested error recovery from attempting a conversion that yields missing values when a higher frequency conversion is specified. This option is ignored if the FREQ= option is not set. For a more complete discussion of Haver frequencies and SAS time intervals, see the section [“Mapping Haver Frequencies to SAS Time Intervals”](#) on page 2777.

Following is an example of the LIBNAME *libref* SASEHAVR statement:

```
LIBNAME libref sasehavr 'physical-name'
      FREQ=MONTHLY;
```

By default, the SASEHAVR engine reads all time series in the Haver database that you reference by *libref*. The *start_date* is specified in the form YYYYMMDD. The start date is used to delimit the data to a specified start date.

For example, to read the time series in the TEST library starting on July 4, 1996, specify the following statement:

```
LIBNAME test sasehavr 'physical-name'
      STARTDATE=19960704;
```

When you use the START= option, you limit the range of observations that are read from the time series and that are converted to the desired frequency. Start dates can help save resources when processing large databases or when processing a large number of observations. It is also possible to select specific variables to be included or excluded from the SAS data set by using the KEEP= or the DROP= option, respectively.

```
LIBNAME test sasehavr 'physical-name'
      KEEP="ABC*, XYZ??";
```

```
LIBNAME test sasehavr 'physical-name'
      DROP="*SC*, #T#";
```

When the KEEP= or the DROP= option is used, the resulting SAS data set keeps or drops the variables that you select in that option. Three wildcards are available: '*', '?' and '#'. The '*' wildcard corresponds to any character string and includes any string pattern that corresponds to that position in the matching variable name. The '?' means that any single alphanumeric character is valid. The '#' wildcard corresponds to a single numeric character. You can also select time series in your data by using the GROUP=, SOURCE=, SHORT=, LONG=, GEOG1=, or the GEOG2= option to select on group name, source name, short source name, long source name, geography1 code, or the geography2 code, respectively. Alternatively, you can de-select time series by using the DROPGROUP=, DROPSOURCE=, DROPSHORT=, DROPLONG=, DROPGEOG1=, or the DROPGEOG2= option, respectively.

Following are examples that perform variable selection (or deselection) based on groups or sources:

```
LIBNAME test sasehavr 'physical-name'
      GROUP="CBA, *ZYX";
```

```
LIBNAME test sasehavr 'physical-name'
      DROPGROUP="TKN*, XCZ?";
```

```
LIBNAME test sasehavr 'physical-name'
      SOURCE="FRB";
```

```
LIBNAME test sasehavr 'physical-name'
      DROPSOURCE="NYSE";
```

SASEHAVR selects only the variables that are of the specified frequency in the FREQ= option. If this option is not specified, SASEHAVR selects the variables that match the frequency of the first selected variable. If no other selection criteria are specified, by default the first selected variable is the first physical DLX record read from the Haver database. You can specify the FORCE=FREQ option to force the aggregation

of all variables selected to be of the frequency specified in the `FREQ=` option. Aggregation is supported only from a more frequent time interval to a less frequent time interval, such as from weekly to monthly. See the section “[Aggregating to Quarterly Frequency Using the `FORCE=FREQ` Option](#)” on page 2781 for suggested recovery from using a frequency that does not aggregate the data appropriately. The `FORCE=` option is ignored if the `FREQ=` option is not specified. The `AGGMODE= STRICT` option is used when a strict aggregation method is desired. The default value for `AGGMODE` is `RELAXED`, the same method that was used in prior releases of SASEHAVR.

Details: SASEHAVR Interface Engine

SAS Output Data Set

You can use the SAS `DATA` step to write the Haver converted series to a SAS data set so that you can easily analyze the data using the SAS System. You can specify the name of the output data set in the `DATA` statement. This causes the engine supervisor to create a SAS data set with the specified name in either the SAS Work library, or if specified, the `Sasuser` library.

When `OUTSELECT=OFF` (the default), the contents of the SAS data set include the date of each observation, the name of each series read from the Haver database, and the label or Haver description of each series. Missing values are represented as ‘.’ in the SAS data set. You can use the `PRINT` procedure and the `CONTENTS` procedure to print your output data set and its contents. You can use the `SQL` procedure along with the SASEHAVR engine to create a view of your SAS data set.

The `DATE` variable in the SAS data set contains the date of the observation. The SASEHAVR engine automatically maps the Haver intervals to the appropriate corresponding SAS intervals.

When `OUTSELECT=ON`, the `OUT=` data set does not contain the observations of all time series. Instead, each observation contains the name of the time series, the source of the time series, the geography1 code, the geography2 code, the short source, and the long source for that time series. In addition, the contents of the `OUT=` data set shows every selected time series name and label. See [Output 41.11.1](#) and [Output 41.11.2](#) for more details about the `OUTSELECT=ON` option.

A more detailed discussion of how to map Haver frequencies to SAS time intervals follows.

Mapping Haver Frequencies to SAS Time Intervals

Table 41.2 summarizes the mapping of Haver frequencies to SAS time intervals. For more information, see Chapter 4, “[Date Intervals, Formats, and Functions](#).”

Table 41.2 Mapping Haver Frequencies to SAS Time Intervals

Haver Frequency	SAS Time Interval	FREQ=
ANNUAL	YEAR	YEARLY
QUARTERLY	QTR	QTRLY
MONTHLY	MONTH	MON
WEEKLY (SUNDAY)	WEEK.1	WEEK.1
WEEKLY (MONDAY)	WEEK.2	WEEK.2
WEEKLY (TUESDAY)	WEEK.3	WEEK.3
WEEKLY (WEDNESDAY)	WEEK.4	WEEK.4
WEEKLY (THURSDAY)	WEEK.5	WEEK.5
WEEKLY (FRIDAY)	WEEK.6	WEEK.6
WEEKLY (SATURDAY)	WEEK.7	WEEK.7
WEEKLY WEEK.1-WEEK.7	WEEKLY	WEEKLY
DAILY	WEEKDAY17W	DAY

Error Recovery for SASEHAVR

Common errors are easy to avoid by noting the valid dates that are specified in the warning messages in your SAS log. Often you can get rid of errors by removing the date restriction (START= and END= options), by removing the FORCE=FREQ option, or by deleting the FREQ= option so that the frequency defaults to the original frequency rather than attempting a conversion.

Following are some common error scenarios and how to handle them.

Using the Optimum Range for Best Output Results

Suppose you see the following warnings in your SAS log:

```
libname kgs2 sasehavr "%sysget(HAVER_DATA)"
      start= 19550101 end=19600105
      keep="FCSEED, FCSEEI, FCSEEM, BGSX, BGSM, FXDUSBC"
      group="I01, F56, M02, R30"
      source="JPM,CEN,OMB" ;
```

NOTE: Libref KGS2 was successfully assigned as follows:

```
Engine:          SASEHAVR
Physical Name: C:\haver
```

```
data kgse9;
```

```
  set kgs2.haver;
```

NOTE: Defaulting to MONTHLY frequency.

WARNING: Start date (19550101) is not a valid date.

Engine is ignoring your start date and using

default. Setting the default Haver start date to 7001.

WARNING: End date (19600105) is not a valid date.

```

Engine is ignoring your end date and using
default. Setting the default Haver end date to 10103.
run;

```

NOTE: There were 375 observations read from the data set KGS2.HAVER.

NOTE: The data set WORK.KGSE9 has 375 observations and 4 variables.

The important diagnostic to note here is the warning message that tells you that the data starts in January of 1970 (Haver date 7001), and ends in March, 2001 (Haver date 10103). Since the specified range falls outside the range of data, no observations are in range. So, the engine uses the default range stated in the warning messages. Change the START= and END= options to overlap the results in data that span from JAN1970 to MAR2001. To view the entire range of selected data, remove the START= and END= options from the LIBNAME statement:

```

libname kgs sasehavr "%sysget(HAVER_DATA)"
    keep="FCSEED, FCSEEI, FCSEEM, BGSX, BGSM, FXDUSBC"
    group="I01, F56, M02, R30"
    source="JPM,CEN,OMB" ;

```

NOTE: Libref KGS was successfully assigned as follows:

Engine: SASEHAVR

Physical Name: C:\haver

```

data kgse5;
    set kgs.haver;
NOTE: Defaulting to MONTHLY frequency.
run;

```

NOTE: There were 375 observations read from the data set KGS.HAVER.

NOTE: The data set WORK.KGSE5 has 375 observations and 4 variables.

Using a Valid Range of Data with START= and END= Options

In this example, an error about an invalid range is issued:

```

libname lib1 sasehavr "%sysget(HAVER_DATA)" freq=Weekly
    start=20060301 end=20060531;
NOTE: Libref LIB1 was successfully assigned as follows:
    Engine: SASEHAVR
    Physical Name: C:\haver
libname lib2 "\\dntsrc\usrtmp\saskff" ;
NOTE: Libref LIB2 was successfully assigned as follows:
    Engine: V9
    Physical Name: \\dntsrc\usrtmp\saskff
data lib2.wweek;
    set lib1.intwkly;
ERROR: No observations found inside RANGE.
    The valid range for HAVER dates is (610104-1050318).
ERROR: No observations found in specified range.
    keep date m11: ;

```

```
run;
```

```
WARNING: The variable date in the DROP, KEEP, or RENAME list
has never been referenced.
WARNING: The variable m11: in the DROP, KEEP, or RENAME list
has never been referenced.
NOTE: The SAS System stopped processing this step because of errors.
WARNING: The data set LIB2.WWEEK may be incomplete.
When this step was stopped there were 0
observations and 0 variables.
WARNING: Data set LIB2.WWEEK was not replaced because this step was stopped.
```

The important diagnostic message is the first error statement which tells you that the range of Haver dates is not valid for the specified frequency. A valid range is one that overlaps the dates (610104–1050318). Removing the range altogether causes the engine to output the entire range of data.

```
libname lib1 sasehavr "%sysget(HAVER_DATA)" freq=Weekly;
```

```
NOTE: Libref LIB1 was successfully assigned as follows:
Engine:          SASEHAVR
Physical Name: C:\haver
```

```
libname lib2 "\\dntsrc\usrtmp\saskff" ;
```

```
NOTE: Libref LIB2 was successfully assigned as follows:
Engine:          V9
Physical Name: \\dntsrc\usrtmp\saskff
```

```
data lib2.wweek;
  set lib1.intwkly;
  keep date m11: ;
run;
```

```
NOTE: There were 2307 observations read from the data set LIB1.INTWKLY.
NOTE: The data set LIB2.WWEEK has 2307 observations and 35 variables.
```

Since the START= and END= options give day-based dates, it is important to use dates that correspond to the FREQ= option when giving a range of dates, especially with weekly frequencies such as WEEK.1–WEEK.7. Since FREQ=WEEK.4 selects weeks that begin on Wednesday, the start and end dates need to be specified as Wednesday dates.

```
libname lib1 sasehavr "%sysget(HAVER_DATA)" freq=Week.4
start=20050302 end=20050309;
```

```
NOTE: Libref LIB1 was successfully assigned as follows:
Engine:          SASEHAVR
Physical Name: \\tappan\crsp1\haver
```

```
title2 'Weekly dataset with freq=week.4 range is small';
```

```
libname lib2 "\\dntsrc\usrtmp\saskff" ;
```

```
NOTE: Libref LIB2 was successfully assigned as follows:
Engine:          V9
Physical Name: \\dntsrc\usrtmp\saskff
```

```
data lib2.wweek;
    set lib1.intwkly;
    keep date m11: ;
run;
```

NOTE: There were 2 observations read from the data set LIB1.INTWKLY.

NOTE: The data set LIB2.WWEEK has 2 observations and 25 variables.

Giving bad dates (for example, Tuesday dates) for a Wednesday `FREQ=WEEK.4` results in the following error:

```
ERROR: Fatal error in GetDate routine.
        Remove the range statement or change the START= date to
        be consistent with the freq=option.
ERROR: No observations found in specified range.
```

Aggregating to Quarterly Frequency Using the `FORCE=FREQ` Option

In the next example, six time series are selected by the `KEEP=` option. Their frequencies are annual, monthly, and quarterly, so when the `FREQ=WEEKLY` and `FORCE=FREQ` options are used, a diagnostic appears in the log stating that the engine is forcing the frequency to `QUARTERLY` for better date alignment of observations. The first selected variable is `BALO`, which is a quarterly time series and causes the default choice of `FREQ` to be quarterly.

```
title1 '***HAVKWC.SAS: KEEP= option tests with wildcards***';

%setup( ets );

/*-----*/
/* Wildcard: * */
/*-----*/

title2 "keep=B*, G*, I*";
title3 "6 valid variables are: BALO BGSM BGSX BPBCA G IUM";
libname lib1 sasehavr 'C:\haver\' keep="B*, G*, I*"
    freq=weekly force=freq;
NOTE: Libref LIB1 was successfully assigned as follows:
      Engine:          SASEHAVR
      Physical Name: C:\haver\

data wc;
    set lib1.haver;
WARNING: Earliest Start Date in DLX Database matches QUARTERLY frequency
        better than the specified WEEKLY frequency.
        Engine is forcing the frequency to QUARTERLY for better date
        alignment of observations.

run;

NOTE: There were 221 observations read from the data set LIB1.HAVER.
NOTE: The data set WORK.WC has 221 observations and 7 variables.
```

Note that the time series IUM is an annual frequency. The attempt to convert to a quarterly frequency produces all missing values in the output range because aggregation produces only missing values when forced to go from a lower frequency to a higher frequency.

Data Elements Reference: Haver Analytics DLX Database Profile

The Haver DLX economic and financial database offerings include U.S. economic indicators, specialized databases, financial indicators, industry, industrial countries, emerging markets, international organizations, forecasts and as-reported data, and U.S. regional service. Table 41.3 is a list of available databases and the corresponding description of each.

Table 41.3 Available Data Offerings

Database Name	Offering Type	Description
USECON	U.S. economic indicators	U.S. economic, financial data
USNA	U.S. economic indicators	Complete U.S. NIPA accounts from the Bureau of Economic Analysis (BEA)
SURVEYS	U.S. economic indicators	Business and consumer expectations, surveys
SURVEYW	U.S. economic indicators	Business and consumer expectations, weekly surveys
CPIDATA	U.S. economic indicators	Consumer price indexes (CPI), monthly in CPI detailed report
PPI	U.S. economic indicators	Producer price indexes (PPI), by the Bureau of Labor Statistics (BLS)
PPIR	U.S. economic indicators	Producer price indexes by BLS
LABOR	U.S. economic indicators	Employment and earnings by BLS
EMPL	U.S. economic indicators	Household employment survey, monthly by BLS
CEW	U.S. economic indicators	Covered employment and wages, monthly, quarterly
IP	U.S. economic indicators	Industrial production and capacity utilization by Federal Reserve Board (FRB)
FFUNDS	U.S. economic indicators	Flow of funds data by FRB
CAPSTOCK	U.S. economic indicators	Capital stock by the Bureau of Economic Analysis (BEA)
USINT	U.S. economic indicators	U.S. international trade (TIC) data by country and product
CBDB	Specialized databases	Conference Board database, monthly by The Conference Board (TCB)

Table 41.3 *continued*

Database Name	Offering Type		Description
BCI	Specialized databases		U.S. business cycle indicators, by TCB
UMSCA	Specialized databases		Consumer Sentiment Survey from the University of Michigan
FIBERUS	Specialized databases		U.S. FIBER business cycle indicators from the Foundation of International Business and Economic Research (FIBER)
FIBER	Specialized databases		FIBER business cycle indicators from FIBER
DAILY	Financial indicators	indicators	U.S. daily statistics data
INTDAILY	Financial indicators	indicators	Country daily statistics
WEEKLY	Financial indicators	indicators	U.S. weekly statistics
INTWKLY	Financial indicators	indicators	Country weekly statistics
SPD	Financial indicators	indicators	Standard and Poor's industry groups, daily
SPW	Financial indicators	indicators	Standard and Poor's industry groups, weekly
SPM	Financial indicators	indicators	Standard and Poor's industry groups, monthly
SPAH	Financial indicators	indicators	Standard and Poor's Analysts' Handbook, yearly
MSCID	Financial indicators	indicators	Morgan Stanley Capital International, daily
MSCIW	Financial indicators	indicators	Morgan Stanley Capital International, weekly
MSCIM	Financial indicators	indicators	Morgan Stanley Capital International, monthly
EMBI	Financial indicators	indicators	Emerging Markets Bond Index from J.P. Morgan
BONDINDX	Financial indicators	indicators	U.S. bond indexes, from Barclays Capital, Citigroup, Merrill Lynch, and Standard and Poors
BONDS	Financial indicators	indicators	Citigroup bond performance indexes by Citigroup Global Markets, formerly Salomon Smith Barney
ICI	Financial indicators	indicators	Mutual fund activity from the Investment Company Institute
QFR	Financial indicators	indicators	Quarterly financial report by FRB
MBAMTG	Financial indicators	indicators	Mortgage delinquency rates by the Mortgage Bankers Association

Table 41.3 *continued*

Database Name	Offering Type		Description
MBAMOS	Financial	indicators	Mortgage origination surveys, from two Mortgage Banker Association surveys
MARKIT	Financial	indicators	Markit's indexes used to price credit default swaps
DLINQ	Financial	indicators	Consumer delinquency rates by American Bankers Association, monthly
FDIC	Financial	indicators	FDIC banking statistics TIC data from the Quarterly Banking Profile
GOVFIN	Financial	indicators	U.S. government financial statistics by U.S. Treasury
INDUSTRY	Industry		U.S. industry statistics, from Department of Agriculture, trade associations
WARDS	Industry		Automotive statistics, from Ward's Automotive Group
USDA	Industry		World agriculture statistics, from U.S. Department of Agriculture (USDA)
REALTOR	Industry		Home sales from National Association of Realtors
CREALTOR	Industry		Home sales from National Association of Realtors
PREALTOR	Industry		Pending home sales from National Association of Realtors
EEI	Industry		U.S. electric output from the Edison Electric Institute, weekly
ASM	Industry		Annual Survey of Manufactures from the U.S. Census Bureau
RAILSHAR	Industry		Railcar loadings from Association of American Railroads and Atlantic Systems
CHEMWEEK	Industry		Weekly chemical prices from Access Intelligence
BALTIC	Industry		Baltic freight indexes, from the Baltic Exchange in London
OGJ	Industry		U.S. and international energy statistics, from Penwell Publishing's Oil & Gas Journal
OGJANN	Industry		U.S. and international energy statistics, from Penwell Publishing's Oil & Gas Journal, annual
OILWKLY	Industry		Weekly oil statistics, from Penwell Publishing's Oil & Gas Journal
OMI	Industry		Oil market intelligence, from Energy Intelligence
NGW	Industry		Natural Gas Week, from Energy Intelligence
WGI	Industry		World Gas Intelligence, from Energy Intelligence
G10+	Industrial	countries	International Macroeconomic Data by Haver Analytics
PMI	Industrial	countries	Purchasing Managers Indexes by Markit Economics

Table 41.3 *continued*

Database Name	Offering Type	Description
INTSRVYS	Industrial countries	Country surveys
JAPAN	Industrial countries	Japan from Nomura Research Institute
JAPANW	Industrial countries	Japan from Nomura Research Institute, weekly
CANSIM	Industrial countries	Canada from Statistics Canada and the Bank of Canada
CANSIMR	Industrial countries	Canada from Statistics Canada and the Bank of Canada
UK	Industrial countries	United Kingdom, from the Office of National Statistics and the Bank of England
UKSRVYS	Industrial countries	United Kingdom surveys, by NTC Economics, Ltd.
GERMANY	Industrial countries	Germany, from the Deutsche Bundesbank and Statistics Bundesamt
FRANCE	Industrial countries	France, Statistics from INSEE (France's National Statistical Office), the Bank of France, and the Ministry of France
ITALY	Industrial countries	Italy, from Istituto Nazionale di Statistica and Banca d'Italia
SPAIN	Industrial countries	Spain, from the Instituto Nacional de Estadística and the Banco de España
IRELAND	Industrial countries	Ireland, from the Central Statistics Office and Central Bank
NORDIC	Industrial countries	Norway, Sweden, Denmark, Finland
ALPMED	Industrial countries	Austria, Switzerland, Greece, Portugal
BENELUX	Industrial countries	Belgium, Netherlands, Luxembourg, monthly
ANZ	Industrial countries	Australia and New Zealand
EMERGELA	Emerging markets	Latin American macroeconomic data
EMERGECEW	Emerging markets	Central and Eastern Europe and Western Asia
EMERGEMA	Emerging markets	Middle East and African emerging markets
EMERGEPR	Emerging markets	Asia/Pacific Rim emerging markets
CHINA	Emerging markets	CEIC Premium China Database, from CEIC Data Company Ltd (CEIC)

Table 41.3 *continued*

Database Name	Offering Type	Description
INDIA	Emerging markets	CEIC Premium India Database, from CEIC
EUROSTAT	International organizations	European Union data from Eurostat, the European Central Bank, and the European Commission
EULABOR	International organizations	European Union regional labor from Eurostat
OECDMEI	International organizations	Organisation for Economic Cooperation and Development (OECD) main economic indicators
OECDNAQ	International organizations	OECD Quarterly National Accounts
OECDNA	International organizations	OECD Annual National Accounts
OECDFIN	International organizations	OECD Financial Accounts and Financial Balance Sheets
OECDFEI	International organizations	OECD foreign direct investment data
OUTLOOK	International organizations	OECD Economic Outlook
IFS	International organizations	International Financial Statistics from International Monetary Fund
IFSANN	International organizations	International Financial Statistics, annual from International Monetary Fund
IMFBOP	International organizations	Balance of Payment Statistics from International Monetary Fund
IMFBOPA	International organizations	Annual Balance of Payment Statistics from International Monetary Fund
IMFDOT	International organizations	Direction of Trade Statistics from International Monetary Fund
IMFDOTM	International organizations	Direction of Trade Statistics, monthly from International Monetary Fund
IMFWEO	International organizations	Analysis and projections of economic development at global level from International Monetary Fund
BIS	International organizations	International financial claims and liabilities from the Bank for International Settlements
WBPRICES	International organizations	World commodity prices from The World Development Prospects Group (Pinksheets)
WBDEBT	International organizations	Global development finance from The World Bank debt tables
UNPOP	International organizations	United Nations population projections
INTCOMP	International organizations	International comparisons from U.S. Bureau of Labor Statistics

Table 41.3 *continued*

Database Name	Offering Type	Description
MA4CAST	Forecasts and as-reported data	Short-term U.S. economic forecasts from Macro-economic Advisers
MA4CSTL	Forecasts and as-reported data	Long-term U.S. economic forecasts from Macro-economic Advisers
CQM	Forecasts and as-reported data	Canadian quarterly model from Centre for Spatial Economics
CPM	Forecasts and as-reported data	Canadian provincial model from Centre for Spatial Economics
OEFAQMACR	Forecasts and as-reported data	Global macroeconomic forecasts from Oxford Economic Forecasting

PERMITP	U.S. regional	Residential building permits
PERMITC	U.S. regional	Residential building permits
PERMITA	U.S. regional	Residential building permits
REGIONAL	U.S. regional	Selected regional indicators
REGIONW	U.S. regional	Selected regional indicators
PIQR	U.S. regional	Personal income
PIR	U.S. regional	Personal income
PIRMSA	U.S. regional	Personal income
PICOUNTY	U.S. regional	Personal income
PIRC1 to 9	U.S. regional	Personal income
MBAMTG	U.S. regional	Mortgage delinquency rates from Mortgage Bankers Association
DLINQR	U.S. regional	Consumer delinquency rates from American Bankers Association
FALOAN	U.S. regional	Real estate and construction delinquency rates by Foresight Analytics
BANKRUPT	U.S. regional	Bankruptcies by county and metropolitan statistical area

Table 41.3 *continued*

Database Name	Offering Type	Description
GSP	U.S. regional	Gross state product from BEA
GDPSA	U.S. regional	Gross domestic product by Metropolitan Statistical Areas (MSA)
USPOP	U.S. regional	Population by age and sex
USPOPC	U.S. regional	Population by age and sex
PORTS	U.S. regional	Trade by port
EXPRQ1 to 9	U.S. regional	Exports by industry and country from the World Institute for Strategic Economic Research and the U.S. Census Bureau
EXPORTSR	U.S. regional	Exports by industry and country from the World Institute for Strategic Economic Research and the U.S. Census Bureau
GOVFINR	U.S. regional	Government financial statistics from the U.S. Census Bureau and Rockefeller Institute of Government
FDICR	U.S. regional	FDIC banking statistics

Examples: SASEHAVR Interface Engine

Before running the following sample code, set your HAVR_DATA environment variable to point to the SAS/ETS SASMISC folder that contains sample Haver databases. The provided sample data files are HAVERD.DAT, HAVERD.IDX, HAVERW.IDX, and HAVERW.DAT. In the following example, the Haver database is called haverw and it resides in the directory lib1. The DATA statement names the SAS output data set hwouty, which will reside in the Work library.

Example 41.1: Examining the Contents of a Haver Database

To see which time series are in your Haver database, use the CONTENTS procedure with the SASEHAVR LIBNAME statement to read the contents.

```
libname lib1 sasehavr "%sysget(HAVR_DATA)"
    freq=yearly start=19920101
    end=20041231
    force=freq;

data hwouty;
    set lib1.haverw;
run;
title1 'Haver Analytics Database, HAVERW.DAT';
```

```

title2 'PROC CONTENTS for Time Series converted to yearly frequency';
proc contents data=hwouty;
run;

```

All time series in the Haver haverw database are listed alphabetically in [Output 41.1.1](#).

Output 41.1.1 Examining the Contents of Haver Analytics Database, haverw.dat

Haver Analytics Database, HAVERW.DAT				
PROC CONTENTS for Time Series converted to yearly frequency				
The CONTENTS Procedure				
Alphabetic List of Variables and Attributes				
#	Variable	Type	Len	Format Label
1	DATE	Num	8	YEAR4. Date of Observation
2	FA	Num	8	Total Assets: All Commercial Banks (SA, Bil.\$)
3	FCM1M	Num	8	1-Month Treasury Bill Market Bid Yield at Constant Maturity (%)
4	FM1	Num	8	Money Stock: M1 (SA, Bil.\$)
5	FTA1MA	Num	8	Treasury 4-Week Bill: Total Amount Accepted (Bil\$)
6	FTB3	Num	8	3-Month Treasury Bills, Auction (% p.a.)
7	LICN	Num	8	Unemployment Insurance: Initial Claims, State Programs (NSA, Thous)

You could also use the following SAS statements to create a SAS data set named hwouty and to print its contents.

```

libname lib1 sasehavr "%sysget(HAVER_DATA)"
    freq=yearly
    start=19920101
    end=20041231
    force=freq;

data hwouty;
    set lib1.haverw;
run;

title1 'Haver Analytics Database, Frequency=yearly, infile=haverw.dat';
title2 'Define a range inside the data range for OUT= dataset,';
title3 'Using the START=19920101 END=20041231 LIBNAME options.';

proc print data=hwouty;
run;

```

The preceding LIBNAME LIB1 statement specifies that all time series in the haverw database be converted to a yearly frequency but to select only the range of data from January 1, 1992, to December 31, 2004. The resulting SAS data set hwouty is shown in [Output 41.1.2](#).

Output 41.1.2 Defining a Range inside the Data Range for Yearly Time Series

Haver Analytics Database, Frequency=yearly, infile=haverw.dat Define a range inside the data range for OUT= dataset, Using the START=19920101 END=20041231 LIBNAME options.							
Obs	DATE	FA	FCM1M	FM1	FTA1MA	FTB3	LICN

Example 41.3: Viewing Monthly Time Series from a Haver Database

The following statements convert weekly time series to a monthly frequency:

```

libname lib1 sasehavr "%sysget(HAVER_DATA) "
      freq=monthly
      start=20040401
      end=20041231
      force=freq;

data hwoutm;
  set lib1.haverw;
run;

title1 'Haver Analytics Database, Frequency=monthly, infile=haverw.dat';
title2 '  Define a range inside the data range for OUT= dataset';
title3 '  Using the START=20040401 END=20041231 LIBNAME options.';

proc print data=hwoutm;
run;

```

The result from using the range of April 1, 2004, to December 31, 2004, is shown in [Output 41.3.1](#).

Output 41.3.1 Defining a Range inside the Data Range for Monthly Time Series

Haver Analytics Database, Frequency=monthly, infile=haverw.dat Define a range inside the data range for OUT= dataset Using the START=20040401 END=20041231 LIBNAME options.

Example 41.5: Viewing Daily Time Series from a Haver Database

Consider viewing the Haver Analytics daily database named haverd. The contents of this database can be seen by submitting the following DATA step:

```
libname lib1 sasehavr "%sysget (HAVER_DATA) "
      freq=daily
      start=20041201
      end=20041231;

data hwoutd;
  set lib1.haverd;
run;

title1 'Haver Analytics Database, HAVERD.DAT';
title2 'PROC CONTENTS for Time Series converted to daily frequency';
proc contents data=hwoutd;
run;
```

Output 41.5.1 shows the output of PROC CONTENTS with the time ID variable DATE followed by the time series variables FCM10, FCM1M, FFED, FFP1D, FXAUS, and TCC with their corresponding attributes such as type, length, format, and label.

Output 41.5.1 Examining the Contents of a Daily Haver Analytics Database, haverd.dat

HAVER Analytics Database, HAVERD.DAT				
PROC CONTENTS for Time Series converted to daily frequency				
The CONTENTS Procedure				
Alphabetic List of Variables and Attributes				
#	Variable	Type	Len	Format Label
1	DATE	Num	8	DATE9. Date of Observation
2	FCM10	Num	8	10-Year Treasury Note Yield at Constant Maturity (Avg, % p.a.)
3	FCM1M	Num	8	1-Month Treasury Bill Market Bid Yield at Constant Maturity (%)
4	FFED	Num	8	Federal Funds [Effective] Rate (% p.a.)
5	FFP1D	Num	8	1-Day AA Financial Commercial Paper (% per annum)
6	FXAUS	Num	8	Foreign Exchange Rate: Australia (US\$/Australian\$)
7	TCC	Num	8	Treasury: Closing Operating Cash Balance (Today, Mil.\$)

Example 41.6: Limiting the Range of Time Series from a Haver Database

The following statements limit the range of data to the month of December:

```
libname lib1 sasehavr "%sysget(HAVER_DATA) "
      freq=daily
      start=20041201
      end=20041231;

data hwoutd;
  set lib1.haverd;
run;

title1 'Haver Analytics Database, Frequency=daily, infile=haverd.dat';
title2 '  Define a range inside the data range for OUT= dataset';
title3 '  Using the START=20041201 END=20041231 LIBNAME options.';

proc print data=hwoutd;
run;
```

Note that [Output 41.6.1](#) for daily conversion shows the frequency as the SAS time interval for WEEKDAY.

Output 41.6.1 Defining a Range inside the Data Range for Daily Time Series

Haver Analytics Database, Frequency=daily, infile=haverd.dat Define a range inside the data range for OUT= dataset Using the START=20041201 END=20041231 LIBNAME options.

23	31DEC2004	4.24	1.89	1.97	2.18	0.7805	24690

Example 41.7: Using the WHERE Statement to Subset Time Series from a Haver Database

Using a WHERE statement in the DATA step can be useful for further subsetting.

```
libname lib1 sasehavr "%sysget(HAVER_DATA)"
      freq=daily start=20041101 end=20041231;

data hwoutd;
  set lib1.haverd;
  where date between '01nov2004'd and '01dec2004'd;
run;

title1 'Haver Analytics Database, Frequency=daily, infile=haverd.dat';
title2 '  Define a range inside the data range for OUT= dataset';
title3 '  Using the START=20041101 END=20041231 LIBNAME options.';
title4 'Subset further: where date between 01nov2004 and 31dec2004.';
proc print data=hwoutd;
run;
```

Output 41.7.1 shows that the time slice of November 1, 2004, to December 31, 2004, is narrowed further by the DATE test in the WHERE statement to stop at December 1, 2004.

Output 41.7.1 Defining a Range Using the WHERE Statement, START=20041101, and END=20041231

Haver Analytics Database, Frequency=daily, infile=haverd.dat							
Define a range inside the data range for OUT= dataset							
Using the START=20041101 END=20041231 LIBNAME options.							
Subset further: where date between 01nov2004 and 31dec2004.

Example 41.8: Using the KEEP Option to Subset Time Series from a Haver Database

To select specific time series, you can use the KEEP= or DROP= option as follows:

```
libname lib1 sasehavr "%sysget (HAVER_DATA) "  
    freq=daily  
    start=20041101  
    end=20041231  
    keep="FCM*";  
  
data hwoutd;  
    set lib1.haverd;  
run;  
  
title1 'Haver Analytics Database, Frequency=daily, infile=haverd.dat';  
title2 '    Define a range inside the data range for OUT= dataset';  
title3 '    Using the START=20041101 END=20041231 LIBNAME options.';  
title4 '    Subset further: Using keep="FCM*" LIBNAME option ';  
proc print data=hwoutd;  
run;
```

Output 41.8.1 shows two series that are selected by using KEEP="FCM*" in the LIBNAME statement.

Output 41.8.1 Using the KEEP Option and Defining a Range Using START=20041101 and END=20041231

Haver Analytics Database, Frequency=daily, infile=haverd.dat
 Define a range inside the data range for OUT= dataset
 Using the START=20041101 END=20041231 LIBNAME options.
 Subset further: Using keep="FCM*" LIBNAME option

You can use the DROP option to drop specific variables from a Haver database. To specify this option, use DROP= instead of KEEP=.

Example 41.9: Using the SOURCE Option to Subset Time Series from a Haver Database

You can use the SOURCE= or DROPSOURCE= option to select specific variables that belong to a certain source, similar to the way you use the KEEP= or DROP= option.

```
libname lib1 sasehavr "%sysget(HAVER_DATA) "
      freq=daily
      start=20041101
      end=20041223
      source="FRB";

data hwoutd;
  set lib1.haverd;
run;

title1 'Haver Analytics Database, Frequency=daily, infile=haverd.dat';
title2 '  Define a range inside the data range for OUT= dataset';
title3 '  Using the START=20041101 END=20041223 LIBNAME options.';
title4 '  Subset further: Using source="FRB" LIBNAME option';
proc print data=hwoutd;
run;
```

[Output 41.9.1](#) shows two series that are selected by using SOURCE="FRB" in the LIBNAME statement.

Output 41.9.1 Using the SOURCE Option and Defining a Range Using START=20041101 and END=20041223

Haver Analytics Database, Frequency=daily, infile=haverd.dat
 Define a range inside the data range for OUT= dataset
 Using the START=20041101 END=20041223 LIBNAME options.
 Subset further: Using source="FRB" LIBNAME option

Example 41.10: Using the GROUP Option to Subset Time Series from a Haver Database

You can use the GROUP= or DROPGROUP= option to select specific variables that belong to a certain group, similar to the way you use the KEEP= or DROP= option.

Output 41.10.1, Output 41.10.2, and Output 41.10.3 show three different cross sections of the same database, haverw, by specifying three unique GROUP= options: GROUP="F*" in LIBNAME LIB1, GROUP="M*" in LIBNAME LIB2, and GROUP="E*" in LIBNAME LIB3.

The following statements specify GROUP="F*" in the LIBNAME LIB1 statement:

```
libname lib1 sasehavr "%sysget (HAVER_DATA) "  
    freq=week.6  
    force=freq  
    start=20040102  
    end=20041001  
    group="F*";  
  
data hwoutwA;  
    set lib1.haverw;  
run;  
  
title1 'Haver Analytics Database, Frequency=week.6, infile=haverw.dat';  
title2 '    Define a range inside the data range for OUT= dataset';  
title3 '    Using the START=20040102 END=20041001 LIBNAME options.';  
title4 '    Subset further: Using group="F*" LIBNAME option';  
proc print data=hwoutwA;  
run;
```

Output 41.10.1 shows the output.

Output 41.10.1 Using the GROUP=F* Option and Defining a Range

Haver Analytics Database, Frequency=week.6, infile=haverw.dat
 Define a range inside the data range for OUT= dataset
 Using the START=20040102 END=20041001 LIBNAME options.
 Subset further: Using group="F*" LIBNAME option

Example 41.11: Using the OUTSELECT=ON Option to View the Key Selection Variables in a Haver Database

Suppose you want to select your time series based on geography codes or source codes. To construct your wildcard for selection, first run with the OUTSELECT=ON option to see the possible values for each selection key.

```
libname lib1 sasehavr "%sysget(HAVER_DATA) "
      outselect=on ;

data validD1;
  set lib1.haverd;
run;

title1 'OUTSELECT=ON, Print the OUT= Data Set';
title2 'Shows the Values for Key Selection Variables: ';
title3 'Name, Source, Geog1, Geog2, Shortsrc, Longsrc';
title4 'OUTSELECT=ON, the CONTENTS Procedure with Variable Names and Labels';
proc print data=validD1;
run;

proc contents data=validD1;
run;
```

Output 41.11.1 shows the output values for each key selection variable.

Output 41.11.1 OUTSELECT=ON Option Shows the Values for Key Selection Variables

Example 41.12: Selecting Variables Based on Short Source Key Code

Using the information from [Example 41.11](#), you can now select time series by using selection keys such as the SHORT=, GEOG1=, or GEOG2= options. Since the short source values are nontrivial in database haverd, it is best in this case to use the SHORT= option. For more information about using geography codes as selection keys, see [Output 41.13.1](#) for the GEOG1= option and [Output 41.13.2](#) for the GEOG2= option.

```
Libname lib1 sasehavr "%sysget(HAVER_DATA)"
      short="GOLDMAN, FRB, CRB";
data valide2;
  set lib1.haverd;
  where date between '18jan2005'd and '29mar2005'd;
run;

title1 'SHORT= option list: GOLDMAN, FRB, CRB';
title2 'Should contain these time series: ';
title3 'FCM10, FCM1M, FFED, FFP1D';
title4 'SHORT= option, Print the OUT= Valide2 Data Set';
proc print data=valide2;
run;

Example 41.13: Selecting Variables Based on Geography Key Codes

Since the haverd database did not have interesting geography codes, the following statements access the INTWKLY database by using its more complete geography key codes to select the desired time series from the specified geography codes:

```

Libname lib1 sasehavr "%sysget(HAVER_DATA_NEW) "
outselect=on
keep="R273RF3,X924USBE,R023DF,R273G1,F023A,F158FBS,F023ACR,X156VEB,F023ACE";

data valid1(keep=NAME SOURCE GEOG1 GEOG2 SHORTSRC LONGSRC);
set lib1.intwkly;
run;

title1 'OUTSELECT=ON, Print the OUT= Data Set';
title2 'Shows the Values for Key Selection Variables: ';
title3 'Name, Source, Geog1, Geog2, Shortsrc, Longsrc';
title4 'OUTSELECT=ON, the CONTENTS Procedure with Variable Names and Labels';
proc print data=valid1;
run;

Libname lib2 sasehavr "%sysget(HAVER_DATA_NEW) "
geog1="156";

data valid2(
keep=date R273RF3 X924USBE R023DF R273G1 F023A F158FBS F023ACR X156VEB F023ACE);
set lib2.intwkly;
run;

title1 'Only one GEOG1 Code, 156, contains time series X156VEB';
title2 'Select Geography Code 1 Option: ';
title3 'GEOG1= option';

```

```

title4 'Only Time Series X156VEB has Geog1 = 156';

proc contents
  data=valid2;
run;

Libname lib3 sasehavr "%sysget(HAVER_DATA_NEW) "
  geog2="299";

data valid3(
  keep=date R273RF3 X924USBE R023DF R273G1 F023A F158FBS F023ACR X156VEB F023ACE);
  set lib3.intwkly;
run;

title1 'Only one GEOG2 Code, 299, contains time series X156VEB';
title2 'Select Geography Code 2 Option: ';
title3 'GEOG2= option';
title4 'Only Time Series X156VEB has Geog2 = 299';

proc contents
  data=valid3;
run;

title1 'Compare GEOG1 Code 156';
title2 'Over nonmissing values range';
title3 'With GEOG2 Code 299';
title4 'Over nonmissing values range';

proc compare listall briefsummary criterion=1.0e-5

Time Series Forecasting System

Chapter 42

Overview of the Time Series Forecasting System

Contents

Introduction	2821
Using the Time Series Forecasting System	2822
SAS Software Products Needed	2823

Introduction

The Time Series Forecasting system forecasts future values of time series variables by extrapolating trends and patterns in the past values of the series or by extrapolating the effect of other variables on the series. The system provides convenient point-and-click windows to control the time series analysis and forecasting tools of SAS/ETS software.

You can use the system in a fully automatic mode, or you can use the system’s diagnostic features and time series modeling tools interactively to develop forecasting models customized to best predict your time series. The system provides both graphical and statistical features to help you choose the best forecasting method for each series.

The following is a brief summary of the features of the Time Series Forecasting system. You can use the system in the following ways:

- use a wide variety of forecasting methods, including several kinds of exponential smoothing models, Winters method, and ARIMA (Box-Jenkins) models. You can also produce forecasts by combining the forecasts from several models.
- use predictor variables in forecasting models. Forecasting models can include time trend curves, regressors, intervention effects (dummy variables), adjustments you specify, and dynamic regression (transfer function) models.
- view plots of the data, predicted versus actual values, prediction errors, and forecasts with confidence limits, as well as autocorrelations and results of white noise and stationarity tests. Any of these plots can be zoomed and can represent raw or transformed series.
- use hold-out samples to select the best forecasting method

- compare goodness-of-fit measures for any two forecasting models side by side or list all models sorted by a particular fit statistic
- view the predictions and errors for each model in a spreadsheet or compare the fit of any two models in a spreadsheet
- examine the fitted parameters of each forecasting model and their statistical significance
- control the automatic model selection process: the set of forecasting models considered, the goodness-of-fit measure used to select the best model, and the time period used to fit and evaluate models
- customize the system by adding forecasting models for the automatic model selection process and for point-and-click manual selection
- save your work in a project catalog
- print an audit trail of the forecasting process
- show source statements for PROC ARIMA code
- save and print system output including spreadsheets and graphs

Using the Time Series Forecasting System

Chapters starting from Chapter 43, “[Getting Started with Time Series Forecasting](#),” through Chapter 47, “[Using Predictor Variables](#),” contain a series of example sessions that show the major features of the system. Chapters from Chapter 48, “[Command Reference](#),” through Chapter 50, “[Forecasting Process Details](#),” serve as reference and provide more details about how the system operates. The reference chapters contain a complete list of system features.

To get started using the Time Series Forecasting system, it is a good idea to work through a few of the example sessions. Start with Chapter 43, “[Getting Started with Time Series Forecasting](#),” and use the system to reproduce the steps shown in the examples. Continue with the other chapters when you feel comfortable using the system.

The example sessions make use of time series data sets contained in the SASHELP library: `air`, `citimon`, `citiqtr`, `citiyr`, `citiwk`, `citiday`, `gnp`, `retail`, `usecon`, and `workers`. You can use these data sets to work through the example sessions or to experiment further with the system.

Once you are familiar with how the system operates, start working with your own data to build your own forecasting models. When you have questions, consult the reference chapters mentioned above for more information about particular features.

The Time Series Forecasting system forecasts *time series*, that is, variables that consist of ordered observations taken at regular intervals over time. Since the Time Series Forecasting system is a part of the SAS software system, time series values must be stored as variables in a SAS data set or data view, with the observations representing the time periods. The data can also be stored in an external spreadsheet or data base if you license SAS/ACCESS software.

The Time Series Forecasting System chapters refer to *series* and *variables*. Since time series are stored as variables in SAS data sets or data views, these terms are used interchangeably. However, the term *series* is preferred when attention is focused on the sequence of data values, and the term *variable* is preferred when attention is focused on the data set.

SAS Software Products Needed

The Time Series Forecasting system is part of SAS/ETS software. To use it, you must have a license for SAS/ETS. To use the graphical display features of the system, you must also license SAS/GRAPH software.

This chapter outlines the forecasting process and introduces the major windows of the system through three example sessions.

The first example, beginning with the section “The Time Series Forecasting Window,” shows how to use the system for fully automated forecasting of a set of time series. This example also introduces the system’s features for viewing data and forecasts through tables and interactive graphs. It also shows how to save and restore forecasting work in SAS catalogs.

The second example, beginning with the section “Develop Models Window,” introduces the features for developing the best forecasting models for individual time series. The chapter concludes with an example showing how to create dating variables for your data in the form expected by the system.

After working through the examples in this chapter, you should be able to do the following:

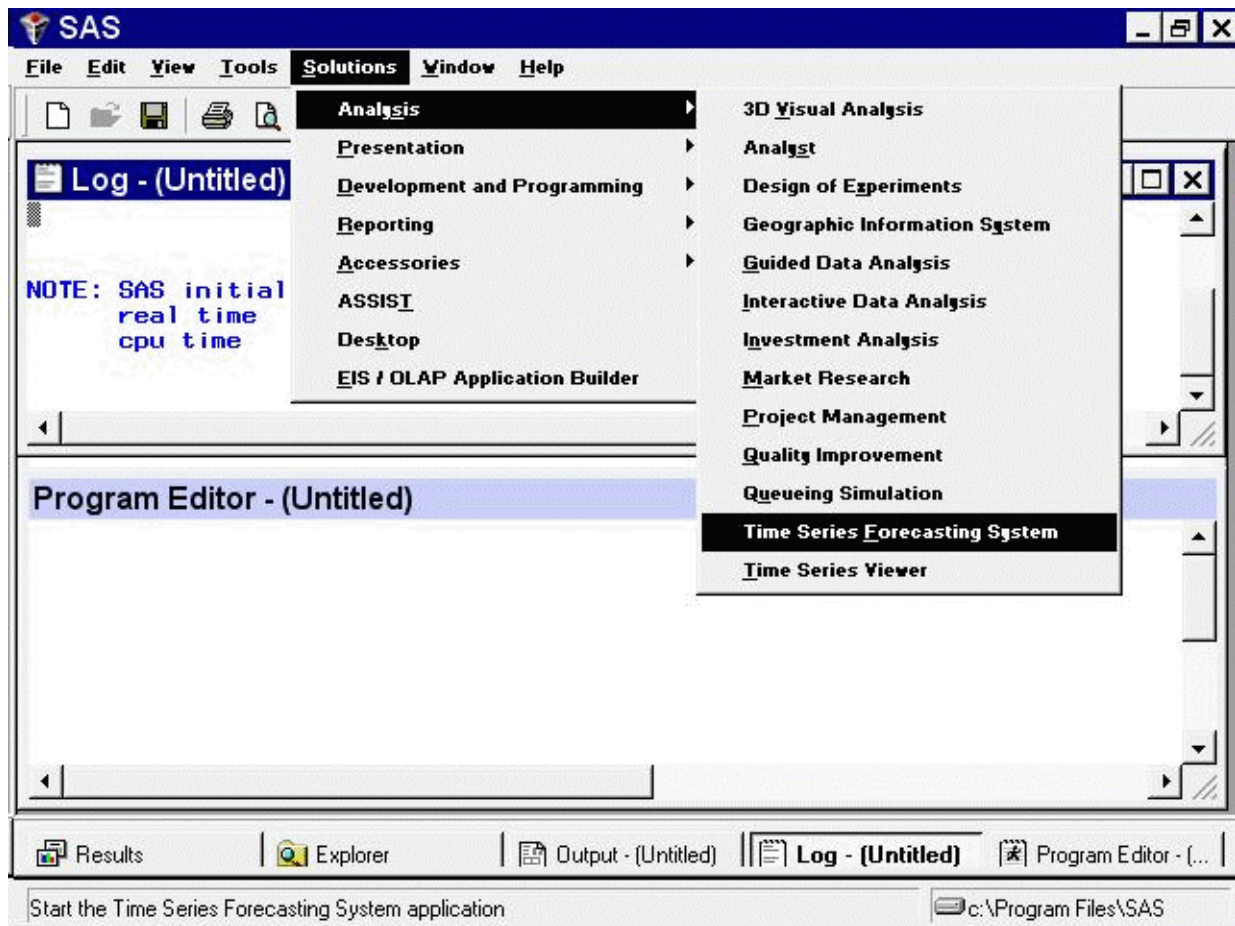

- select a data set of time series to work with and specify its periodicity and time ID variable
- use the automatic forecasting model selection feature to create forecasting models for the variables in a data set
- produce and save forecasts of variables in a data set
- examine your data and forecasts as tables of values and through interactive graphs
- save and restore your forecasting models by using project files in a SAS catalog and edit project information
- use some of the model development features to fit and select forecasting models for individual time series variables

This chapter introduces these topics and helps you get started using the system. Later chapters present these topics in greater detail and document more advanced features and options.

The Time Series Forecasting Window

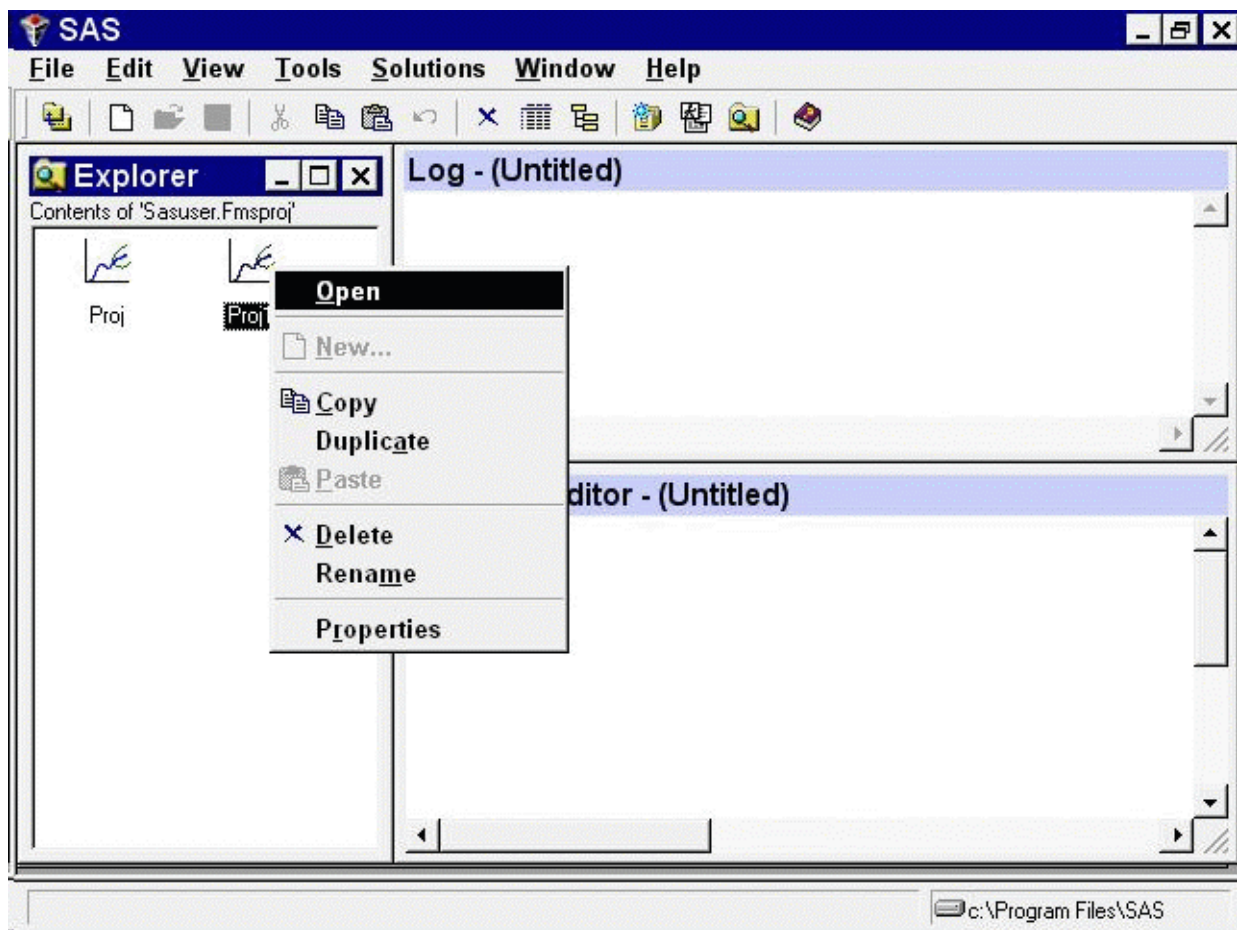

There are several ways to get to the Time Series Forecasting System. If you prefer to use commands, invoke the system by entering `forecast` on the command line. You can optionally specify additional information on the command line; see Chapter 48, “[Command Reference](#),” for details.

If you are using the SAS windowing environment with pull-down menus, select the Solutions menu from the menu bar, select the Analysis item, and then select `Time Series Forecasting System`, as shown in [Figure 43.1](#).

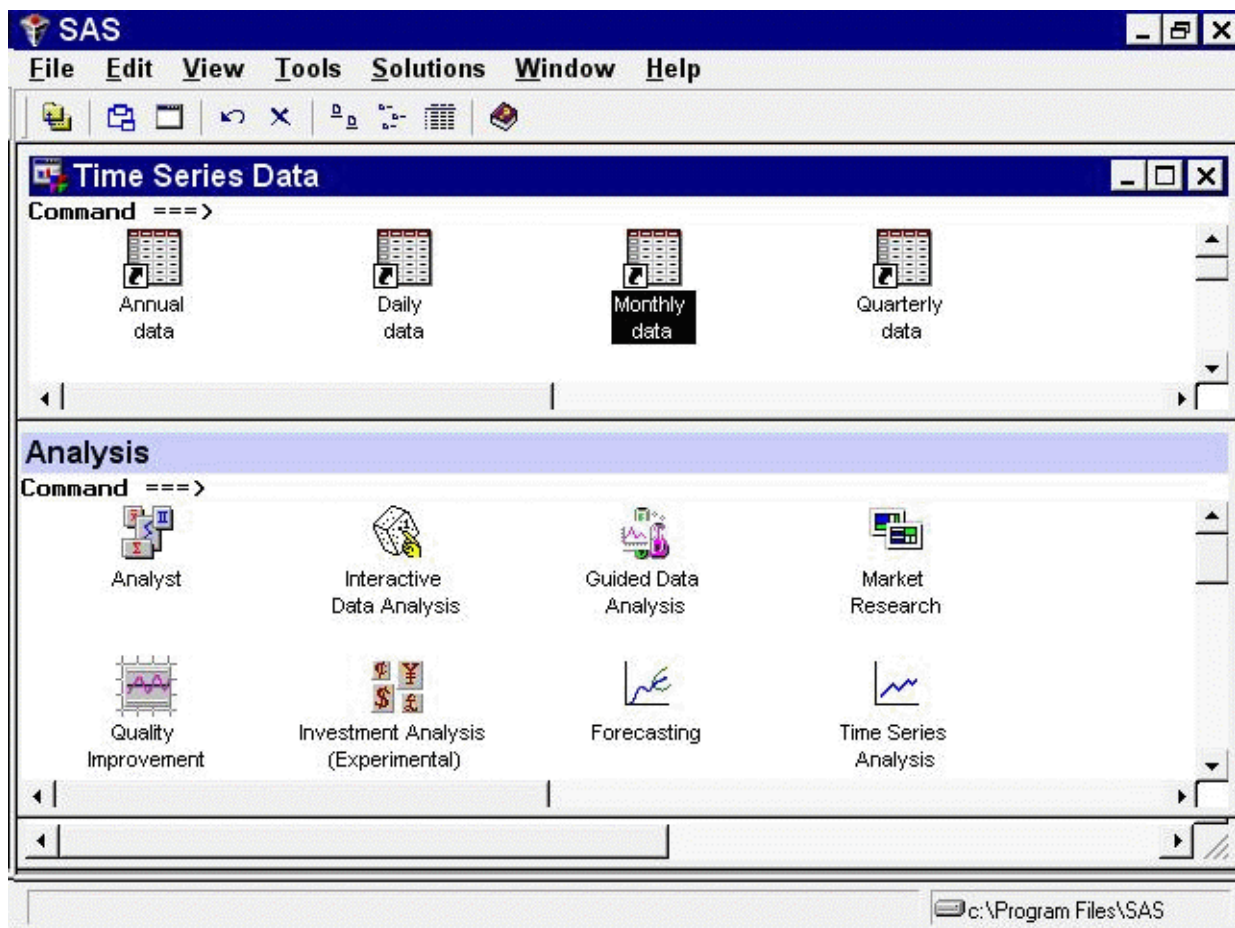

Figure 43.1 Time Series Forecasting System Menu Selection

You can invoke the Forecasting System from the SAS Explorer window by opening an existing forecasting project. By default these projects are stored in the FMSPROJ catalog in the SASUSER library. Select SASUSER in the Explorer to display its contents. Then select FMSPROJ. This catalog is created the first time you use the Forecasting System. If you have saved projects, they appear in the Explorer with the forecasting graph icon, as shown in [Figure 43.2](#). Double-click one of the projects, or select it with the right mouse button and then select Open from the pop-up menu, as shown in the figure. This opens the Forecasting System and opens the selected project.

Figure 43.2 Opening a Project from the Explorer

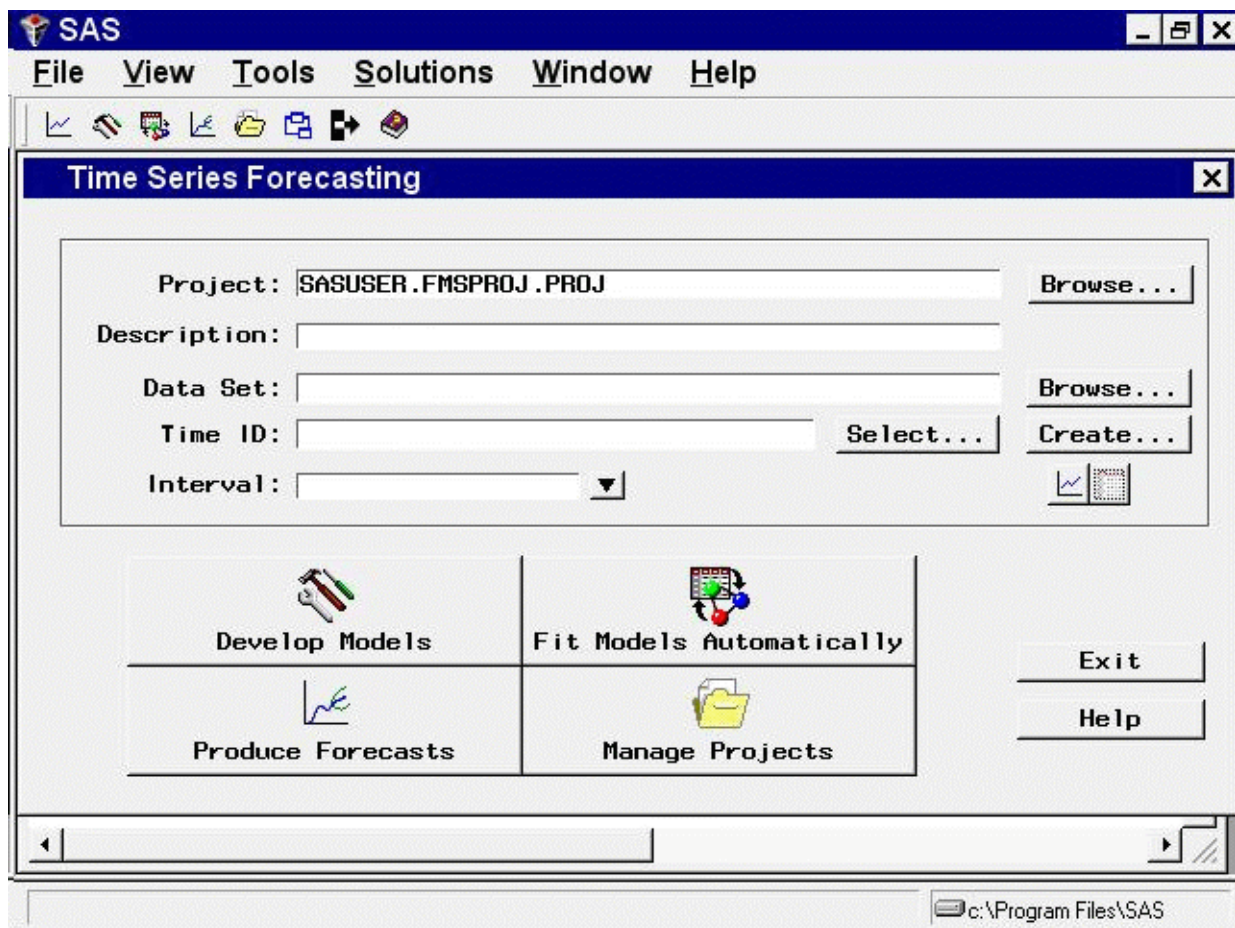

To invoke the Forecasting System in the SAS desktop environment, select the **Solutions** menu from the menu bar, select **Desktop**, and then open the **Analysis** folder. You can run the Time Series Forecasting System or the Time Series Viewer directly, or you can drag and drop. Figure 43.3 illustrates dragging a data set (known as a table in the Desktop environment) and dropping it on the Forecasting icon. In this example, the tables reside in a user-defined folder called *Time Series Data*.

Figure 43.3 Drag and Drop on the SAS Desktop

If you are using SAS/ASSIST software, select the Planning button and then select `Forecasting` from the pop-up menu.

Any of these methods takes you to the Time Series Forecasting window, as shown in [Figure 43.4](#).

Figure 43.4 Time Series Forecasting Window

At the top of the window is a data selection area for specifying a project file and the input data set containing historical data (the known past values) for the time series variables that you want to forecast. This area also contains buttons for opening viewers to explore your input data either graphically, one series at a time, or as a table, one data set at a time.

The Project and Description fields are used to specify a project file for saving and restoring forecasting models created by the system. Using project files is discussed later, and these fields are ignored for now.

The lower part of the window contains six buttons:

Develop Models

opens the Develop Models window, which you use to develop and fit forecasting models interactively for individual time series.

Fit Models Automatically

opens the Automatic Model Fitting window, which you use to search automatically for the best forecasting model for multiple series in the input data set.

Produce Forecasts

opens the Produce Forecasts window, which you use to compute forecasts for all the variables in the input data set for which forecasting models have been fit.

Manage Projects

opens the Manage Forecasting Project window, which lists the time series for which you have fit forecasting models. You can drill down on a series to see the models that have been fit. You can delete series or models from the project, re-evaluate or refit models, and explore models and forecasts graphically or in tabular form.

Exit

exits the Forecasting System.

Help

displays information about the Forecasting System.

Outline of the Forecasting Process

The examples shown in the following sections illustrate the basic process you use with the Forecasting System.

Specify the Input Data Set

Suppose you have a number of *time series*, variables recorded over time, for which you want to forecast future values. The past values of these time series are stored as variables in a SAS data set or data view. The observations of this data set correspond to regular time periods, such as days, weeks, or months. The first step in the forecasting process is to tell the system to use this data set by setting the Data Set field.

If your time series are not in a SAS data set, you must provide a way for the SAS System to access the data. You can use SAS features to read your data into a SAS data set; refer to *SAS Language Reference*. You can use a SAS/ACCESS product to establish a view of data in a database management system; refer to SAS/ACCESS documentation. You can use PROC SQL to create a SAS data view. You can use PROC DATASOURCE to read data from files supplied by supported data vendors; refer to Chapter 12, “[The DATASOURCE Procedure](#),” for more details.

Provide a Valid Time ID Variable

To use the Forecasting System, your data set must be dated: the data set must contain a *time ID variable* that gives the date of each observation. The time ID variable must represent the observation dates with *SAS date values* or with *SAS datetime values* (for hourly data or other frequencies less than a day), or you can use a simple time index.

When SAS date values are used, the ID variable contains dates within the time periods corresponding to the observations. For example, for monthly data, the values for the time ID variable can be the date of the first day of the month corresponding to each observation, or the time ID variable can contain the date of the last day in the month. (Any date within the period serves as the time ID for the observation.)

If your data set already contains a valid time ID variable with SAS date or datetime values, the next step is to specify this time ID variable in the Time ID field. If the time ID variable is named DATE, the system fills in the Time ID field automatically.

If your data set does not contain a time ID, you must add a valid time ID variable before beginning the forecasting process. The Forecasting System provides features that make this easy to do. See Chapter 44, “Creating Time ID Variables,” for details.

Select and Fit a Forecasting Model for Each Series

If you are using the automated model selection feature, the system performs this step for you and chooses a forecasting model for each series automatically. All you need to do is select the Fit Models Automatically button and then select the variables to fit models for.

If you want more control over forecasting model selection, you can select the Develop Models button, select the series you want to forecast, and use the Develop Models window to specify a forecasting model. As part of this process, you can use the Time Series Viewer and Model Viewer graphical tools. Once you have selected a model for the first series, you can select a different series to work with and repeat the model development process until you have created forecasting models for all the series you want to forecast.

The system provides many features to help you choose the best forecasting model for each series. The features of the Develop Models window and graphical viewer tools are introduced in later sections.

Produce the Forecasts

Once a forecasting model has been fit for each series, select the Produce Forecasts button and use the Produce Forecasts window to compute forecast values and store them in a SAS data set.

Save Your Work

If you want only a single forecast, your task is now complete. But you might want to produce updated forecasts later, as more data becomes available. In this case, you want to save the forecasting models you have created, so that you do not need to repeat the model selection and fitting process.

To save your work, fill in the Project field with the name of a SAS catalog member in which the system will store the model information when you exit the system. Later, you will select the same catalog member name when you first enter the Forecasting System, and the model information will be reloaded.

Note that any number of people can work with the same project file. If you are working on a forecasting project as part of a team, you should take care to avoid conflicting updates to the project file by different team members.

Summary

This is the basic outline of how the Forecasting System works. The system offers many other features and options that you might need to use (for example, the time range of the data used to fit models and how far into the future to forecast). These options will become apparent as you work with the Forecasting System.

As an introductory example, the following sections use the Automatic Model Fitting and Produce Forecasts windows to perform automated forecasting of the series in an example data set.

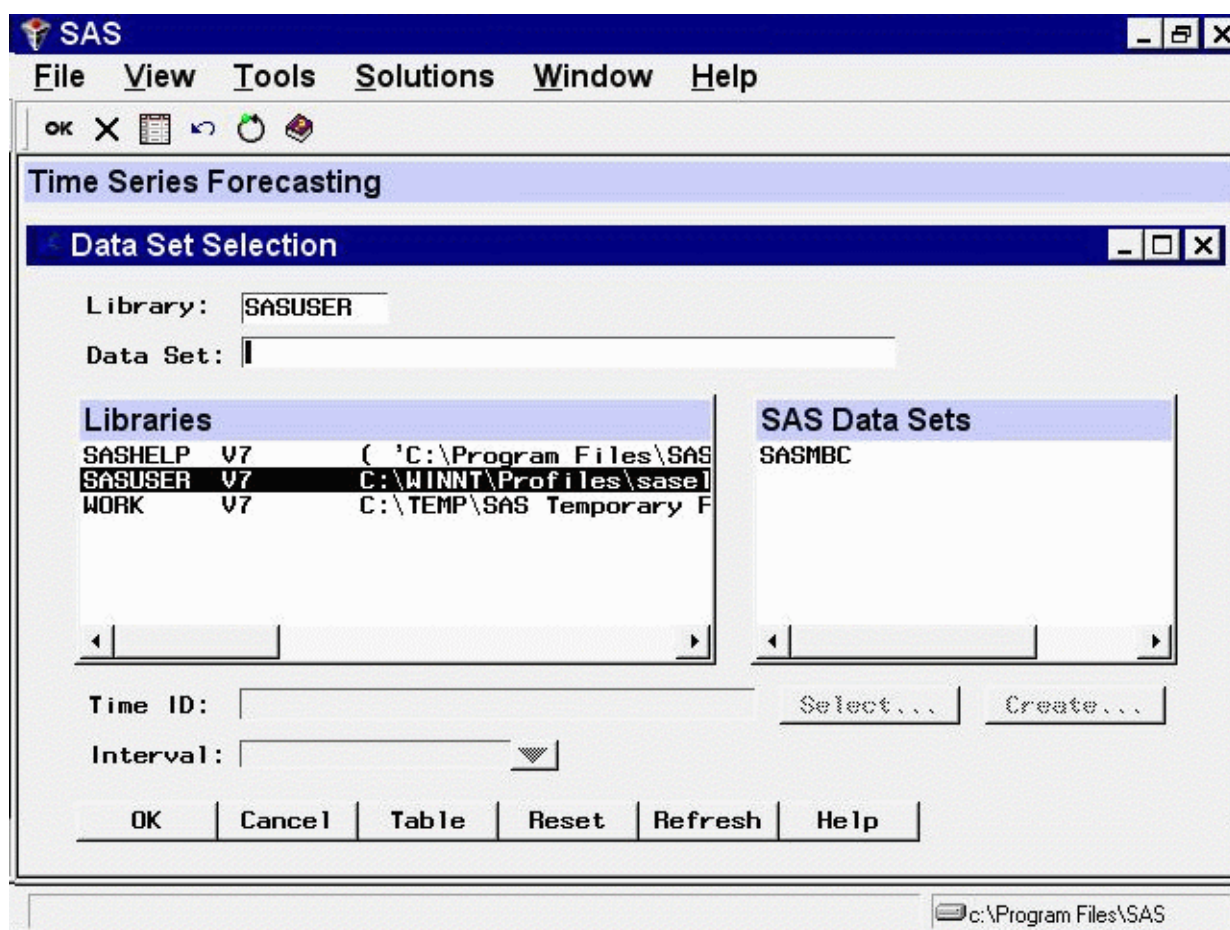

The Input Data Set

As the first step, you must specify the input data set.

The Data Set field in the Time Series Forecasting window gives the name of the input data set containing the time series to forecast. Initially, this field is blank. You can specify the input data set by typing the data set name in this field. Alternatively, you can select the Browse button at the right of the Data Set field to select the data set from a list, as shown in the following section.

The Data Set Selection Window

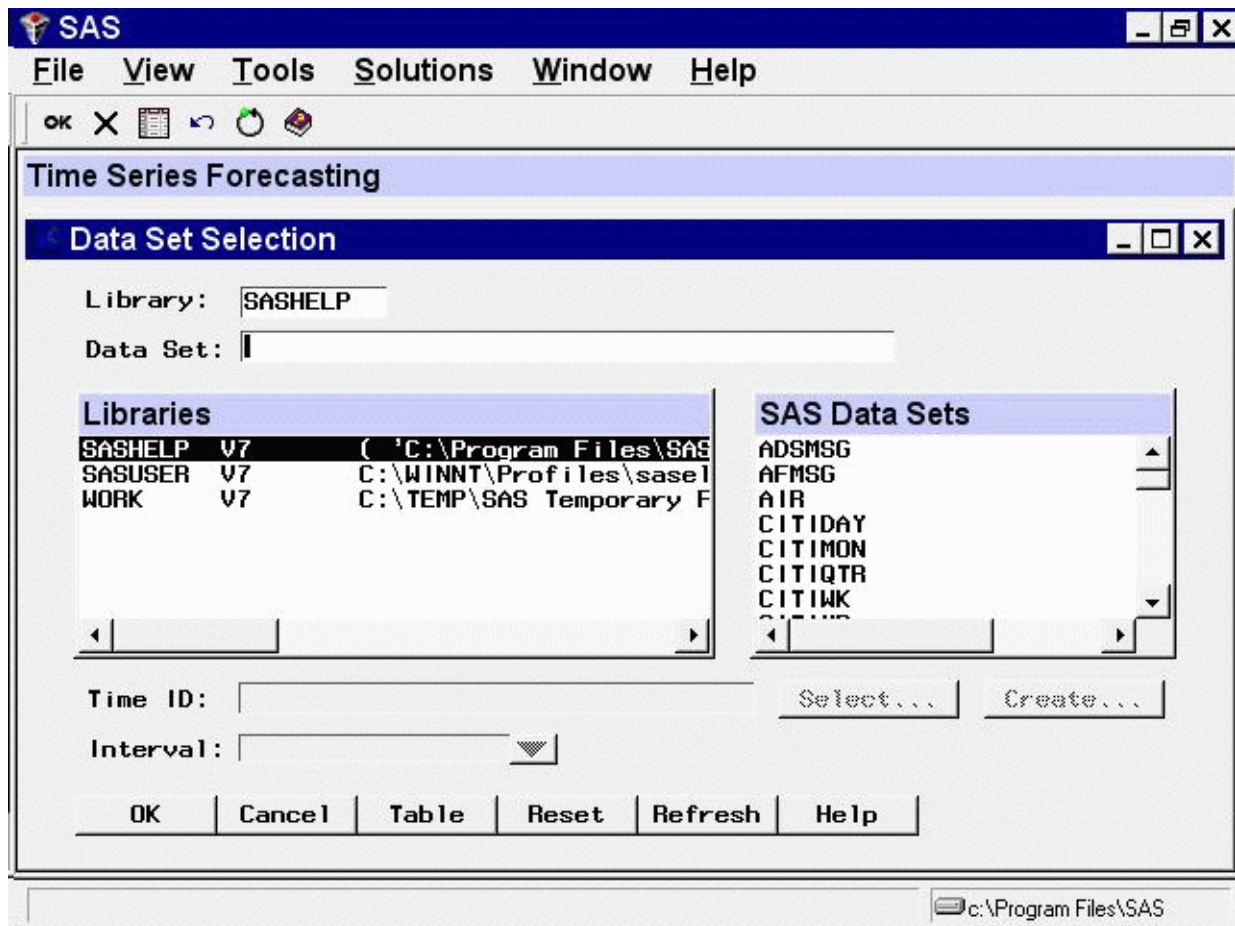

Select the Browse button to the right of the Data Set field. This opens the Data Set Selection window, as shown in [Figure 43.5](#).

Figure 43.5 Data Set Selection Window

The **Libraries** list shows the SAS librefs that are currently allocated in your SAS session. Initially, the **SASUSER** library is selected, and the **SAS Data Sets** list shows the data sets available in your **SASUSER** library.

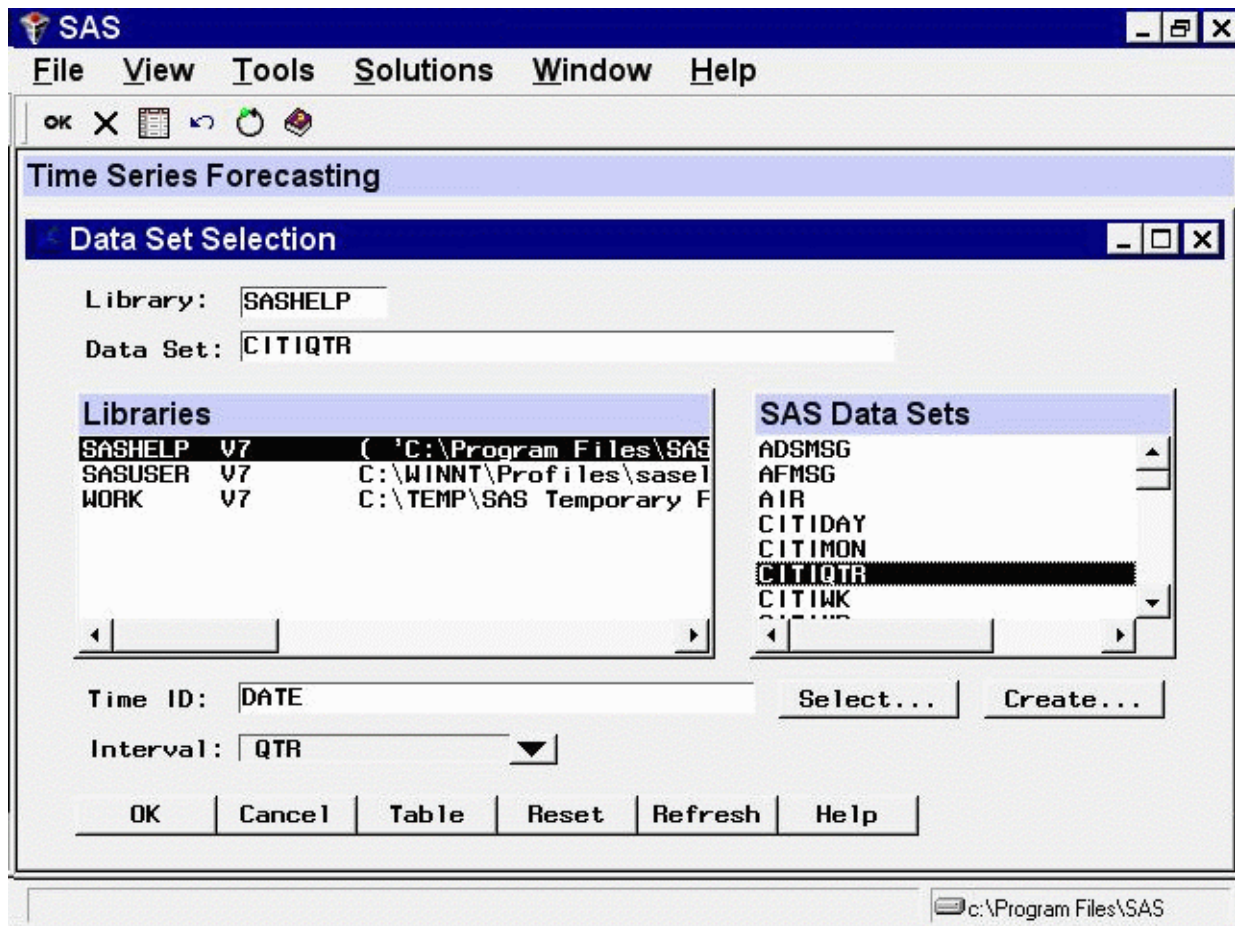

In the **Libraries** list, select the row that starts with **SASHELP**. The Data Set Selection window now lists the data sets in the **SASHELP** library, as shown in [Figure 43.6](#).

Figure 43.6 SASHELP Library

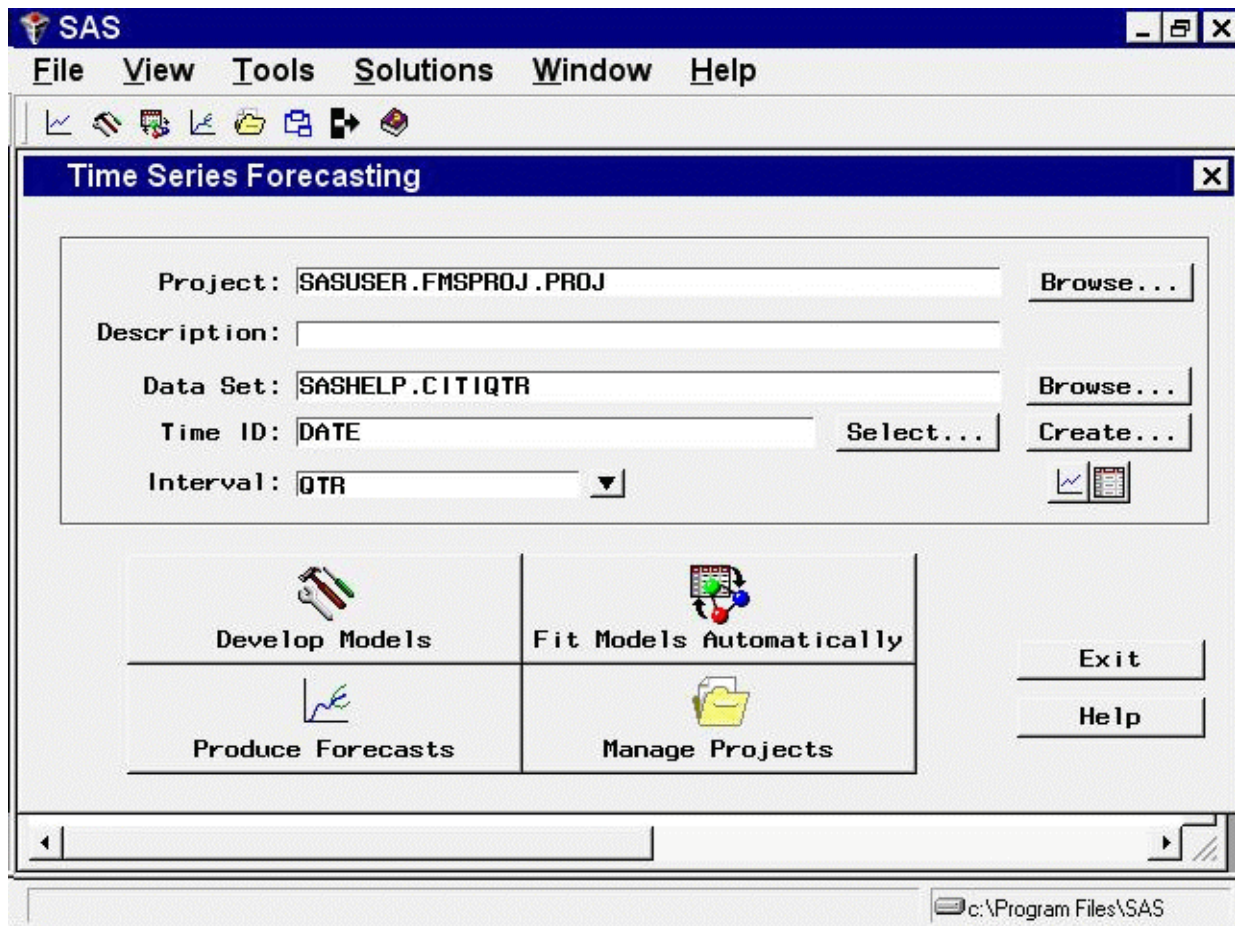

Use the vertical scroll bar on the SAS Data Sets list to scroll down the list until the data set CITIQTR appears. Then select the CITIQTR row. This selects the data set SASHELP.CITIQTR as the input data set.

Figure 43.7 shows the Data Set Selection window after selection of CITIQTR from the SAS Data Sets list.

Figure 43.7 CITIQTR Data Set Selected

Note that the Time ID field is now set to DATE and the Interval field is set to QTR. These fields are explained in the following section.

Now select the OK button to complete selection of the CITIQTR data set. This closes the Data Set Selection window and returns to the Time Series Forecasting window, as shown in [Figure 43.8](#).

Figure 43.8 Time Series Forecasting Window

Time Series Data Sets, ID Variables, and Time Intervals

Before you continue with the example, it is worthwhile to consider how the system determined the values for the Time ID and Interval fields in the Data Set Selection window.

The Forecasting System requires that the input data set contain time series observations, with one observation for each time period. The observations must be sorted in increasing time order, and there must be no gaps in the sequence of observations. The time period of each observation must be identified by an ID variable, which is shown in the Time ID field.

If the data set contains a variable named DATE, TIME, or DATETIME, the system assumes that this variable is the SAS date or datetime valued ID variable, and the Time ID field is filled in automatically. The time ID variable for the SASHELP.CITIQTR data set is named DATE, and therefore the system set the Time ID field to DATE.

If the time ID variable for a data set is not named DATE, TIME, or DATETIME, you must specify the time ID variable name. You can specify the time ID variable either by typing the ID variable name in the Time ID field or by clicking the Select button.

If your data set does not contain a time ID variable with SAS date values, you can add a time ID variable using one of the windows described in Chapter 44, “[Creating Time ID Variables](#).”

Once the time ID variable is known, the Forecasting System examines the ID values to determine the time interval between observations. The data set SASHELP.CITIQTR contains quarterly observations. Therefore, the system determined that the data have a quarterly interval, and set the Interval field to QTR.

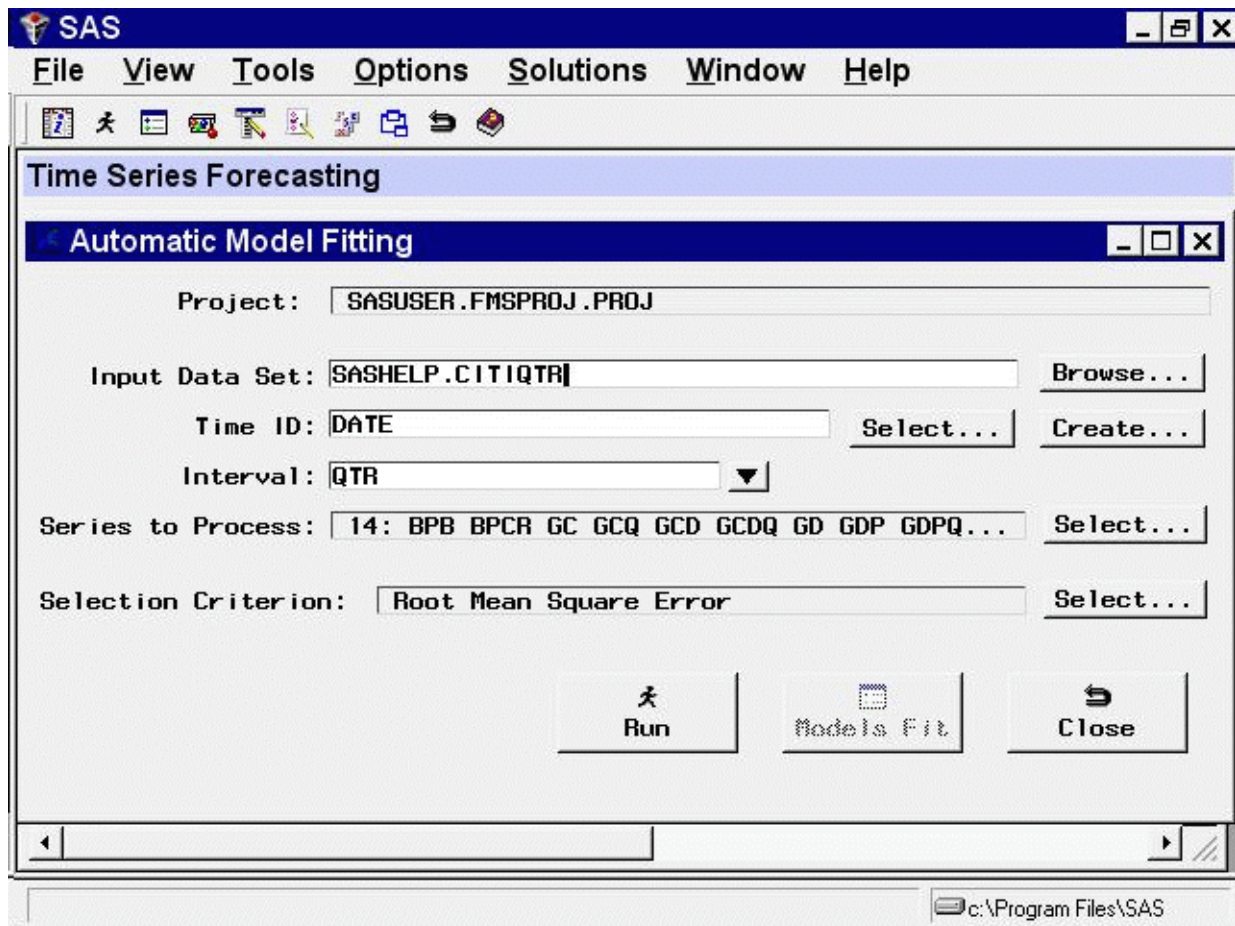

If the system cannot determine the data frequency from the values of the time ID variable, you must specify the time interval between observations. You can specify the time interval by using the `Interval` combo box. In addition to the interval names provided in the pop-up list, you can type in more complex interval names to specify an interval that is a multiple of other intervals or that has date values in the middle of the interval (such as monthly data with time ID values falling on the 10th day of the month).

See Chapter 3, “[Working with Time Series Data](#),” and Chapter 4, “[Date Intervals, Formats, and Functions](#),” for more information about time intervals, SAS date values, and ID variables for time series data sets.

Automatic Model Fitting Window

Before you can produce forecasts, you must fit forecasting models to the time series. Select the Fit Models Automatically button. This opens the Automatic Model Fitting window, as shown in [Figure 43.9](#).

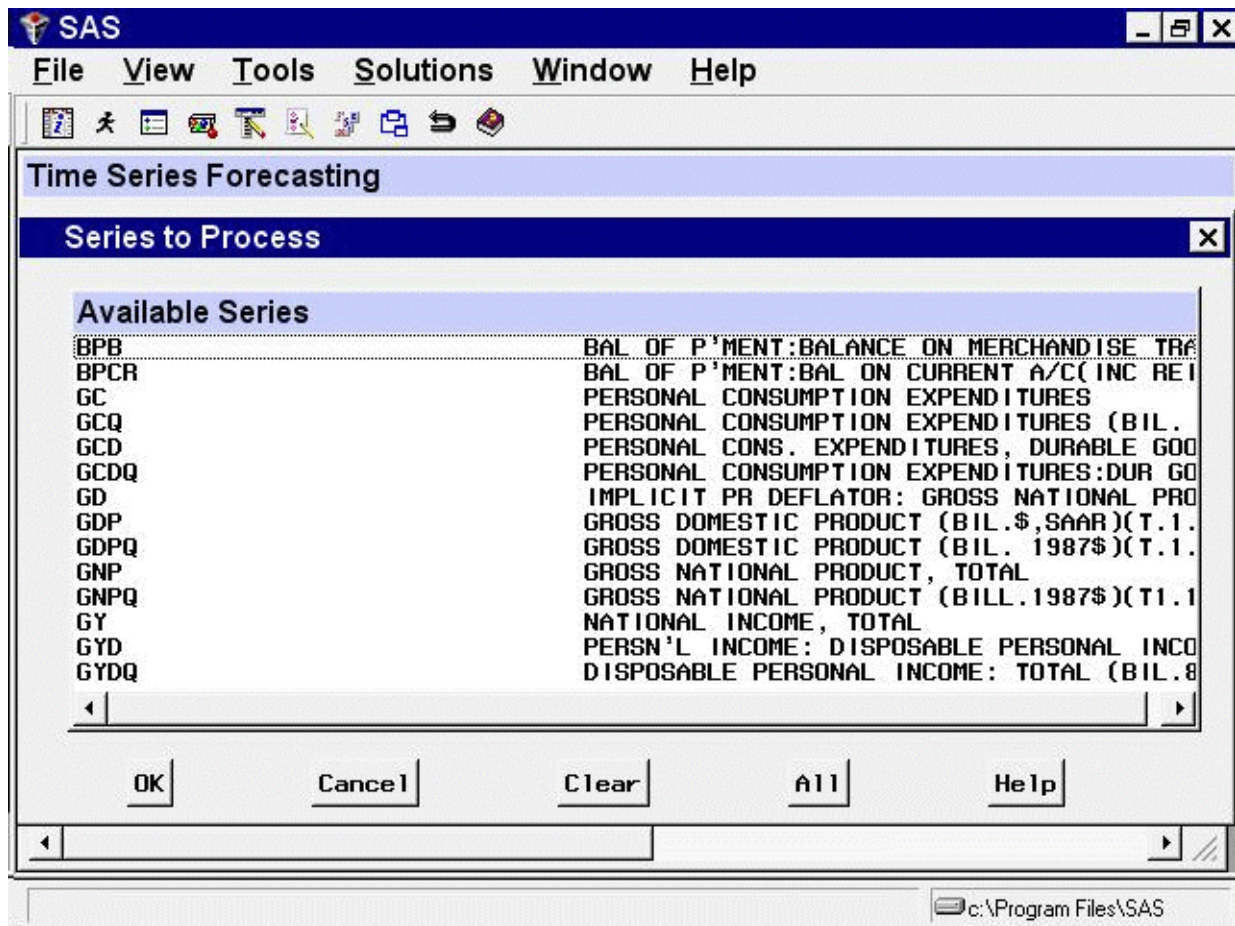

Figure 43.9 Automatic Model Fitting Window

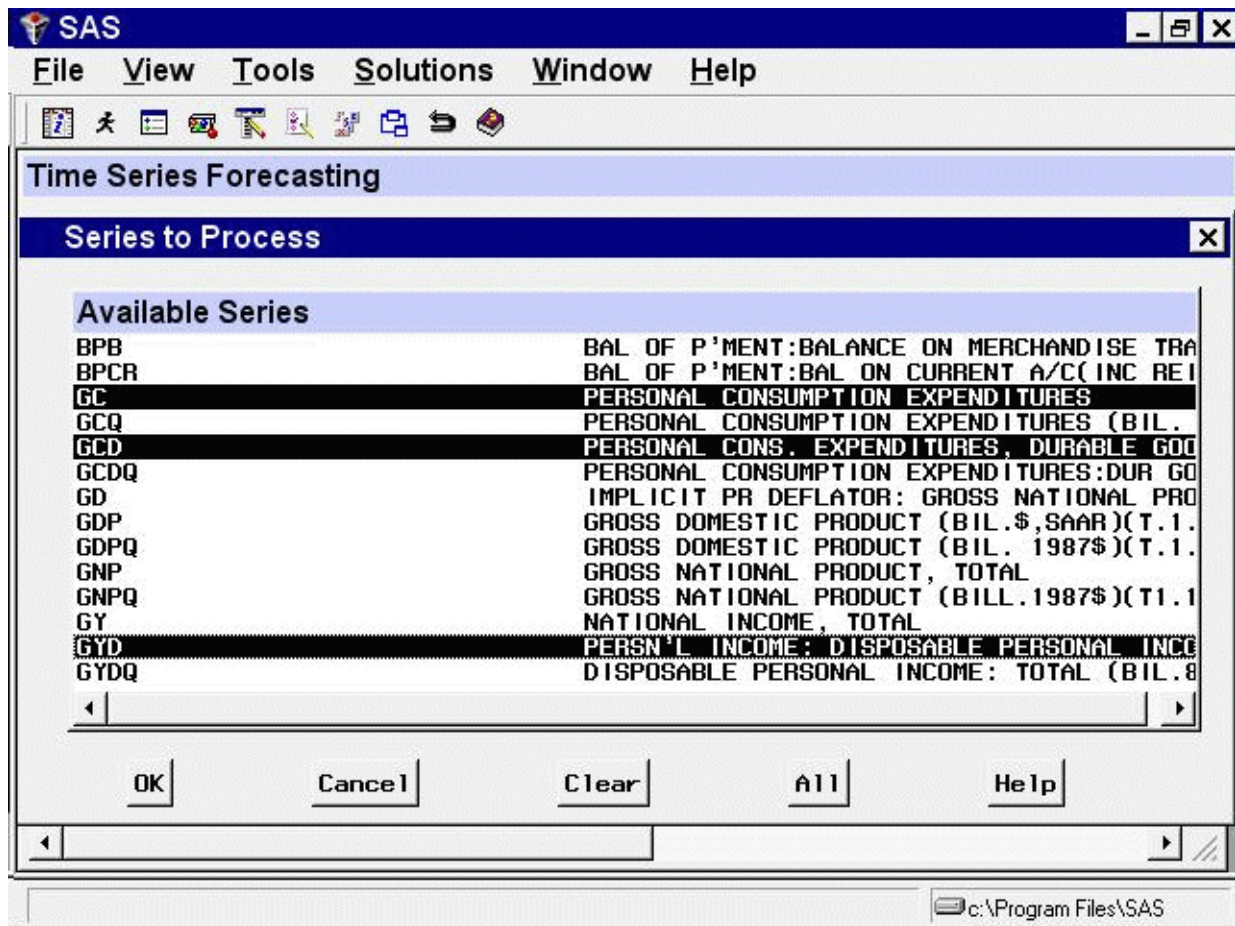

The first part of the Automatic Model Fitting window confirms the project filename and the input data set name.

The Series to Process field shows the number and lists the names of the variables in the input data set to which the Automatic Model Fitting process will be applied. By default, all numeric variables (except the time ID variable) are processed. However, you can specify that models be generated for only a select subset of these variables.

Click the Select button to the right of the Series to Process field. This opens the Series to Process window, as shown in [Figure 43.10](#).

Figure 43.10 Series to Process Window

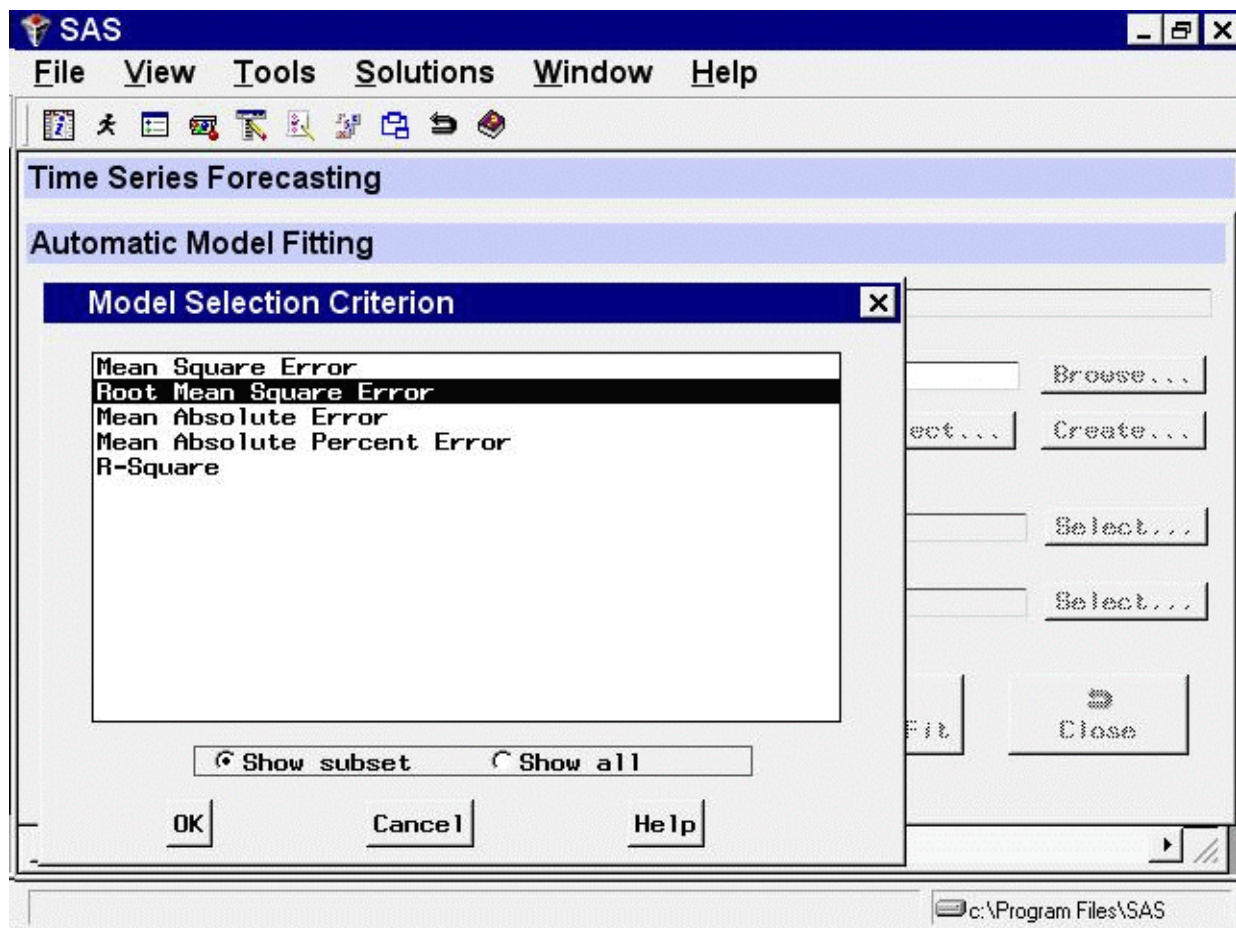

Use the mouse and the CTRL key to select the personal consumption expenditures series (GC), the personal consumption expenditures for durable goods series (GCD), and the disposable personal income series (GYD), as shown in Figure 43.11. (Remember to hold down the CTRL key as you make the selections; otherwise, selecting a second series will deselect the first.)

Figure 43.11 Selecting Series for Automatic Model Fitting

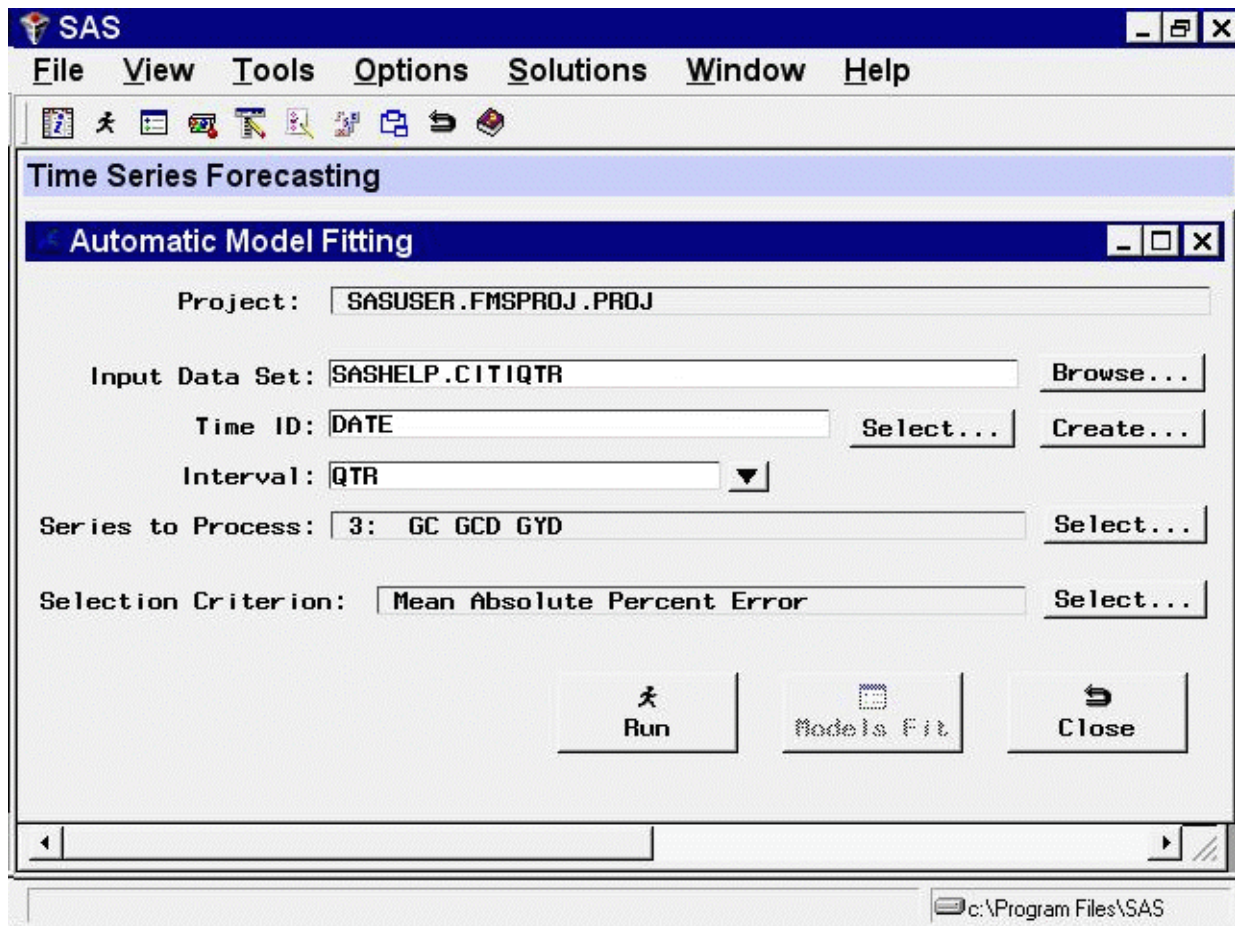

Now select the OK button. This returns you to the Automatic Model Fitting window. The Series to Process field now shows the selected variables.

The Selection Criterion field shows the goodness-of-fit measure that the Forecasting System will use to select the best fitting model for each series. By default, the selection criterion is the root mean squared error. To illustrate how you can control the selection criterion, this example uses the mean absolute percent error to select the best fitting models.

Click the Select button to the right of the Selection Criterion field. This opens a list of statistics of fit, as shown in Figure 43.12.

Figure 43.12 Choosing the Model Selection Criterion

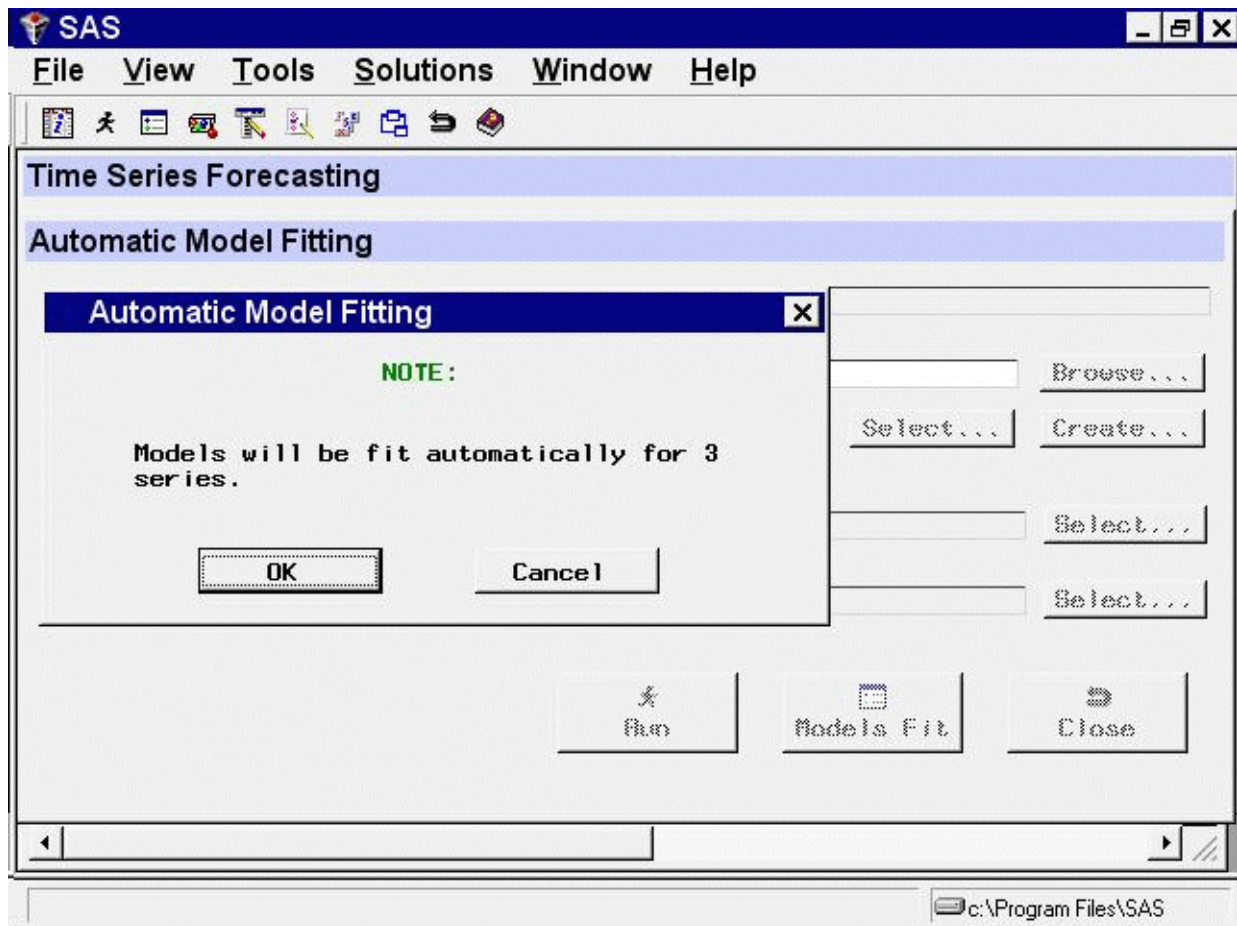

Select *Mean Absolute Percent Error* and then select the OK button. The Automatic Model Fitting window now appears as shown in [Figure 43.13](#).

Figure 43.13 Automatic Model Fitting Window

Now that all the options are set appropriately, select the Run button.

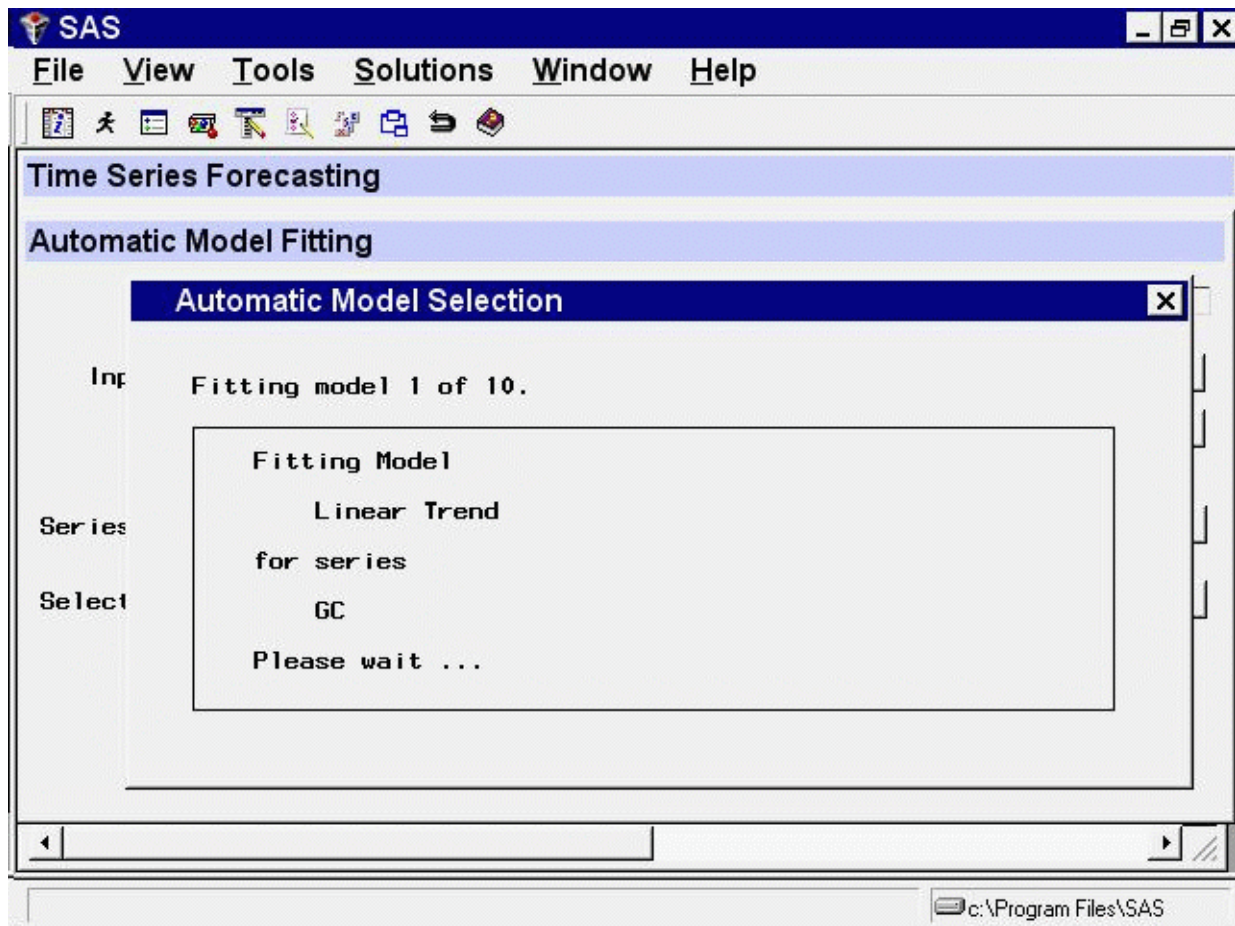

The Forecasting System now displays a notice, shown in [Figure 43.14](#), confirming that models will be fit for three series using the automatic forecasting model search feature. This prompt is displayed because it is possible to fit models for a large number of series at once, which might take a lot of time. So the system gives you a chance to cancel if you accidentally ask to fit models for more series than you intended. Select the OK button.

Figure 43.14 Automatic Model Fitting Note

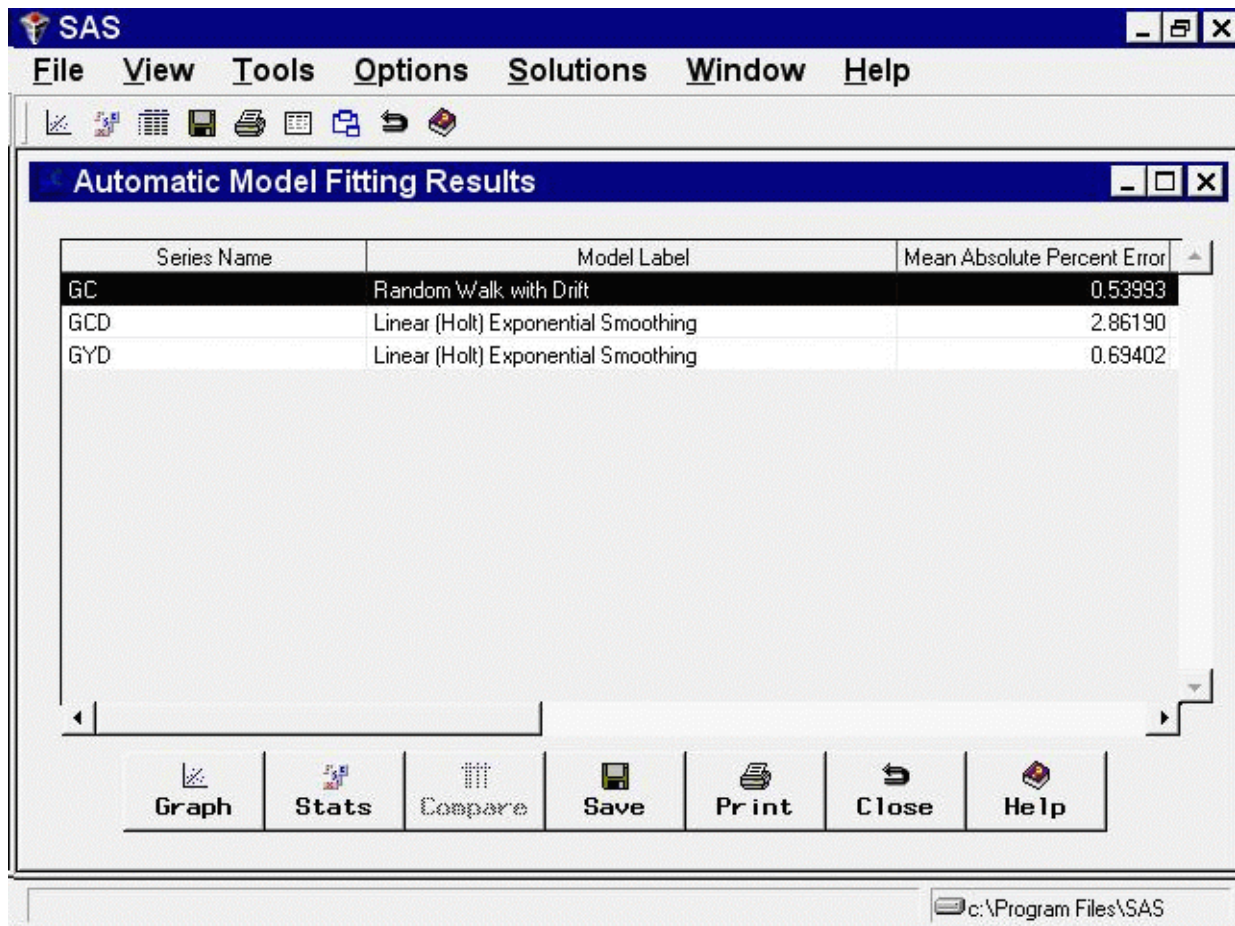

The system now fits several forecasting models to each of the three series you selected. While the models are being fit, the Forecasting System displays notices indicating what it is doing so that you can observe its progress, as shown in [Figure 43.15](#).

Figure 43.15 “Working” Notice

For each series, the system saves the model that produces the smallest mean absolute percent error. You can have the system save all the models fit by selecting *Automatic Fit* from the Options menu.

After the Automatic Model Fitting process has completed, the results are displayed in the Automatic Model Fitting Results window, as shown in [Figure 43.16](#).

Figure 43.16 Automatic Model Fitting Results

This resizable window shows the list of series names and descriptive labels for the forecasting models chosen for them, as well as the values of the model selection criterion and other statistics of fit. Select the Close button.

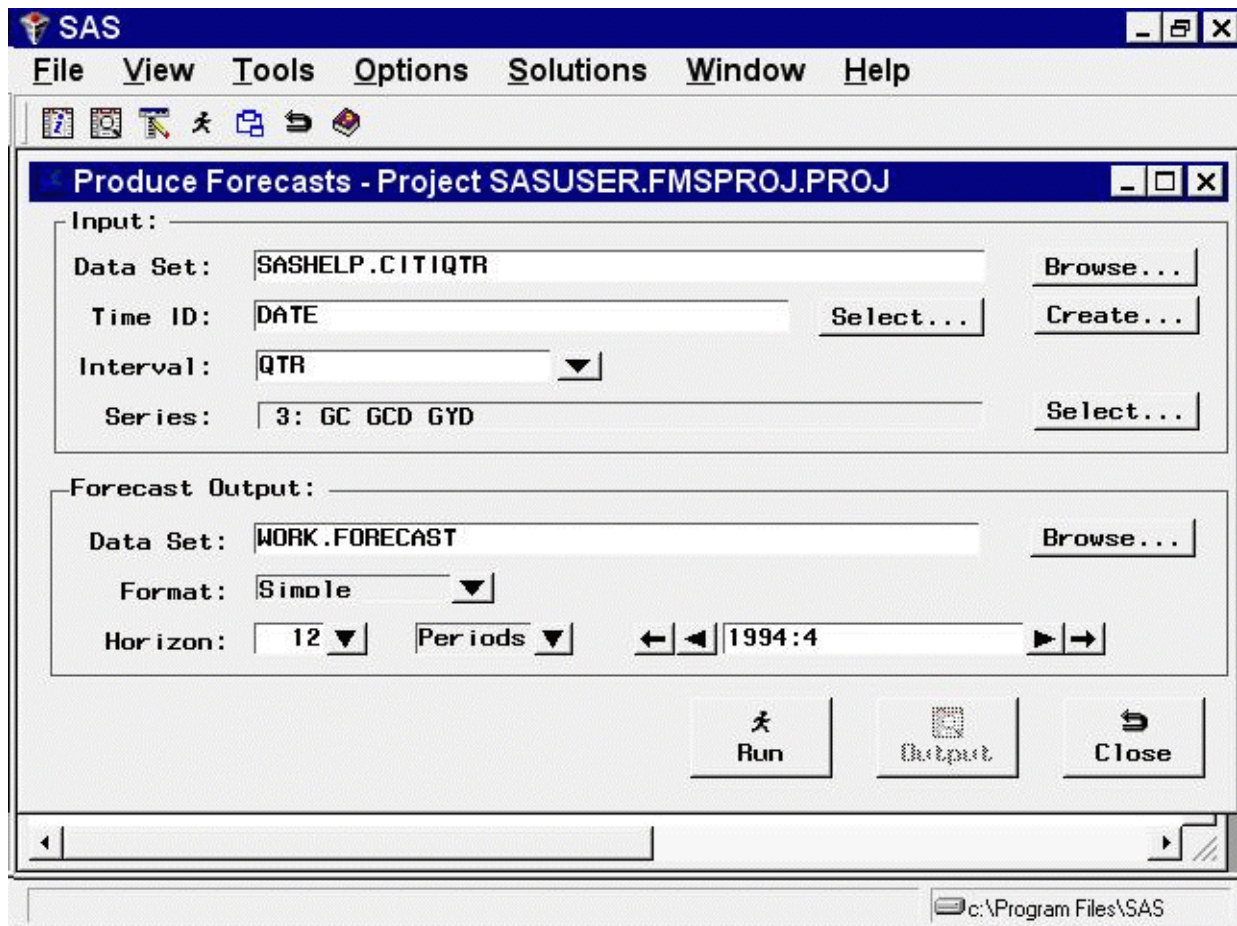

This returns you to the Automatic Model Fitting window. You can now fit models for other series in this data set or change to a different data set and fit models for series in the new data set.

Select the Close button to return to the Time Series Forecasting window.

Produce Forecasts Window

Now that you have forecasting models for these three series, you are ready to produce forecasts. Select the Produce Forecasts button. This opens the Produce Forecasts window, as shown in [Figure 43.17](#).

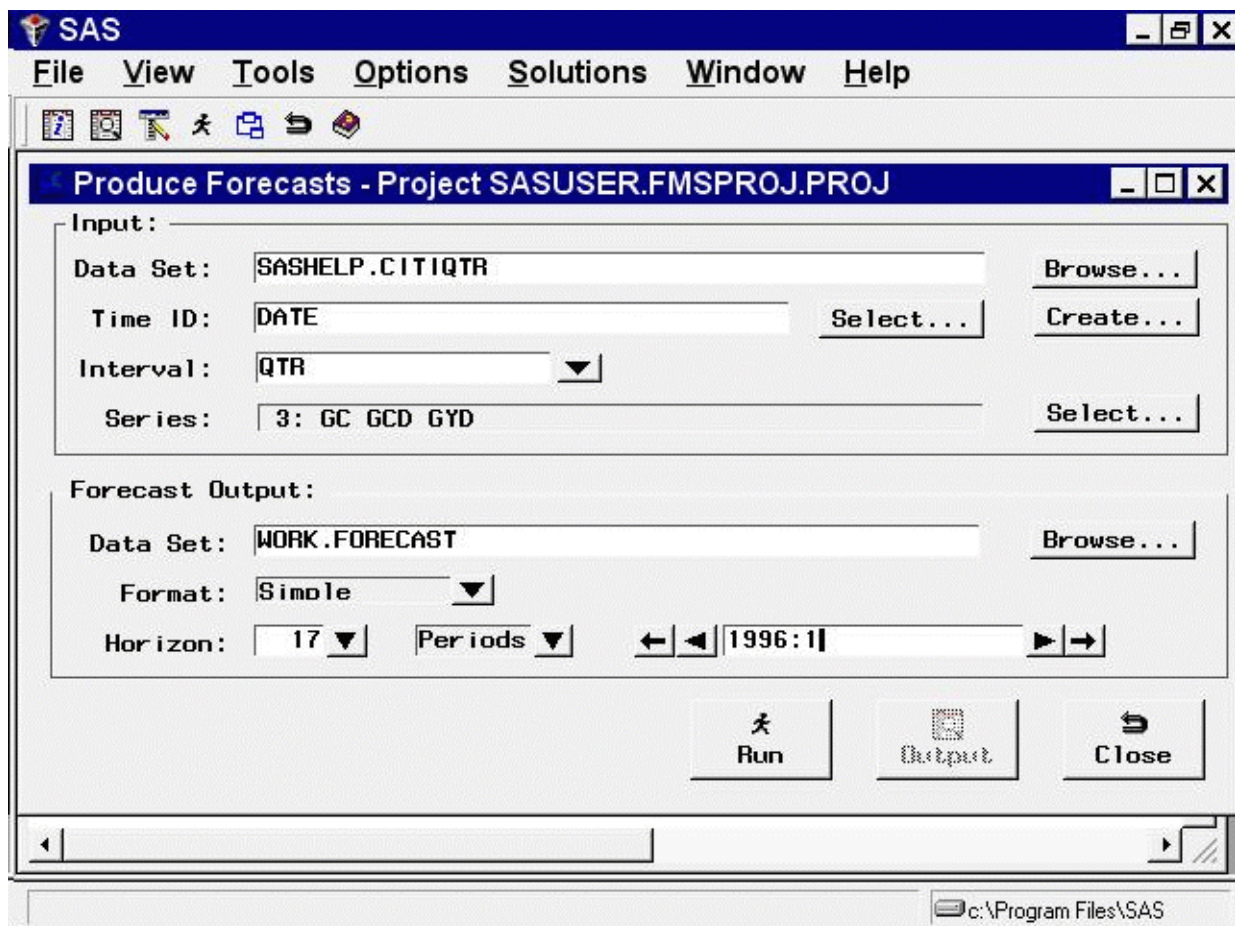

Figure 43.17 Produce Forecasts Window

The Produce Forecasts window shows the input data set information and indicates the variables in the input data set for which forecasting models exist. Forecasts will be produced for these series. If you want to produce forecasts for only some of these series, use the Select button at the right of the Series field to select the series to forecast. The Data Set field in the Forecast Output box contains the name of the SAS data set in which the system will store the forecasts. The default output data set is WORK.FORECAST.

You can set the forecast horizon by using the controls on the line labeled Horizon. The default horizon is 12 periods. You can change it by specifying the number of periods, number of years, or the date of the last forecast period. Position the cursor in the date field and change the forecast ending date to 1 January 1996 by typing jan1996 and pressing the ENTER key.

The window now appears as shown in [Figure 43.18](#).

Figure 43.18 Produce Forecasts Window

Now select the Run button to produce the forecasts. The system indicates that the forecasts have been stored in the output data set. Select OK to dismiss the notice.

The Forecast Data Set

The Forecasting System can save the forecasts to a SAS data set in three different formats. Depending on your needs, you might find one of these output formats more convenient. The output data set format is controlled by the `Format` combo box. You can select the following output formats. The simple format is the default.

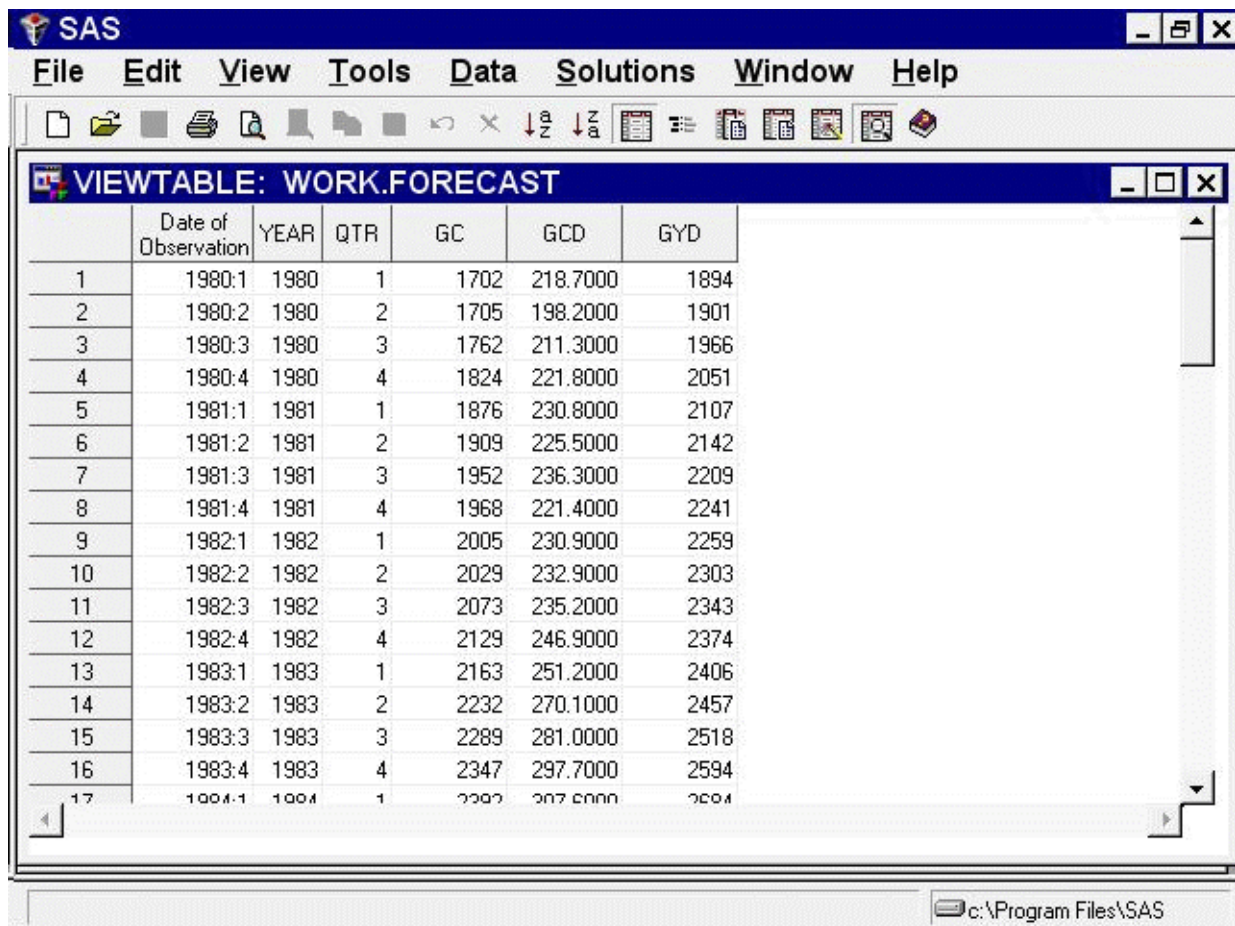

Simple	The data set contains time ID variables and the forecast variables, and it contains one observation per time period. Observations for earlier time periods contain actual values copied from the input data set; later observations contain the forecasts.
Interleaved	The data set contains time ID variables, the variable <code>TYPE</code> , and the forecast variables. There are several observations per time period, with the meaning of each observation identified by the <code>TYPE</code> variable.

Concatenated The data set contains the variable **SERIES**, time ID variables, and the variables **ACTUAL**, **PREDICT**, **ERROR**, **UPPER**, **LOWER**, and **STD**. There is one observation per time period per forecast series. The variable **SERIES** contains the name of the forecast series, and the data set is sorted by **SERIES** and **DATE**.

Simple Format Forecast Data Set

To see the simple format forecast data set that the system created, select the **Output** button. This opens a **VIEWTABLE** window to display the data set, as shown in [Figure 43.19](#).

Figure 43.19 Forecast Data Set—Simple Format

The screenshot shows the SAS VIEWTABLE: WORK.FORECAST window. The table contains 17 observations with columns for Date of Observation, YEAR, QTR, GC, GCD, and GYD. The data represents quarterly forecasts from 1980 to 1984.

	Date of Observation	YEAR	QTR	GC	GCD	GYD
1	1980:1	1980	1	1702	218.7000	1894
2	1980:2	1980	2	1705	198.2000	1901
3	1980:3	1980	3	1762	211.3000	1966
4	1980:4	1980	4	1824	221.8000	2051
5	1981:1	1981	1	1876	230.8000	2107
6	1981:2	1981	2	1909	225.5000	2142
7	1981:3	1981	3	1952	236.3000	2209
8	1981:4	1981	4	1968	221.4000	2241
9	1982:1	1982	1	2005	230.9000	2259
10	1982:2	1982	2	2029	232.9000	2303

15	1983:3	1983	3	2289	281.0000	2518
16	1983:4	1983	4	2347	297.7000	2594
17	1984:1	1984	1	2397	307.6000	2694

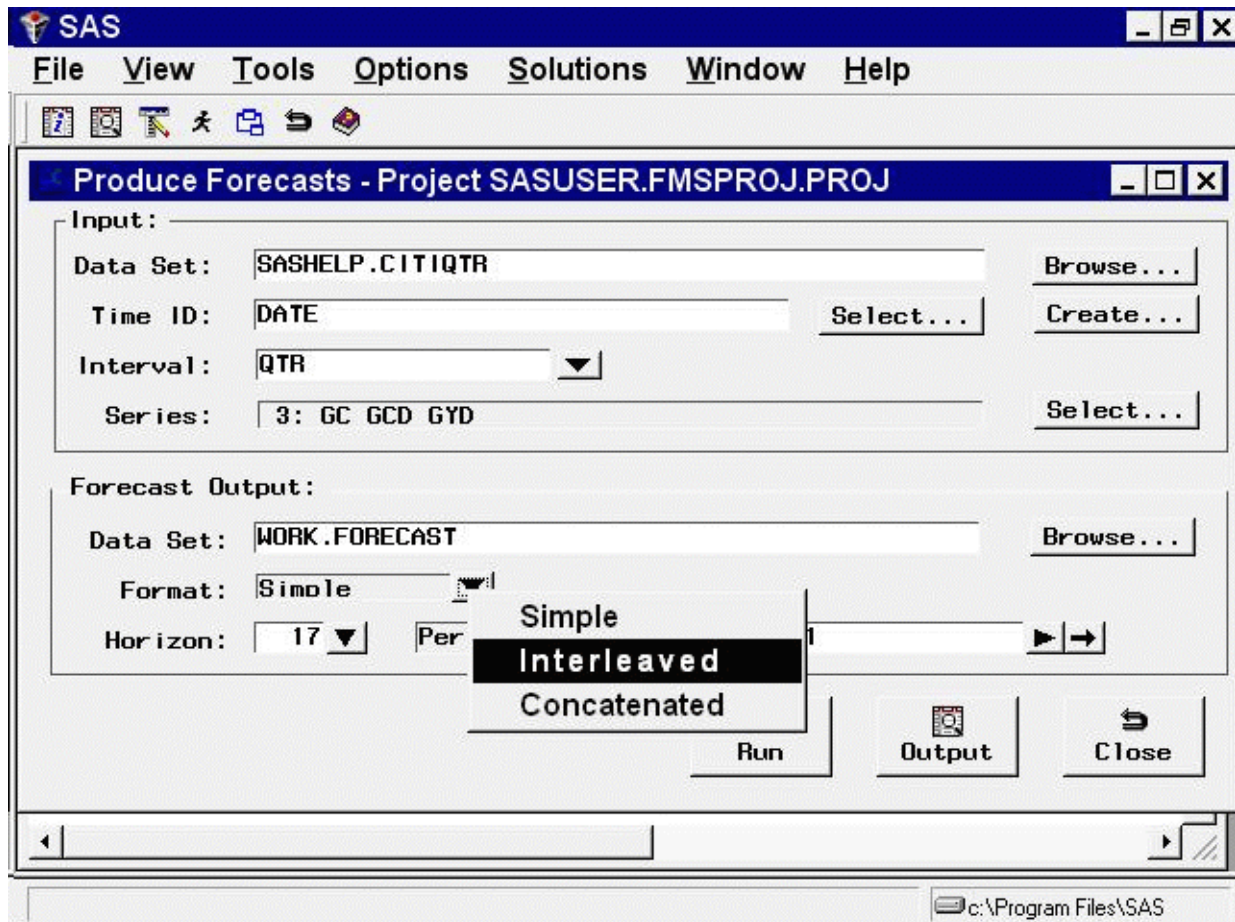

[Figure 43.19](#) shows the default simple format. This form of the forecast data set contains time ID variables and the variables that you forecast. The forecast variables contain actual values or predicted values, depending on whether the date of the observation is within the range of data supplied in the input data set.

Select **File** and **Close** to close the Viewtable window.

Interleaved Format Forecast Data Set

From the Produce Forecasts window, use the list to select the *Interleaved* format, as shown in Figure 43.20.

Figure 43.20 Forecast Data Set Options

Now select the Run button again. The system presents a warning notice reminding you that the data set WORK.FORECAST already exists and asking if you want to replace it. Select *Replace*.

The forecasts are stored in the data set WORK.FORECAST again, this time in the *Interleaved* format. Dismiss the notice that the forecast was stored.

Now select the Output button again. This opens a Viewtable window to display the data set, as shown in Figure 43.21.

Figure 43.21 Forecast Data Set—Interleaved Format

	Date of Observation	YEAR	QTR	Type of Observation	GC	GCD	GYD
1	1980:1	1980	1	ACTUAL	1702	218.7000	1894

NOTE: Table has been opened in browse mode.

c:\Program Files\SAS

In the interleaved format, there are several output observations for each input observation, identified by the TYPE variable. The values of the forecast variables for observations with different TYPE values are as follows.

ACTUAL	actual values copied from the input data set
ERROR	the difference between the actual and predicted values
LOWER	the lower confidence limits
PREDICT	the predicted values from the forecasting model. These are within-sample, one-step-ahead predictions for observations within the historical period, or multistep predictions for observations within the forecast period.
STD	the estimated standard deviations of the prediction errors
UPPER	the upper confidence limits

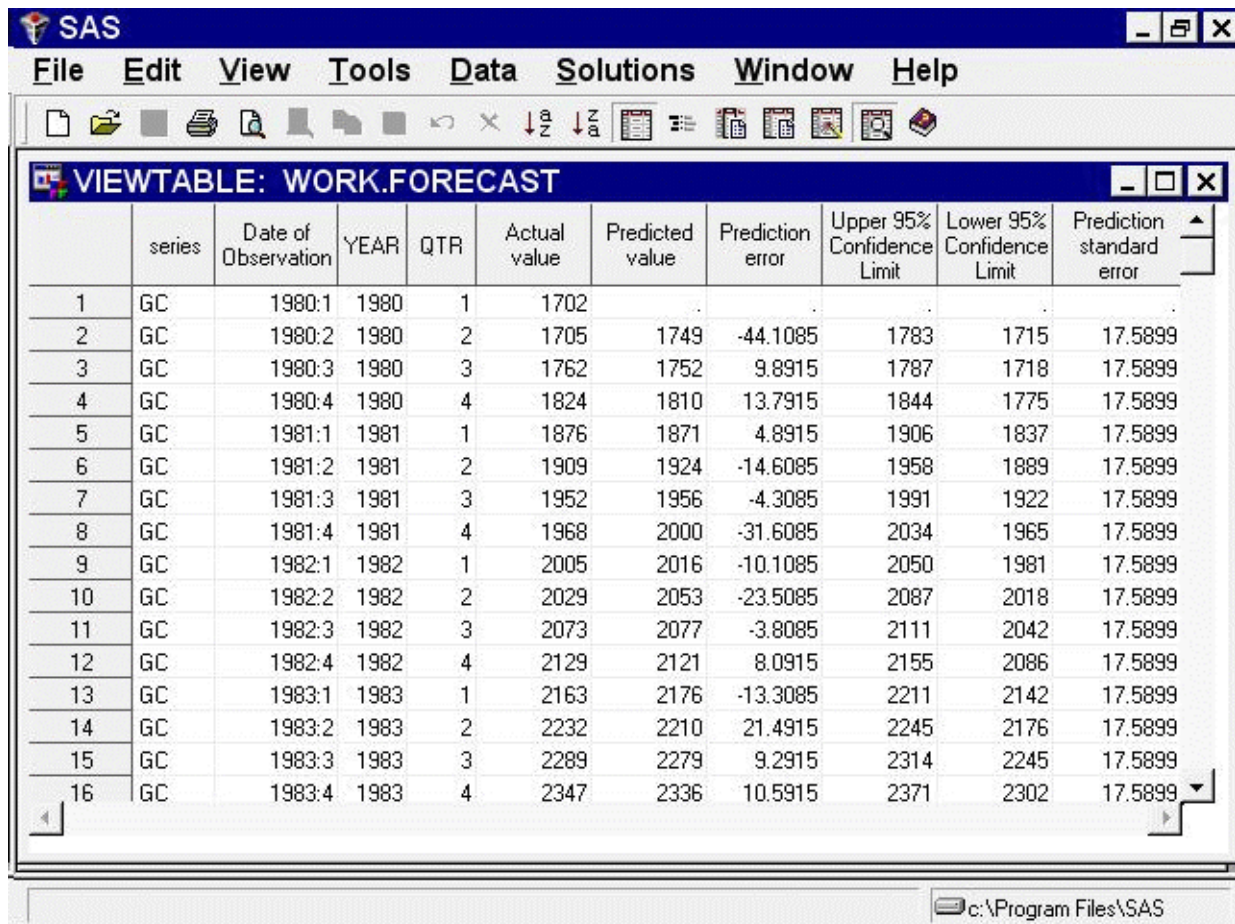

Select **File** and **Close** to close the VIEWTABLE window.

Concatenated Format Forecast Data Set

Use the list to select the `Concatenated` format. Create the forecast data set again, and then select the `Output` button.

The Viewtable window showing the concatenated format of the forecast data set appears, as shown in Figure 43.22.

Figure 43.22 Forecast Data Set—Concatenated Format

	series	Date of Observation	YEAR	QTR	Actual value	Predicted value	Prediction error	Upper 95% Confidence Limit	Lower 95% Confidence Limit	Prediction standard error
1	GC	1980:1	1980	1	1702					
2	GC	1980:2	1980	2	1705	1749	-44.1085	1783	1715	17.5899
3	GC	1980:3	1980	3	1762	1752	9.8915	1787	1718	17.5899

11	GC	1982:3	1982	3	2073	2077	-3.8085	2111	2042	17.5899
12	GC	1982:4	1982	4	2129	2121	8.0915	2155	2086	17.5899
13	GC	1983:1	1983	1	2163	2176	-13.3085	2211	2142	17.5899
14	GC	1983:2	1983	2	2232	2210	21.4915	2245	2176	17.5899
15	GC	1983:3	1983	3	2289	2279	9.2915	2314	2245	17.5899
16	GC	1983:4	1983	4	2347	2336	10.5915	2371	2302	17.5899

This completes the example of how to use the Produce Forecasts window. Select `File` and `Close` to close the Viewtable window. Select the `Close` button to return to the Time Series Forecasting window.

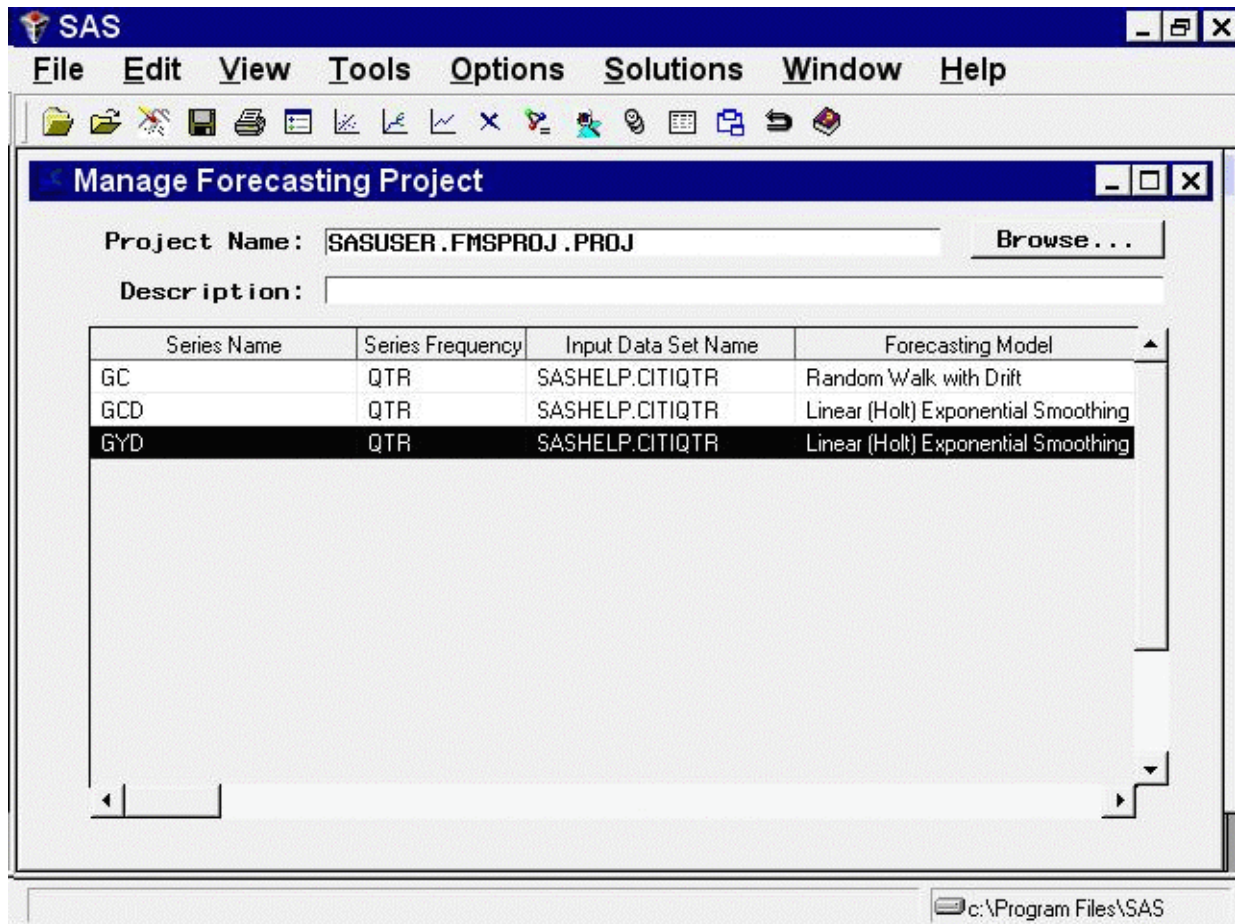

Forecasting Projects

The system collects all the forecasting models you create, together with the options you set, into a package called a *forecasting project*. You can save this information in a SAS catalog entry and restore your work in

later forecasting sessions. You can store any number of forecasting projects under different catalog entry names.

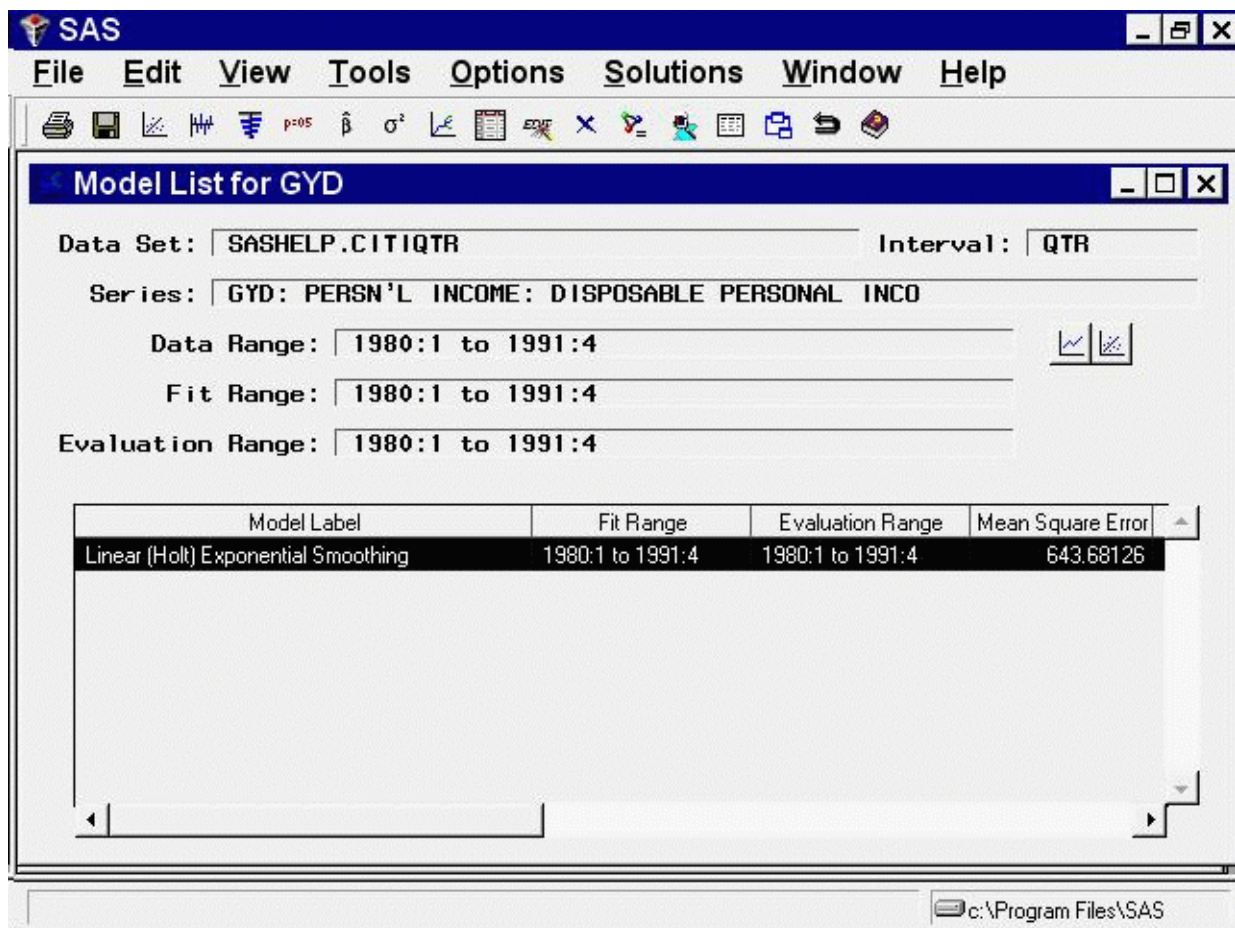

To see how this works, select the Manage Projects button. This opens the Manage Forecasting Project window, as shown in Figure 43.23.

Figure 43.23 Manage Forecasting Project Window

The table in this window lists the series for which forecasting models have been fit, and it shows for each series the forecasting model used to produce the forecasts. This window provides several features that allow you to manage the information in your forecasting project.

You can select a row of the table to drill down to the list of models fit to the series. Select the GYD row of the table, either by double-clicking with the mouse or by clicking once to highlight the table row and then selecting **List Models** from the toolbar or from the Tools menu. This opens the Model List window for this series, as shown in Figure 43.24.

Figure 43.24 Model List Window

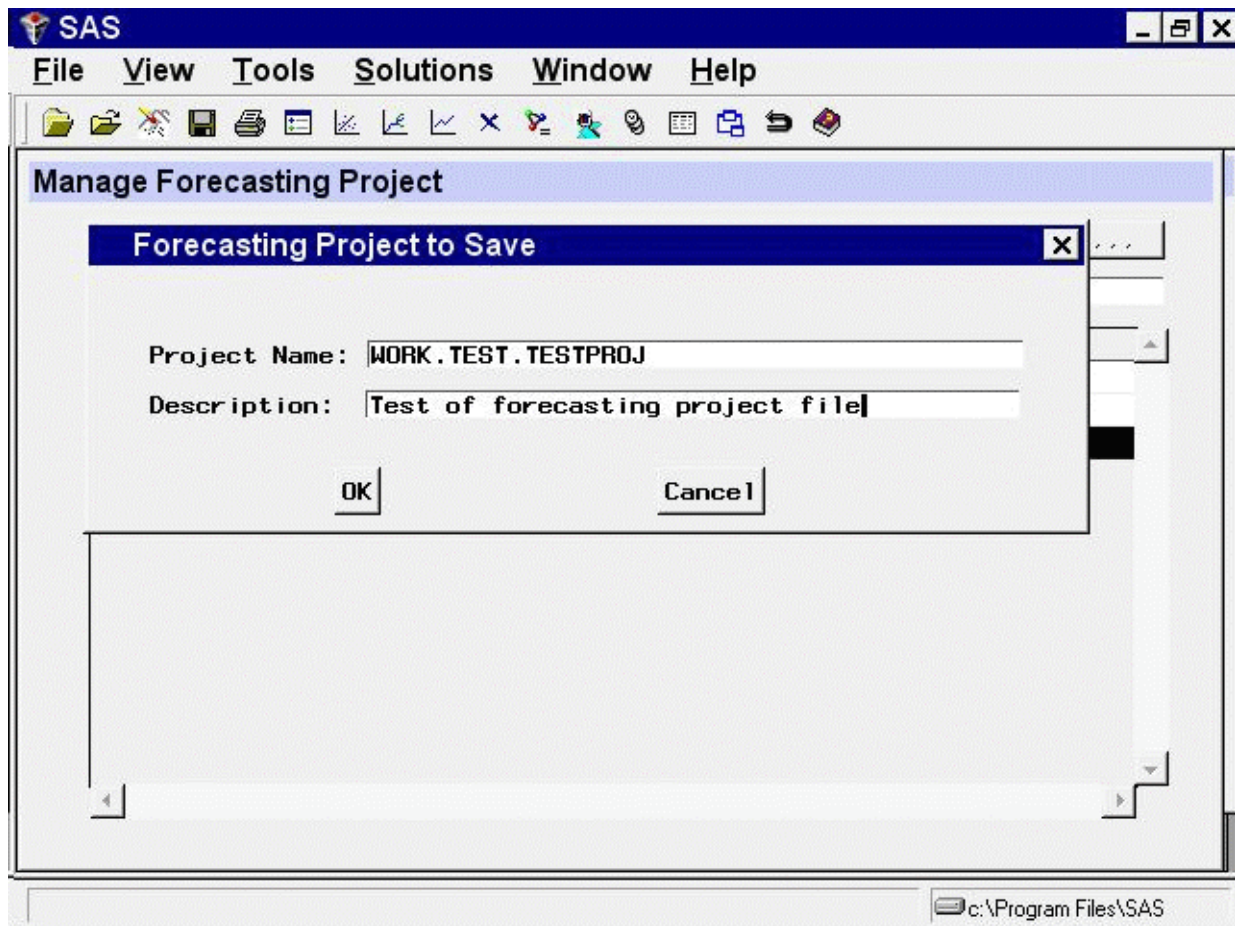

Because the Automatic Model Fitting process kept only the best fitting model, only one model appears in the model list. You can fit and retain any number of models for each series, and all the models fit and kept will appear in the series' model list.

Select **Close** from the toolbar or from the **File** menu to return to the Manage Forecasting Project window.

Saving and Restoring Project Information

To illustrate how you can save your work between sessions, in this section you will exit and then re-enter the Forecasting System.

From the Manage Forecasting Project window, select **File** and **Save as**. This opens the Forecasting Project to Save window. In the Project Name field, type the name WORK.TEST.TESTPROJ. In the Description field, type "Test of forecasting project file." The window should now appear as shown in Figure 43.25.

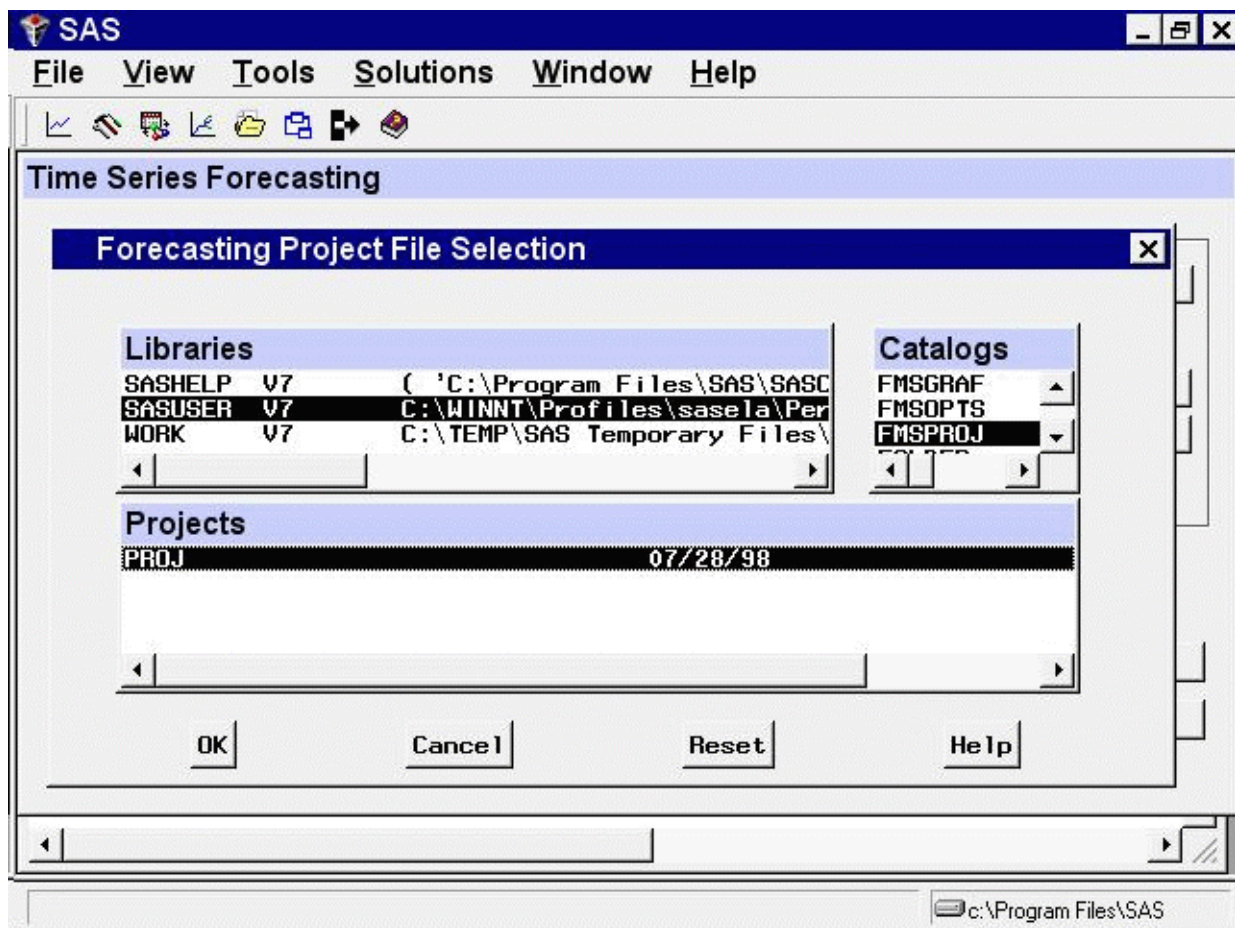

Figure 43.25 Project to Save Name and Description

Select the **OK** button. This returns you to the Project Management window and displays a message indicating that the project was saved.

Select **Close** from the toolbar or from the **File** menu to return to the Time Series Forecasting window. Now select the **Exit** button. The system asks if you are sure you want to exit the system; select **Yes**. The forecasting application now terminates.

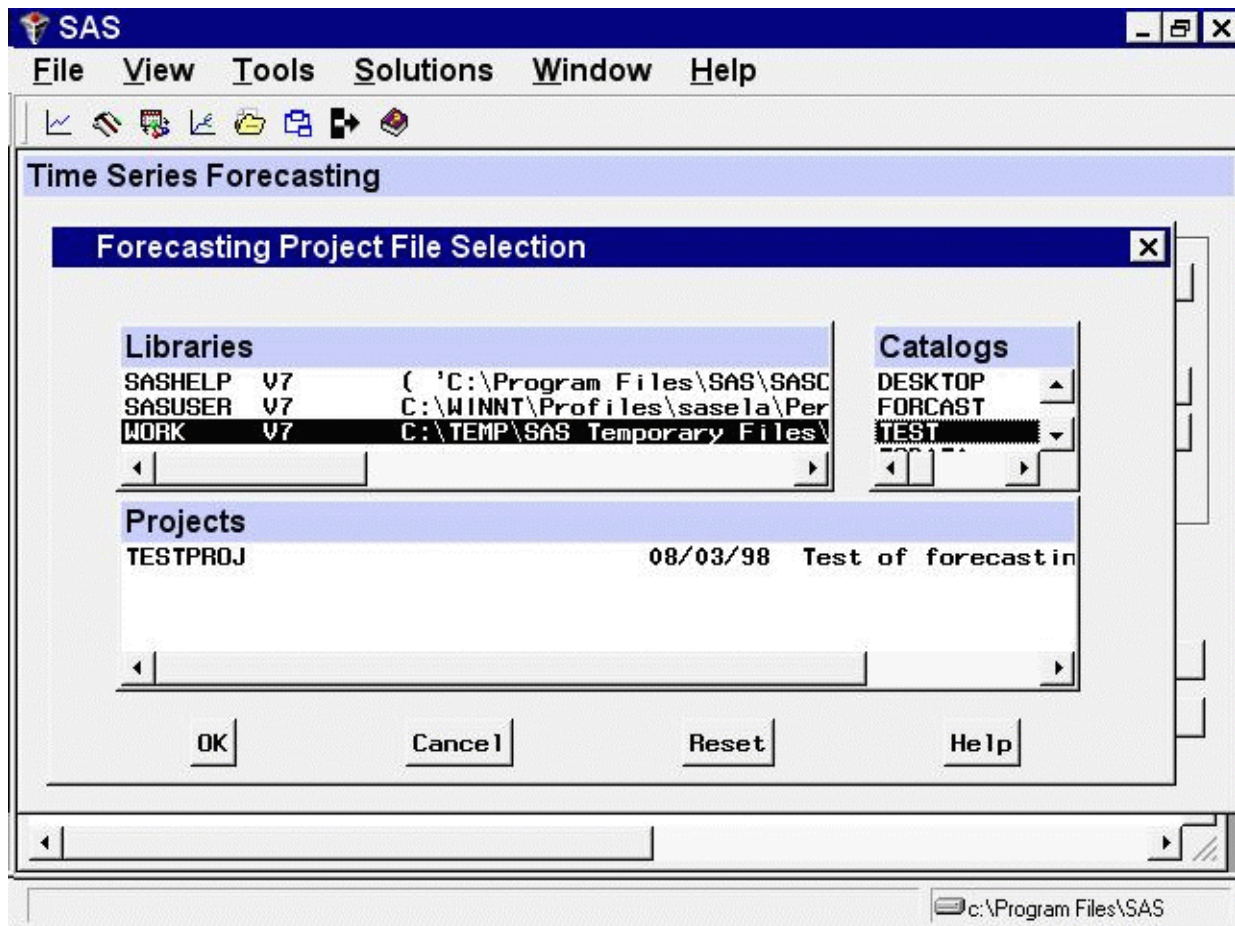

Open the forecasting application again. A new project name is displayed by default.

Now restore the forecasting project you saved previously. Select the **Browse** button to the right of the Project field. This opens the Forecasting Project File Selection window, as shown in [Figure 43.26](#).

Figure 43.26 Forecasting Project File Selection Window

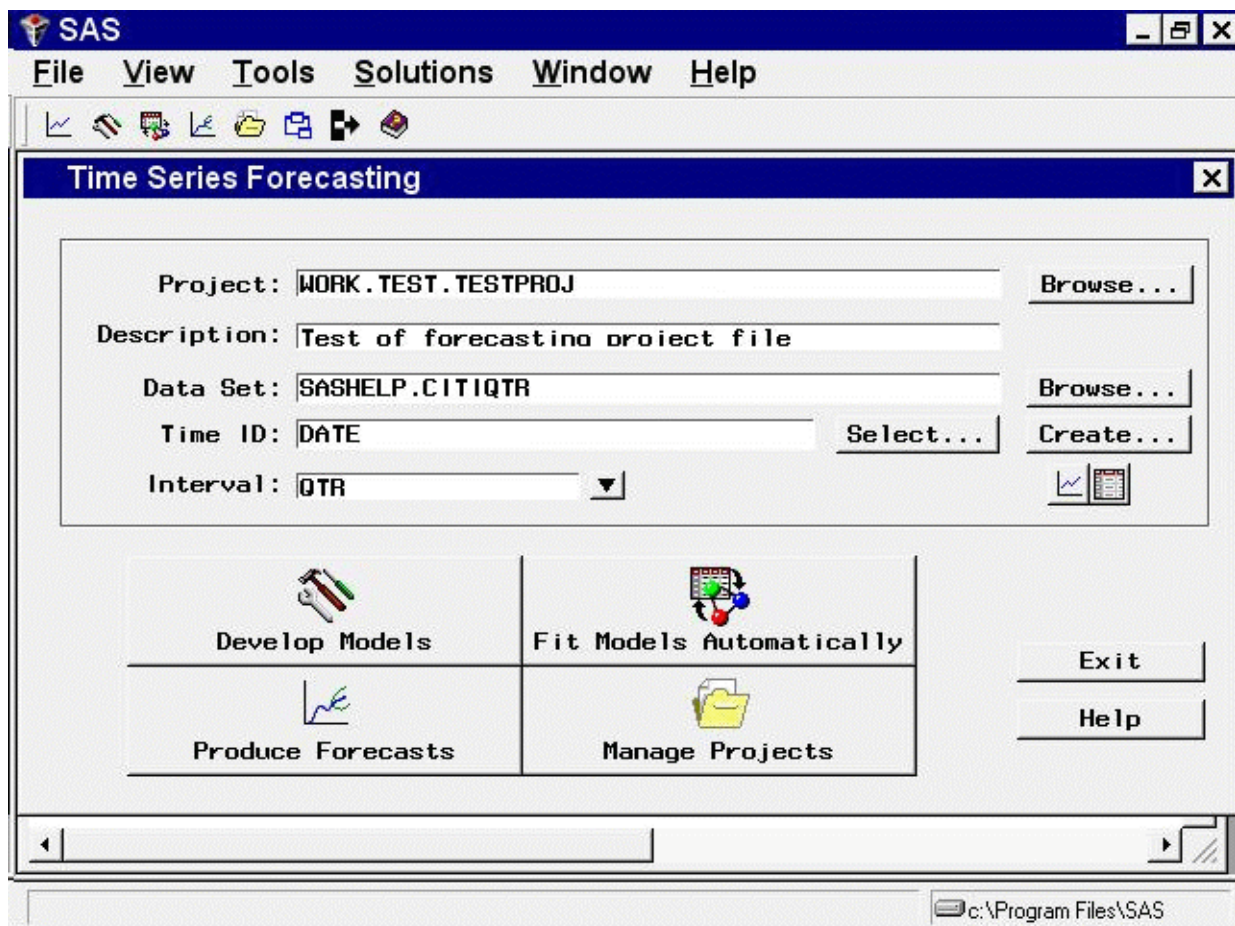

Select the WORK library from the Libraries list. The Catalogs list now shows all the SAS catalogs in the WORK library.

Select the TEST catalog. The Projects list now shows the list of forecasting projects in the catalog TEST. So far, you have created only one project file, TESTPROJ; so TESTPROJ is the only entry in the Projects list, as shown in Figure 43.27.

Figure 43.27 Forecasting Projects List

Select TESTPROJ from the Projects list and then select the OK button. This returns you to the Time Series Forecasting window.

The system loads the project information you saved in TESTPROJ and displays a message indicating this. The Project field is now set to WORK.TEST.TESTPROJ, and the description is the description you previously gave to TESTPROJ, as shown in [Figure 43.28](#).

Figure 43.28 Time Series Forecasting Window after Loading Project

If you now select the Manage Projects button, you will see the list of series and forecasting models you created in the previous forecasting session.

Sharing Projects

If you plan to work with others on a forecasting project, you might need to consider how project information can be shared. The series, models, and results of your project are stored in a forecasting project (FMSPROJ) catalog entry in the location you specify, as illustrated in the previous section. You need only read access to the catalog to work with it, but you must have write access to save the project. Multiple users cannot open a project for update at the same time, but they can do so at different times if they all have write access to the catalog where it is stored.

Project options settings such as the *model selection criterion* and *number of models to keep* are stored in an SLIST catalog entry in the SASUSER or TSFSUSER library. Write access to this catalog is required. If you have only read access to the SASUSER library, you can use the -RSASUSER option when starting SAS. You will be prompted for a location for the TSFSUSER library, if it is not already assigned. If you want to use TSFSUSER routinely, assign it before you start the Time Series Forecasting System. Select New from

the SAS Explorer file menu. In the New Library window, type TSFSUSER for the name. Click the Browse button and select the directory or folder you want to use. Turn on the *enable at startup* option so this library will be assigned automatically in subsequent sessions.

The SASUSER library is typically used for private settings saved by individual users. This is the default location for project options. If a work group shares a single options catalog (SASUSER or TSFSUSER points to the same location for all users), then only one user can use the system at a time.

Develop Models Window

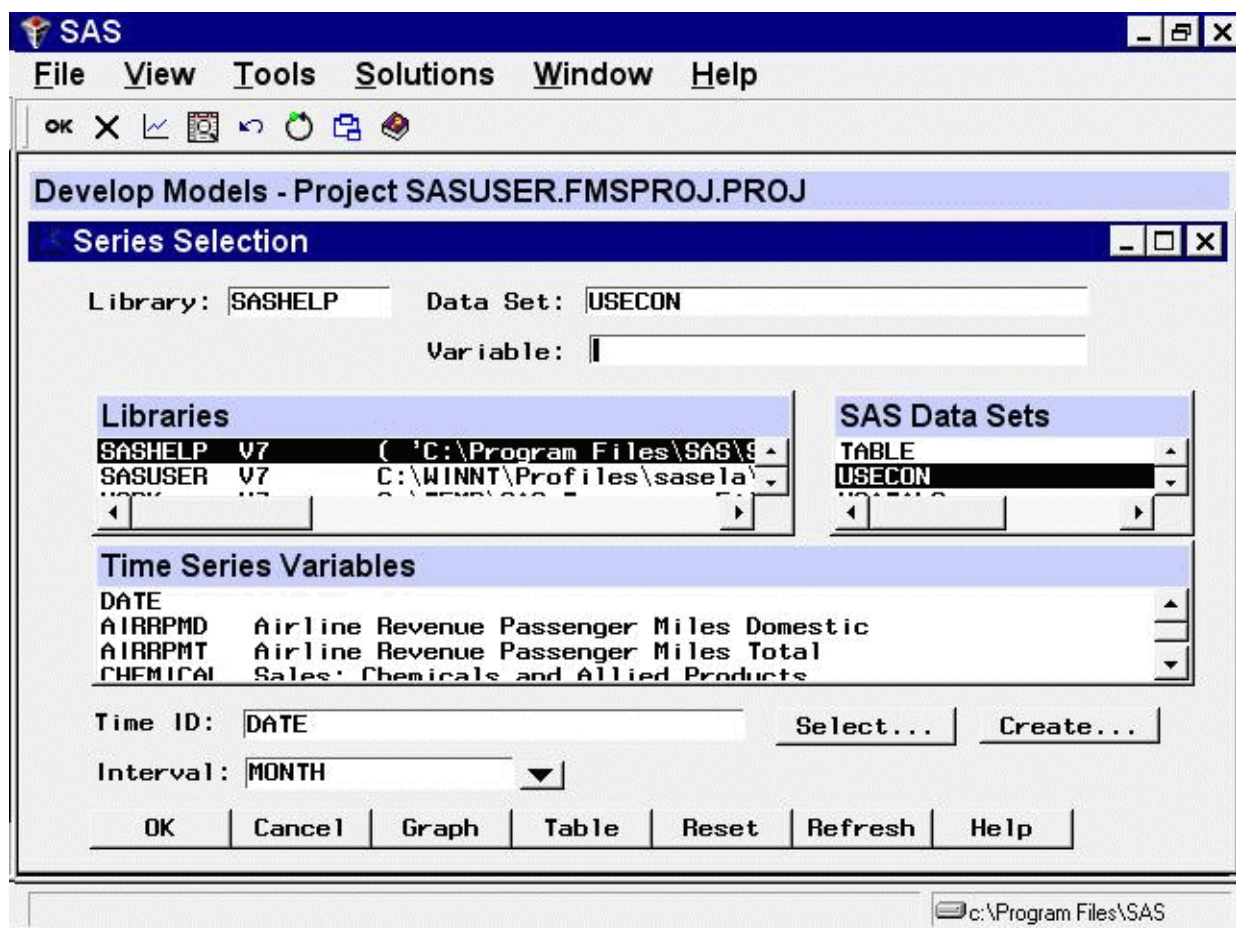

In the first forecasting example, you used the Automatic Model Fitting window to fit and select the forecasting model for each series automatically. In addition to this automatic forecasting process, you can also work with time series one at a time to fit forecasting models and apply your own judgment to choose the best forecasting model for each series.

Using the Automatic Model Fitting feature, the system acts like a “black box.” This section goes inside the black box to look at the kinds of forecasting methods that the system provides and introduces some of the tools the system offers to help you find the best forecasting model.

Introduction

From the Time Series Forecasting window, select the Browse button to the right of the Data Set field to open the Data Set Selection window. Select the USECON data set from the SASHELP library. This data set contains monthly data on the U.S. economy.

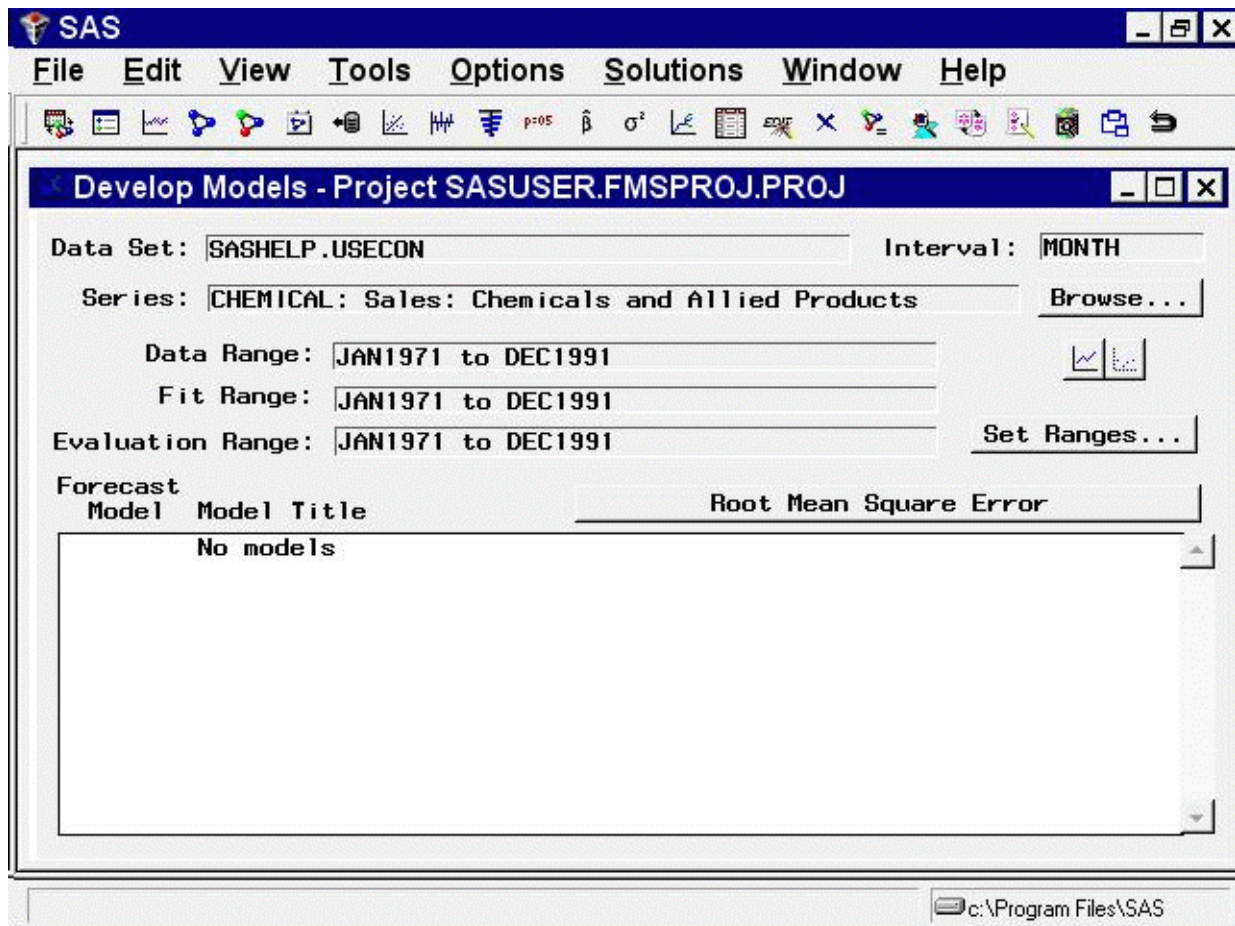

Select OK to close the selection window. Now select the Develop Models button. This opens the Series Selection window, as shown in [Figure 43.29](#). You can enlarge this window for easier viewing of lists of data sets and series.

Figure 43.29 Series Selection Window

Select the series CHEMICAL: Sales of Chemicals and Allied Products, and then select the OK button.

This opens the Develop Models window, as shown in Figure 43.30.

Figure 43.30 Develop Models Window

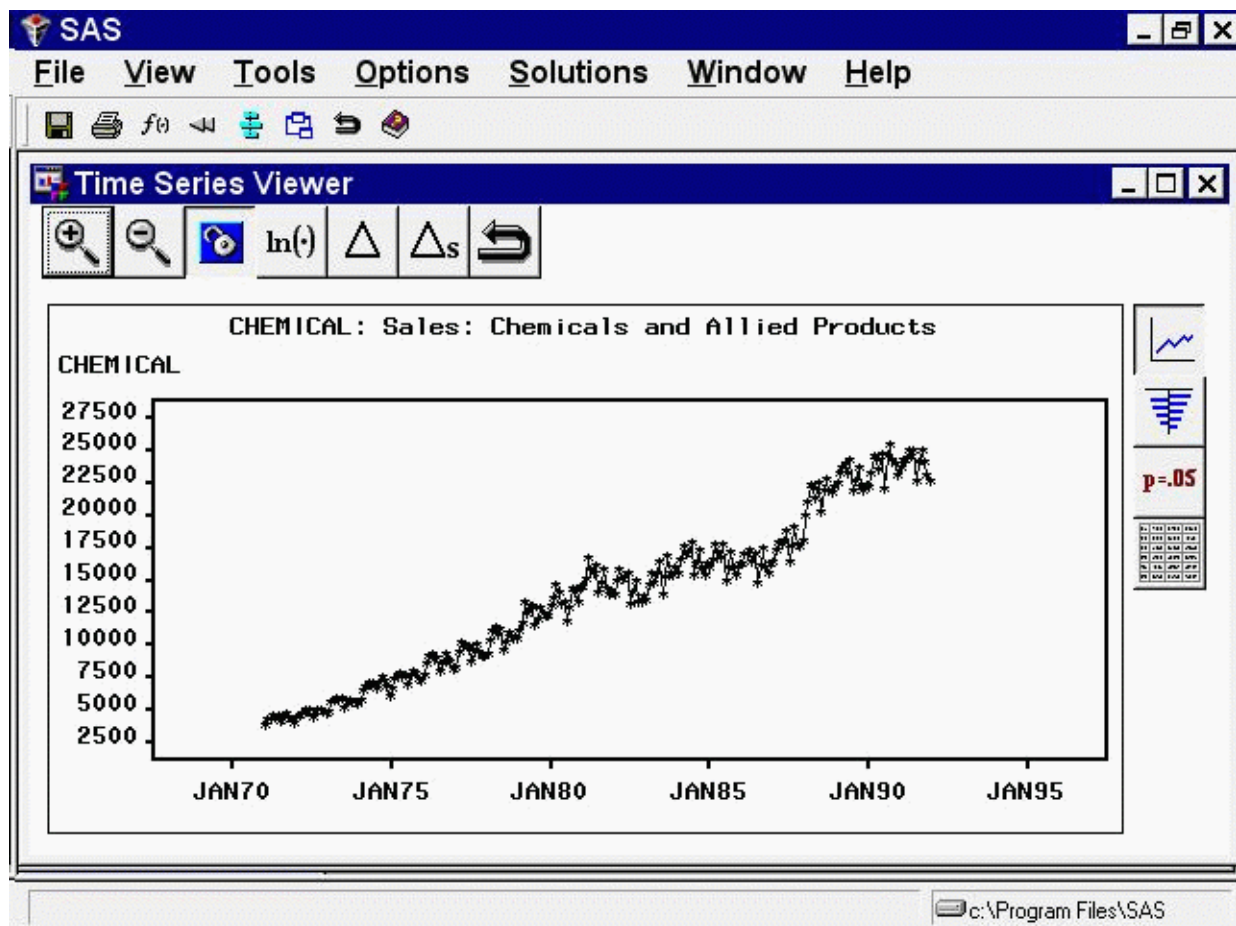

The Data Set, Interval, and Series fields in the upper part of the Develop Models window indicate the series with which you are currently working. You can change the settings of these fields by selecting the Browse button.

The Data Range, Fit Range, and Evaluation Range fields show the time period over which data are available for the current series, and what parts of that time period are used to fit forecasting models to the series and to evaluate how well the models fit the data. You can change the settings of these fields by selecting the Set Ranges button.

The bottom part of the Develop Models window consists of a table of forecasting models fit to the series. Initially, the list is empty, as indicated by the message “No models.” You can fit any number of forecasting models to each series and designate which one you want to use to produce forecasts.

Graphical tools are available for exploring time series and fitted models. The two icons below the Browse button access the Time Series Viewer and the Model Viewer.

Select the left icon. This opens the Time Series Viewer window, as shown in [Figure 43.31](#).

Figure 43.31 Chemical and Allied Product Series

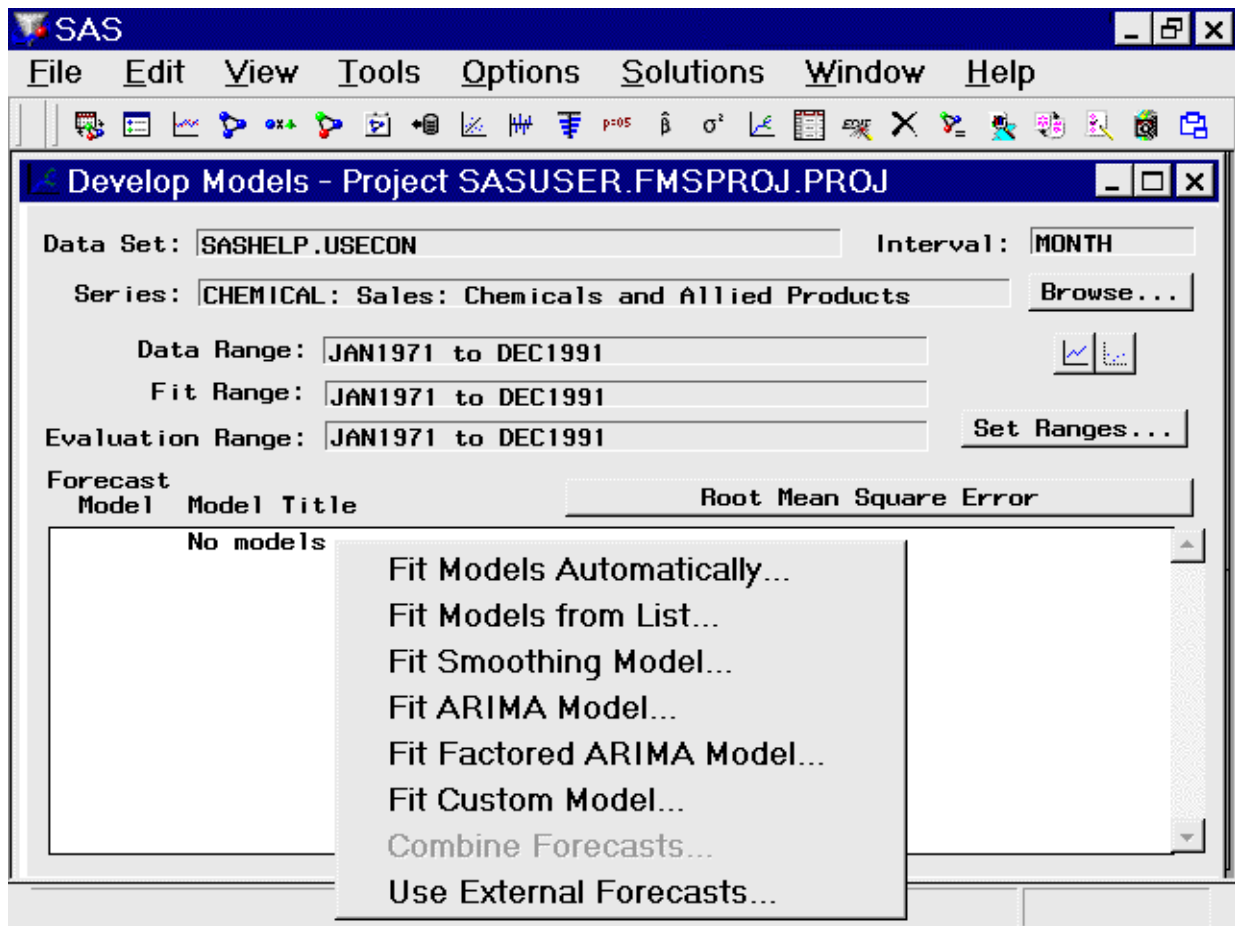

The Time Series Viewer displays a plot of the CHEMICAL series. The Time Series Viewer offers many useful features, which are explored in later sections.

The Time Series Viewer appears in a separate resizable window. You can switch back and forth between the Time Series Viewer window and other windows. For now, return to the Develop Models window. You can close the Time Series Viewer window or leave it open. (To close the Time Series Viewer window, select **Close** from the toolbar or from the File menu.)

Fitting Models

To open a menu of model fitting choices, select **Edit** from the menu bar and then select **Fit Model**, or select **Fit Models from List** in the toolbar, or simply select a blank line in the table as shown in Figure 43.32.

Figure 43.32 Menu of Model Fitting Choices

The Forecasting System provides several ways to specify forecasting models. The eight choices given by the menu shown in Figure 43.32 are as follows:

Fit Models Automatically

performs for the current series the same automatic model selection process that the Automatic Model Fitting window applies to a set of series.

Fit Models from List

presents a list of commonly used forecasting models for convenient point-and-click selection.

Fit Smoothing Model

displays the Smoothing Model Specification window, which enables you to specify several kinds of exponential smoothing and Winters method forecasting models.

Fit ARIMA Model

displays the ARIMA Model Specification window, which enables you to specify many kinds of autoregressive integrated moving average (ARIMA) models, including seasonal ARIMA models and ARIMA models with regressors, transfer functions, and other predictors.

Fit Factored ARIMA Model

displays the Factored ARIMA Model Specification window, which enables you to specify more general ARIMA models, including subset models and models with unusual and/or multiple seasonal cycles. It also supports regressors, transfer functions, and other predictors.

Fit Custom Model

displays the Custom Model Specification window, which enables you to construct a forecasting model by specifying separate options for transforming the data, modeling the trend, modeling seasonality, modeling autocorrelation of the errors, and modeling the effect of regressors and other independent predictors.

Combine Forecasts

displays the Forecast Combination Model Specification window, which enables you to specify models that produce forecasts by combining, or averaging, the forecasts from other models. (This option is not available unless you have fit at least two models.)

Use External Forecasts

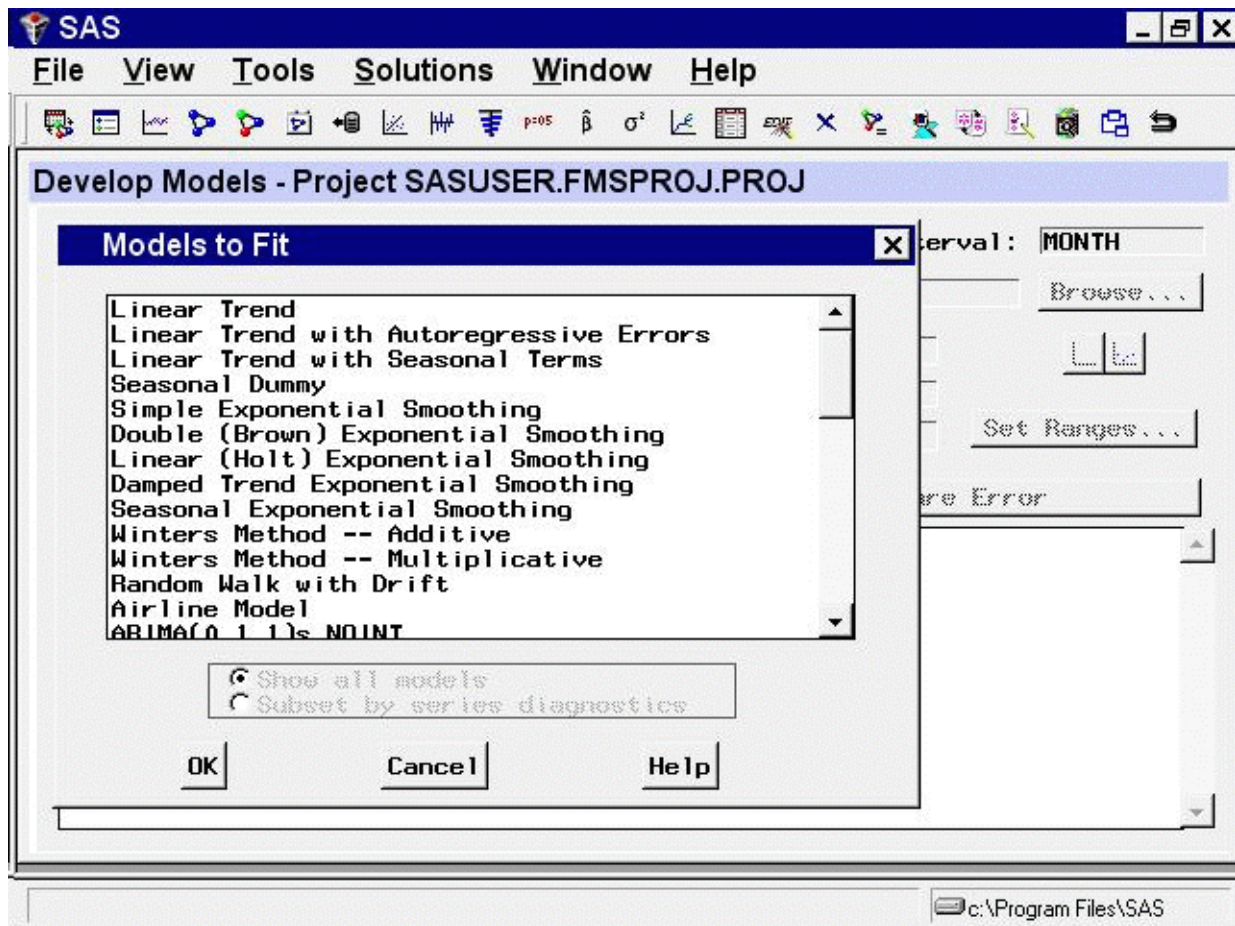

displays the External Forecast Model Specification window, which enables you to use judgmental or externally produced forecasts that have been saved in a separate series in the data set.

All of the forecasting models used by the system are ultimately specified through one of the four windows: Smoothing Method Specification, ARIMA Model Specification, Factored ARIMA Model Specification, or Custom Model Specification. You can specify the same models with either the ARIMA Model Specification window or the Custom Model Specification window, but the Custom Model Specification window can provide a more natural way to specify models for those who are less familiar with the Box-Jenkins style of time series model specification.

The Automatic Model feature, the Models to Fit window, and the Forecast Combination Model Specification window all deal with lists of forecasting models previously defined through the Smoothing Model, ARIMA Model, or Custom Model specification windows. These windows are discussed in detail in later sections.

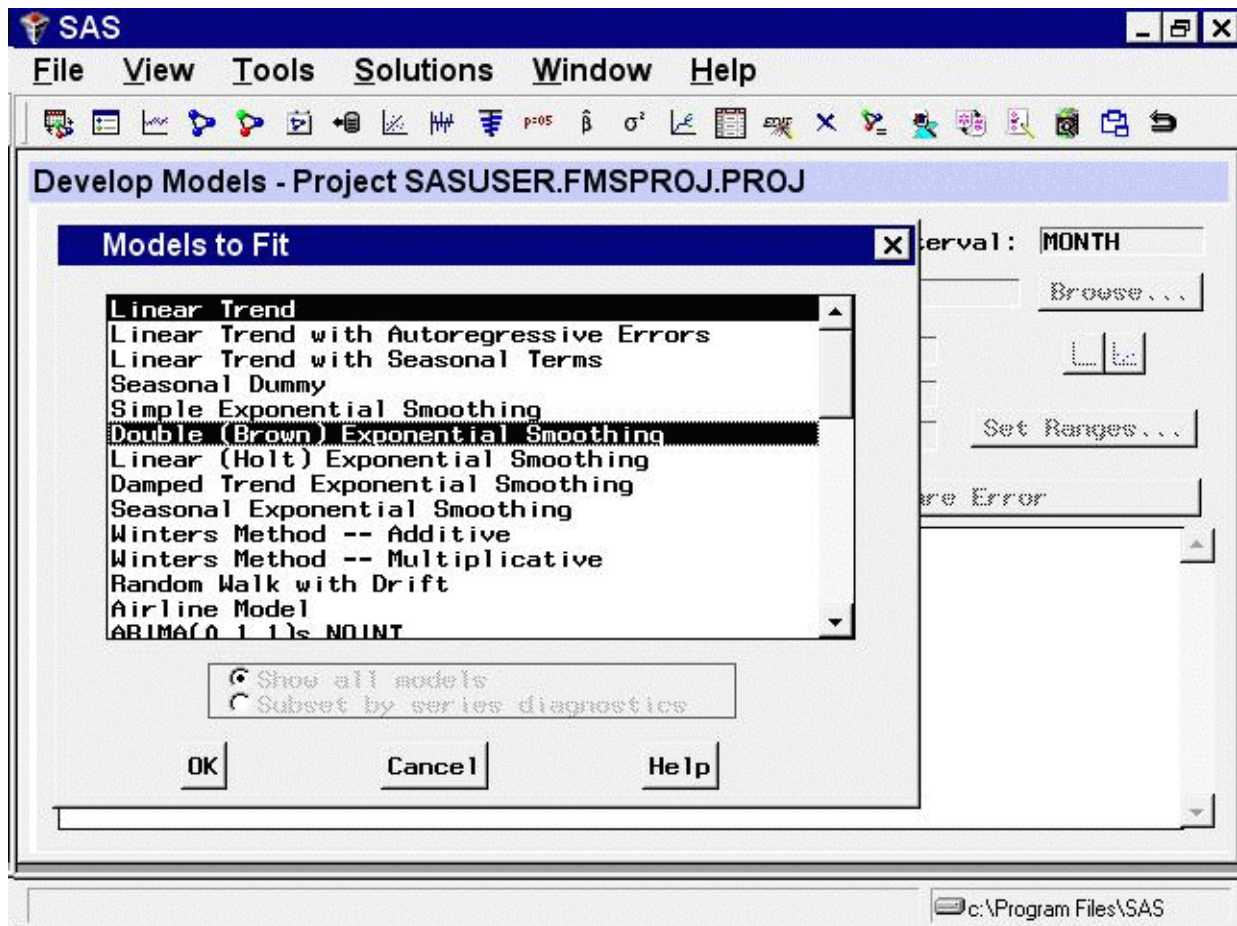

To get started using the Develop Models window, select the Fit Models from List item from the menu shown in [Figure 43.32](#). This opens the Models to Fit window, as shown in [Figure 43.33](#).

Figure 43.33 Models to Fit Window

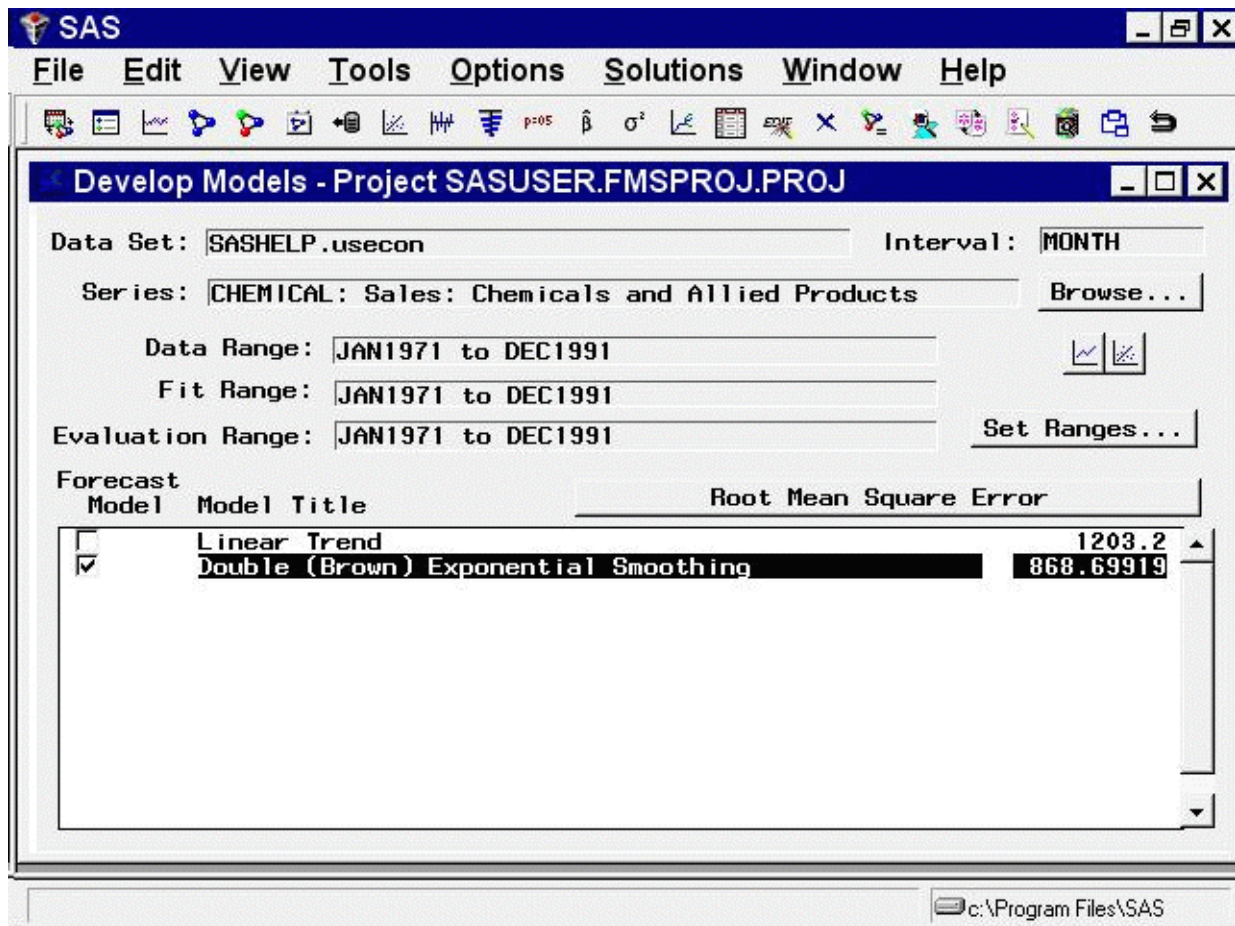

You can select several models to fit at once by holding down the CTRL key as you make the selections. Select **Linear Trend** and **Double (Brown) Exponential Smoothing**, as shown in [Figure 43.34](#), and then select the **OK** button.

Figure 43.34 Selecting Models to Fit

The system fits the two models you selected. After the models are fit, the labels of the two models and their goodness-of-fit statistic are added to the model table, as shown in [Figure 43.35](#).

Figure 43.35 Fitted Models List

Model List and Statistics of Fit

In the model list, the *Model Title* column shows the descriptive labels for the two fitted models, in this case Linear Trend and Double Exponential Smoothing.

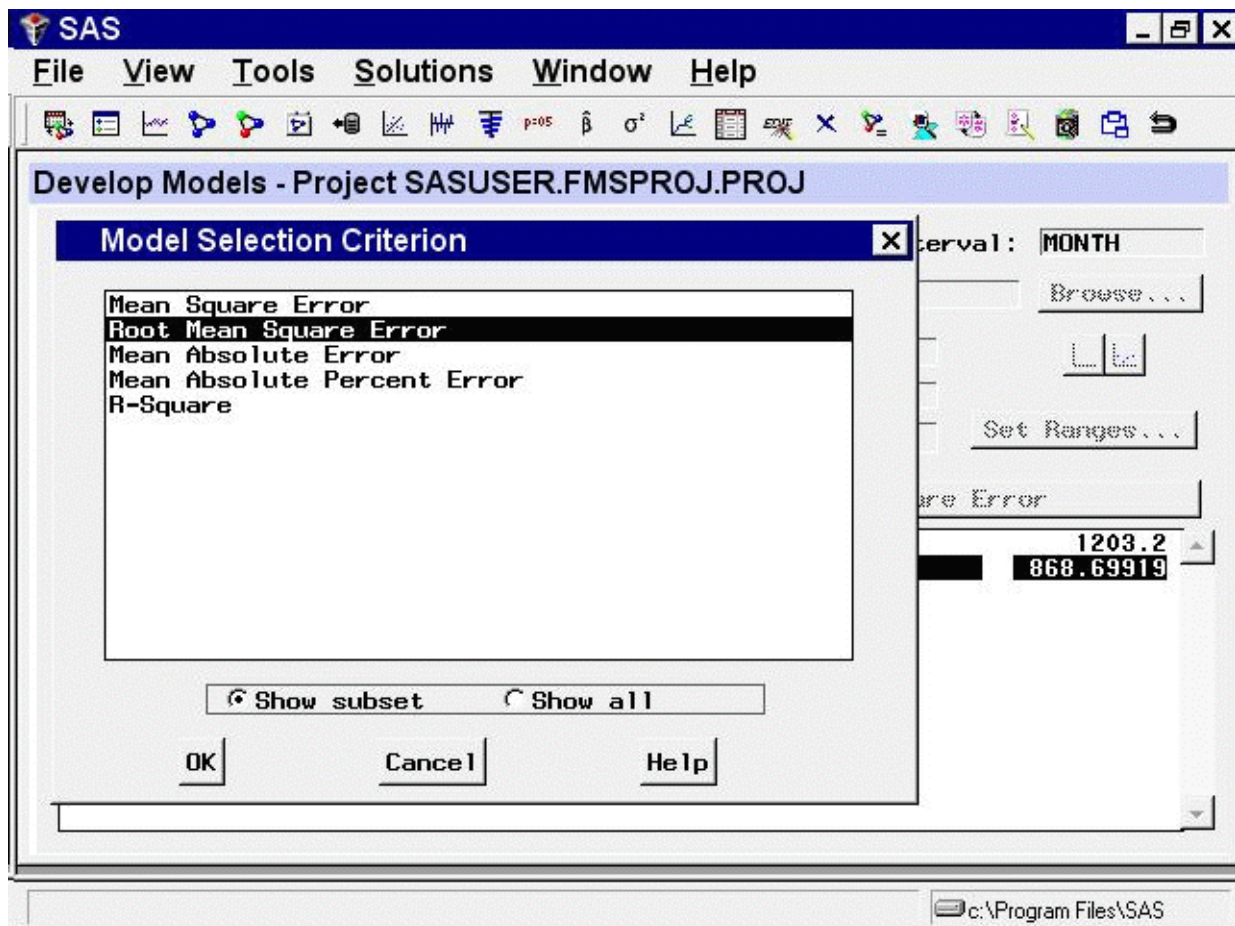

The column labeled *Root Mean Square Error* (or labeled *Mean Absolute Percent Error* if you continued from the example in the previous section) shows the goodness-of-fit criterion used to decide which model fits better. By default, the criterion used is the root mean square error, but you can choose a different measure of fit. The linear trend model has a root mean square error of 1203, while the double exponential smoothing model fits better, with a RMSE of only 869.

The left column labeled *Forecast Model* consists of check boxes that indicate which one of the models in the list has been selected as the model to use to produce the forecasts for the series. When new models are fit and added to the model list, the system sets the Forecast Model flags to designate the one model with the best fit—as measured by the selected goodness-of-fit statistic—as the forecast model. (In the case of ties, the first model with the best fit is selected.)

Because the Double Exponential Smoothing model has the smaller RMSE of the two models in the list, its Forecast Model check box is set. If you would rather produce forecasts by using the Linear Trend model, choose it by selecting the corresponding check box in the Forecast Model column.

To use a different goodness-of-fit criterion, select the button with the current criterion name on it (Root Mean Square Error or Mean Absolute Percent Error). This opens the Model Selection Criterion window, as shown in Figure 43.36.

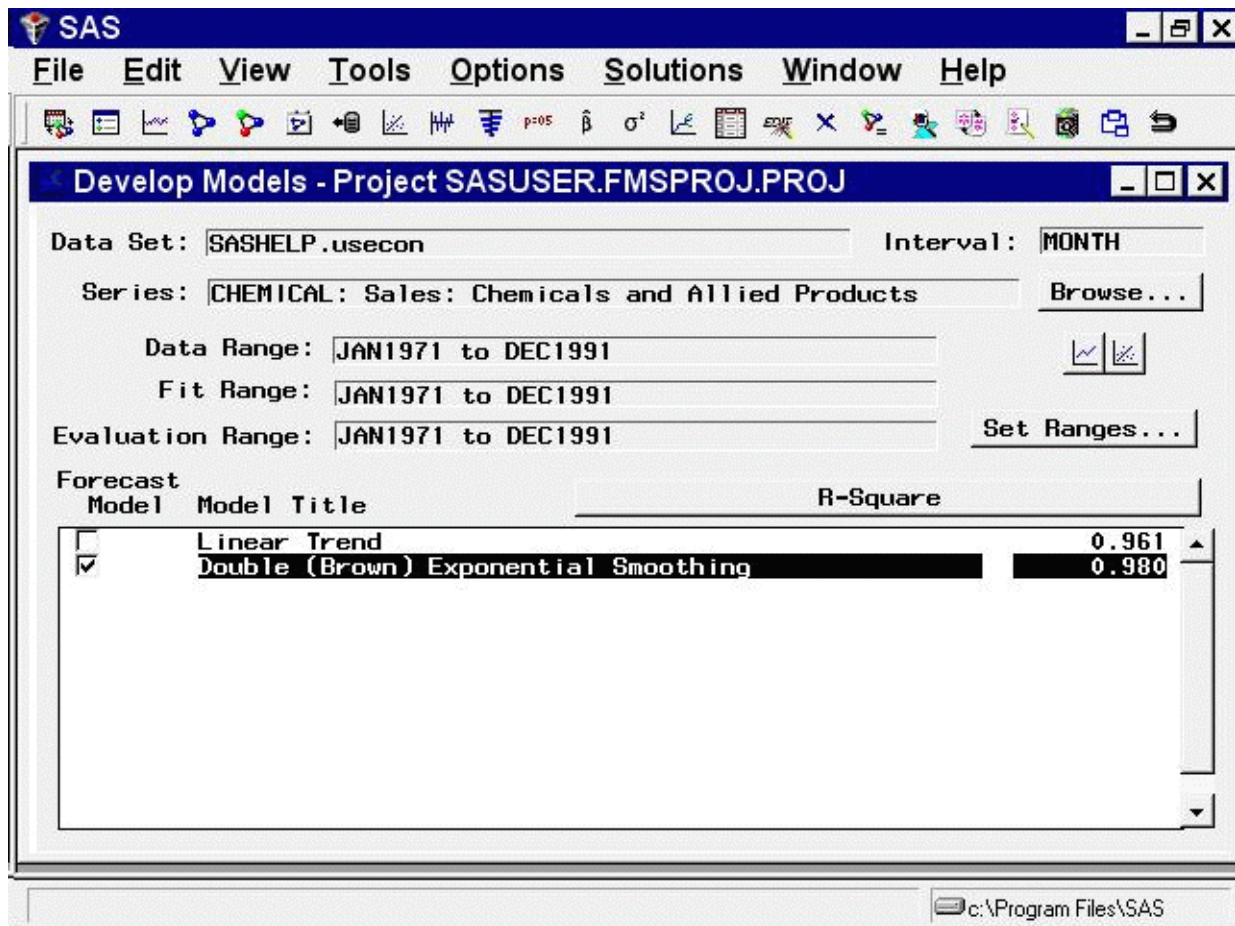

Figure 43.36 Model Selection Criterion Window

The system provides many measures of fit that you can use as the model selection criterion. To avoid confusion, only the most popular of the available fit statistics are shown in this window by default. To display the complete list, you can select the *Show all* option. You can control the subset of statistics listed in this window through the Statistics of Fit item in the Options menu on the Develop Models window.

Initially, Root Mean Square Error is selected. Select R-Square and then select the OK button. This changes the fit statistic displayed in the model list, as shown in Figure 43.37.

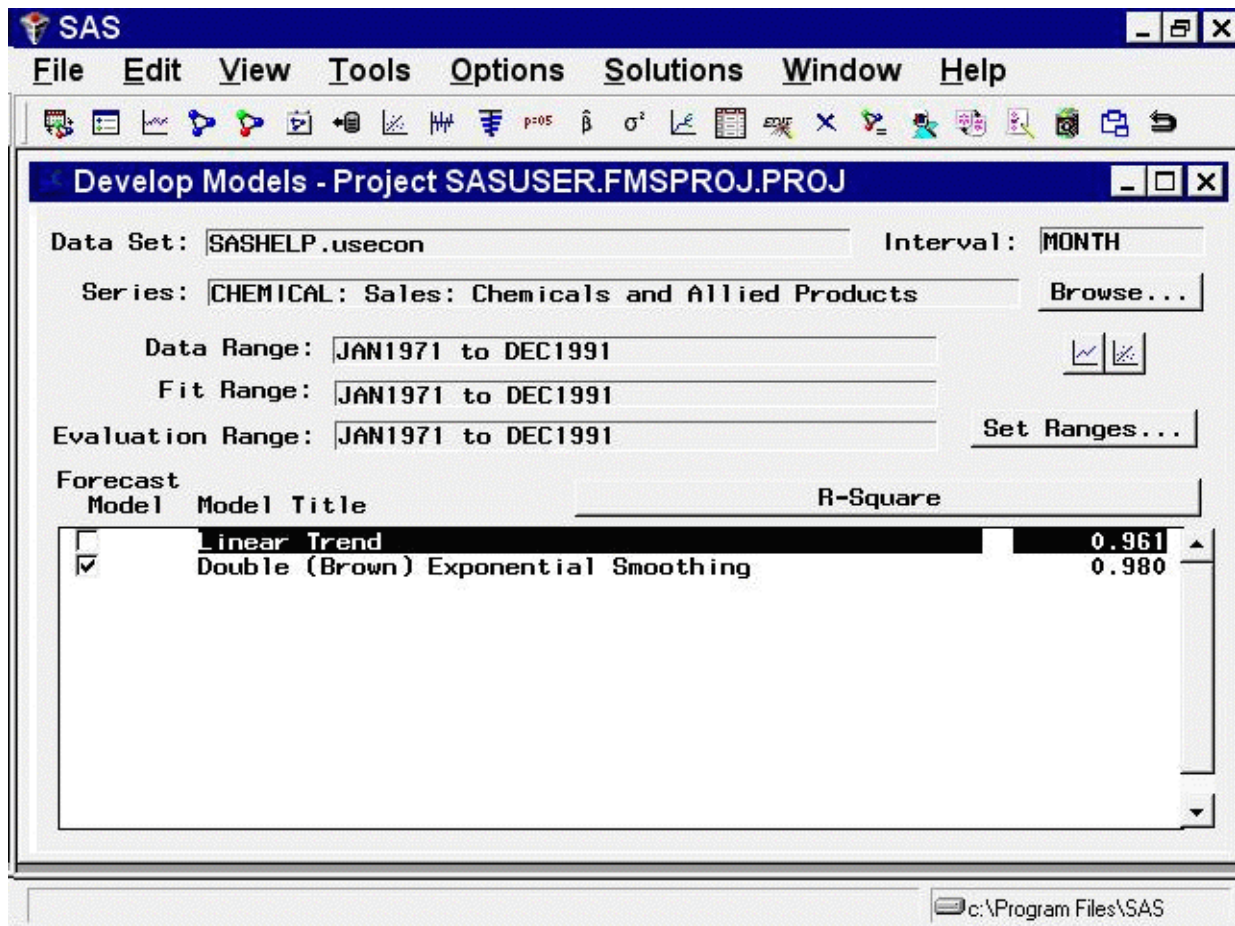

Figure 43.37 Model List with R-Square Statistics

Now that you have fit some models to the series, you can use the Model Viewer button to take a closer look at the predictions of these models.

Model Viewer

In the Develop Models window, select the row in the table containing the Linear Trend model so that this model is highlighted. The model list should now appear as shown in Figure 43.38.

Figure 43.38 Selecting a Model to View

Note that the Linear Trend model is now highlighted, but the Forecast Model column still shows the Double Exponential Smoothing model as the model chosen to produce the final forecasts for the series. Selecting a model in the list means that this is the model that menu items such as *View Model*, *Delete*, *Edit*, and *Refit* will act upon. Choosing a model by selecting its check box in the Forecast Model column means that this model will be used by the Produce Forecasts process to generate forecasts.

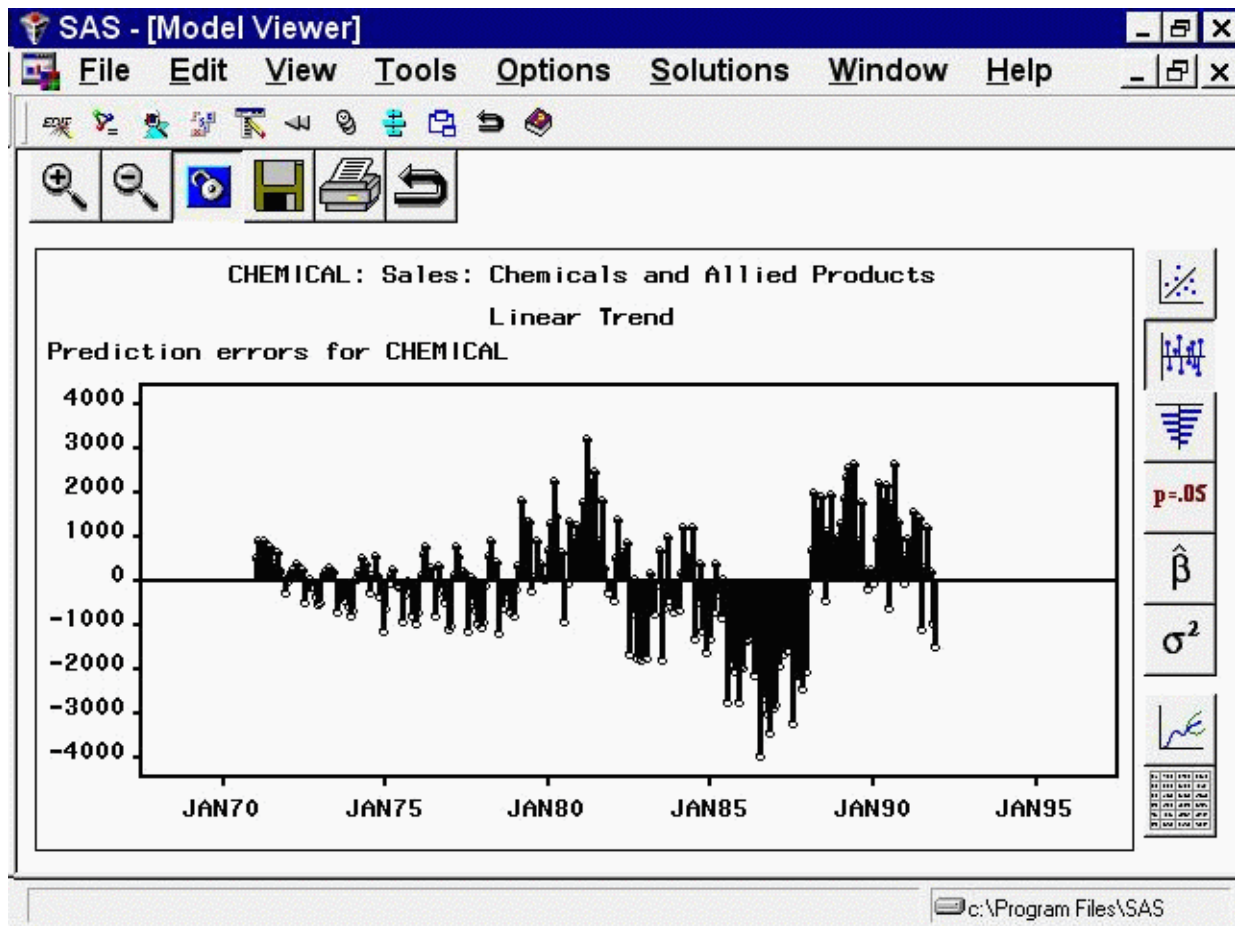

Now open the Model Viewer by selecting the right-hand icon under the Browse button, or by selecting *Model Predictions* in the toolbar or from the View menu. The Model Viewer displays the Linear Trend model, as shown in Figure 43.39.

Figure 43.39 Model Viewer: Actual and Predicted Values Plot

This graph shows the linear trend line representing the model predicted values together with a plot of the actual data values, which fluctuate about the trend line.

Prediction Error Plots

Select the second icon from the top in the vertical toolbar in the Model Viewer window. This switches the Viewer to display a plot of the model prediction errors (actual data values minus the predicted values), as shown in [Figure 43.40](#).

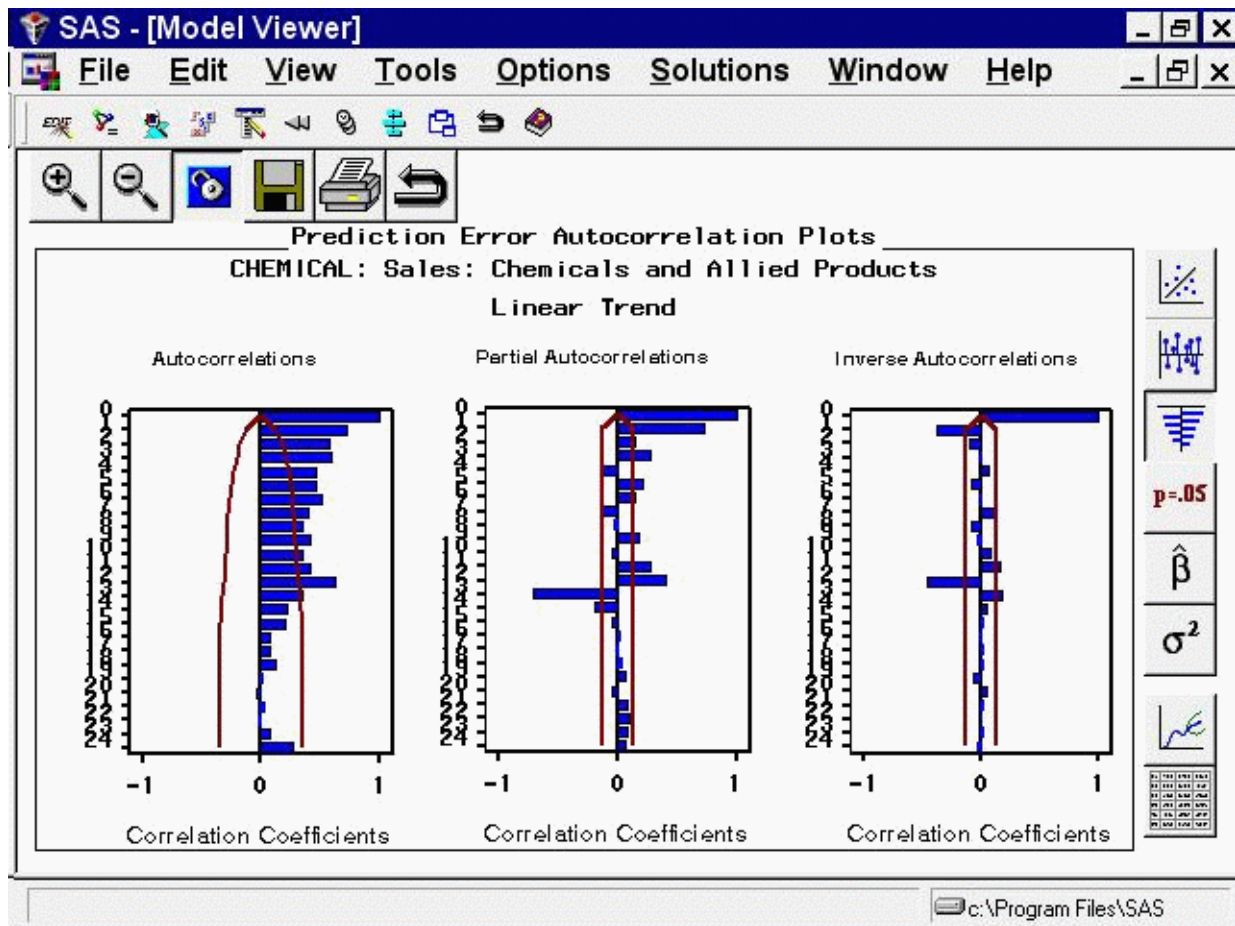

Figure 43.40 Model Viewer: Prediction Errors Plot

If the model being viewed includes a transformation, prediction errors are defined as the difference between the transformed series actual values and model predictions. You can choose to graph instead the difference between the untransformed series values and untransformed model predictions, which are called *model residuals*. You can also graph normalized prediction errors or normalized model residuals. Use the Residual Plot Options submenu under the Options menu.

Autocorrelation Plots

Select the third icon from the top in the vertical toolbar. This switches the Viewer to display a plot of autocorrelations of the model prediction errors at different lags, as shown in [Figure 43.41](#). Autocorrelations, partial autocorrelations, and inverse autocorrelations are displayed, with lines overlaid at plus and minus two standard errors. You can switch the graphs so that the bars represent significance probabilities by selecting the Correlation Probabilities item on the toolbar or from the View menu. For more information about the meaning and use of autocorrelation plots, see Chapter 7, “[The ARIMA Procedure](#).”

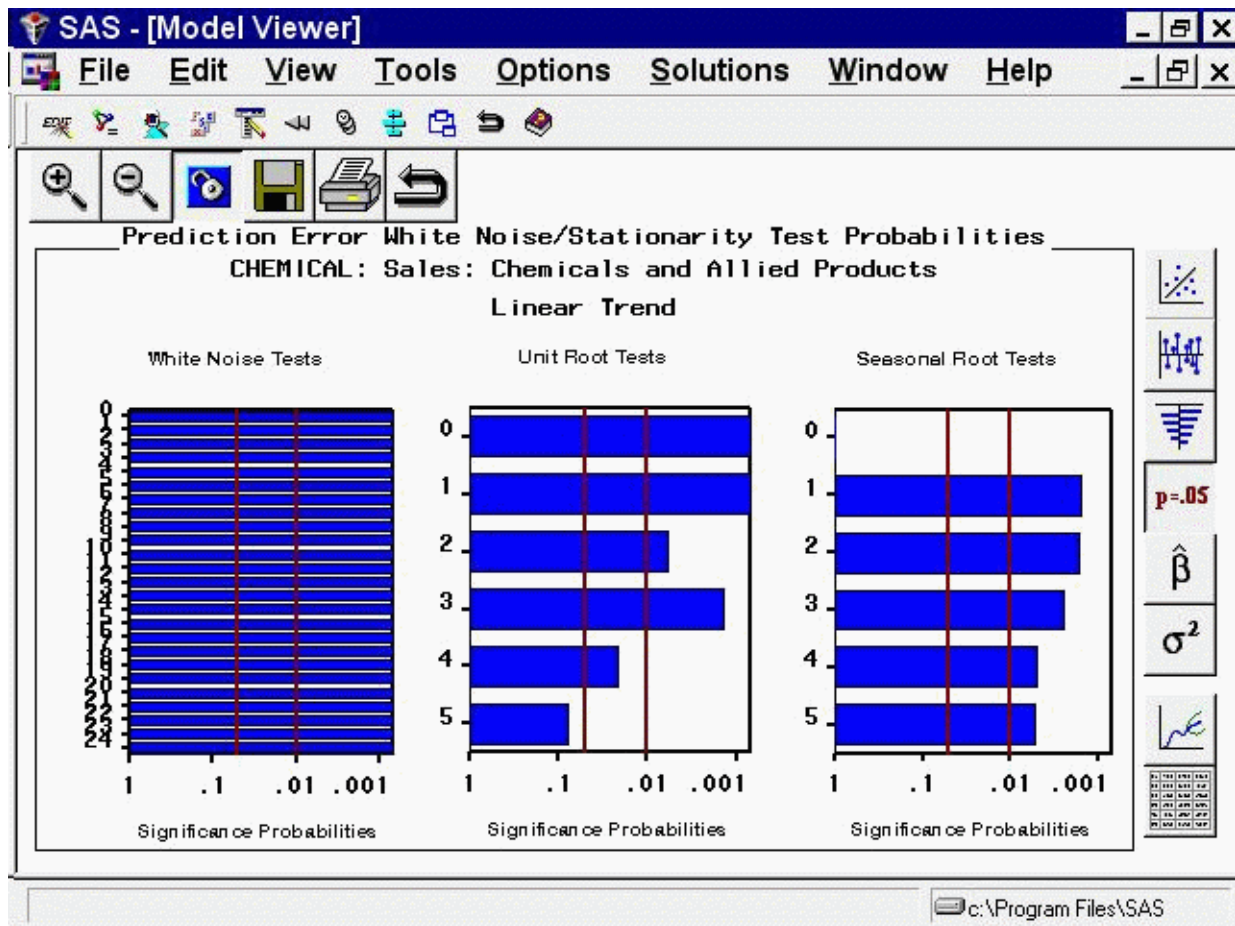

Figure 43.41 Model Viewer: Autocorrelations Plot

White Noise and Stationarity Plots

Select the fourth icon from the top in the vertical toolbar. This switches the Viewer to display a plot of white noise and stationarity tests on the model prediction errors, as shown in Figure 43.42.

Figure 43.42 Model Viewer: White Noise and Stationarity Plot

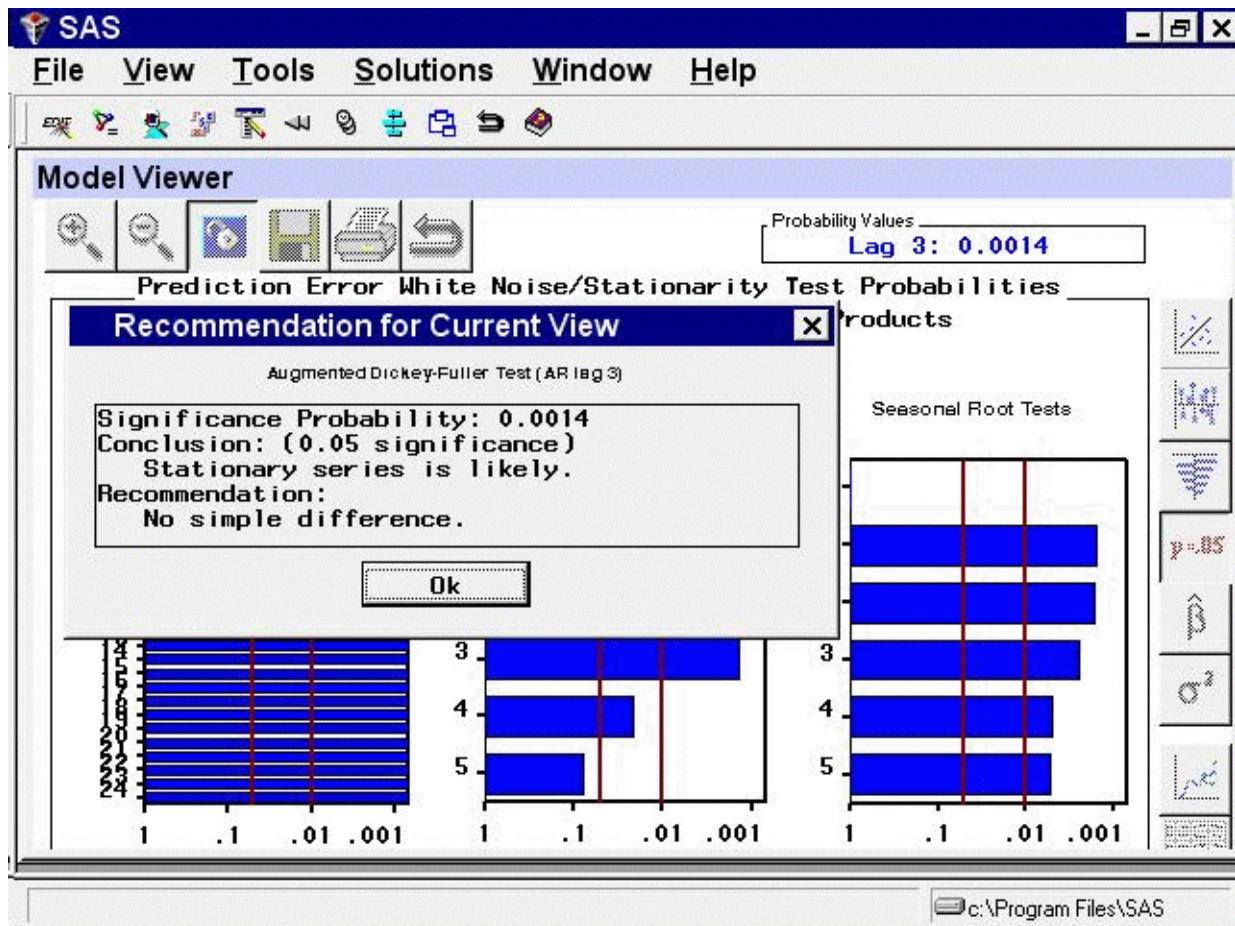

The white noise test bar chart shows significance probabilities of the Ljung-Box chi square statistic. Each bar shows the probability computed on autocorrelations up to the given lag. Longer bars favor rejection of the null hypothesis that the prediction errors represent white noise. In this example, they are all significant beyond the 0.001 probability level, so that you reject the null hypothesis. In other words, the high level of significance at all lags makes it clear that the linear trend model is inadequate for this series.

The second bar chart shows significance probabilities of the augmented Dickey-Fuller test for unit roots. For example, the bar at lag three indicates a probability of 0.0014, so that you reject the null hypothesis that the series is nonstationary. The third bar chart is similar to the second except that it represents the seasonal lags. Since this series has a yearly seasonal cycle, the bars represent yearly intervals.

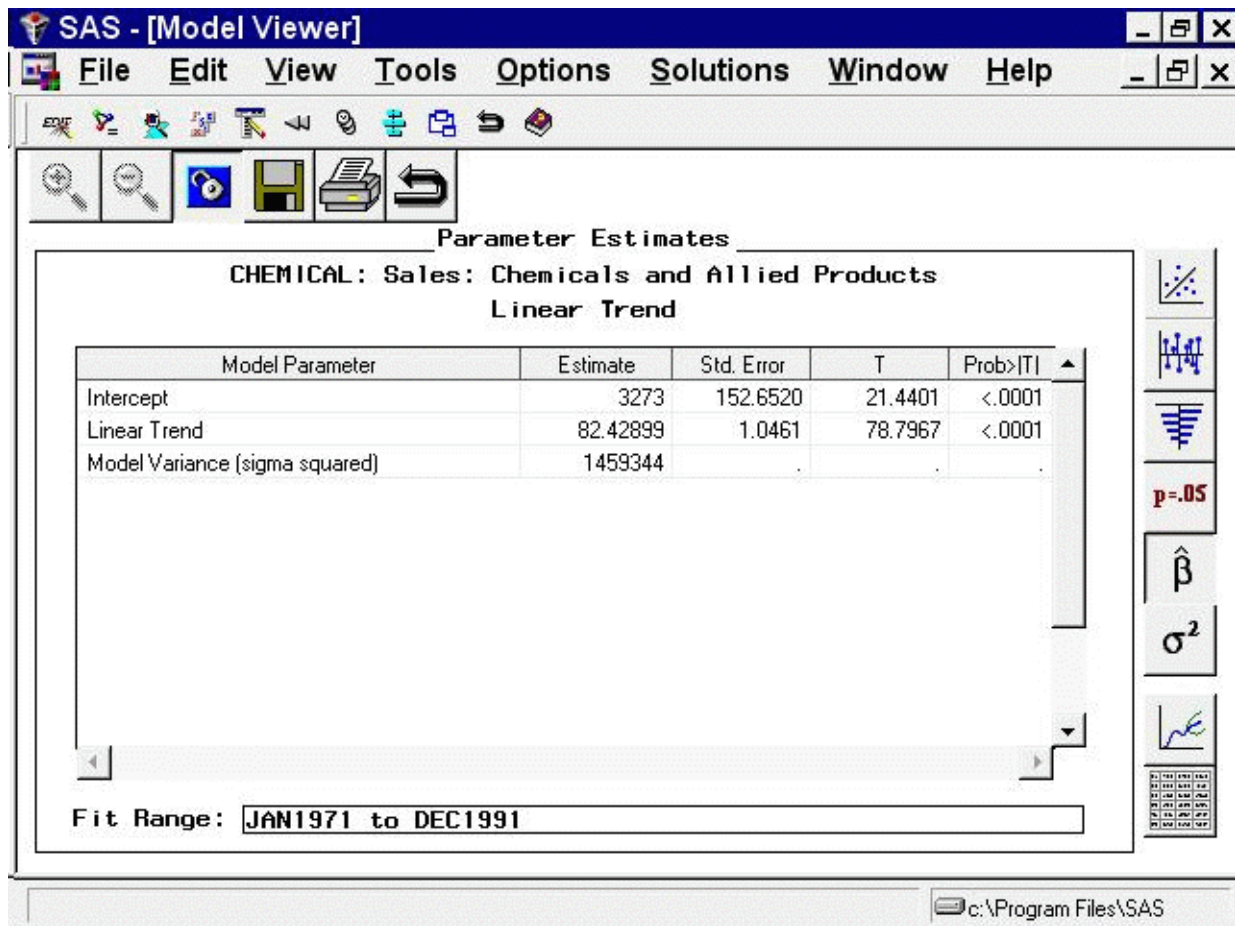

You can select any of the bars to display an interpretation. Select the fourth bar of the middle chart. This displays the *Recommendation for Current View*, as shown in Figure 43.43. This window gives an interpretation of the test represented by the bar that was selected; it is significant, therefore a stationary series is likely. It also gives a recommendation: You do not need to perform a simple difference to make the series stationary.

Figure 43.43 Model Viewer: Recommendation for Current View

Parameter Estimates Table

Select the fifth icon from the top in the vertical toolbar to the right of the graph. This switches the Viewer to display a table of parameter estimates for the fitted model, as shown in Figure 43.44.

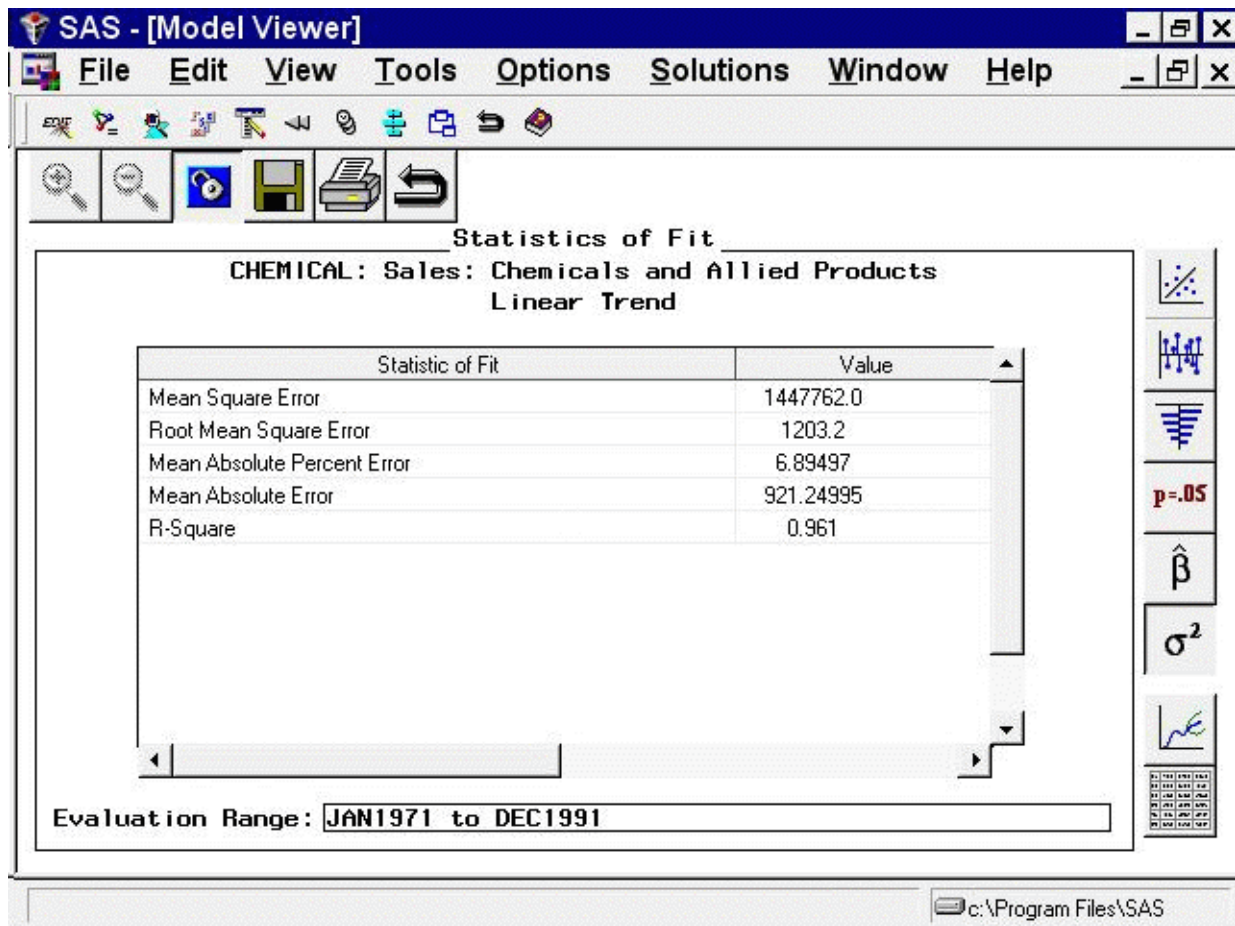

Figure 43.44 Model Viewer: Parameter Estimates Table

For the linear trend model, the parameters are the intercept and slope coefficients. The table shows the values of the fitted coefficients together with standard errors and t tests for the statistical significance of the estimates. The model residual variance is also shown.

Statistics of Fit Table

Select the sixth icon from the top in the vertical toolbar to the right of the table. This switches the Viewer to display a table of statistics of fit computed from the model prediction errors, as shown in [Figure 43.45](#). The list of statistics displayed is controlled by selecting `Statistics of Fit` from the `Options` menu.

Figure 43.45 Model Viewer: Statistics of Fit Table

Changing to a Different Model

Select the first icon in the vertical toolbar to the right of the table to return the display to the predicted and actual values plots (Figure 43.39).

Now return to the Develop Models window, but do not close the Model Viewer window. You can use the Next Viewer icon in the toolbar or your system's window manager controls to switch windows. You can resize the windows to make them both visible.

Select the Double Exponential Smoothing model so that this line of the model list is highlighted. The Model Viewer window is now updated to display a plot of the predicted values for the Double Exponential Smoothing model, as shown in Figure 43.46. The Model Viewer is automatically updated to display the currently selected model, unless you specify `Unlink` (the third icon in the window's horizontal toolbar).

Figure 43.46 Model Viewer Plot for Exponential Smoothing Model

Forecasts and Confidence Limits Plots

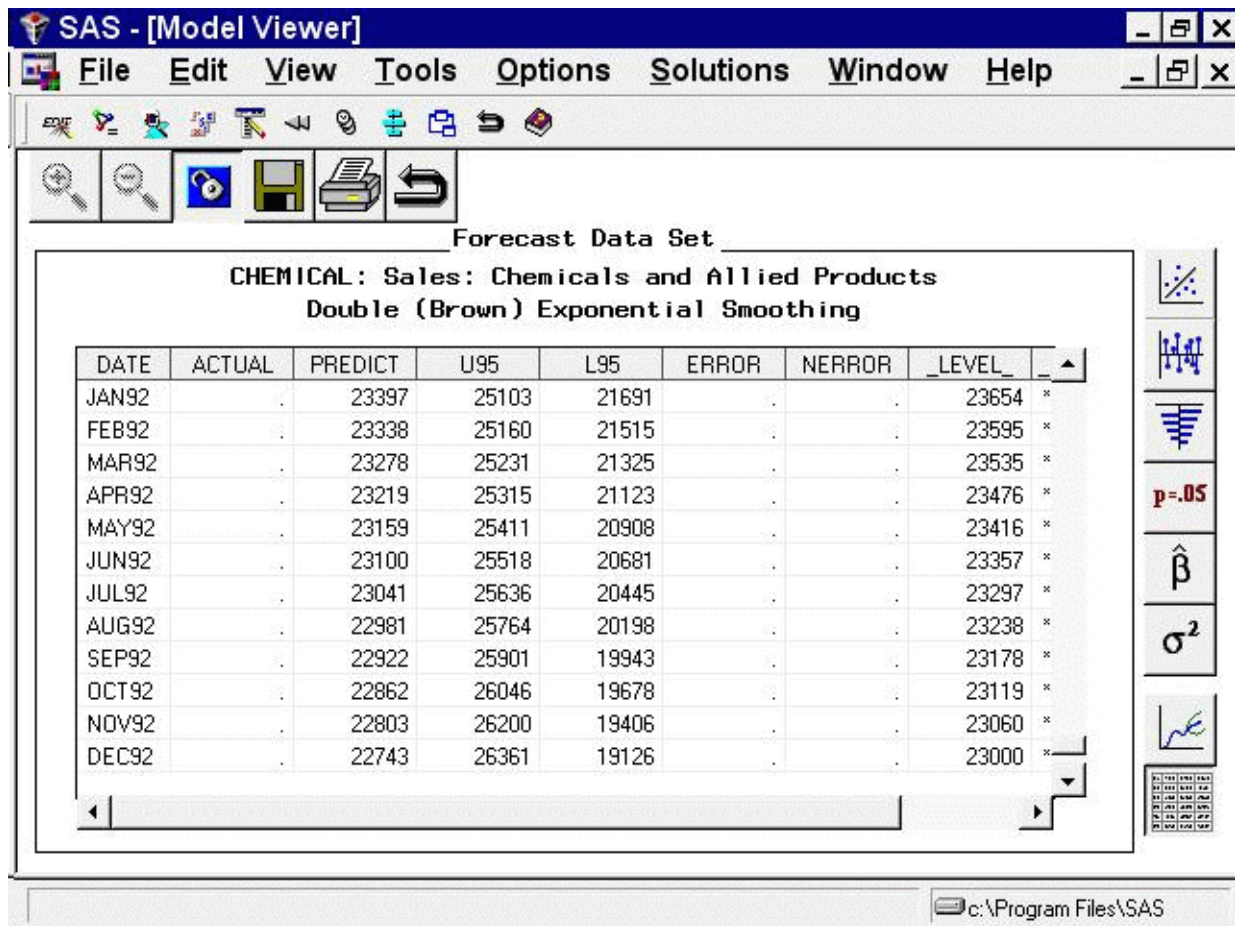

Select the seventh icon from the top in the vertical toolbar to the right of the graph. This switches the Viewer to display a plot of forecast values and confidence limits, together with actual values and one-step-ahead within-sample predictions, as shown in [Figure 43.47](#).

Figure 43.47 Model Viewer: Forecasts and Confidence Limits

Data Table

Select the last icon at the bottom of the vertical toolbar to the right of the graph. This switches the Viewer to display the forecast data set as a table, as shown in [Figure 43.48](#).

Figure 43.48 Model Viewer: Forecast Data Table

To view the full data set, use the vertical and horizontal scroll bars on the data table or enlarge the window.

Closing the Model Viewer

Other features of the Model Viewer and Develop Models window are discussed later in this book. For now, close the Model Viewer window and return to the Time Series Forecasting window.

To close the Model Viewer window, select **Close** from the window's horizontal toolbar or from the File menu.

Chapter 44

Creating Time ID Variables

Contents

Creating a Time ID Value from a Starting Date and Frequency	2881
Using Observation Numbers as the Time ID	2885
Creating a Time ID from Other Dating Variables	2889

The Forecasting System requires that the input data set contain a time ID variable. If the data you want to forecast are not in this form, you can use features of the Forecasting System to help you add time ID variables to your data set. This chapter shows examples of how to use these features.

Creating a Time ID Value from a Starting Date and Frequency

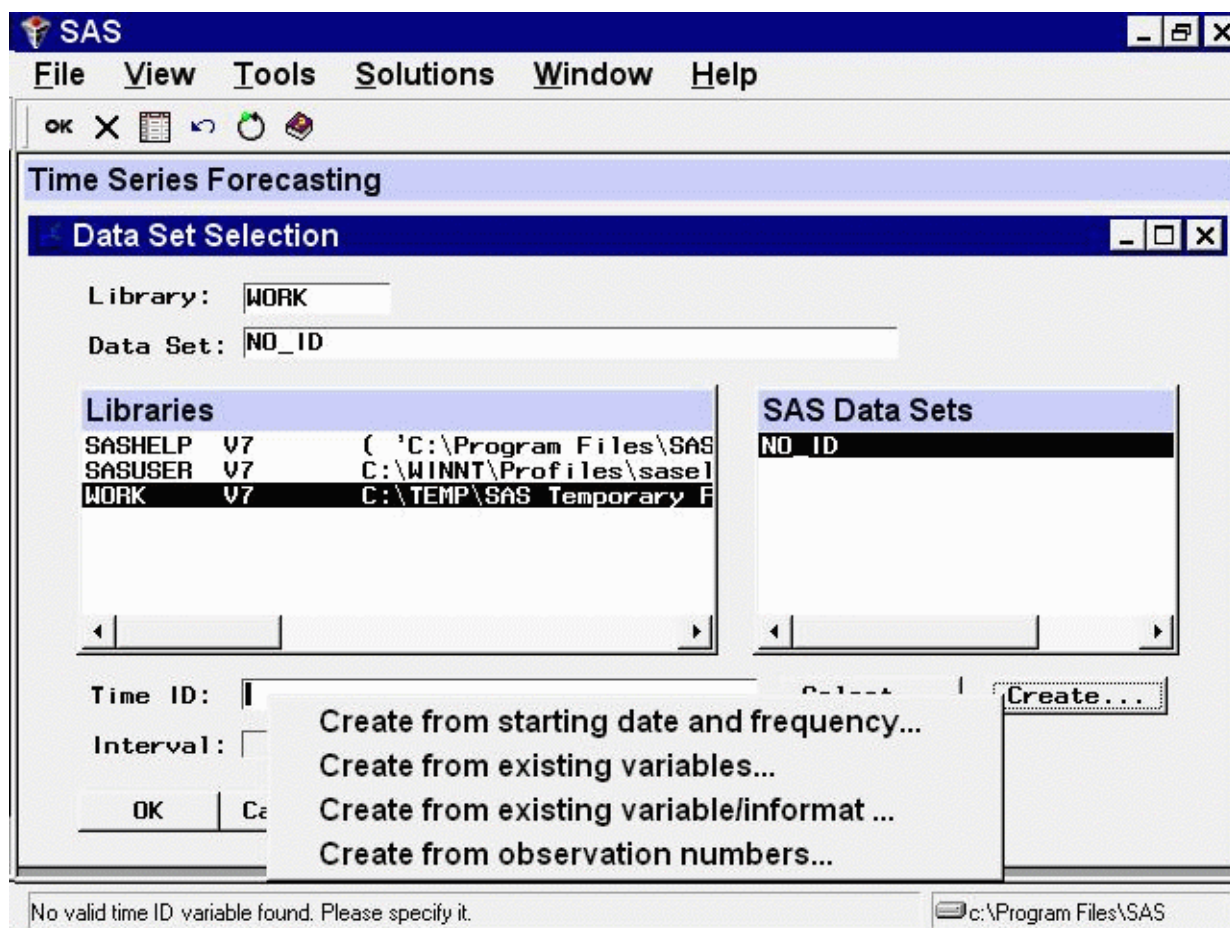

As a first example of adding a time ID variable, use the SAS data set created by the following statements. (Or use your own data set if you prefer.)

```
data no_id;
  input y @@;
datalines;
  10 15 20 25 30 35 40 45
  50 55 60 65 70 75 80 85
run;
```

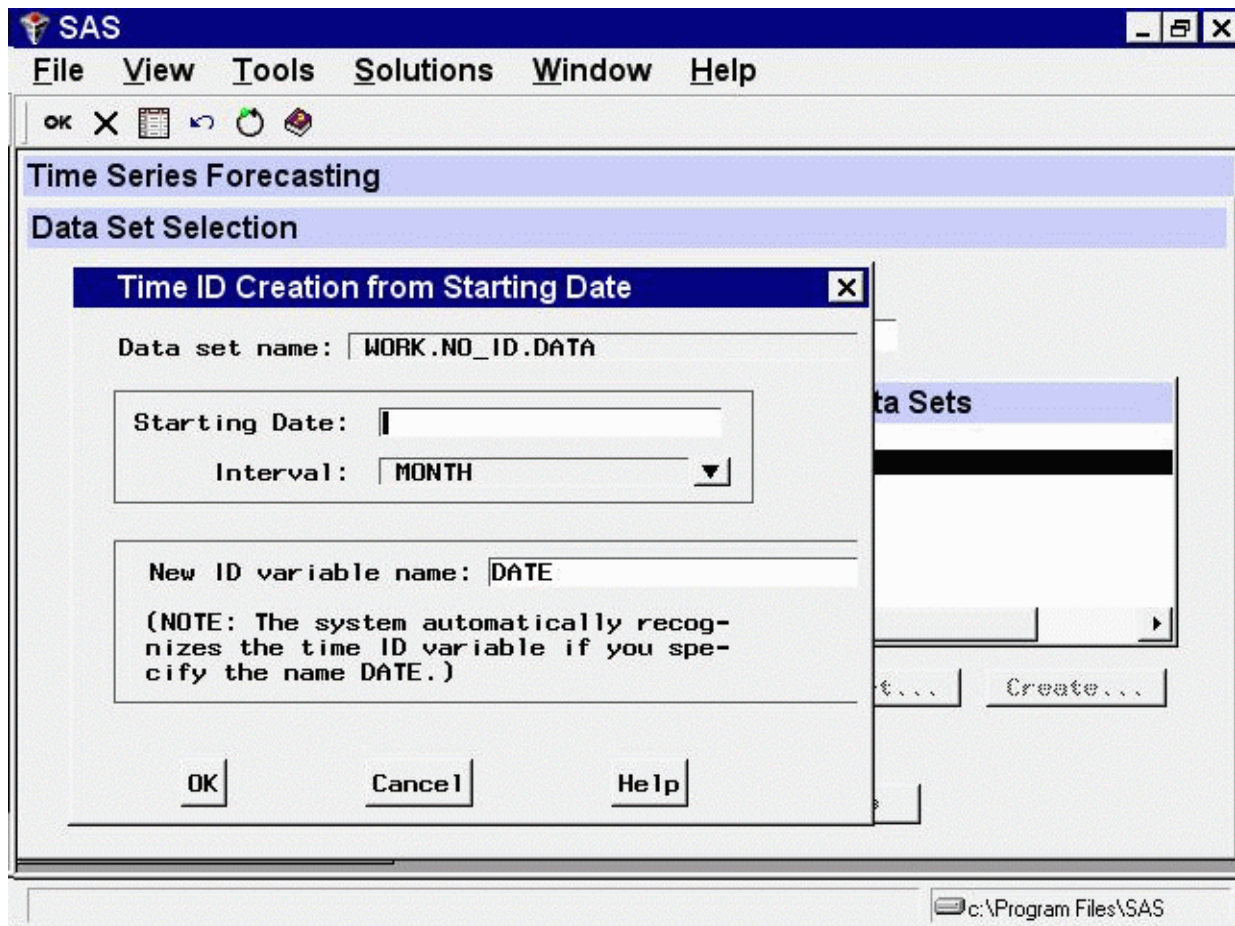

Submit these SAS statements to create the data set NO_ID. This data set contains the single variable Y. Assume that Y is a quarterly series and starts in the first quarter of 1991.

In the Time Series Forecasting window, use the Browse button to the right of the Data set field to bring up the Data Set Selection window. Select the WORK library, and then select the NO_ID data set.

You must create a time ID variable for the data set. Click the Create button to the right of the Time ID field. This opens a menu of choices for creating the Time ID variable, as shown in [Figure 44.1](#).

Figure 44.1 Time ID Creation Popup Menu

Select the first choice, Create from starting date and frequency. This opens the Time ID Creation from Starting Date window shown in Figure 44.2.

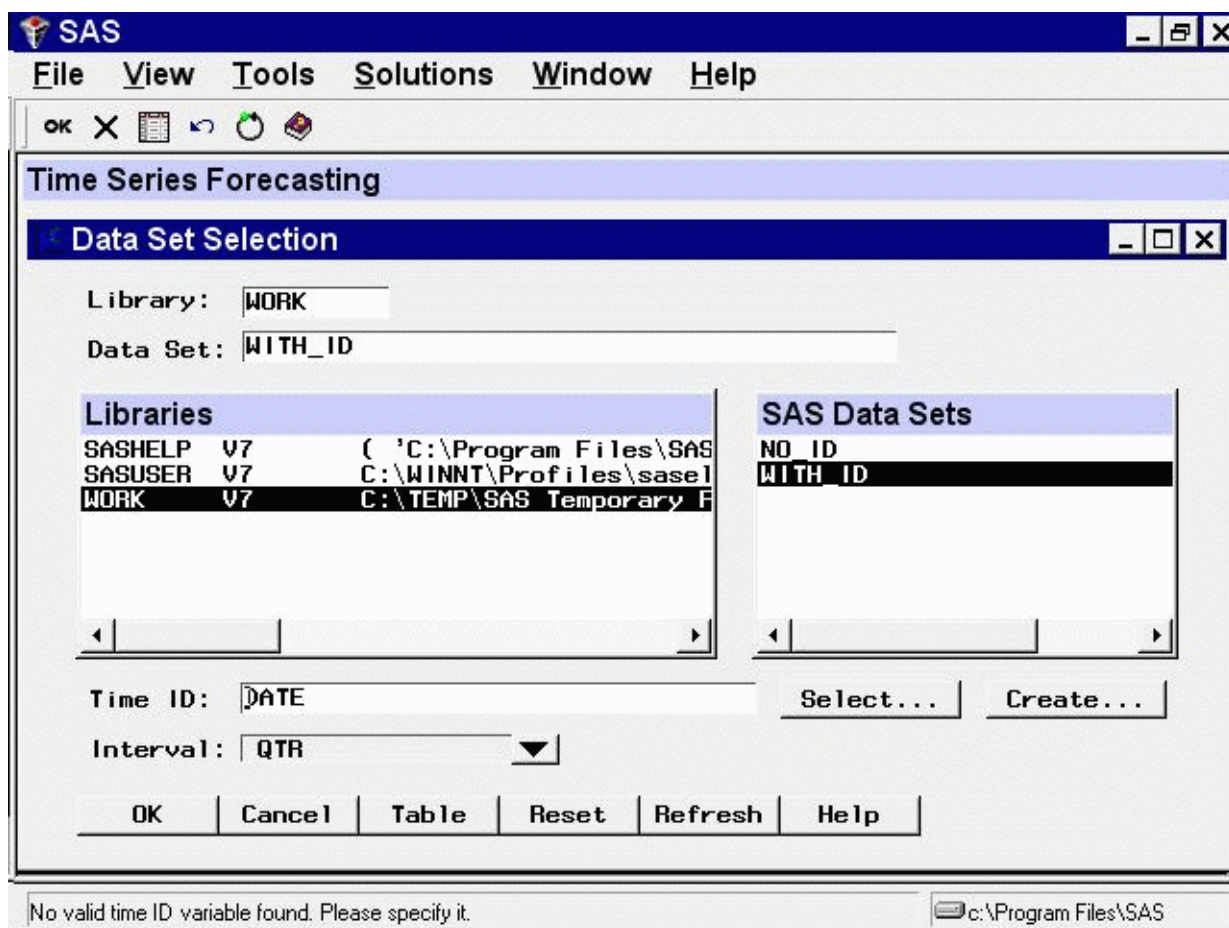

Figure 44.2 Time ID Creation from Starting Date Window

Enter the starting date, 1991:1, in the *Starting Date* field.

Select the *Interval* list arrow and select QTR. The *Interval* value QTR means that the time interval between successive observations is a quarter of a year; that is, the data frequency is quarterly.

Now select the *OK* button. The system prompts you for the name of the new data set. If you want to create a new copy of the input data set with the *DATE* variable added, enter a name for the new data set. If you want to replace the *NO_ID* data set with the new copy containing *DATE*, just select the *OK* button without changing the name.

For this example, change the *New name* field to *WITH_ID* and select the *OK* button. The data set *WITH_ID* is created containing the series *Y* from *NO_ID* and the added ID variable *DATE*. The system returns to the *Data Set Selection* window, which now appears as shown in [Figure 44.3](#).

Figure 44.3 Data Set Selection Window after Creating Time ID

Select the **Table** button to see the new data set `WITH_ID`. This opens a **VIEWTABLE** window for the data set `WITH_ID`, as shown in [Figure 44.4](#). Select **File** and **Close** to close the **VIEWTABLE** window.

Figure 44.4 Viewtable Display of Data Set with Time ID Added

	DATE	y
1	1991:1	10
2	1991:2	15
3	1991:3	20
4	1991:4	25
5	1992:1	30
6	1992:2	35
7	1992:3	40
8	1992:4	45
9	1993:1	50
10	1993:2	55
11	1993:3	60
12	1993:4	65
13	1994:1	70
14	1994:2	75
15	1994:3	80
16	1994:4	85

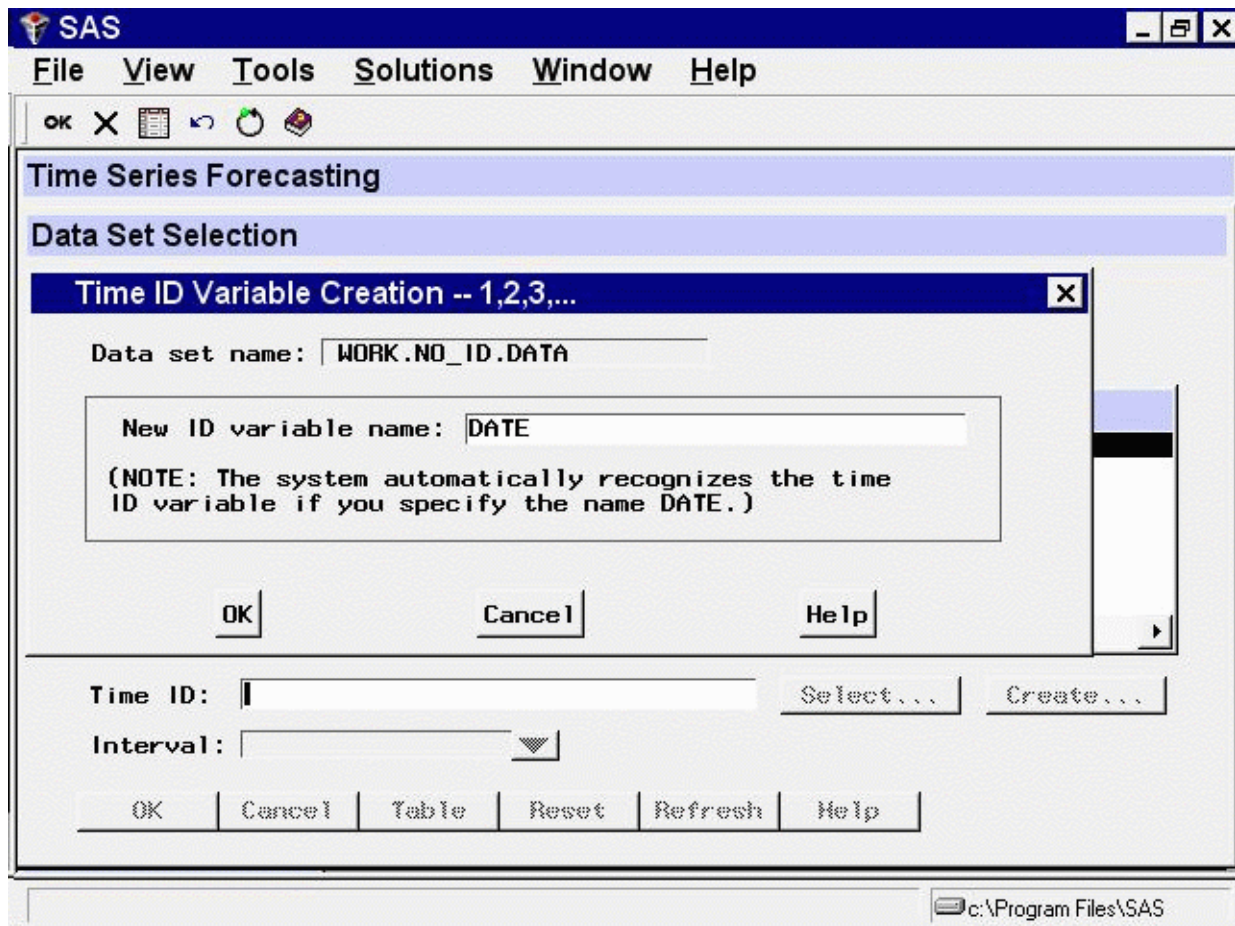

NOTE: Table has been opened in browse mode.

c:\Program Files\SAS

Using Observation Numbers as the Time ID

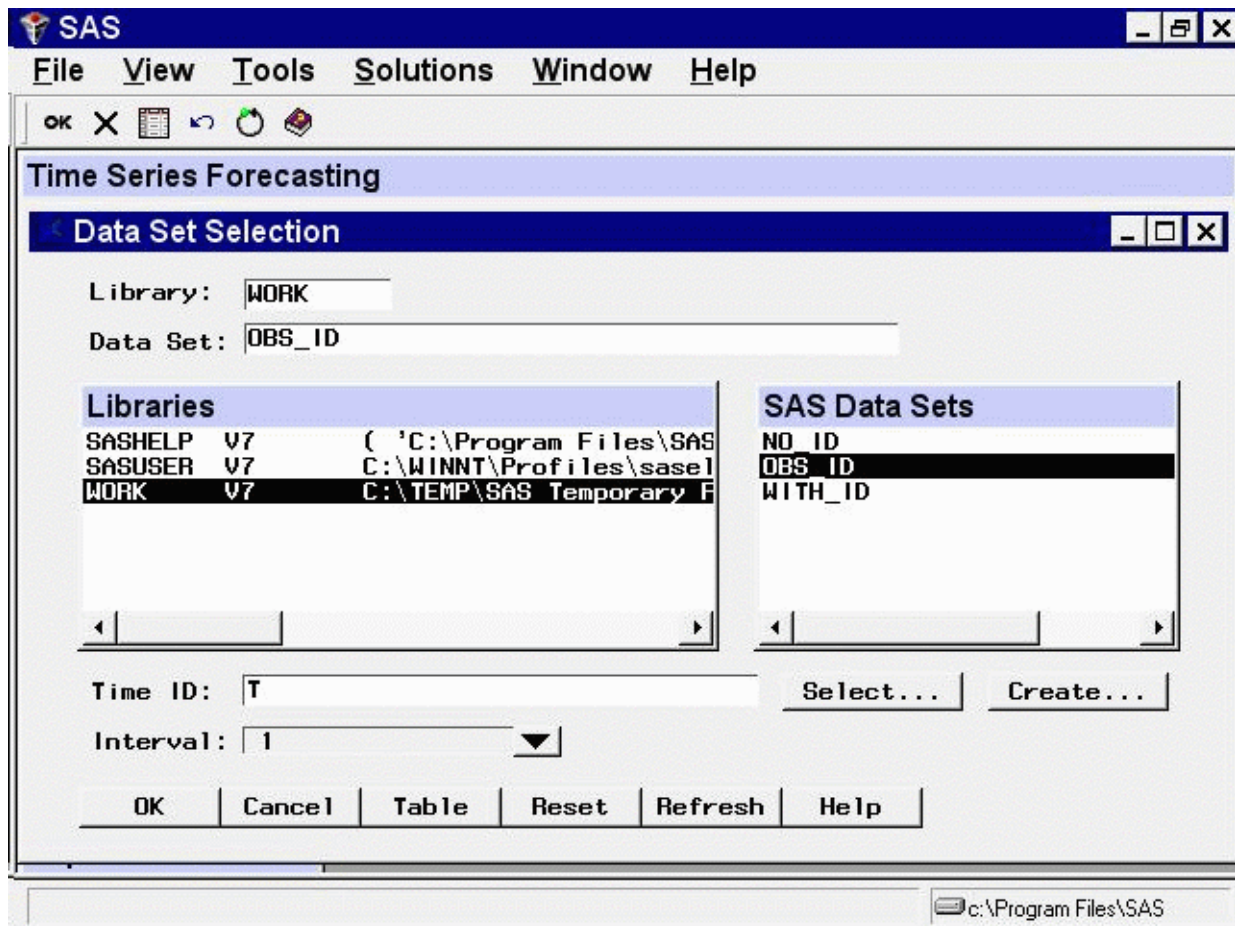

Normally, the time ID variable contains date values. If you do not want to have dates associated with your forecasts, you can also use observation numbers as time ID variables. However, you still must have an ID variable. This can be illustrated by adding an observation index time ID variable to the data set NO_ID.

In the Data Set Selection window, select the data set NO_ID again. Select the Create button to the right of the Time ID field. Select the fourth choice, Create from observation numbers. This opens the Time ID Variable Creation window shown in Figure 44.5.

Figure 44.5 Create Time ID Variable Window

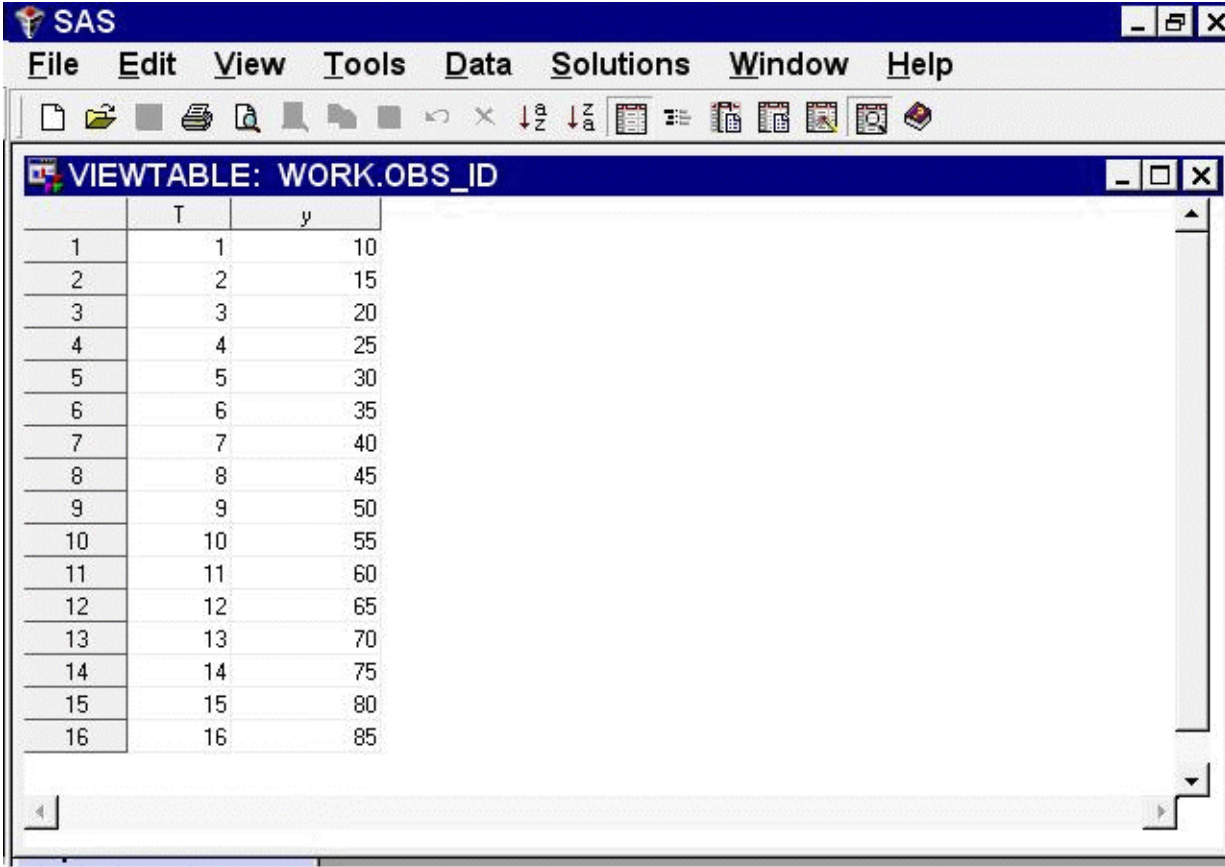

Select the OK button. This opens the New Data Set Name window. Enter "OBS_ID" in the New data set name field. Enter "T" in the New ID variable name field.

Now select the OK button. The new data set OBS_ID is created, and the system returns to the Data Set Selection window, which now appears as shown in [Figure 44.6](#).

Figure 44.6 Data Set Selection Window after Creating Time ID

The `Interval` field for `OBS_ID` has the value '1'. This means that the values of the time ID variable `T` increment by one between successive observations.

Select the `Table` button to look at the `OBS_ID` data set, as shown in [Figure 44.7](#).

Figure 44.7 VIEWTABLE of Data Set with Observation Index ID

The screenshot shows the SAS VIEWTABLE window for the data set WORK.OBS_ID. The window has a menu bar (File, Edit, View, Tools, Data, Solutions, Window, Help) and a toolbar. The table displayed has 16 rows and 3 columns. The first column is labeled 'T', the second is labeled 'y', and the third is unlabeled. The data is as follows:

	T	y	
1	1	10	
2	2	15	
3	3	20	
4	4	25	
5	5	30	
6	6	35	
7	7	40	
8	8	45	
9	9	50	
10	10	55	
11	11	60	
12	12	65	
13	13	70	
14	14	75	
15	15	80	
16	16	85	

At the bottom of the window, a status bar displays the text: NOTE: Table has been opened in browse mode. The path c:\Program Files\SAS is also visible.

Select **File** and **Close** to close the VIEWTABLE window. Select the **OK** button from the Data Set Selection window to return to the Time Series Forecasting window.

Creating a Time ID from Other Dating Variables

Your data set might contain ID variables that date the observations in a different way than the SAS date valued ID variable expected by the forecasting system. For example, for monthly data, the data set might contain the ID variables YEAR and MONTH, which together date the observations.

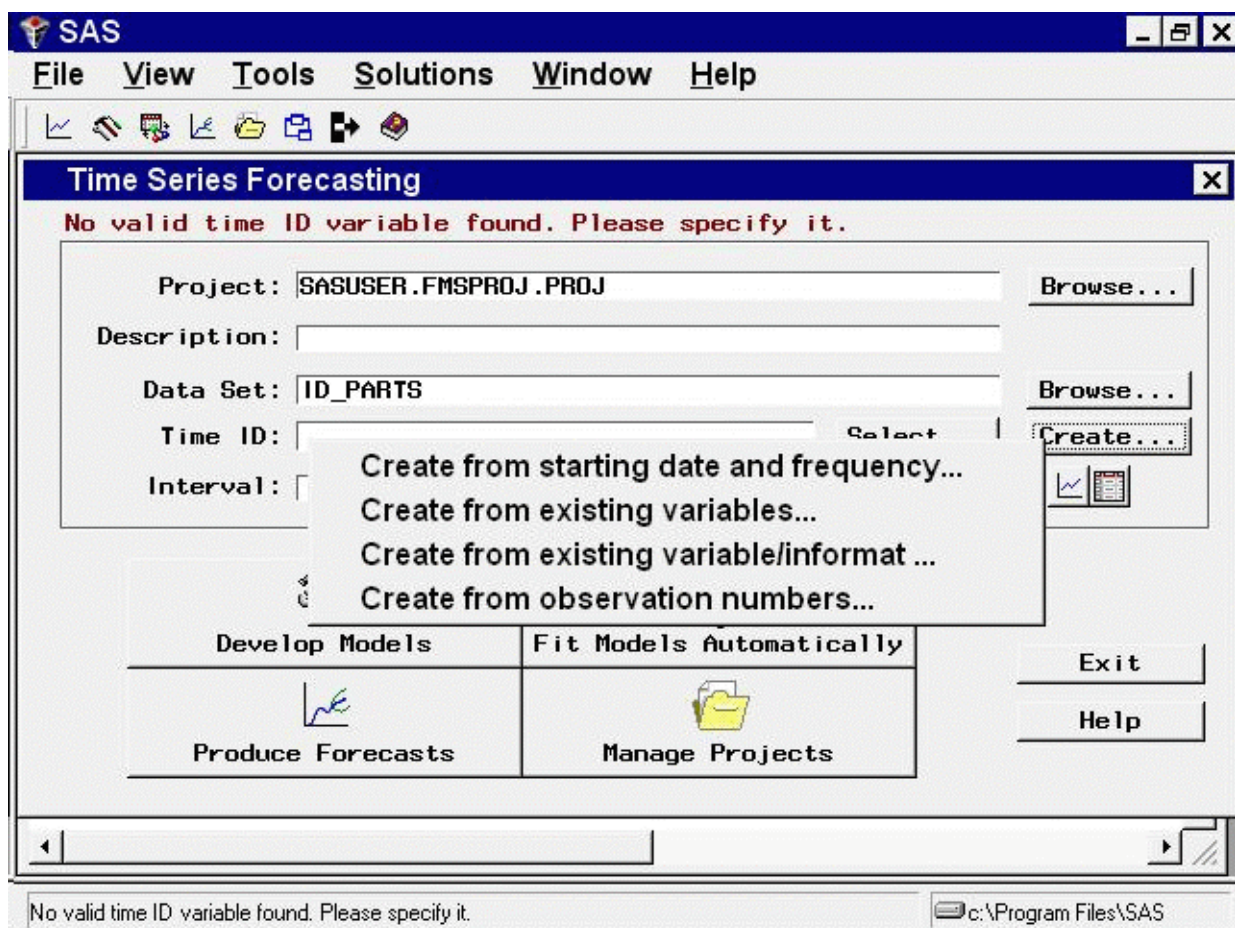

In these cases, you can use the Forecasting System's Create Time ID features to compute a time ID variable with SAS date values from the existing dating variables. As an example of this, use the SAS data set read in by the following SAS statements:

```
data id_parts;  
    input yr qtr y;  
datalines;  
91 1 10  
91 2 15  
91 3 20  
91 4 25  
92 1 30  
92 2 35  
92 3 40  
92 4 45  
93 1 50  
93 2 55  
93 3 60  
93 4 65  
94 1 70  
94 2 75  
94 3 80  
94 4 85  
run;
```

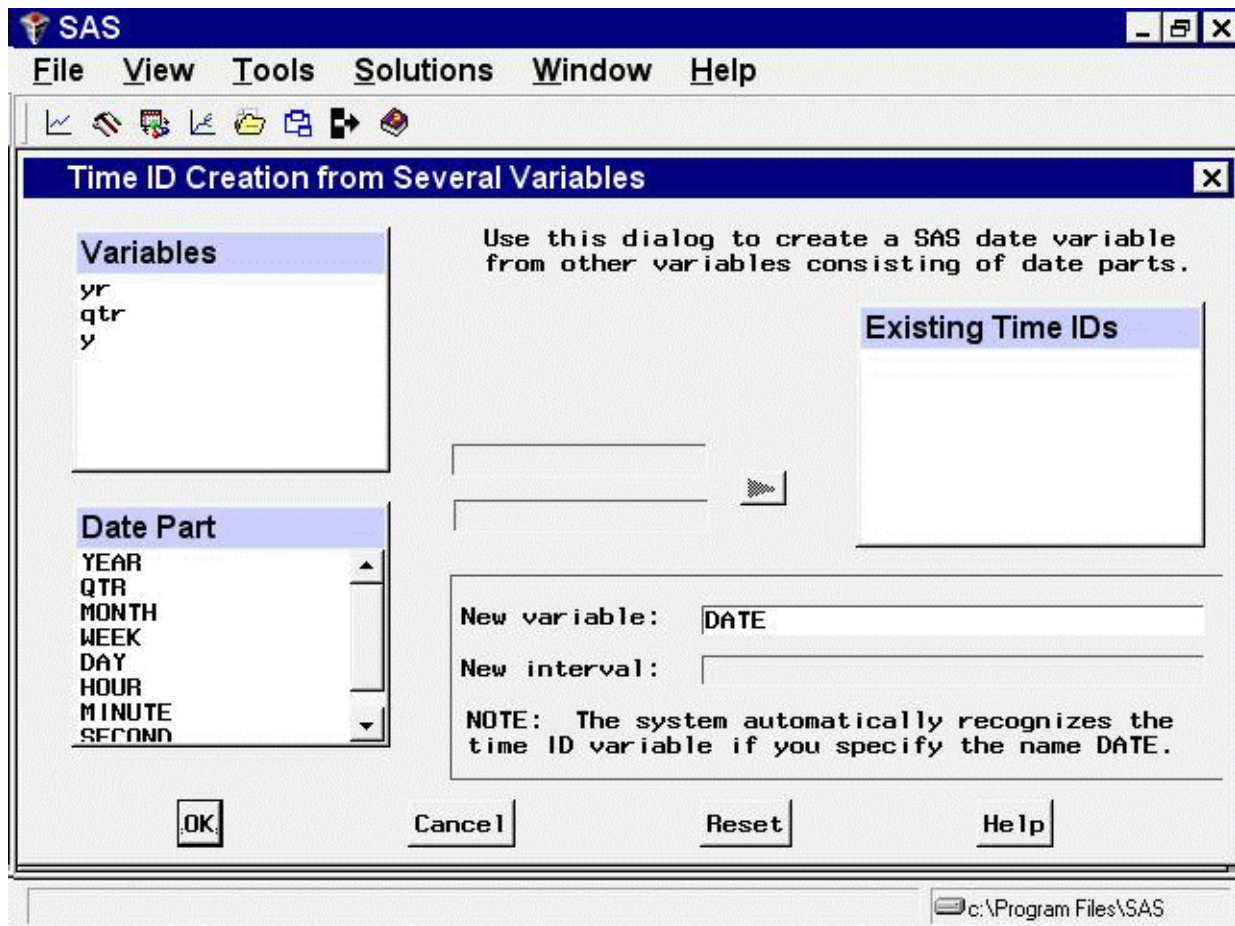

Submit these SAS statements to create the data set ID_PARTS. This data set contains the three variables YR, QTR, and Y. YR and QTR are ID variables that together date the observations, but each variable provides only part of the date information. Because the forecasting system requires a single dating variable containing SAS date values, you need to combine YR and QTR to create a single variable DATE.

Type "ID_PARTS" in the **Data Set** field and press the ENTER key. (You could also use the Browse button to open the Data Set Selection window, as in the previous example, and complete this example from there.)

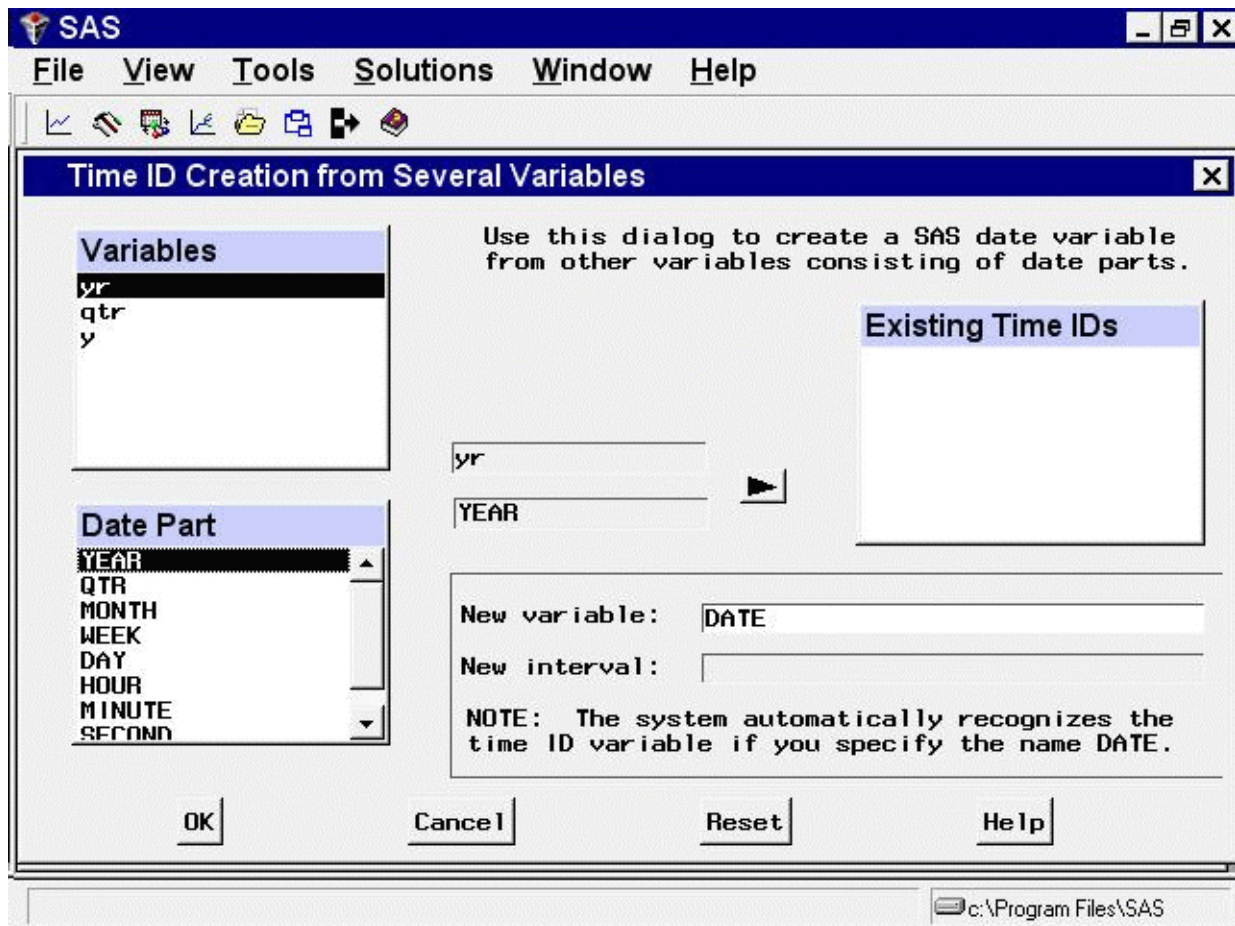

Select the Create button at the right of the **Time ID** field. This opens the menu of Create Time ID choices, as shown in [Figure 44.8](#).

Figure 44.8 Adding a Time ID Variable

Select the second choice, *Create from existing variables*. This opens the window shown in Figure 44.9.

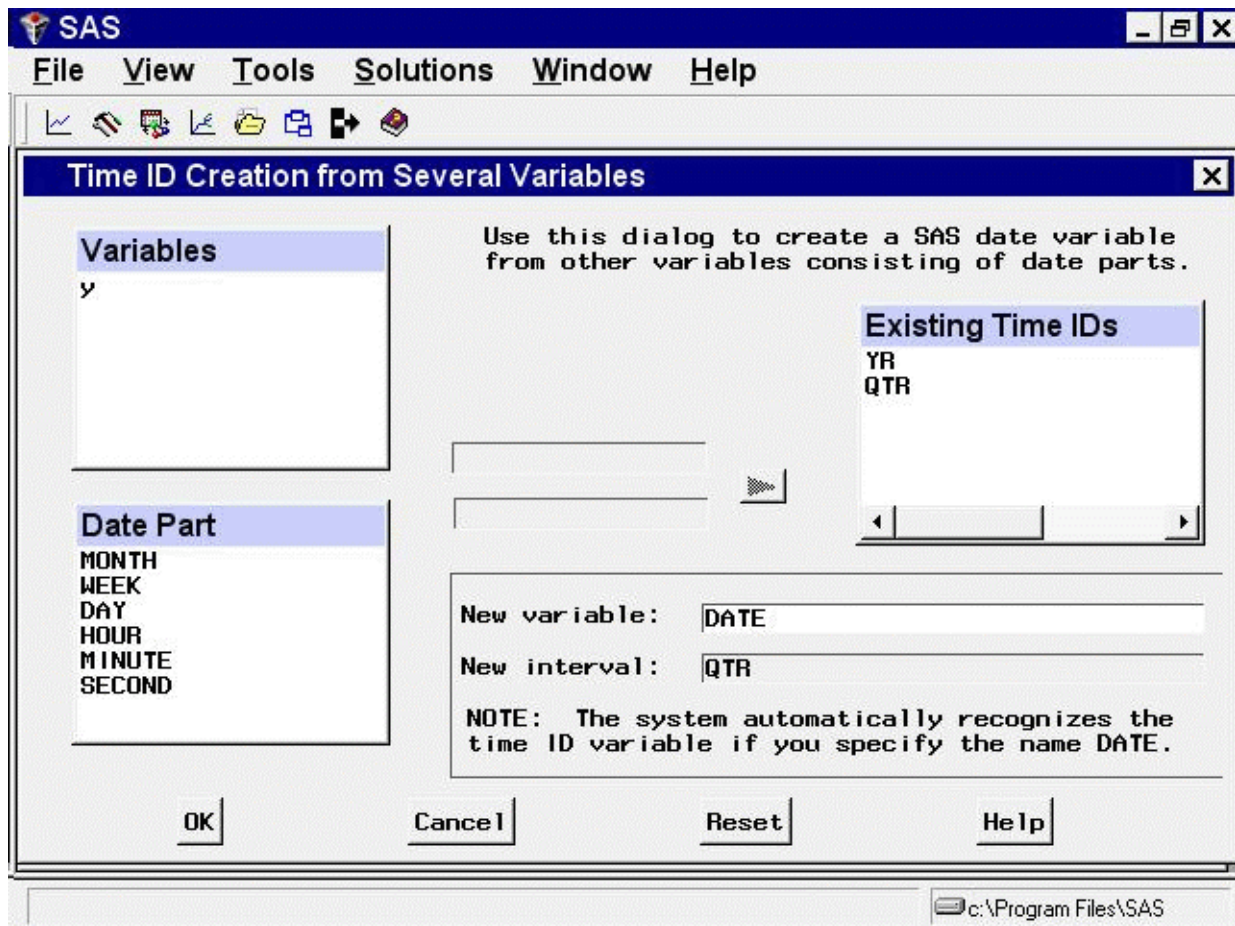

Figure 44.9 Creating a Time ID Variable from Date Parts

In the `Variables` list, select `YR`. In the `Date Part` list, select `YEAR` as shown in [Figure 44.10](#).

Figure 44.10 Specifying the ID Variable for Years

Now click the right-pointing arrow button. The variable YR and the part code YEAR are added to the Existing Time IDs list.

Next select QTR from the Variables list, select QTR from the Date Part list, and click the arrow button. This adds the variable QTR and the part code QTR to the Existing Time IDs list, as shown in Figure 44.11.

Figure 44.11 Creating a Time ID Variable from Date Parts

Now select the **OK** button. This opens the **New Data Set Name** window. Change the **New data set name** field to **NEWDATE**, and then select the **OK** button.

The data set **NEWDATE** is created, and the system returns to the **Time Series Forecasting** window with **NEWDATE** as the selected Data Set. The **Time ID** field is set to **DATE**, and the **Interval** field is set to **QTR**.

Incorporating Forecasts from Other Sources	2927

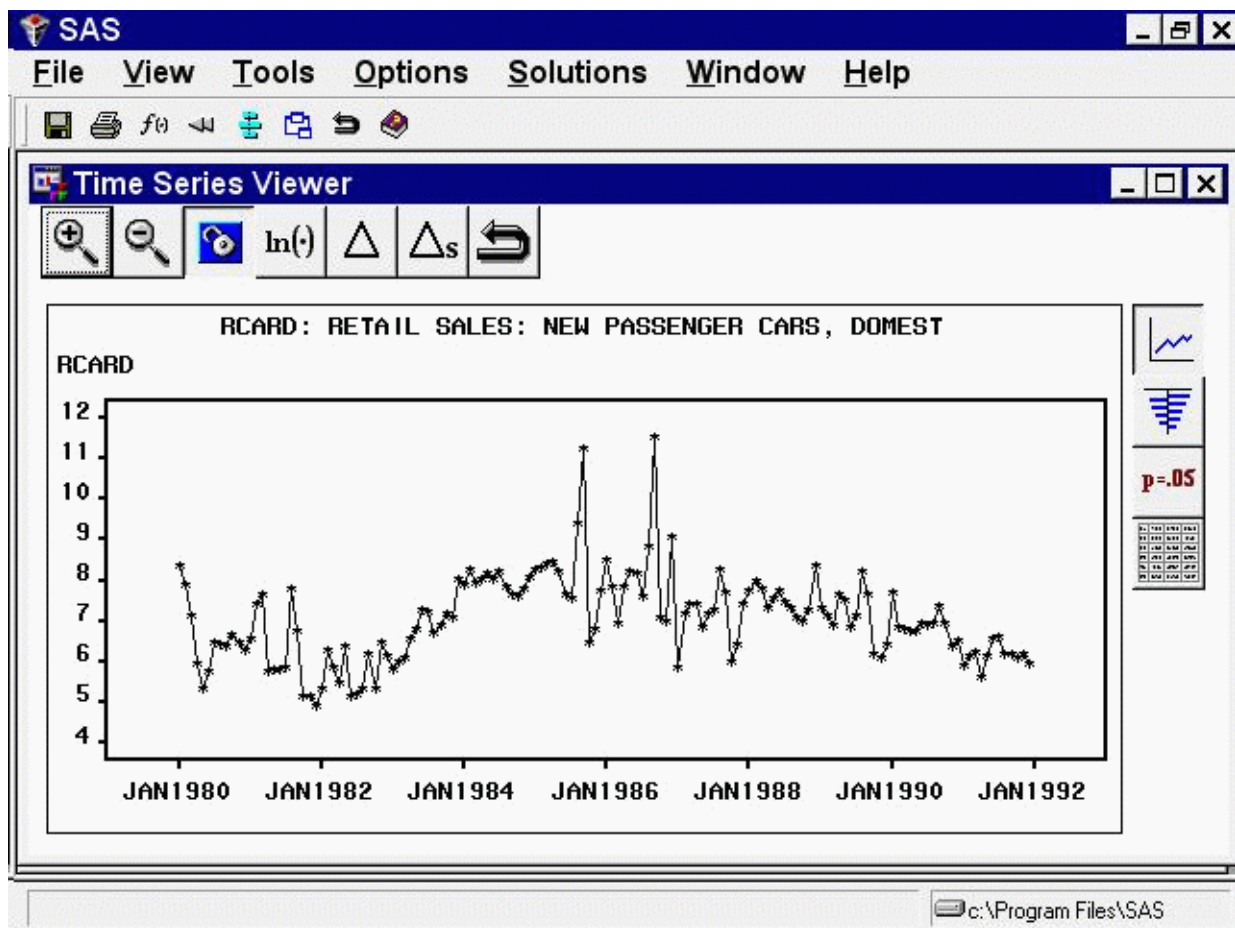

This chapter explores the tools available through the Develop Models window for investigating the properties of time series and for specifying and fitting models. The first section shows you how to diagnose time series properties in order to determine the class of models appropriate for forecasting series with such properties. Later sections show you how to specify and fit different kinds of forecasting models.

Series Diagnostics

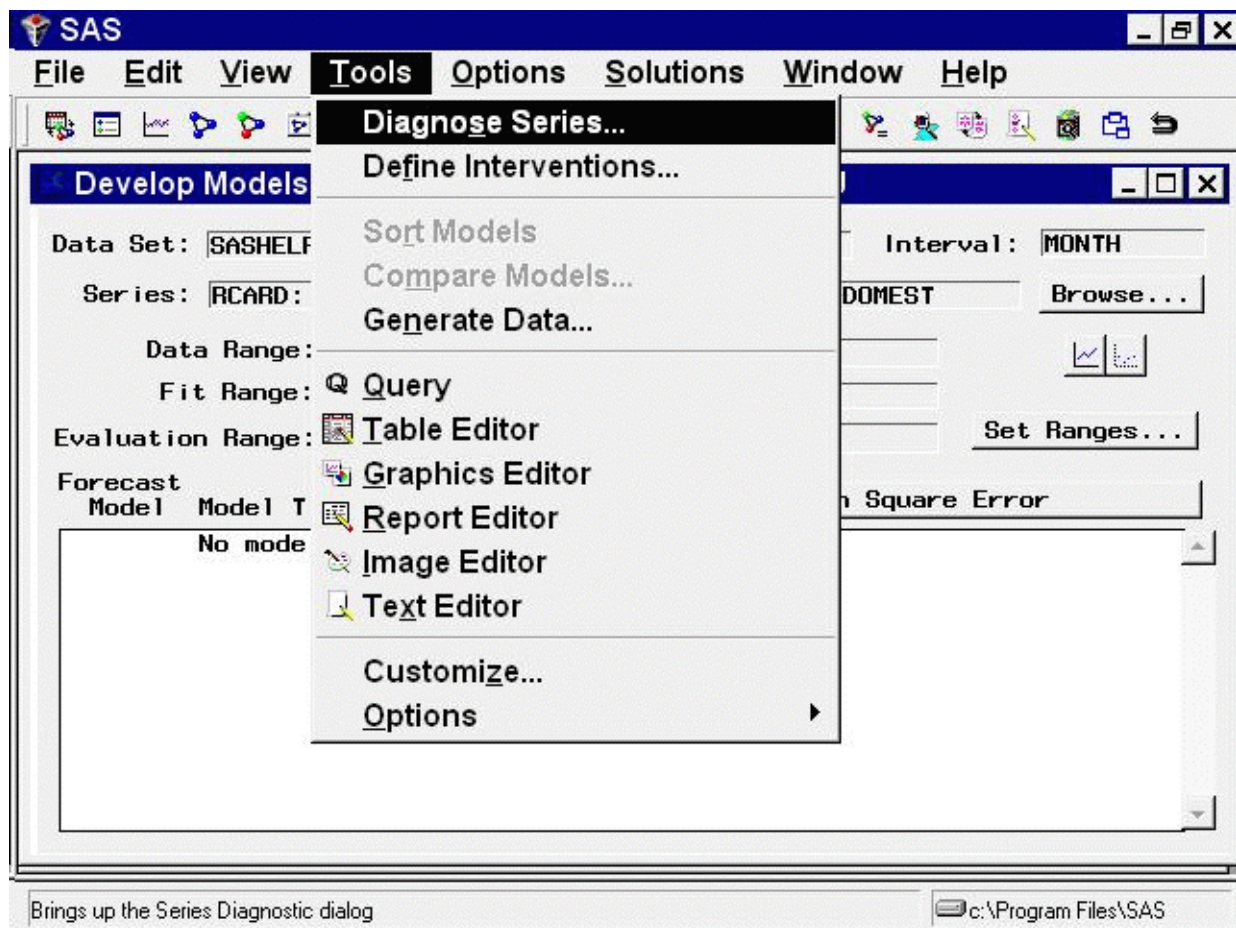

The series diagnostics tool helps you determine the kinds of forecasting models that are appropriate for the data series so that you can limit the search for the best forecasting model. The series diagnostics address these three questions: Is a log transformation needed to stabilize the variance? Is a time trend present in the data? Is there a seasonal pattern to the data?

The automatic model fitting process, which you used in the previous chapter through the Automatic Model Fitting window, performs series diagnostics and selects trial models from a list according to the results. You can also look at the diagnostic information and make your own decisions as to the kinds of models appropriate for the series. The following example illustrates the series diagnostics features.

Select “Develop Models” from the Time Series Forecasting window. Select the library SASHELP, the data set CITIMON, and the series RCARD. This series represents domestic retail sales of passenger cars. To look at this series, select “View Series” from the Develop Models window. This opens the Time Series Viewer window, as shown in [Figure 45.1](#).

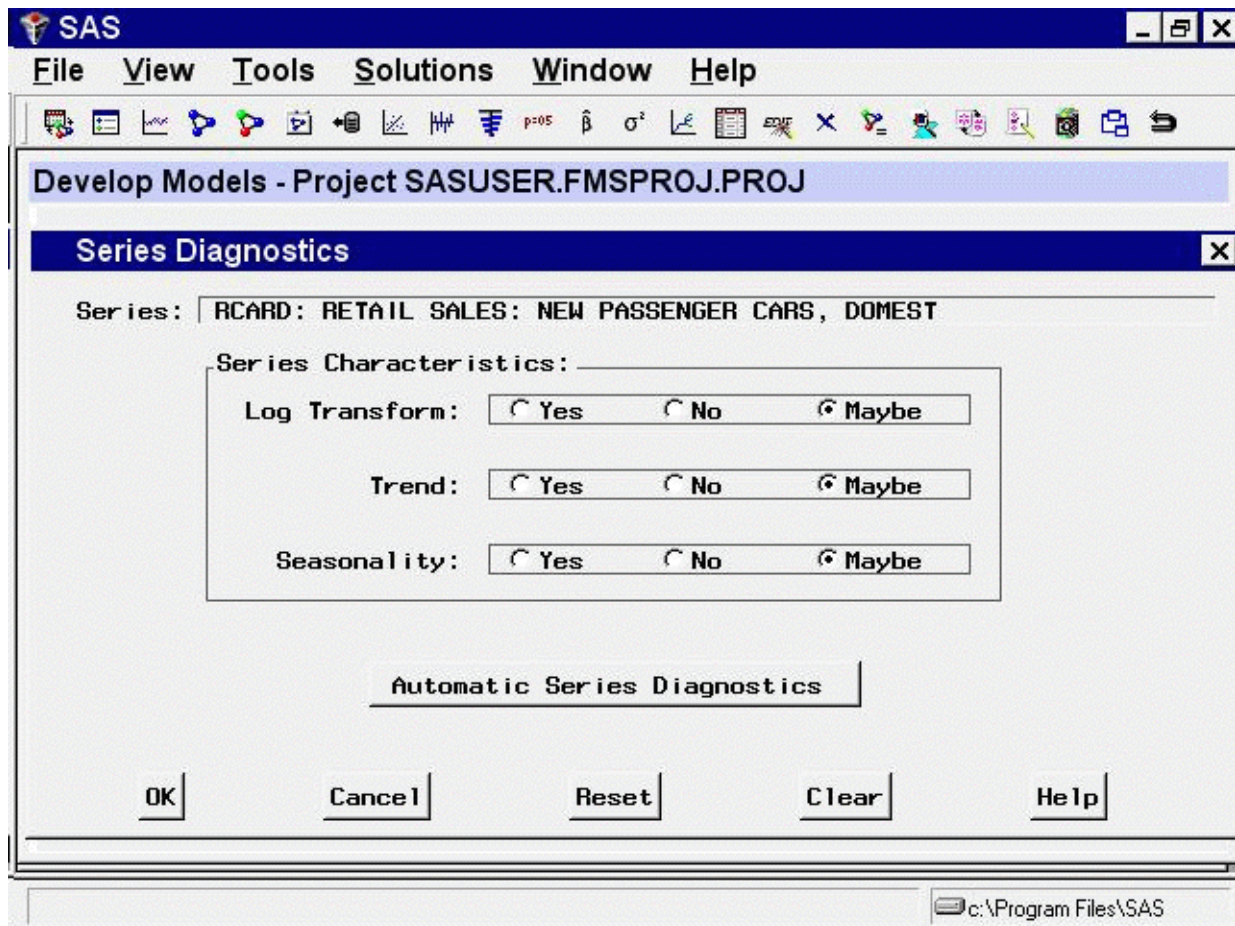

Figure 45.1 Automobile Sales Series

Select “Diagnose Series” from the Tools menu. You can do this from the Develop Models window or from the Time Series Viewer window. [Figure 45.2](#) shows this from the Develop Models window.

Figure 45.2 Selecting Series Diagnostics

This opens the Series Diagnostics window, as shown in [Figure 45.3](#).

Figure 45.3 Series Diagnostics Window

Each of the three series characteristics—need for log transformation, presence of a trend, and seasonality—has a set of options for *Yes*, *No*, and *Maybe*. *Yes* indicates that the series has the characteristic and that forecasting models fit to the series should be able to model and predict this behavior. *No* indicates that you do not need to consider forecasting models designed to predict series with this characteristic. *Maybe* indicates that models with and without the characteristic should be considered. Initially, all these values are set to *Maybe*.

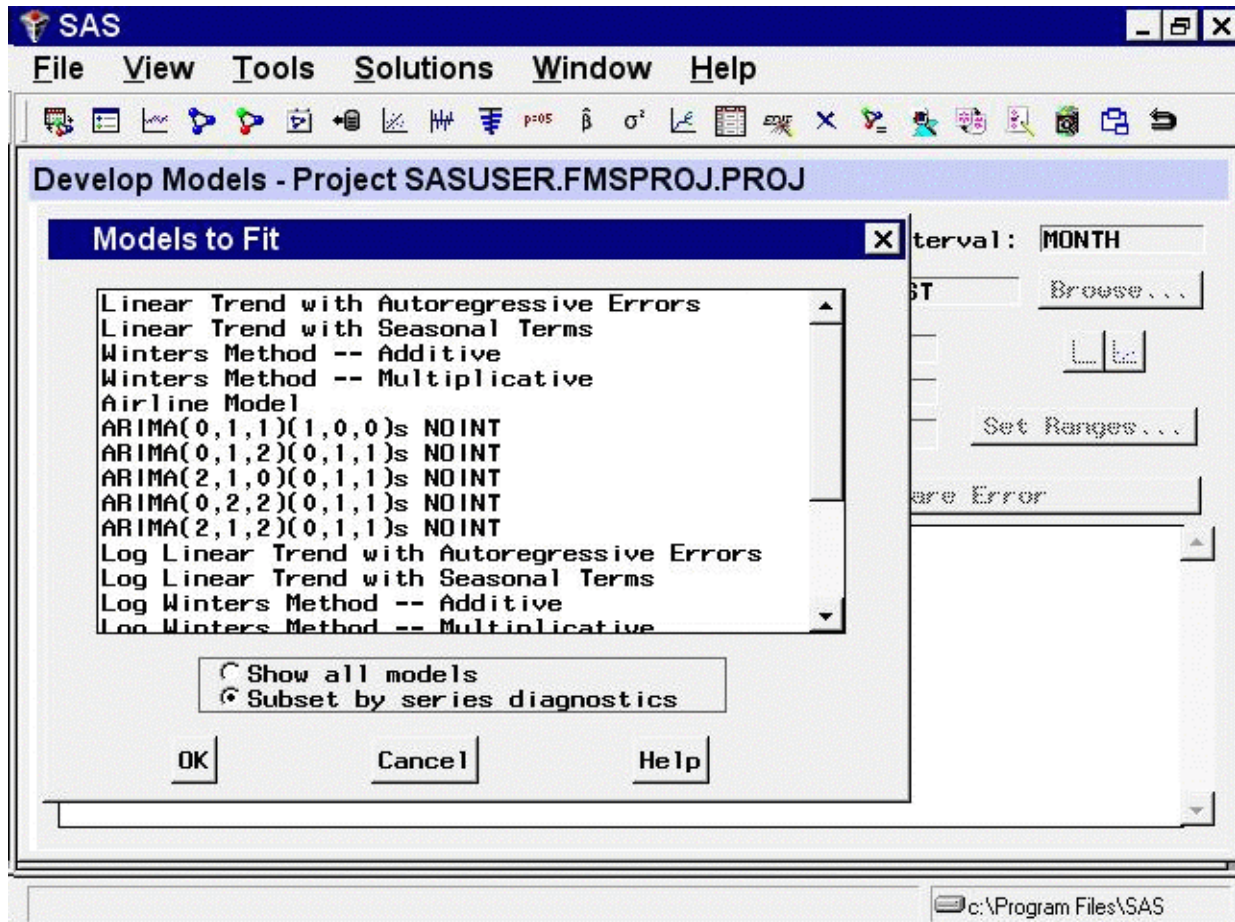

To have the system diagnose the series characteristics, select the **Automatic Series Diagnostics** button. This runs the diagnostic routines described in Chapter 50, “[Forecasting Process Details](#),” and sets the options according to the results. In this example, *Trend* and *Seasonality* are changed from *Maybe* to *Yes*, while *Log Transform* remains set to *Maybe*.

These diagnostic criteria affect the models displayed when you use the **Models to Fit** window or the **Automatic Model Selection** model-fitting options described in the following section. You can set the criteria manually, according to your judgment, by selecting any of the options, whether you have used the **Automatic Series Diagnostics** button or not. For this exercise, leave them as set by the automatic diagnostics. Select the **OK** button to close the **Series Diagnostics** window.

Models to Fit Window

As you saw in the previous chapter, you can select models from a list. Invoke the Models to Fit window by clicking the middle of the table and selecting “Fit Models from List” from the menu. This can also be selected from the tool bar or the Fit Model submenu of the Edit menu. The Models to Fit window comes up, as shown in Figure 45.4.

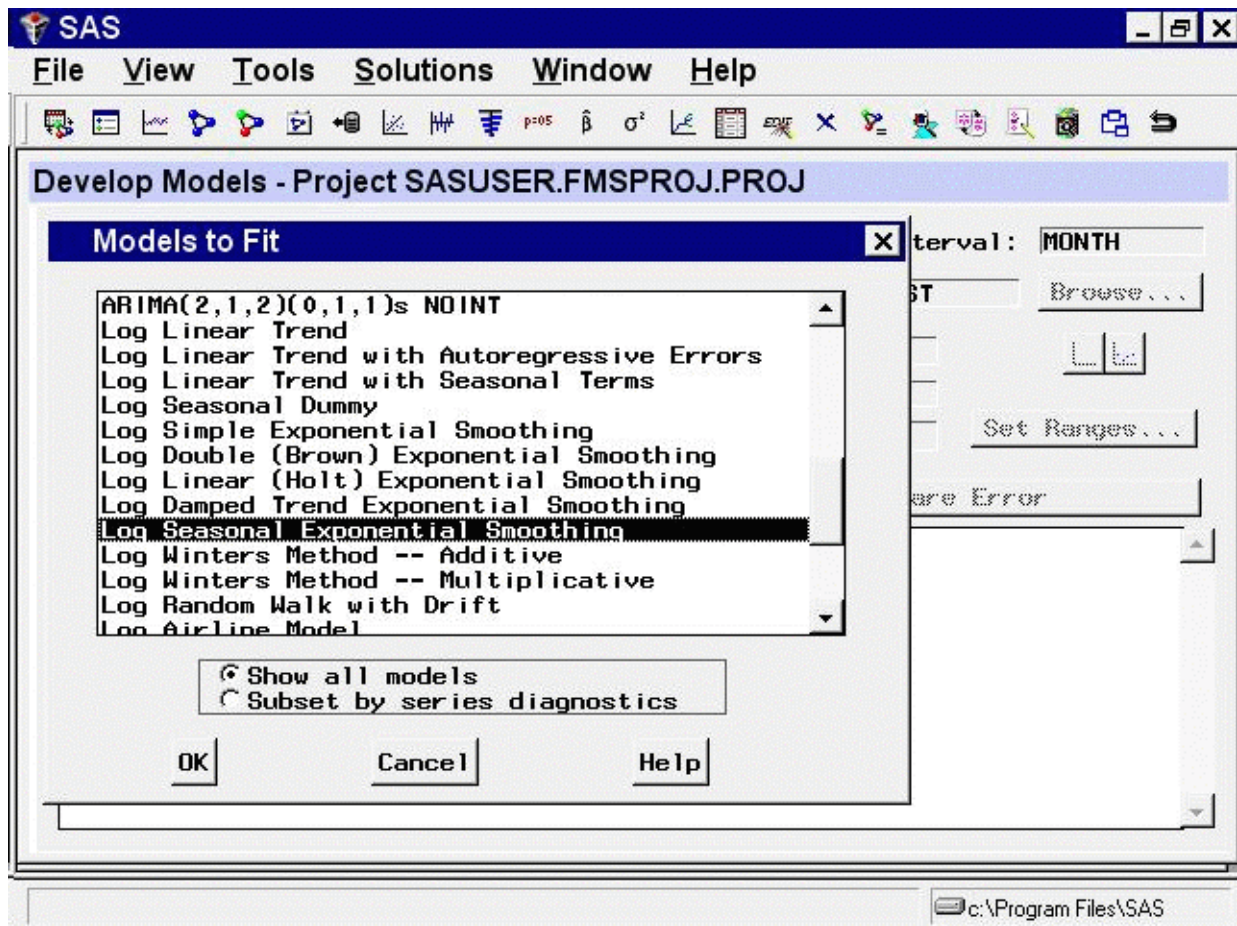

Figure 45.4 Models to Fit Window

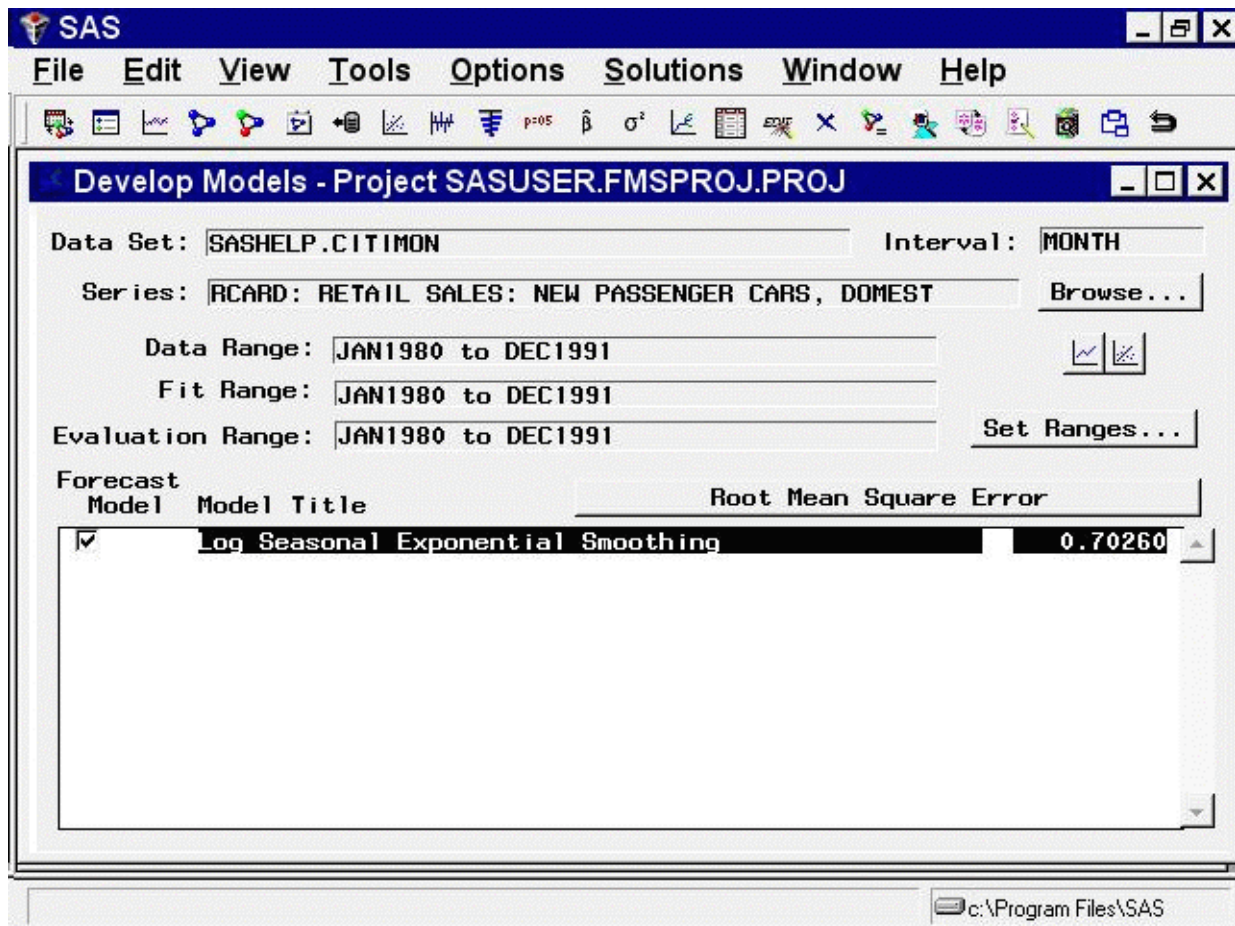

Since you have performed series diagnostics, the models shown are the subset that fits the diagnostic criteria.

Suppose you want to consider models other than those in this subset because you are undecided about including a trend in the model. Select the Show all models option. Now the entire model selection list is shown. Scroll through the list until you find Log Seasonal Exponential Smoothing, as shown in Figure 45.5.

Figure 45.5 Selecting a Model from List

This is a nontrended model, which seems a good candidate. Select this model, and then select the OK button. The model is fit to the series and then appears in the table with the value of the selected fit criterion, as shown in Figure 45.6.

Figure 45.6 Develop Models Window Showing Model Fit

You can edit the model list that appears in the Models to Fit window by selecting “Options” and “Model Selection List” from the menu bar or by selecting the Edit Model List toolbar icon. You can then delete models you are not interested in from the default list and add models using any of the model specification methods described in this chapter. When you save your project, the edited model selection list is saved in the project file. In this way, you can use the Select from List item and the Automatic Model Selection item to select models from a customized search set.

Automatic Model Selection

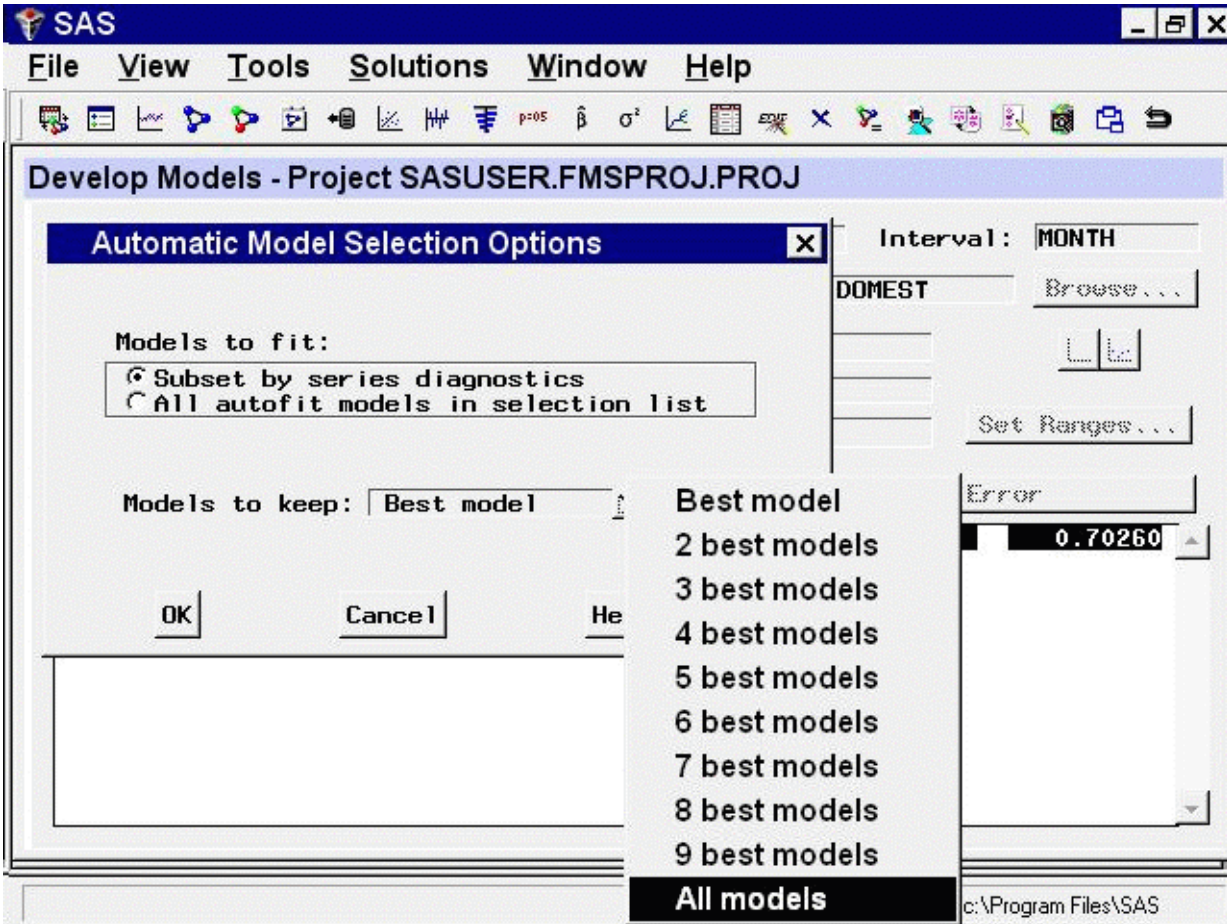

Automatic model selection is equivalent to choosing Select from List, as you did in the preceding section, fitting all the models in the subset list and then deleting all except the best fitting of the models. If series diagnostics have not yet been done, they are performed automatically to determine the model subset to fit. If you set the series diagnostics for log, trend, or seasonal criteria manually using the radio buttons, these choices are honored by the automatic fitting process.

Using automatic selection, the system does not pause to warn you of model fitting errors, such as failure of the estimates to converge (you can track these using the audit trail feature).

By default, only the best fitting model is kept. However, you can control the number of automatically fit models retained in the Develop Models list, and the following example shows how to do this.

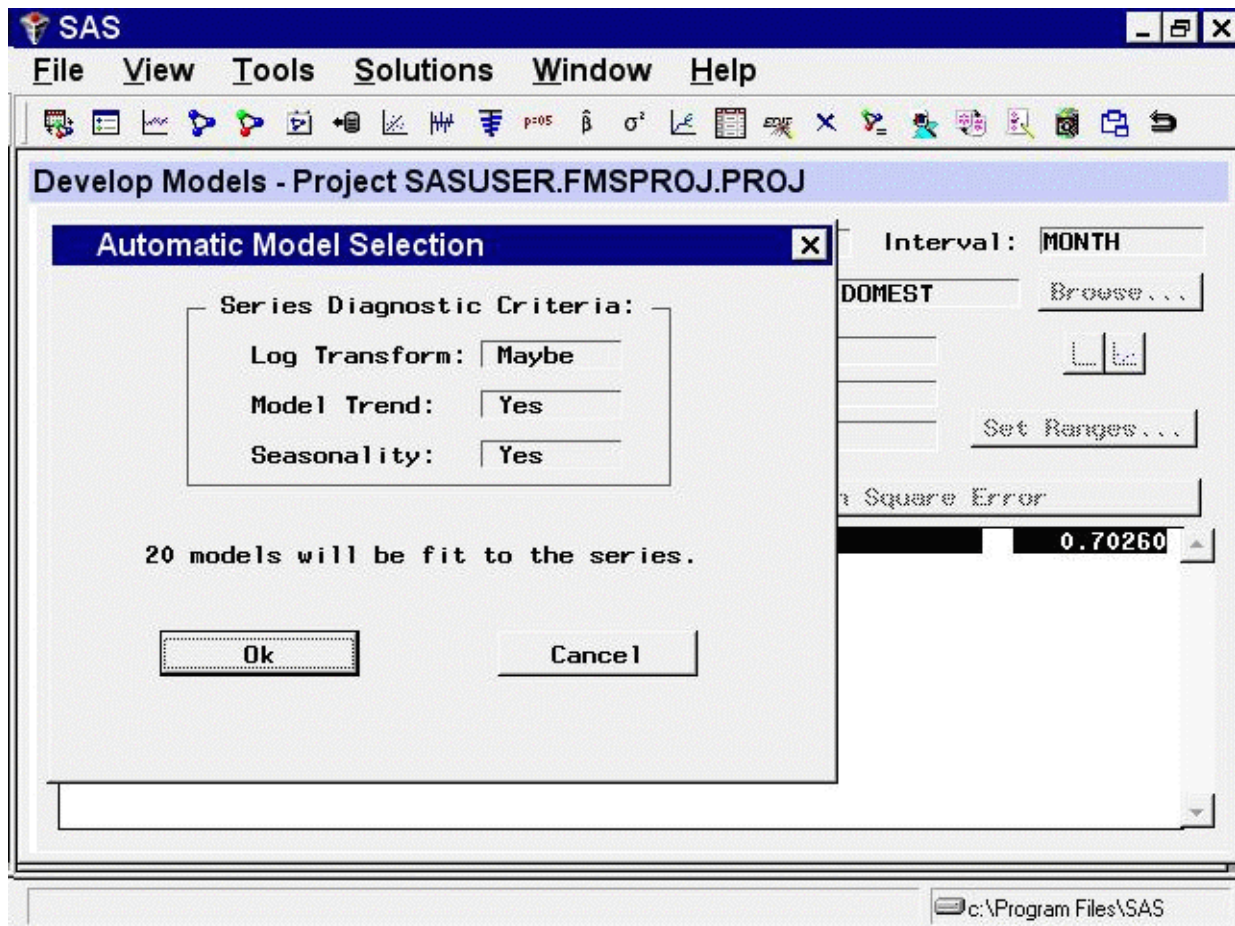

From the menu bar, choose “Options” and “Automatic Fit.” This opens the Automatic Model Selection Options window. Click the Models to Keep list arrow, and select “All models”, as shown in Figure 45.7. Now select OK.

Figure 45.7 Selecting Number of Automatic Fit Models to Keep

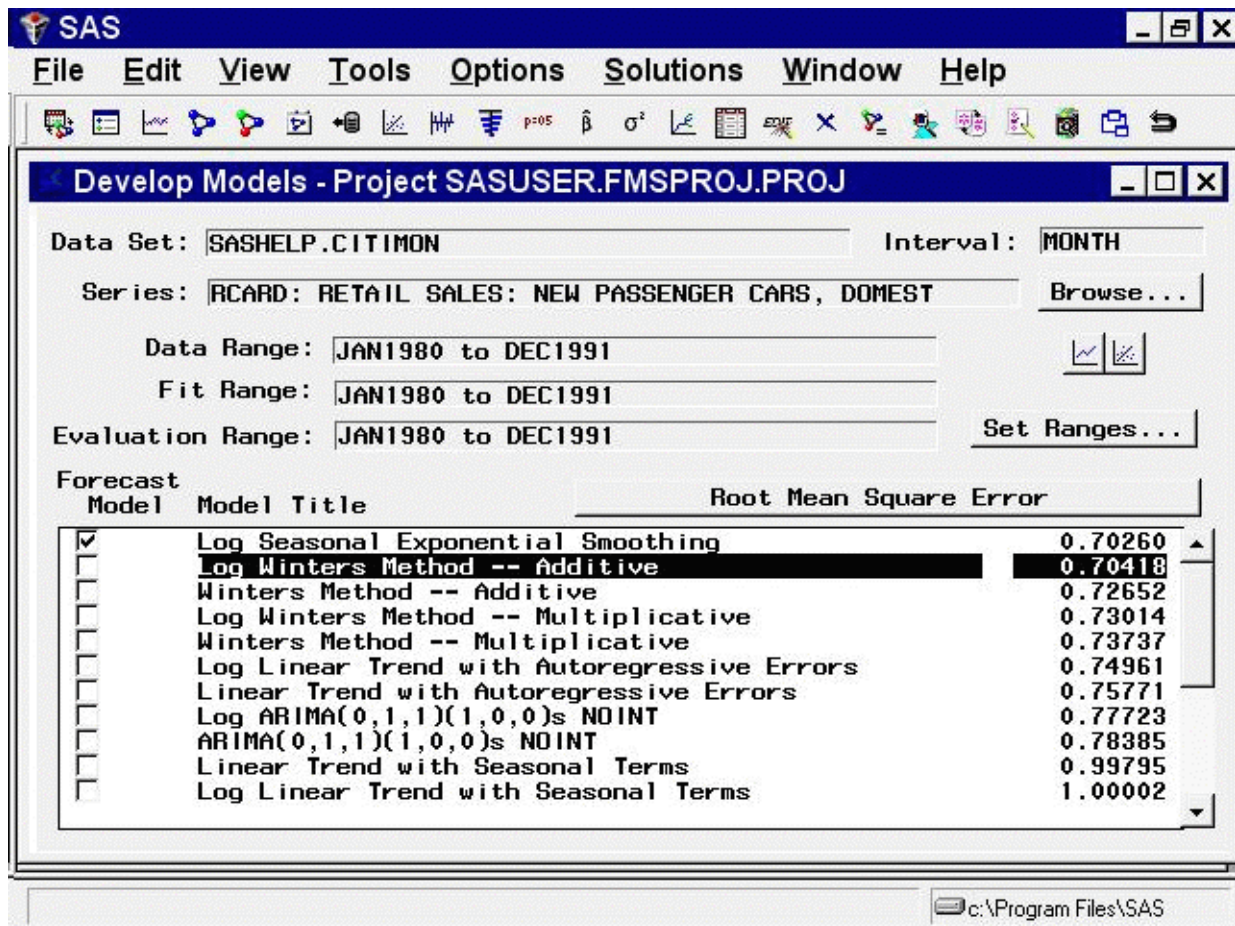

Next, select “Fit Models Automatically” by clicking the middle of the table or using the toolbar or Edit menu. The Automatic Model Selection window appears, showing the diagnostic criteria in effect and the number of models to be fit, as shown in Figure 45.8.

Figure 45.8 Automatic Model Selection Window

Select the OK button. After the models have been fit, all of them appear in the table, in addition to the model which you fit earlier, as shown in [Figure 45.9](#).

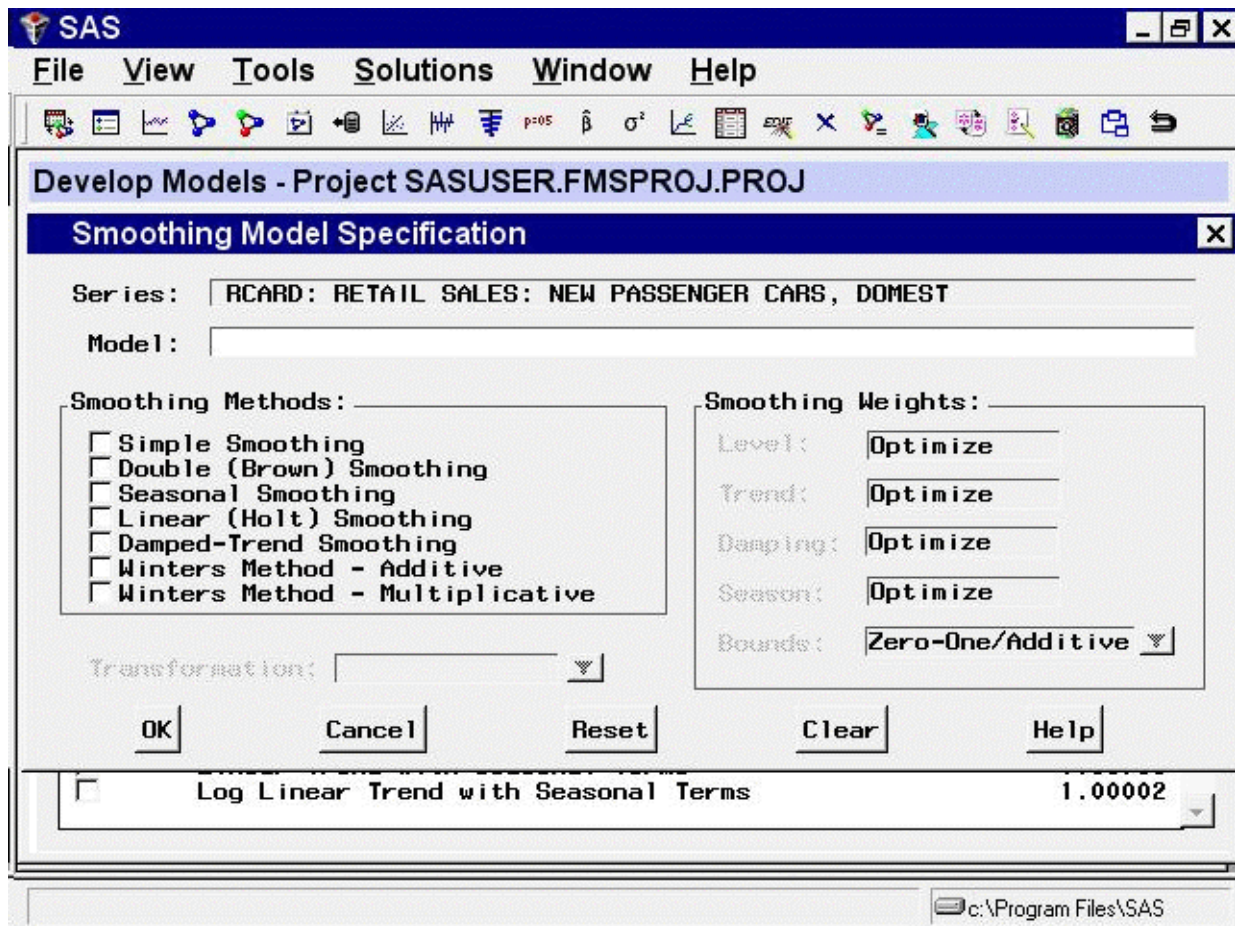

Figure 45.9 Automatically Fit Models

Smoothing Model Specification Window

To fit exponential smoothing and Winters models not already provided in the Models to Fit window, select “Fit Smoothing Model” from the pop-up menu or toolbar or select “Smoothing Model” from the Fit Model submenu of the Edit menu. This opens the Smoothing Model Specification window, as shown in Figure 45.10.

Figure 45.10 Smoothing Model Specification Window

The Smoothing Model Specification window consists of several parts. At the top is the series name and a field for the label of the model you are specifying. The model label is filled in with an automatically generated label as you specify options. You can type over the automatic label with your own label for the model. To restore the automatic label, enter a blank label.

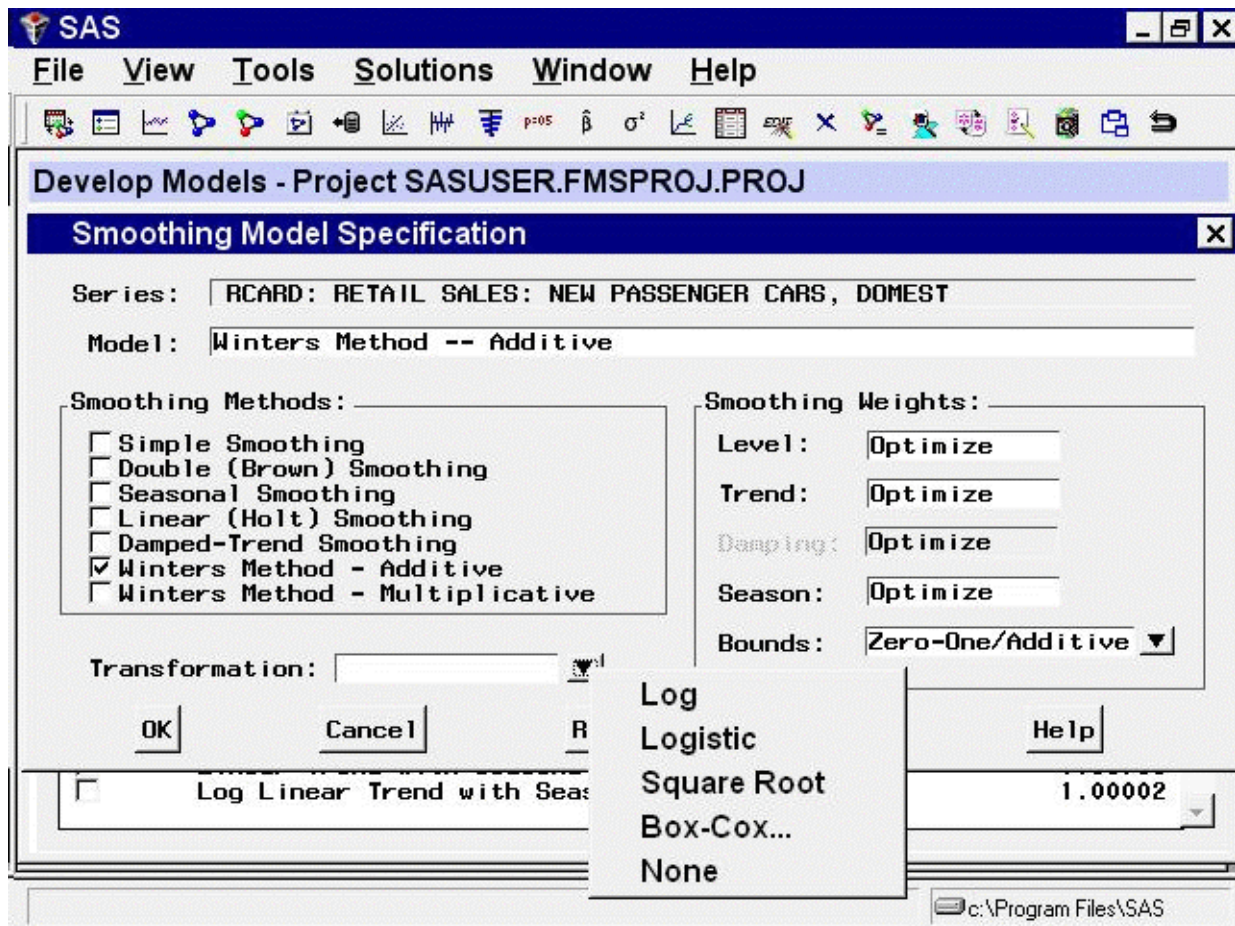

The Smoothing Methods box lists the different methods available. Below the Smoothing Methods box is the Transformation field, which is used to apply the smoothing method to transformed series values.

The Smoothing Weights box specifies how the smoothing weights are determined. By default, the smoothing weights are automatically set to optimize the fit of the model to the data. See Chapter 50, “Forecasting Process Details,” for more information about how the smoothing weights are fit.

Under smoothing methods, select “Winters Method – Additive.” Notice the smoothing weights box to the right. The third item, Damping, is grayed out, while the other items, Level, Trend, and Season, show the word *Optimize*. This tells you that these three smoothing weights are applicable to the smoothing method that you selected and that the system is currently set to optimize these weights for you.

Next, specify a transformation using the Transformation list. A menu of transformation choices pops up, as shown in Figure 45.11.

Figure 45.11 Transformation Options

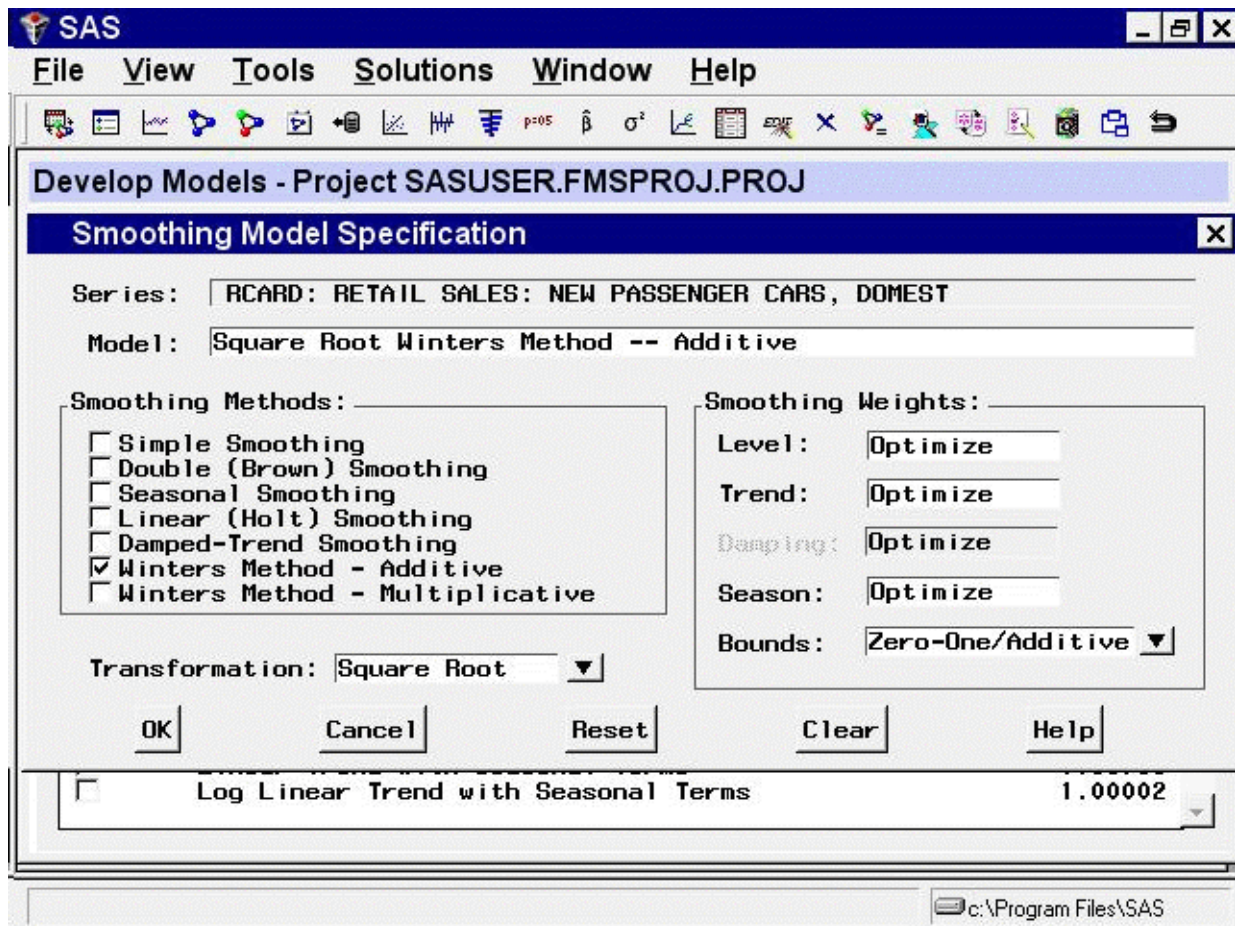

You can specify a logarithmic, logistic, square root, or Box-Cox transformation. For this example, select “Square Root” from the list. The Transformation field is now set to Square Root.

This means that the system will first take the square roots of the series values, apply the additive version of the Winters method to the square root series, and then produce the predictions for the original series by squaring the Winters method predictions (and multiplying by a variance factor if the Mean Prediction option is set in the Forecast Options window). See Chapter 50, “[Forecasting Process Details](#),” for more information about predictions from transformed models.

The Smoothing Model Specification window should now appear as shown in [Figure 45.12](#). Select the OK button to fit the model. The model is added to the table of fitted models in the Develop Models window.

Figure 45.12 Winter's Method Applied to Square Root Series

ARIMA Model Specification Window

To fit ARIMA or Box-Jenkins models not already provided in the Models to Fit window, select the ARIMA model item from the pop-up menu, toolbar, or Edit menu. This opens the ARIMA Model Specification window, as shown in Figure 45.13.

Figure 45.13 ARIMA Model Specification Window

c:\Program Files\SAS

This ARIMA Model Specification window is structured according to the Box and Jenkins approach to time series modeling. You can specify the same time series models with the Custom Model Specification window and the ARIMA Model Specification window, but the windows are structured differently, and you may find one more convenient than the other.

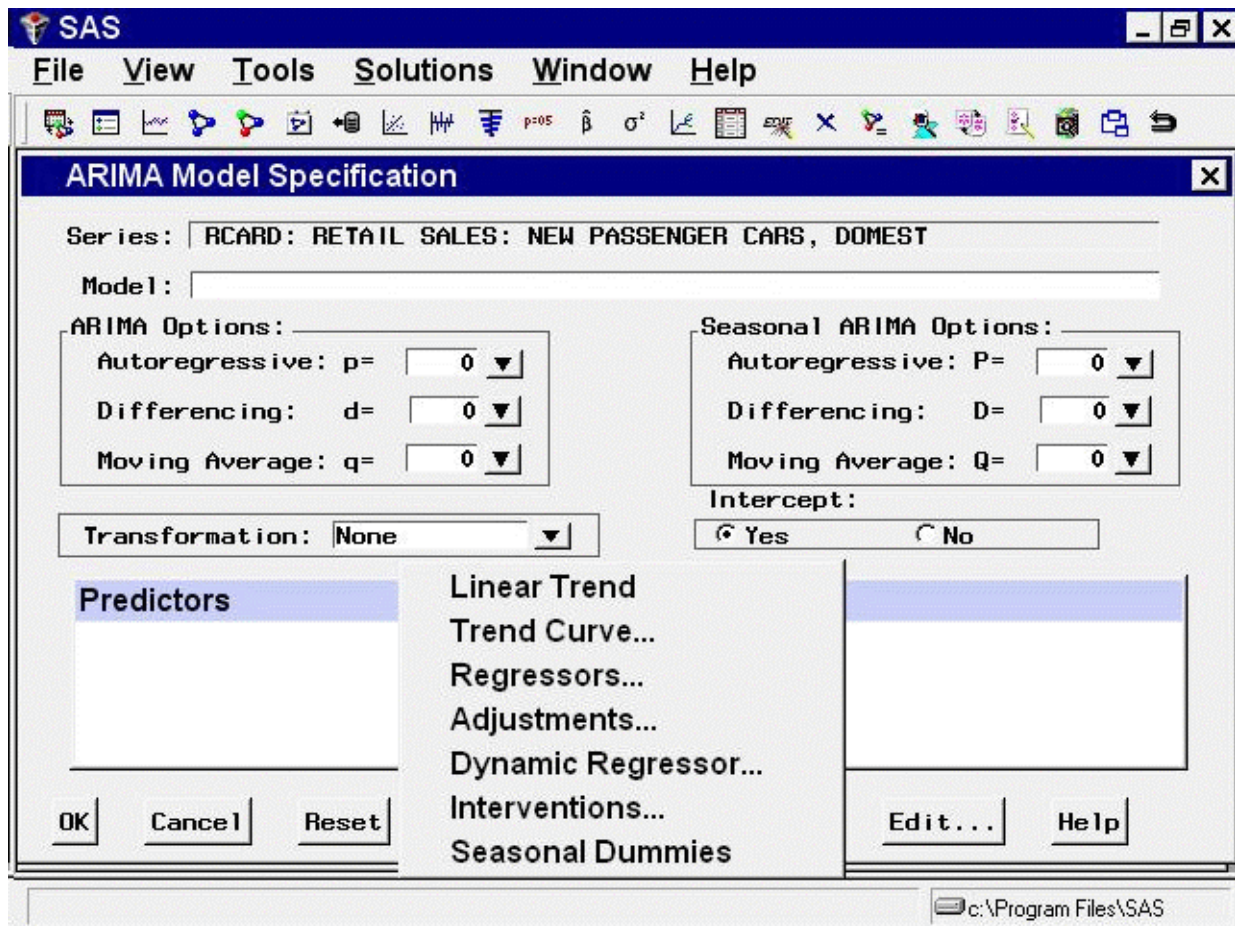

At the top of the ARIMA Model Specification window is the name and label of the series and the label of the model you are specifying. The model label is filled in with an automatically generated label as you specify options. You can type over the automatic label with your own label for the model. To restore the automatic label, enter a blank label.

Using the ARIMA Model Specification window, you can specify autoregressive (p), differencing (d), and moving average (q) orders for both simple and seasonal factors. You can specify transformations with the Transformation list. You can also specify whether an intercept is included in the ARIMA model.

In addition to specifying seasonal and nonseasonal ARIMA processes, you can also specify predictor variables and other terms as inputs to the model. ARIMA models with inputs are sometimes called ARIMAX models or Box-Tiao models. Another term for this kind of model is *dynamic regression*.

In the lower part of the ARIMA Model Specification window is the list of *predictors* to the model (initially empty). You can specify predictors by using the Add button. This opens a menu of different kinds of independent effects, as shown in Figure 45.14.

Figure 45.14 Add Predictors Menu

The kinds of predictor effects allowed include time trends, regressors, adjustments, dynamic regression (transfer functions), intervention effects, and seasonal dummy variables. How to use different kinds of predictors is explained in Chapter 47, “[Using Predictor Variables](#).”

As an example, in the *ARIMA Options* box, set the order of differencing d to 1 and the moving average order q to 2. You can either type in these values or click the arrows and select the values from pop-up lists.

These selections specify an $ARIMA(0,1,2)$ or $IMA(1,2)$ model. (See Chapter 7, “[The ARIMA Procedure](#),” for more information about the notation used for ARIMA models.) Notice that the model label at the top is now $IMA(1,2) NOINT$, meaning that the data are differenced once and a second-order moving-average term is included with no intercept.

In the *Seasonal ARIMA Options* box, set the seasonal moving-average order Q to 1. This adds a first-order moving-average term at the seasonal (12 month) lag. Finally, select “Log” in the Transformation combo box.

The model label is now $Log\ ARIMA(0,1,2)(0,0,1)_S NOINT$, and the window appears as shown in [Figure 45.15](#).

Figure 45.15 Log ARIMA(0,1,2)(0,0,1)s Specified

c:\Program Files\SAS

Select the OK button to fit the model. The model is fit and added to the Develop Models table.

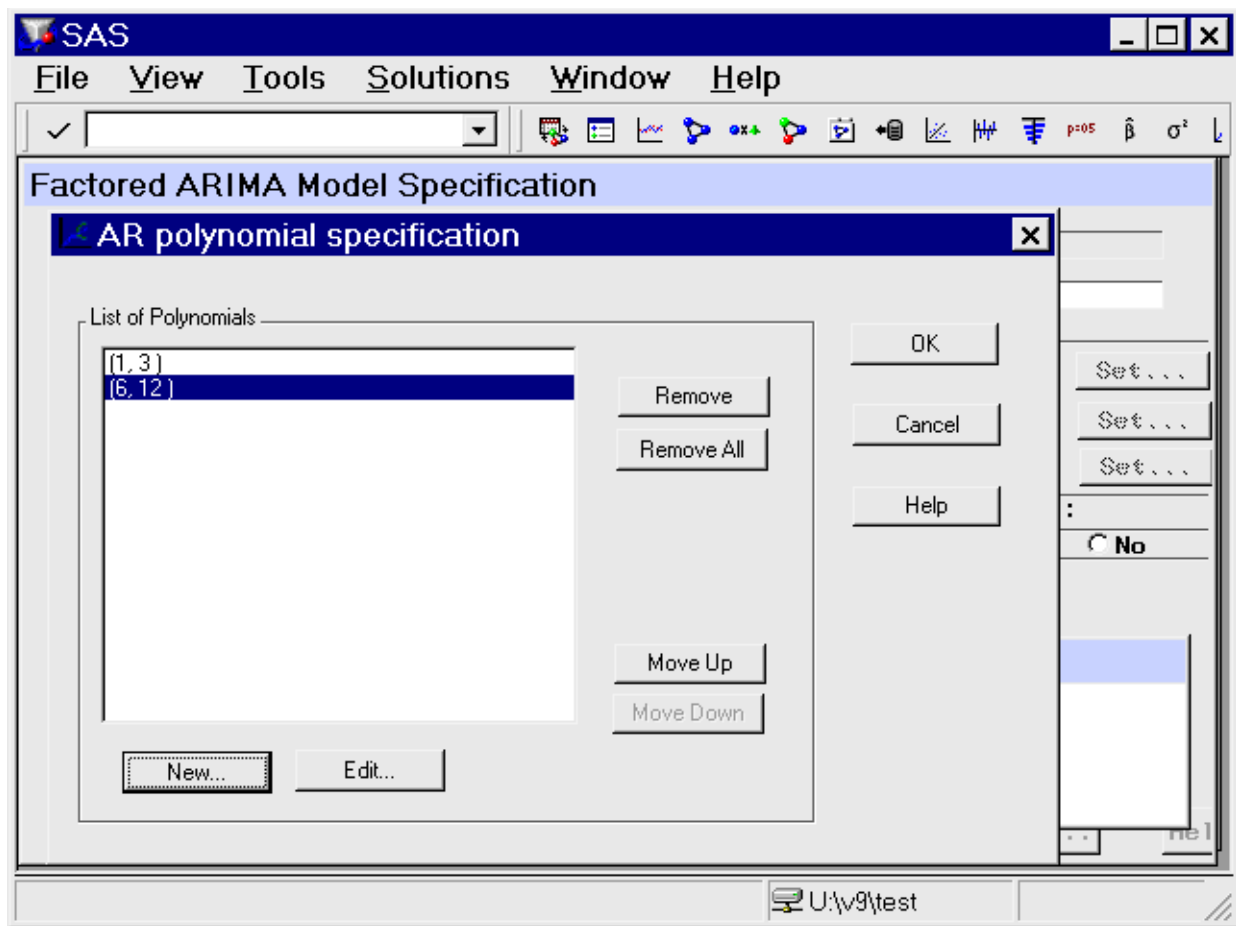

Factored ARIMA Model Specification Window

To fit a factored ARIMA model, select the Factored ARIMA model item from the pop-up menu, toolbar, or Edit menu. This brings up the Factored ARIMA Model Specification window, shown in [Figure 45.16](#).

Figure 45.16 Factored ARIMA Model Specification Window

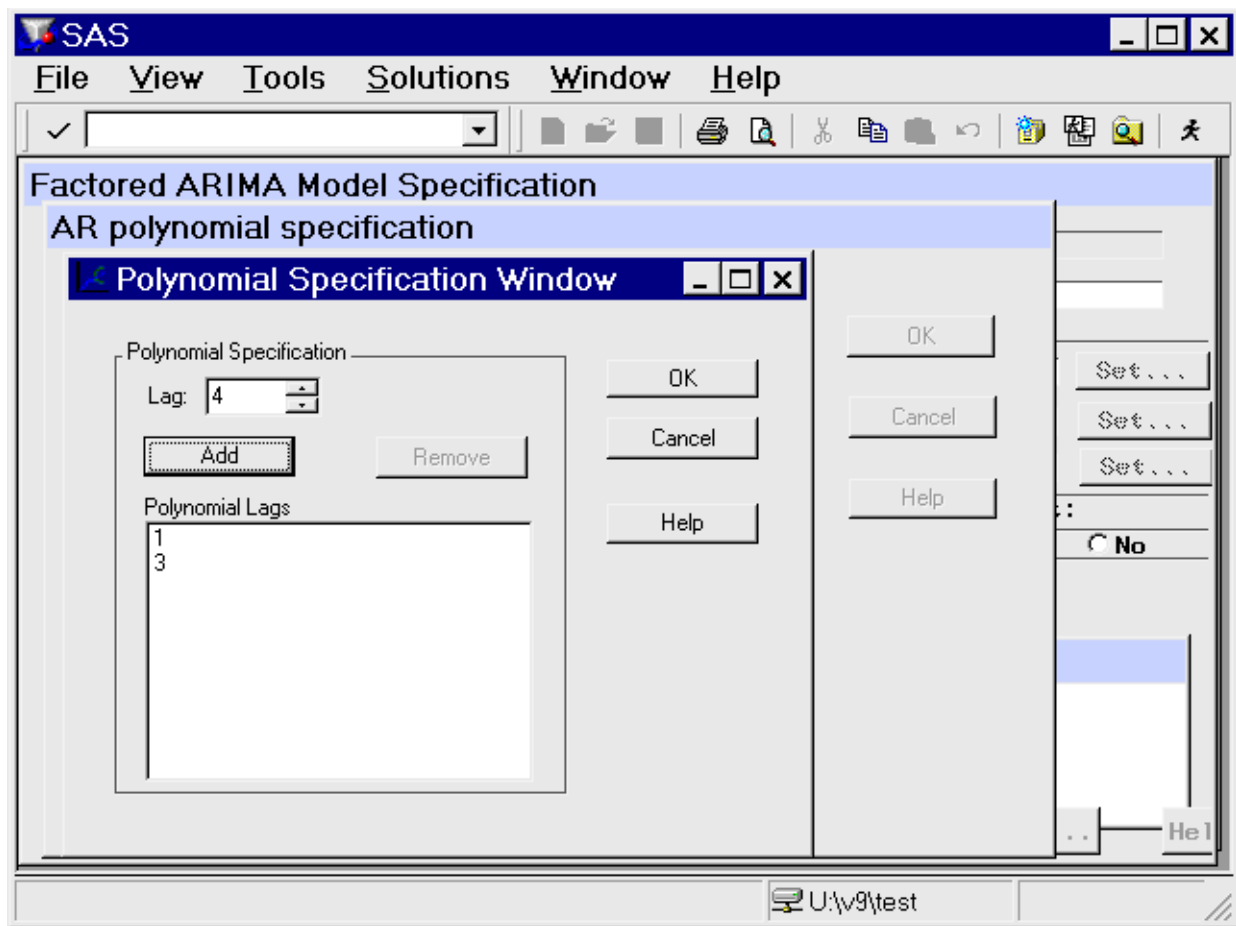

The Factored ARIMA Model Specification window is similar to the ARIMA Model Specification window and has the same features, but it uses a more general specification of the autoregressive (p), differencing (d), and moving-average (q) terms. To specify these terms, select the corresponding Set button, as shown in [Figure 45.16](#). For example, to specify autoregressive terms, select the first Set button. This opens the AR Polynomial Specification Window, shown in [Figure 45.17](#).

Figure 45.17 AR Polynomial Specification Window

To add AR polynomial terms, select the New button. This opens the Polynomial Specification Window, shown in Figure 45.18. Specify the first lag you want to include by using the Lag spin box, then select the Add button. Repeat this process, adding each lag you want to include in the current list. All lags must be specified. For example, if you add only lag 3, the model contains only lag 3, not 1 through 3.

As an example, add lags 1 and 3, then select the OK button. The AR Polynomial Specification Window now shows (1,3) in the list of polynomials. Now select “New” again. Add lags 6 and 12 and select “OK”. Now the AR Polynomial Specification Window shows (1,3) and (6,12) as shown in Figure 45.17. Select “OK” to close this window. The Factored ARIMA Model Specification Window now shows the factored model $p=(1, 3) (6, 12)$. Use the same technique to specify the q terms, or moving-average part of the model. There is no limit to the number of lags or the number of factors you can include in the model.

Figure 45.18 Polynomial Specification Window

To specify differencing lags, select the middle Set button to open the Differencing Specification window. Specify lags using the spin box and add them to the list with the Add button. When you select “OK” to close the window, the differencing lags appear after $d=$ in the Factored ARIMA Specification Window, within a single pair of parentheses.

You can use the Factored ARIMA Model Specification Window to specify any model that you can specify with the ARIMA Model and Custom Model windows, but the notation is more similar to that of the ARIMA procedure (see Chapter 7, “[The ARIMA Procedure](#)”). Consider as an example the classic Airline model fit to the International Airline Travel series, `SASHELP.AIR`. This is a factored model with one moving-average term at lag one and one moving-average term at the seasonal lag, with first-order differencing at the simple and seasonal lags. Using the ARIMA Model Specification Window, you specify the value 1 for the q and d terms and also for the Q and D terms, which represent the seasonal lags. For monthly data, the seasonal lags represent lag 12, since a yearly seasonal cycle is assumed.

By contrast, the Factored ARIMA Model Specification Window makes no assumptions about seasonal cycles. The Airline model is written as $IMA\ d=(1,12)\ q=(1)(12)\ NOINT$. To specify the differencing terms, add the values 1 and 12 in the Differencing Specification Window and select OK. Then select “New” in the MA Polynomial Specification Window, add the value 1, and select OK. To add the factored term, select “New” again, add the value 12, and select OK. Remember to select “No” in the Intercept radio box, since it is not selected by default. Select OK to close the Factored ARIMA Model Specification Window and fit the model.

You can show that the results are the same as they are when you specify the model by using the ARIMA Model Specification Window and when you select Airline Model from the default model list. If you are familiar with the ARIMA Procedure (Chapter 7, “[The ARIMA Procedure](#)”), you might want to turn on the `Show Source Statements` option before fitting the model, then examine the procedure source statements in the log window after fitting the model.

The strength of the Factored ARIMA Specification approach lies in its ability to construct unusual ARIMA models, such as:

Subset models

These are models of order n , where fewer than n lags are specified. For example, an AR order 3 model might include lags 1 and 3 but not lag 2.

Unusual seasonal cycles

For example, a monthly series might cycle two or four times per year instead of just once.

Multiple cycles

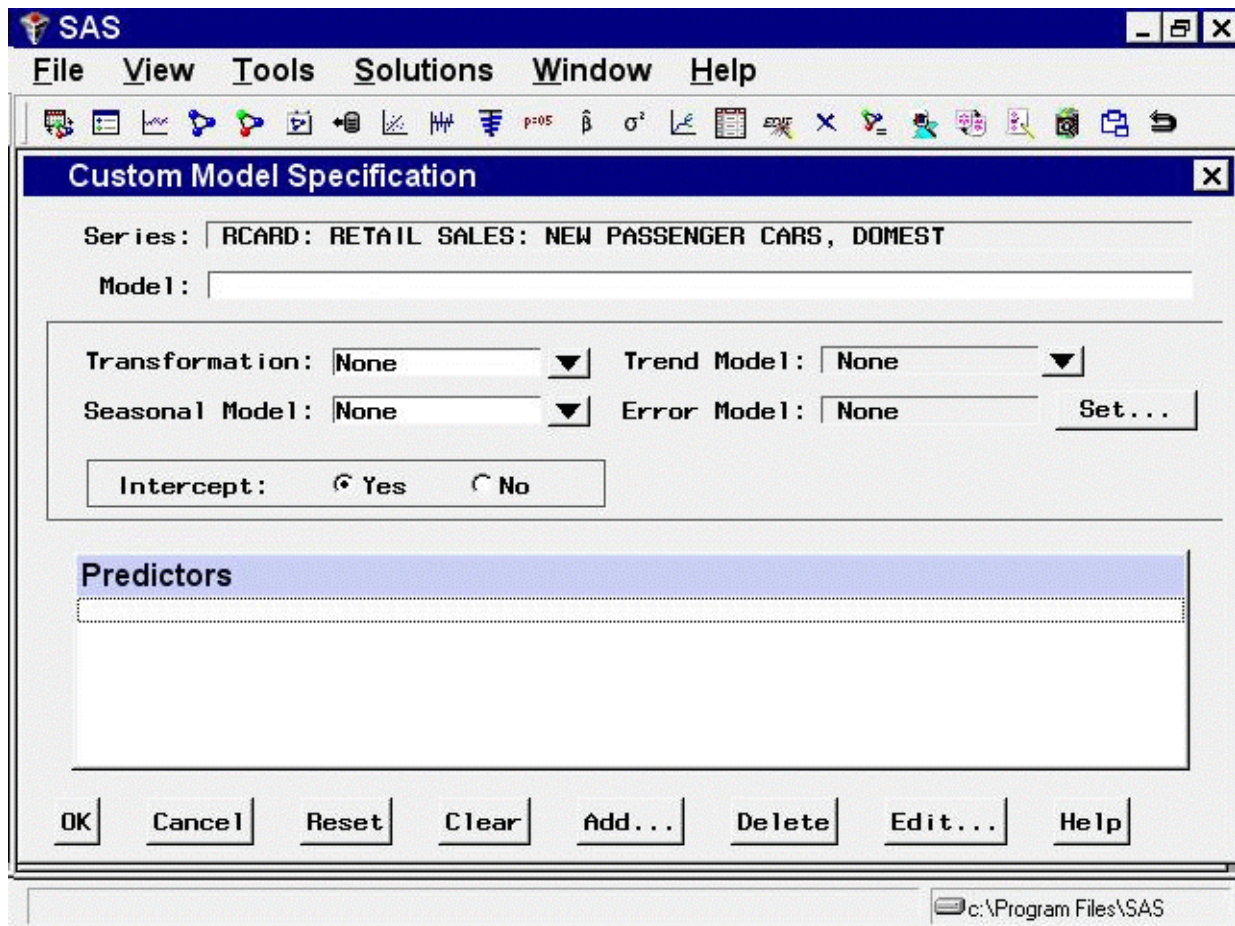

For example, a daily sales series might peak on a certain day each week and also once a year at the Christmas season. Given sufficient data, you can fit a three-factor model, such as $IMA\ d=(1)\ q=(1)(7)(365)$.

Models with high order lags take longer to fit and often fail to converge. To save time, select the Conditional Least Squares or Unconditional Least Squares estimation method (see [Figure 45.16](#)). Once you have narrowed down the list of candidate models, change to the Maximum Likelihood estimation method.

Custom Model Specification Window

To fit a custom time series model not already provided in the Models to Fit window, select the Custom Model item from the pop-up menu, toolbar, or Edit menu. This opens the Custom Model Specification window, as shown in [Figure 45.19](#).

Figure 45.19 Custom Model Specification Window

You can specify the same time series models with the Custom Model Specification window and the ARIMA Model Specification window, but the windows are structured differently, and you might find one more convenient than the other.

At the top of the Custom Model Specification window is the name and label of the series and the label of the model you are specifying. The model label is filled in with an automatically generated label as you specify options. You can type over the automatic label with your own label for the model. To restore the automatic label, enter a blank label.

The middle part of the Custom Model Specification window consists of four fields: *Transformation*, *Trend Model*, *Seasonal Model*, and *Error Model*. These fields allow you to specify the model in four parts. Each part specifies how a different aspect of the pattern of the time series is modeled and predicted.

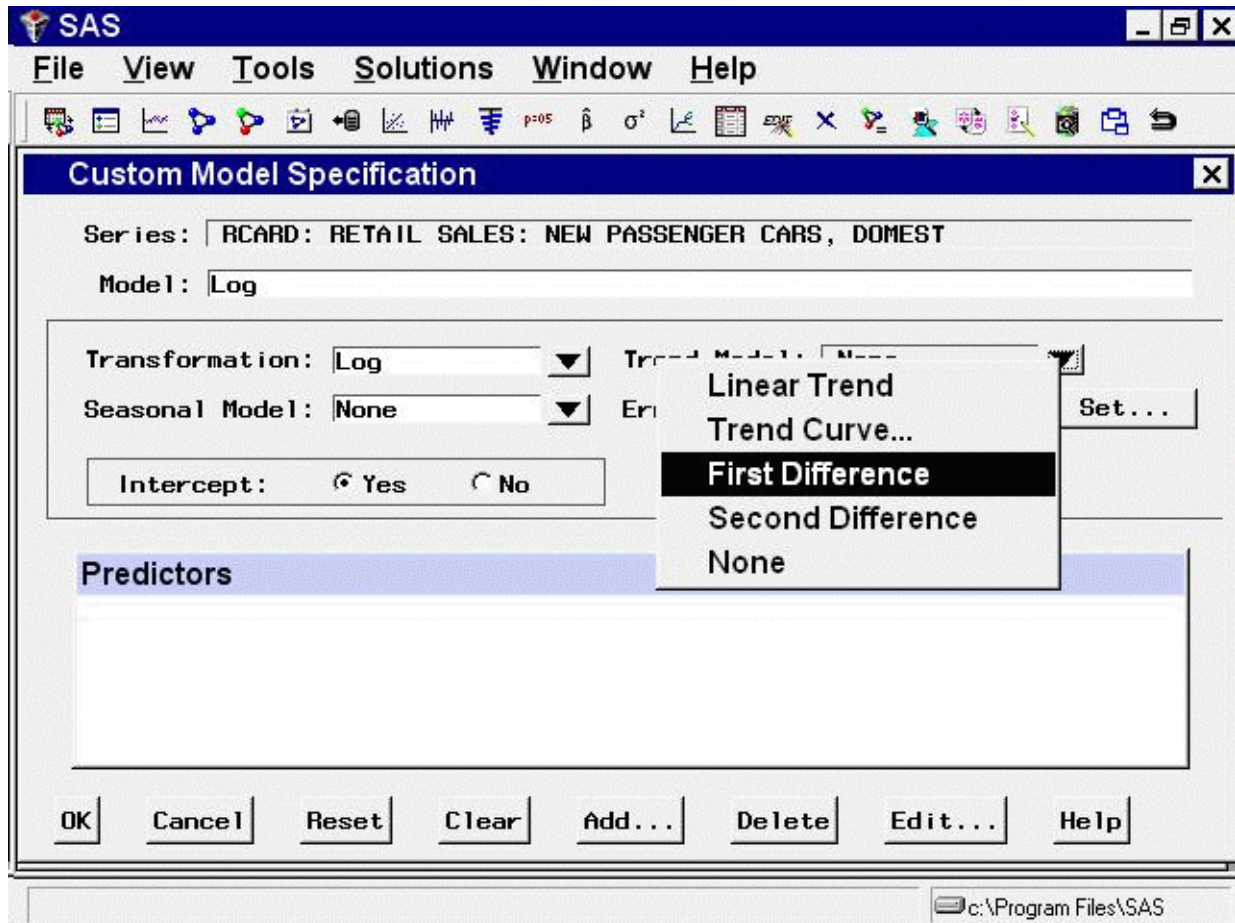

The *Predictors* list at the bottom of the Custom Model Specification window allows you to include different kinds of predictor variables in the forecasting model. The *Predictors* feature for the Custom Model Specification window is like the *Predictors* feature for the ARIMA Model Specification window, except that time trend predictors are provided through the *Trend Model* field and seasonal dummy variable predictors are provided through the *Seasonal Model* field.

To illustrate how to use the Custom Model Specification window, the following example specifies the same model you fit by using the ARIMA Model Specification window.

First, specify the data transformation to use. Select “Log” using the Transformation combo box.

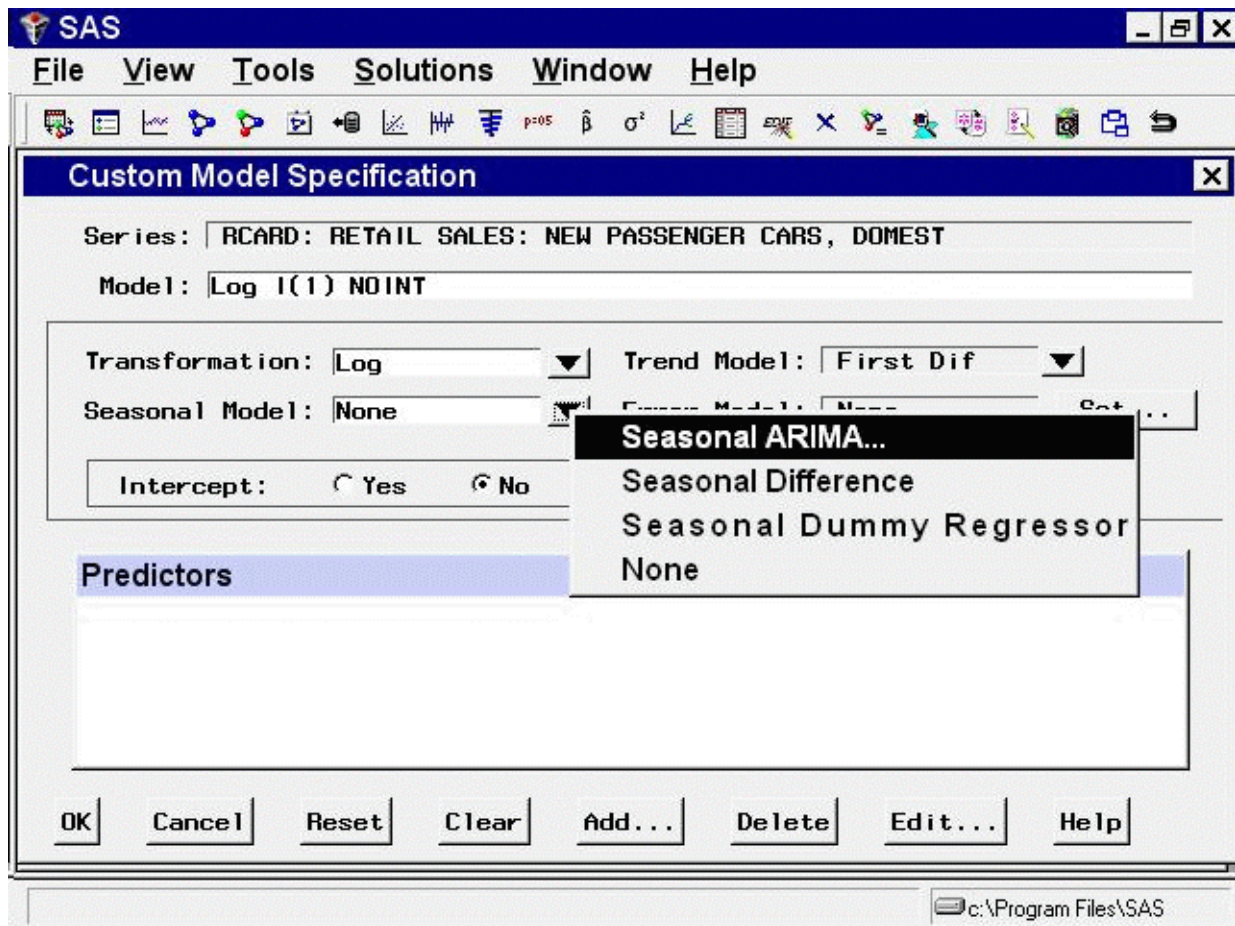

Second, specify how to model the trend in the series. Select `First Difference` in the Trend Model combo box, as shown in [Figure 45.20](#).

Figure 45.20 Trend Model Options

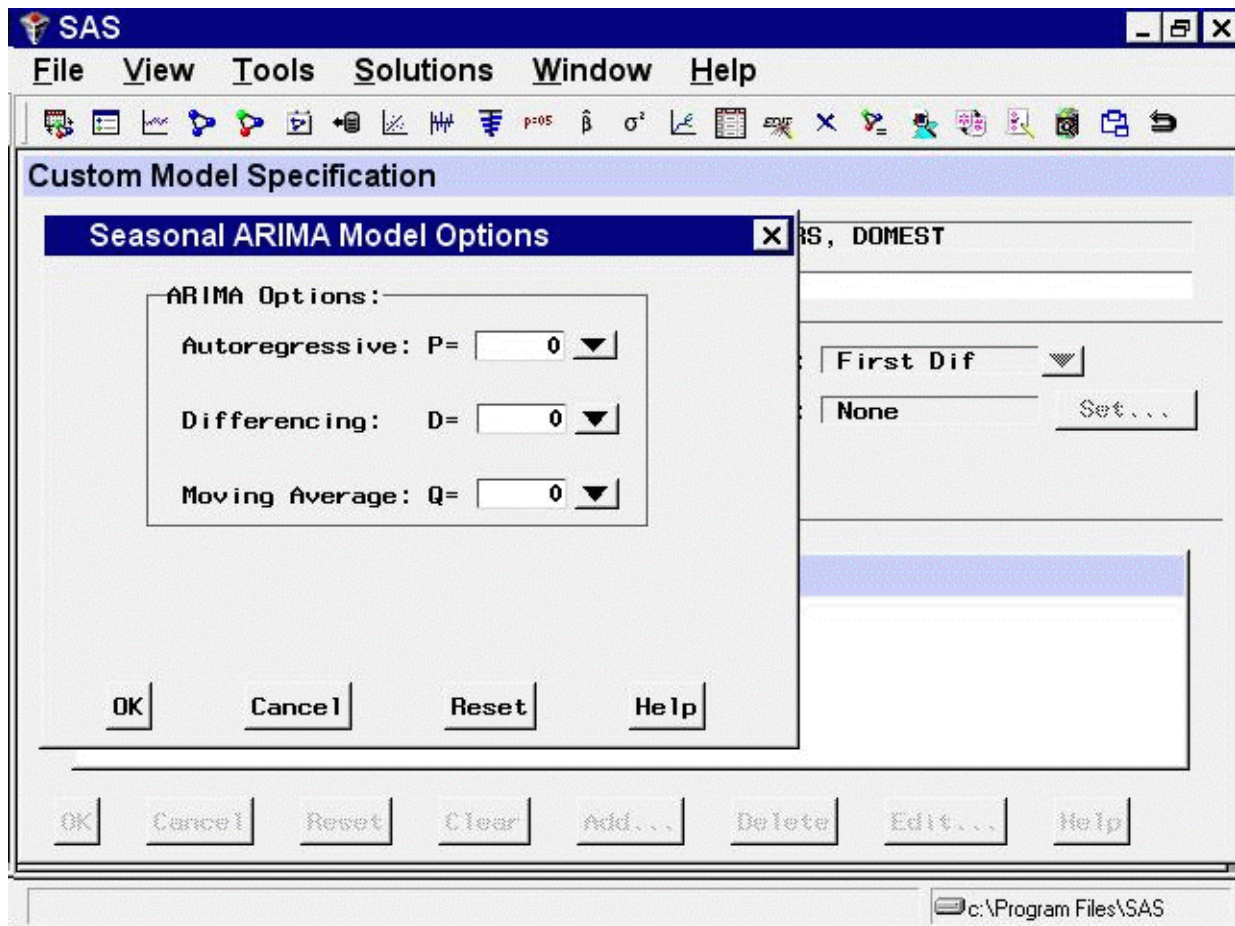

Next, specify how to model the seasonal pattern in the series. Select “Seasonal ARIMA” in the Seasonal Model combo box, as shown in [Figure 45.21](#).

Figure 45.21 Seasonal Model Options

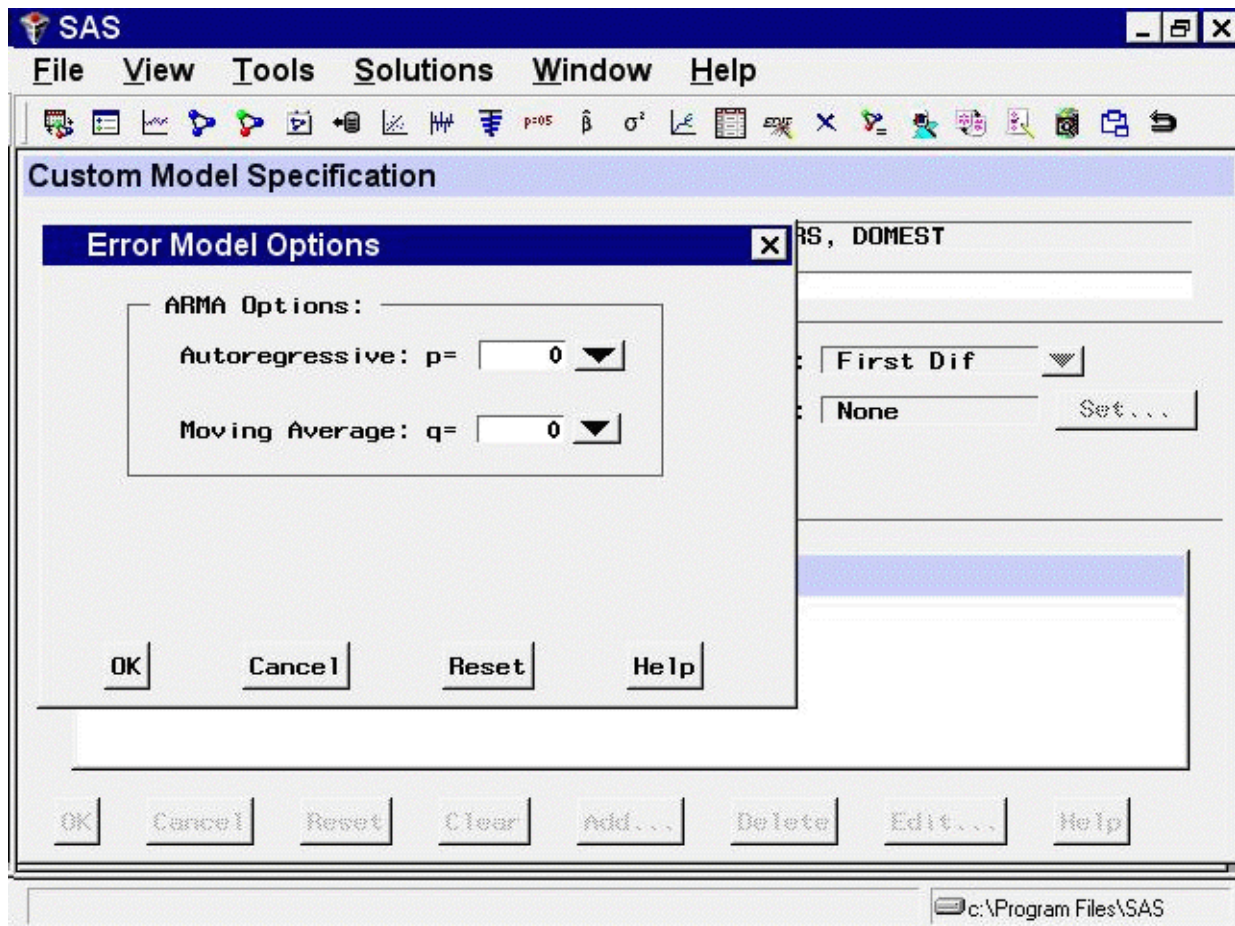

This opens the Seasonal ARIMA Model Options window, as shown in [Figure 45.22](#).

Figure 45.22 Seasonal ARIMA Model Options

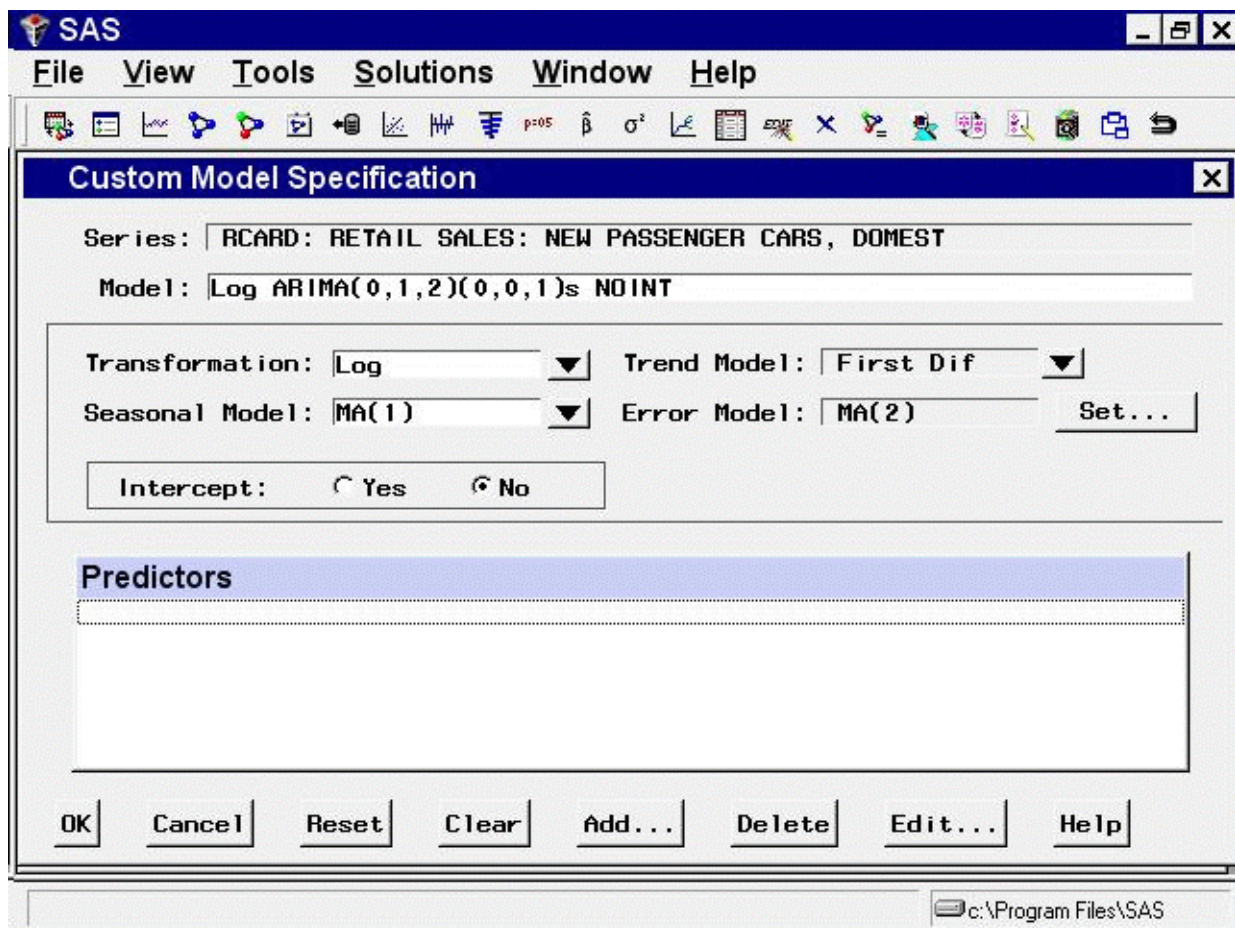

Specify a first-order seasonal moving-average term by typing 1 or by selecting “1” from the Moving Average: Q= combo box pop-up menu, and then select the OK button.

Finally, specify how to model the autocorrelation pattern in the model prediction errors. Select the Set button to the right of the Error Model field. This opens the Error Model Options window, as shown in Figure 45.23. This window allows you to specify an ARMA error process. Set the Moving Average order q to 2, and then select the OK button.

Figure 45.23 Error Model Options

The Custom Model Specification window should now appear as shown in [Figure 45.24](#). The model label at the top of the Custom Model Specification window should now read `Log ARIMA (0,1,2) (0,0,1) s NOINT,` just as it did when you used the ARIMA Model Specification window.

Figure 45.24 Log ARIMA(0,1,2)(0,0,1)s Specified

Now that you have seen how the Custom Model Specification window works, select “Cancel” to exit the window without fitting the model. This should return you to the Develop Models window.

Editing the Model Selection List

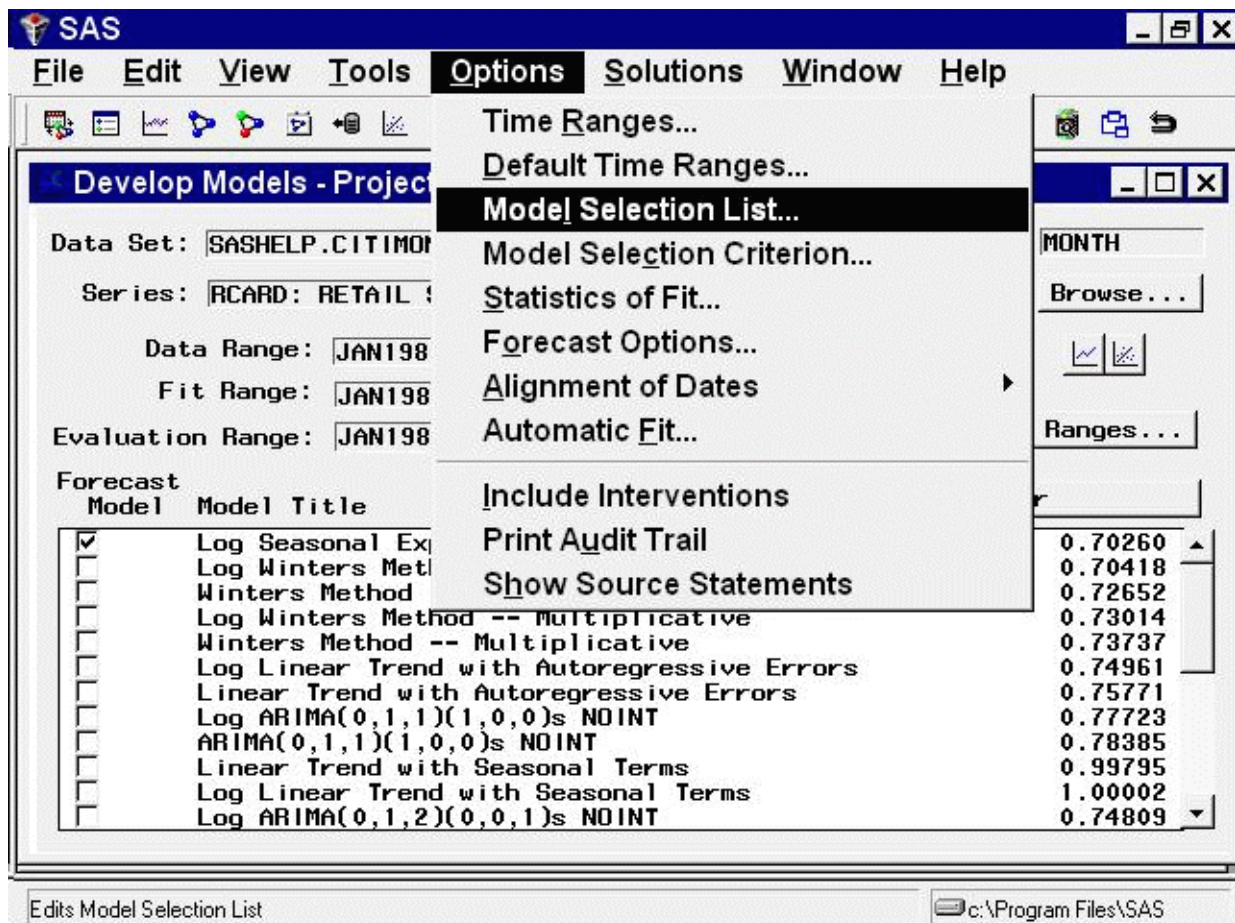

Now that you know how to specify new models that are not included in the system default model selection list, you can edit the model selection list to add models that you expect to use in the future or to delete models that you do not expect to use. When you save the forecasting project to a SAS catalog, the edited model selection list is saved with the project file, and the list is restored when you load the project.

There are two reasons why you would add a model to the model selection list. First, by adding the model to the list, you can fit the model to different time series by selecting it through the **Fit Models from List** action. You do not need to specify the model again every time you use it.

Second, once the model is added to the model selection list, it is available to the automatic model selection process. The model is then considered automatically whenever you use the automatic model selection feature for any series.

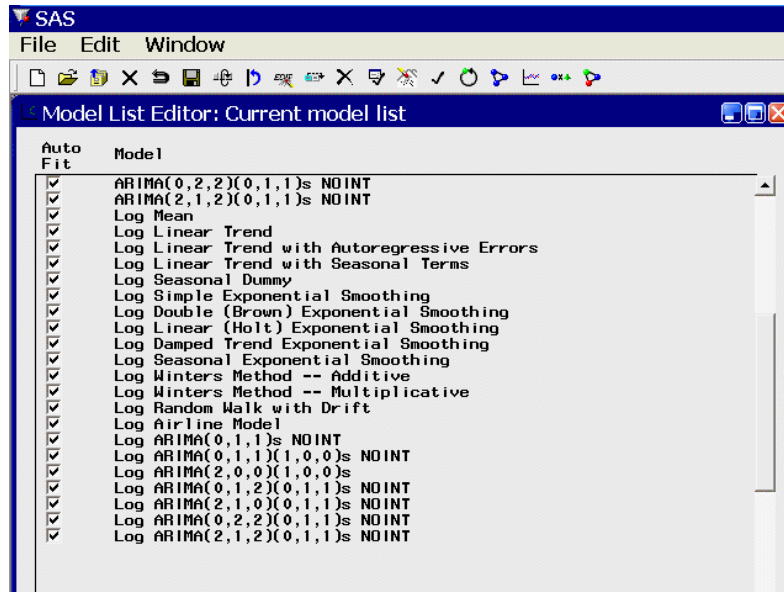

To edit the model selection list, select “Model Selection List” from the Options menu as shown in [Figure 45.25](#), or select the Edit Model List toolbar icon.

Figure 45.25 Model Selection List Option

This selection brings up the Model Selection List editor window, as shown in Figure 45.26. This window consists of the model selection list and an “Auto Fit” column, which controls for each model whether the model is included in the list of models used by the automatic model selection process.

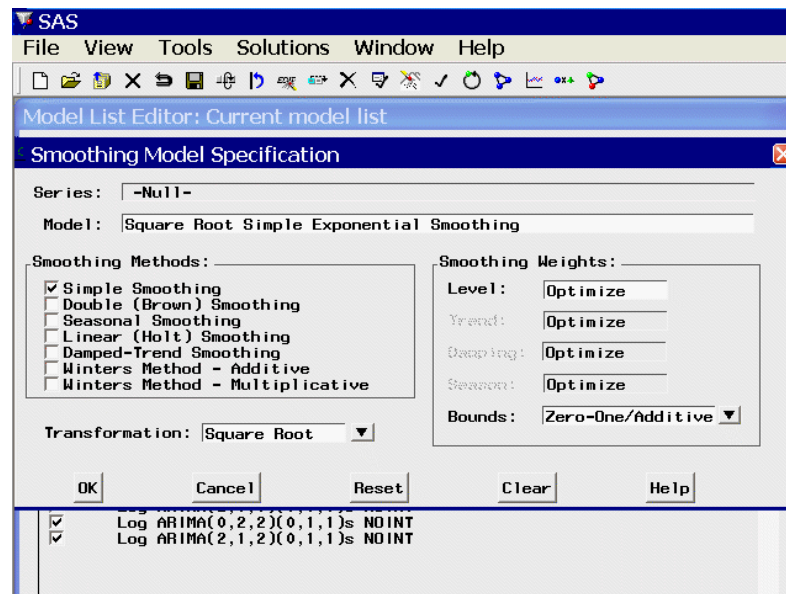

Figure 45.26 Model Selection List Window

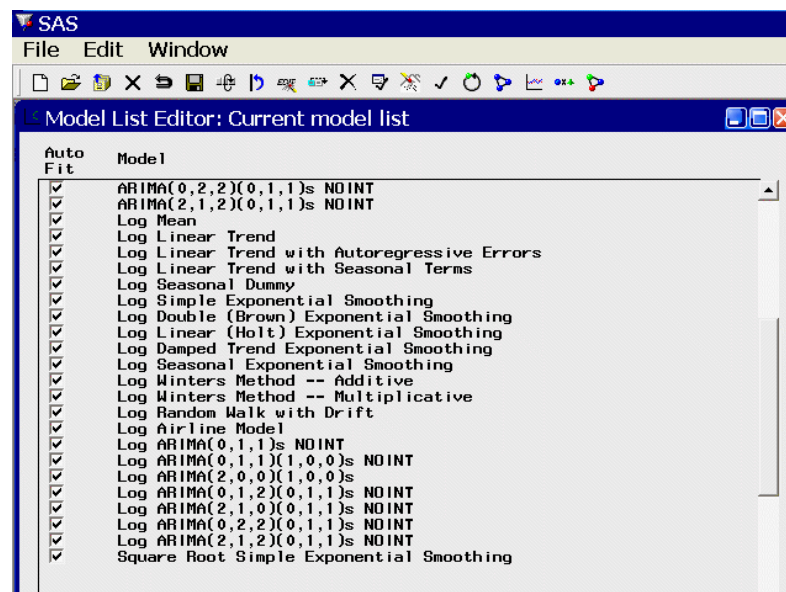

To add a model to the list, select “Add Model” from the Edit menu and then select “Smoothing Model,” “ARIMA Model,” “Factored ARIMA Model,” or “Custom Model” from the submenu. Alternatively, click the corresponding icon on the toolbar.

As an example, select “Smoothing Model.” This brings up the Smoothing Model Specification window. Note that the series name is “-Null-.” This means that you are not specifying a model to be fit to a particular series, but are specifying a model to be added to the selection list for later reference.

Specify a smoothing model. For example, select “Simple Smoothing” and then select the Square Root transformation. The window appears as shown in Figure 45.27.

Figure 45.27 Adding a Model Specification

Select the OK button to add the model to the end of the model selection list and return you to the Model Selection List window, as shown in Figure 45.28. You can now select the Fit Models from List model-fitting option to use the edited selection list.

Figure 45.28 Model Added to Selection List

If you want to delete one or more models from the list, select the model labels to highlight them in the list. Click a second time to clear a selected model. Then select "Delete" from the Edit pull-down menu, or the corresponding toolbar icon. As an example, delete the Square Root Simple Exponential Smoothing model that you just added.

The Model Selection List editor window gives you a lot of flexibility for managing multiple model lists, as explained in the section “[Model Selection List Editor Window](#)” on page 3049. For example, you can create your own model lists from scratch or modify or combine previously saved model lists and those provided with the software, and you can save them and designate one as the default for future projects.

Now select “Close” from the File menu (or the Close icon) to close the Model Selection List editor window.

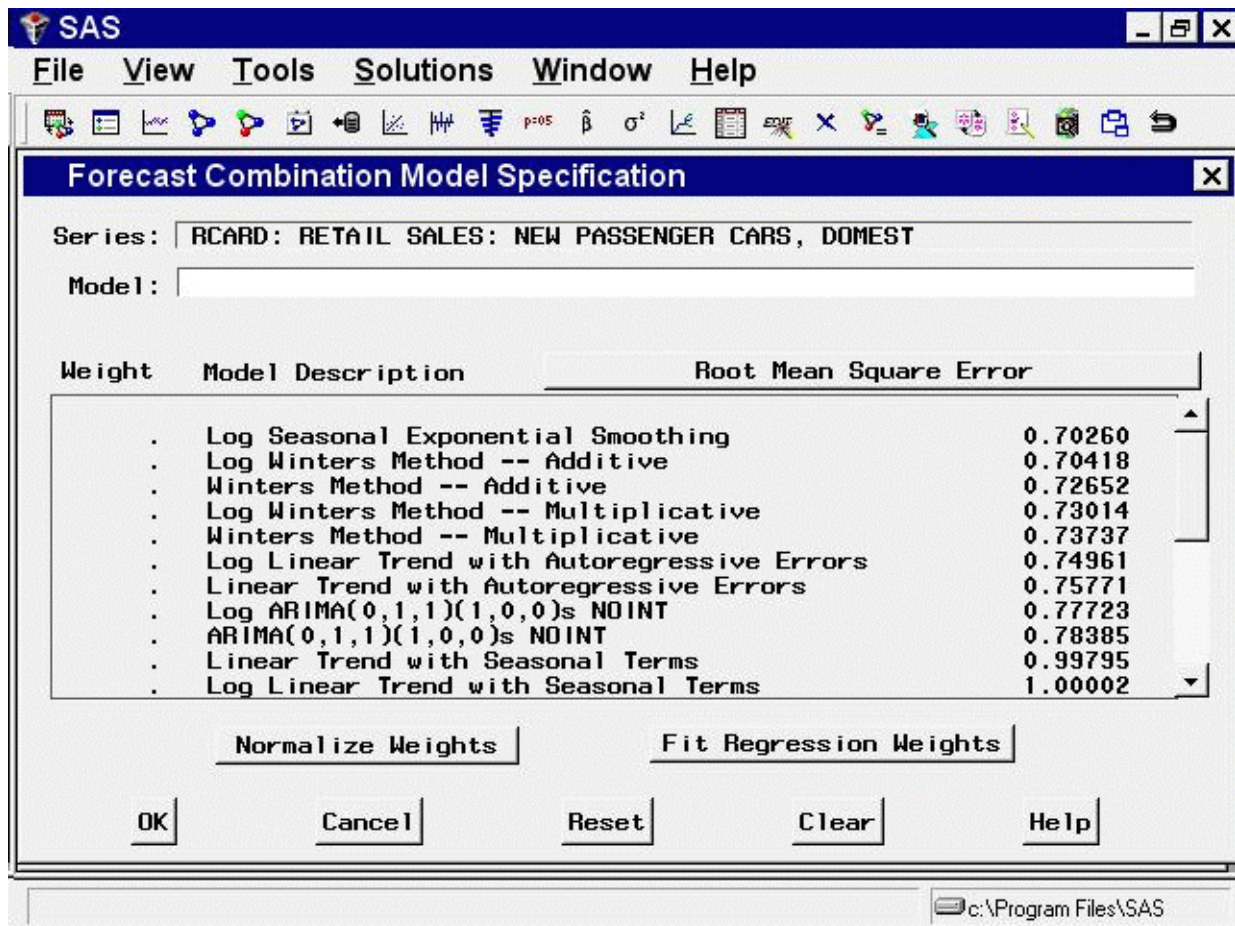

Forecast Combination Model Specification Window

Once you have fit several forecasting models to a series, you face the question of which model to use to produce the final forecasts. One possible answer is to combine or average the forecasts from several models. Combining the predictions from several different forecasting methods is a popular approach to forecasting.

The way that you produce forecast combinations with the Time Series Forecasting System is to use the Forecast Combination Model Specification window to specify a new forecasting model that performs the averaging of forecasts from the models you want to combine. This new model is added to the list of fitted models just like other models. You can then use the Model Viewer window features and Model Fit Comparison window features to examine the fit of the combined model.

To specify a forecast combination model, select “Combine Forecasts” from the pop-up menu or toolbar, or select “Edit” and “Fit Model” from the menu bar. This brings up the Forecast Combination Model Specification window, as shown in [Figure 45.29](#).

Figure 45.29 Forecast Combination Window

At the top of the Forecast Combination window is the name and label of the series and the label of the model you are specifying. The model label is filled in with an automatically generated label as you specify options. You can type over the automatic label with your own label for the model. To restore the automatic label, enter a blank label.

The middle part of the Forecast Combination window consists of the list of models that you have fit to the series. This table shows the label and goodness-of-fit measure for each model and the combining weight assigned to the model.

The **Weight** column controls how much weight is given to each model in the combined forecasts. A missing weight means that the model is not used. Initially, all the models have missing weight values.

You can enter the weight values you want to use in the **Weight** column. Alternatively, you can select models from the **Model Description** column, and weight values for the models you select are set automatically. To remove a model from the combination, select it again. This resets its weight value to missing.

At the bottom of the Forecast Combination window are two buttons: **Normalize Weights** and **Fit Regression Weights**. The **Normalize Weights** button adjusts the nonmissing weight values so that they sum to one. The **Fit Regression Weights** button uses linear regression to compute the weight values that produce the combination of model predictions with the best fit to the series.

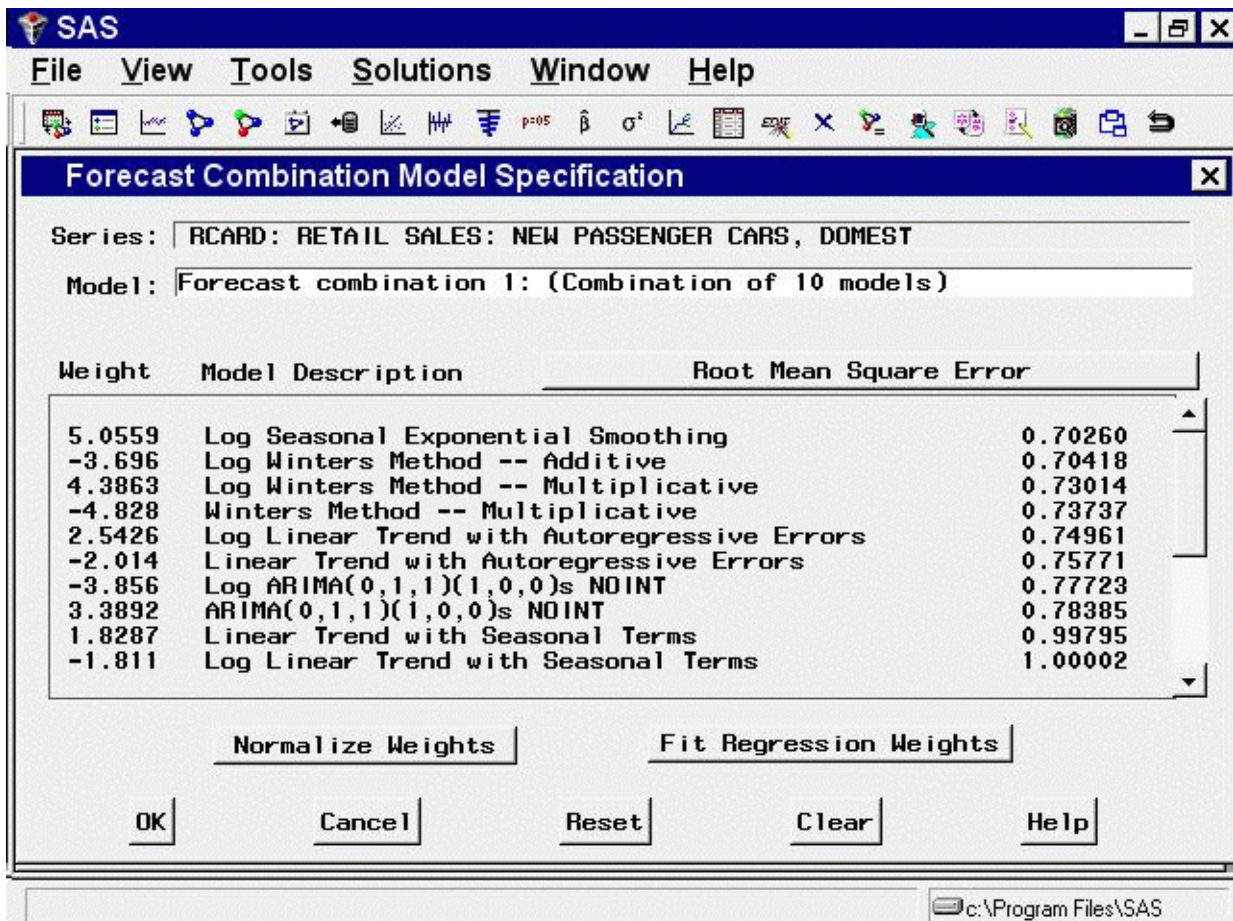

If no models are selected, the Fit Regression Weights button fits weights for all the models in the list. You can compute regression weights for only some of the models by first selecting the models you want to combine and then selecting Fit Regression Weights. In this case, only the nonmissing Weight values are replaced with regression weights.

As an example of how to combine forecasting models, select all the models in the list. After you have finished selecting the models, all the models in the list should now have equal weight values, which implies a simple average of the forecasts.

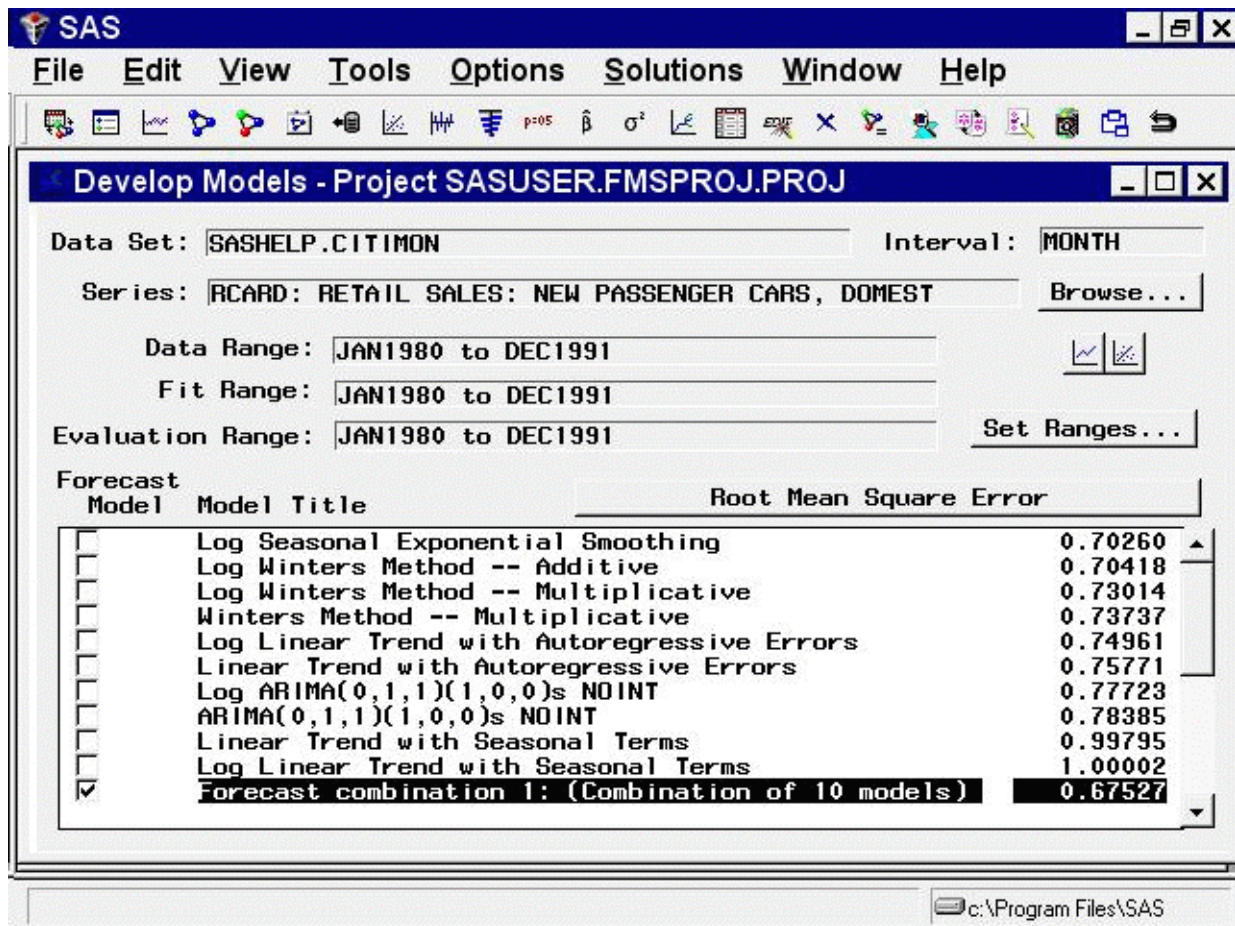

Now select the Fit Regression Weights button. The system performs a linear regression of the series on the predictions from the models with nonmissing weight values and replaces the weight values with the estimated regression coefficients. These are the combining weights that produce the smallest mean square prediction error within the sample.

The Forecast Combination window should now appear as shown in Figure 45.30. (Note that some of the regression weight values are negative.)

Figure 45.30 Combining Models

Select the OK button to fit the combined model. Now the Develop Models window shows this model to be the best fitting according to the root mean square error, as shown in Figure 45.31.

Figure 45.31 Develop Models Window Showing All Models Fit

Notice that the combined model has a smaller root mean square error than any one of the models included in the combination. The confidence limits for forecast combinations are produced by taking a weighted average of the mean square prediction errors for the component forecasts, ignoring the covariance between the prediction errors.

Incorporating Forecasts from Other Sources

You might have forecasts from other sources that you want to include in the forecasting process. Examples of other forecasts you might want to use are “best guess” forecasts based on personal judgments, forecasts produced by government agencies or commercial forecasting services, planning scenarios, and reference or “base line” projections. Because such forecasts are produced externally to the Time Series Forecasting System, they are referred to as external forecasts.

You can include external forecasts in combination models to produce compromise forecasts that split the difference between the external forecast and forecasting models that you fit. You can use external forecasts to compare them to the forecasts from models that are fit by the system.

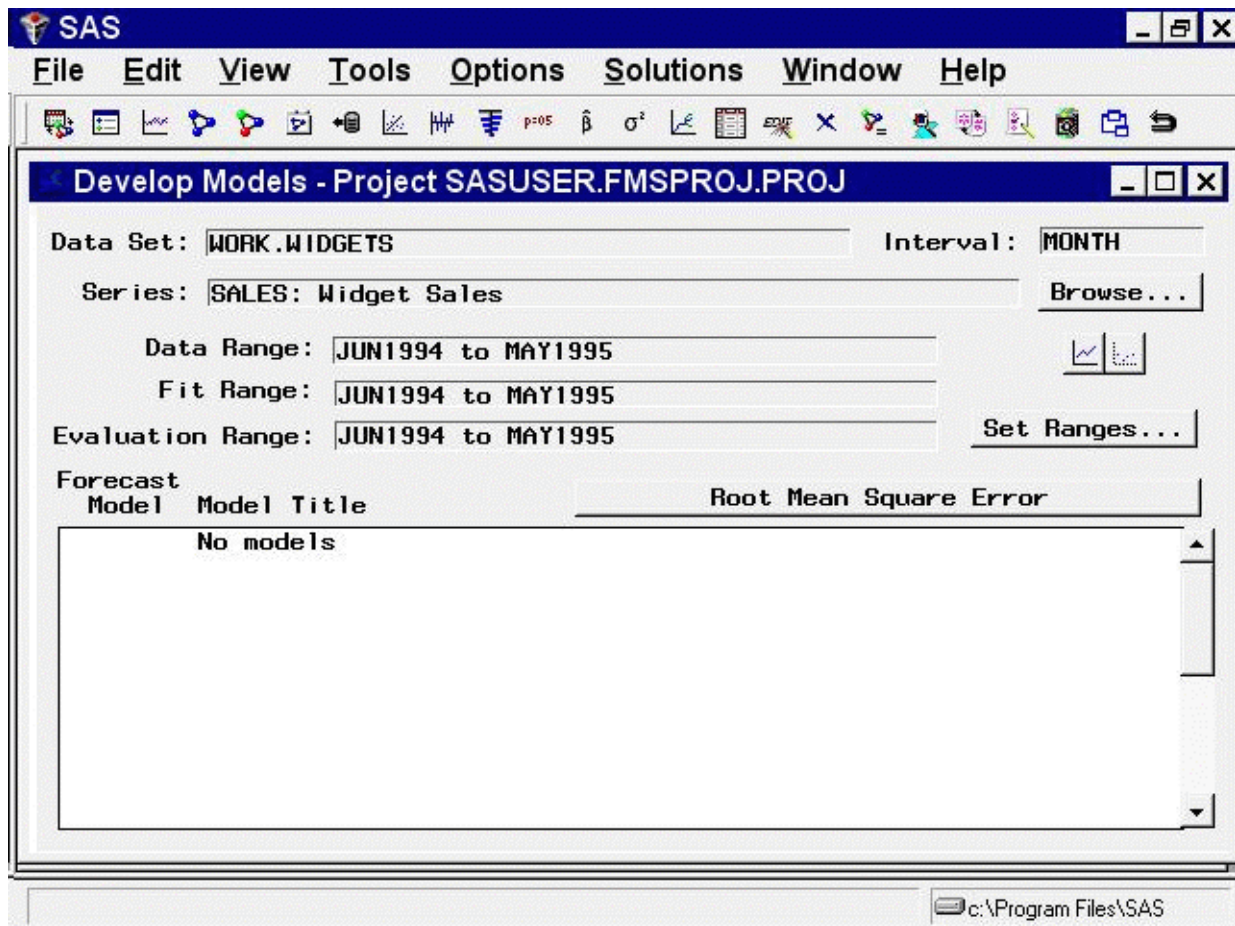

To include external forecasts in the Time Series Forecasting process, you must first supply the external forecast as a variable in the input data set. You then specify a special kind of forecasting “model” whose predictions are identical to the external forecast recorded in the data set.

As an example, suppose you have 12 months of sales data and five months of sales forecasts based on a consensus opinion of the sales staff. The following statements create a SAS data set containing made-up numbers for this situation.

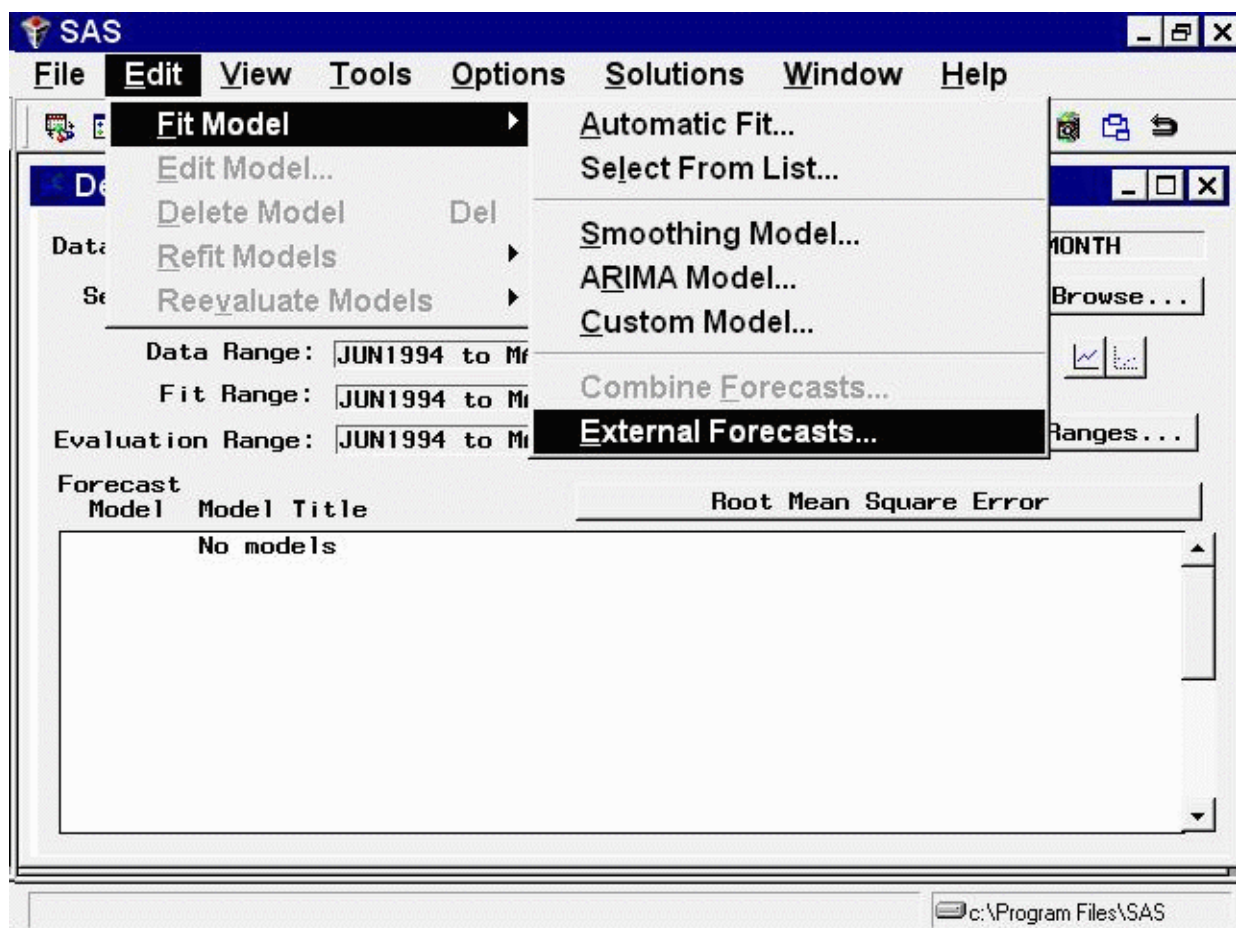

```
data widgets;
    input date monyy5. sales staff;
    format date monyy5.;
    label sales = "Widget Sales"
          staff = "Sales Staff Consensus Forecast";
    datalines;
jun94  142.1    .
jul94   139.6    .
aug94   145.0    .
sep94   150.2    .
oct94   151.1    .
nov94   154.3    .
dec94   158.7    .
jan95   155.9    .
feb95   159.2    .
mar95   160.8    .
apr95   162.0    .
may95   163.3    .
jun95    . 166.
jul95    . 168.
aug95    . 170.
sep95    . 171.
oct95    . 177.
run;
```

Submit the preceding statements in the SAS Program Editor window. From the Time Series Forecasting window, select “Develop Models.” In the Series Selection window, select the data set WORK.WIDGETS and the variable SALES. The Develop Models window should now appear as shown in [Figure 45.32](#).

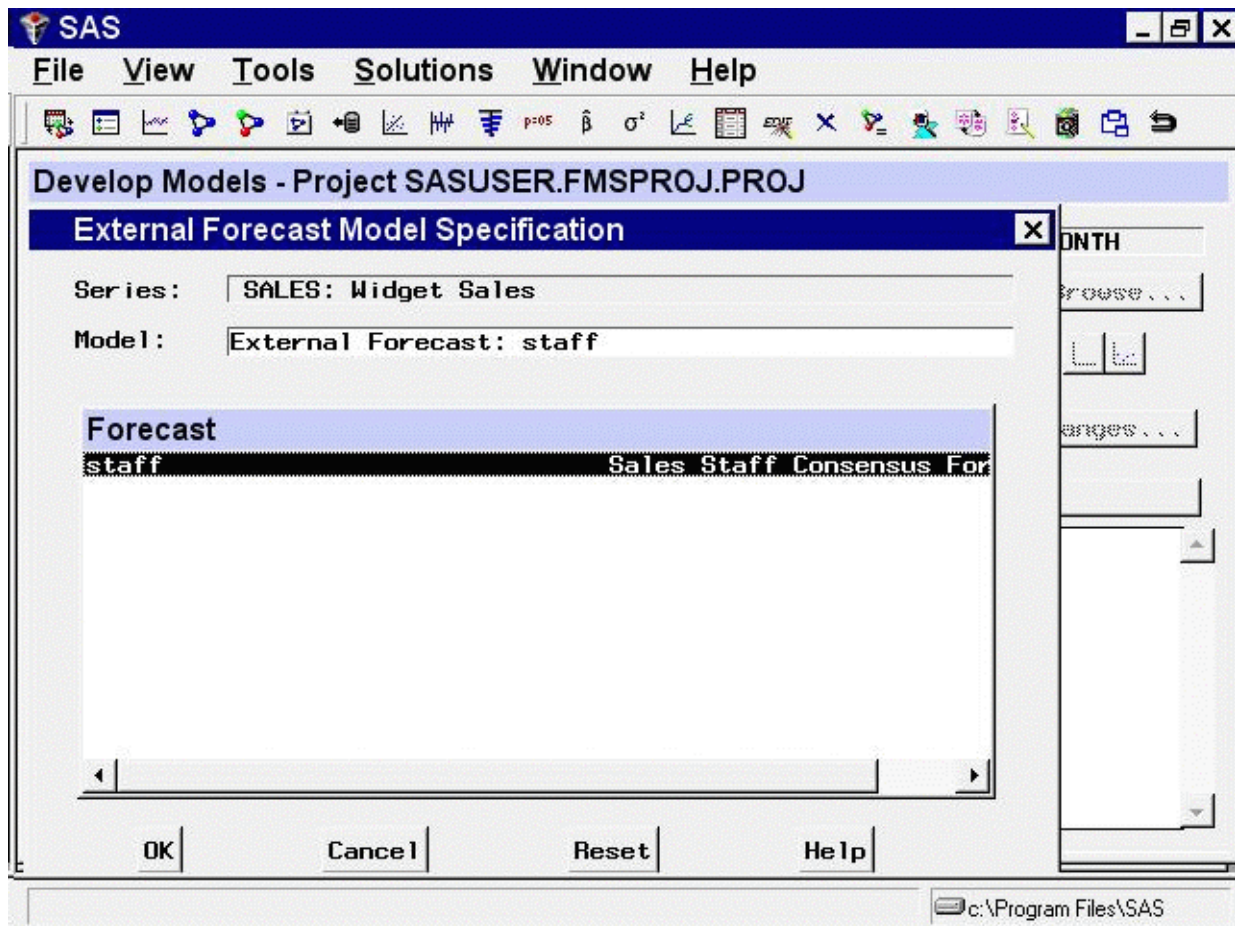

Figure 45.32 Develop Models Window

Now select “Edit,” “Fit Model,” and “External Forecasts” from the menu bar of the Develop Models window, as shown in Figure 45.33, or the Use External Forecasts toolbar icon.

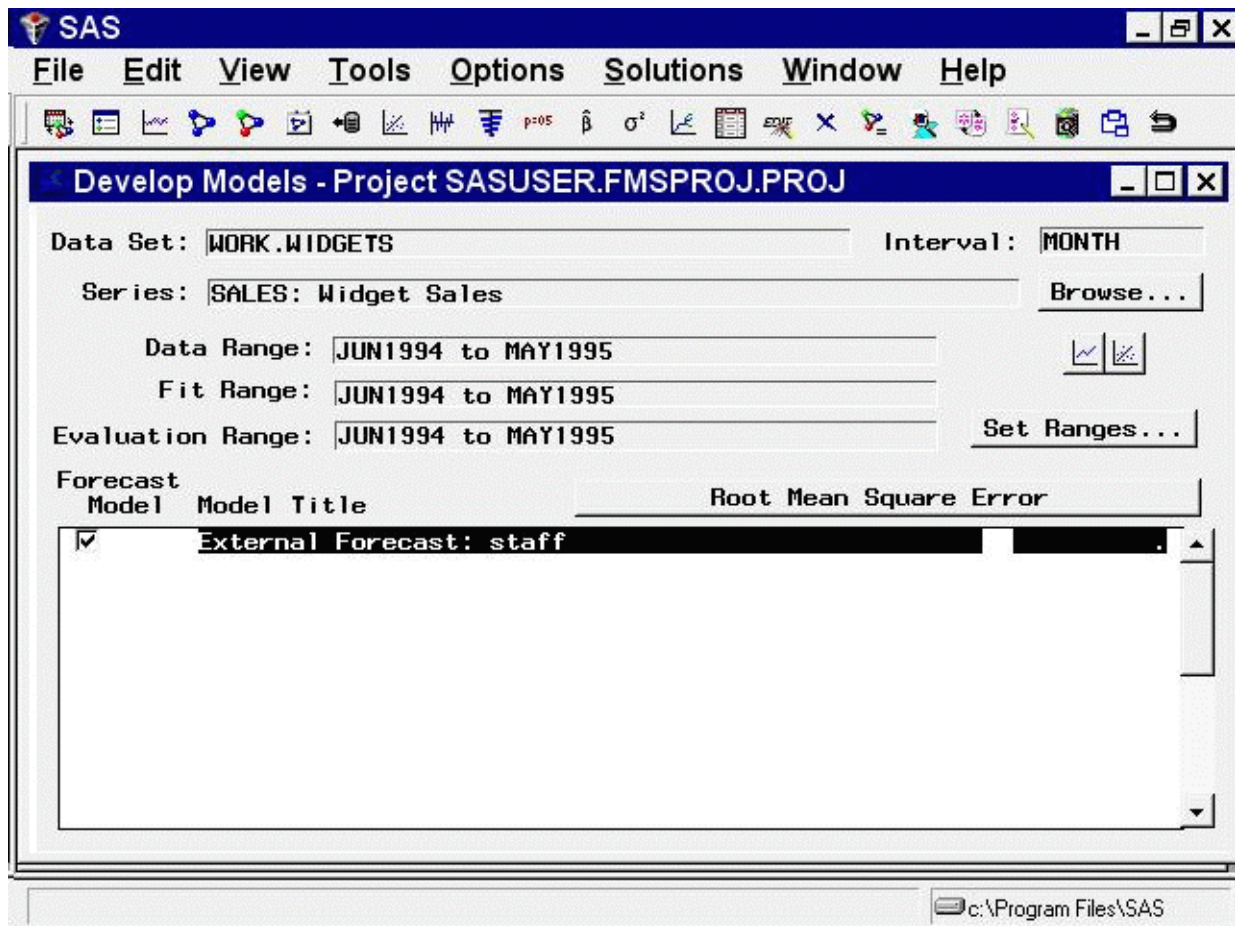

Figure 45.33 Adding a Model for an External Forecast Series

This selection opens the External Forecast Model Specification window. Select the STAFF variable as shown in Figure 45.34.

Figure 45.34 External Forecast Series Selected

Select the OK button. The external forecast model is now “fit” and added to the Develop Models list, as shown in [Figure 45.35](#).

Figure 45.35 Model for External Forecast

You can now use this model for comparison with the predictions from other forecasting models that you fit, or you can include it in a forecast combination model.

Note that no fitting is actually performed for an external forecast model. The predictions of the external forecast model are simply the values of the external forecast series read from the input data set. The goodness-of-fit statistics for such models will depend on the values that the external forecast series contains for observations within the period of fit. In this case, no STAFF values are given for past periods, and therefore the fit statistics for the model are missing.

Chapter 46

Choosing the Best Forecasting Model

Comparing Models	2947
Controlling the Period of Evaluation and Fit	2948
Refitting and Reevaluating Models	2949
Using Hold-out Samples	2949

The Time Series Forecasting System provides a variety of tools for identifying potential forecasting models and for choosing the best fitting model. It allows you to decide how much control you want to have over the process, from a hands-on approach to one that is completely automated. This chapter begins with an exploration of the tools available through the Series Viewer and Model Viewer. It presents an example of identifying models graphically and exercising your knowledge of model properties. The remainder of the chapter shows you how to compare models by using a variety of statistics and by controlling the fit and evaluation time ranges. It concludes by showing you how to refit existing models and how to compare models using hold-out samples.

Time Series Viewer Features

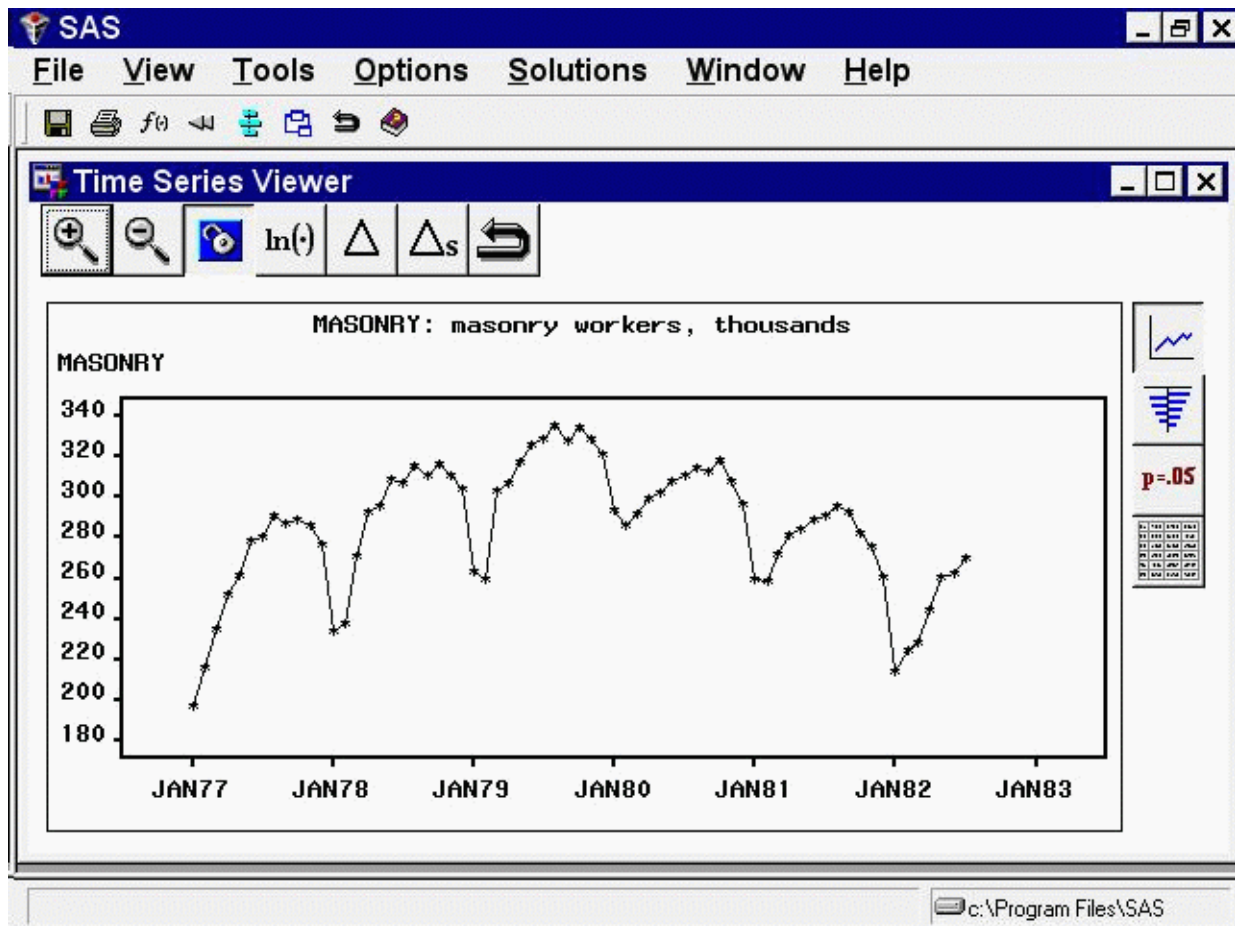

The Time Series Viewer is a graphical tool for viewing and analyzing time series. It can be used separately from the Time Series Forecasting System by using the TSVIEW command or by selecting Time Series Viewer from the Analysis pull-down menu under Solutions.

In this chapter you will use the Time Series Viewer to examine plots of your series before fitting models. Begin this example by invoking the Forecasting system and selecting the View Series Graphically button, as shown in Figure 46.1, or the View Series toolbar icon.

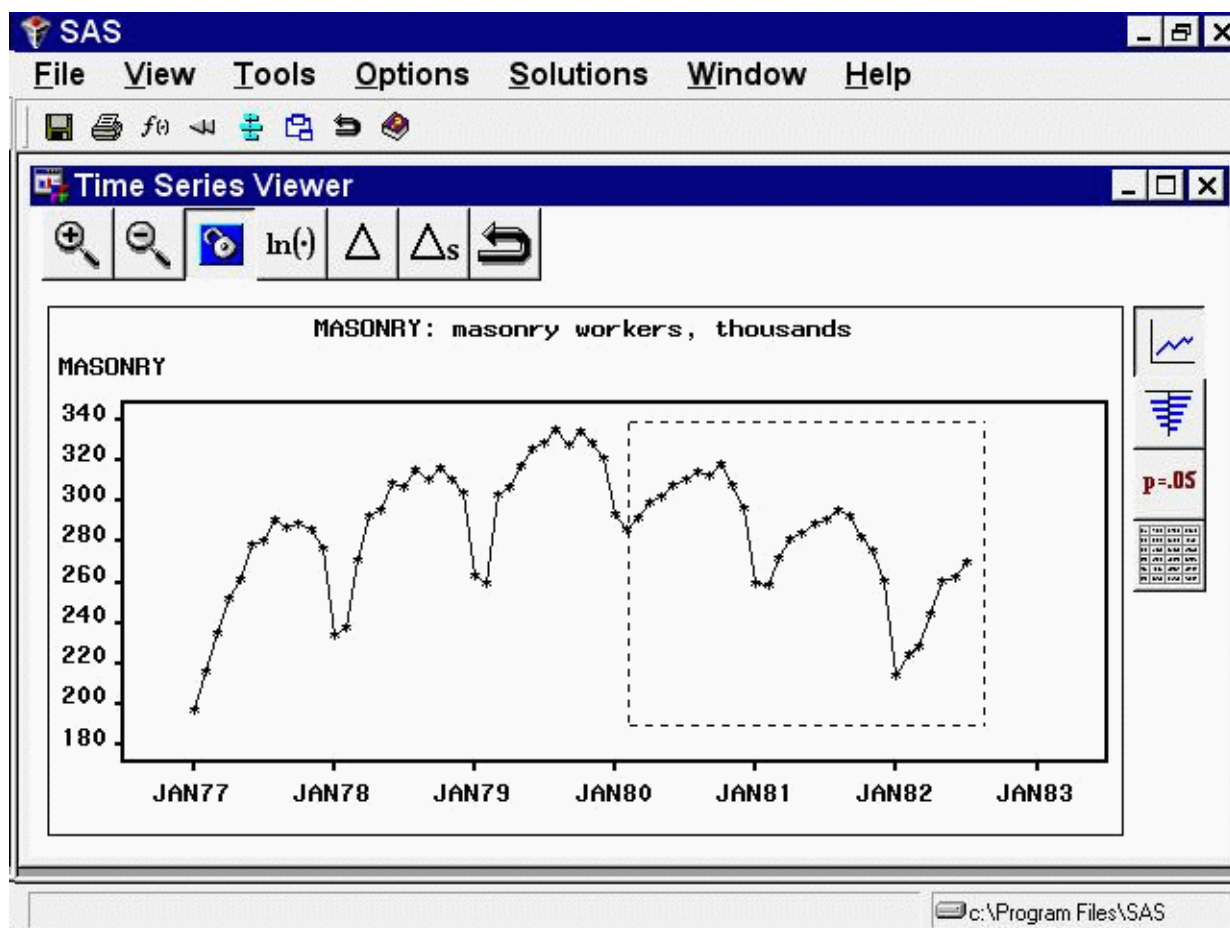

Figure 46.1 Invoking the Time Series Viewer

From the Series Selection window, select SASHELP as the library, WORKERS as the data set, and MASONRY as the time series, and then click the *Graph* button. The Time Series Viewer displays a plot of the series, as shown in [Figure 46.2](#).

Figure 46.2 Series Plot

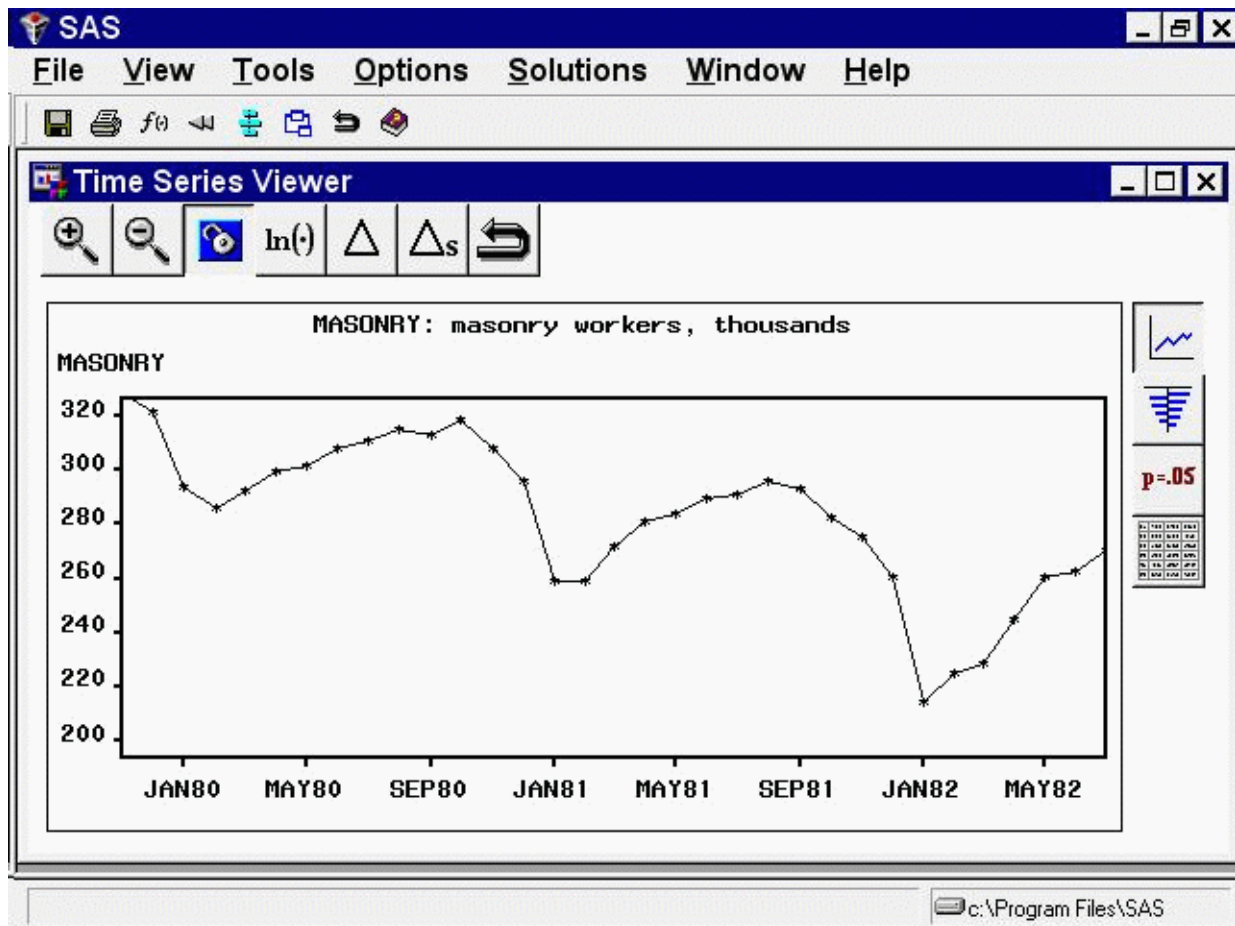

Select the Zoom In icon, the first one on the window's horizontal toolbar. Notice that the mouse cursor changes shape and that "Note: Click on a corner of the region, then drag to the other corner" appears on the message line. Outline an area, as shown in Figure 46.3, by clicking the mouse at the upper-left corner, holding the button down, dragging to the lower-right corner, and releasing the button.

Figure 46.3 Selecting an Area for Zoom

The zoomed plot should appear as shown in [Figure 46.4](#).

Figure 46.4 Zoomed Plot

You can repeat the process to zoom in still further. To return to the previous view, select the Zoom Out icon, the second icon on the window's horizontal toolbar.

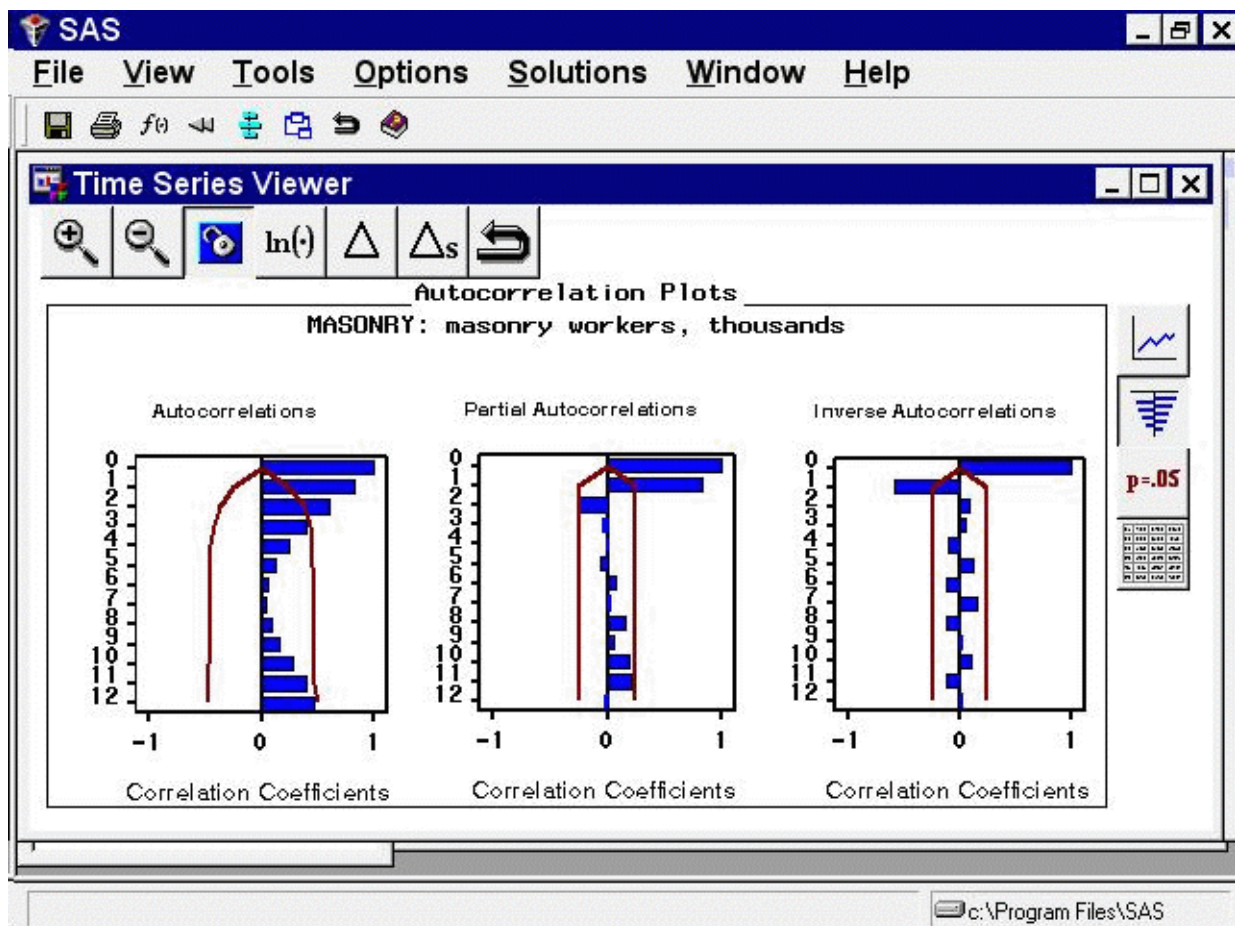

The third icon on the horizontal toolbar is used to link or unlink the viewer window. By default, the viewer is linked, meaning that it is automatically updated to reflect selection of a different time series. To see this, return to the Series Selection window by clicking on it or using the Window menu or Next Viewer toolbar icon. Select the Electric series in the Time Series Variables list box. Notice that the Time Series Viewer window is updated to show a plot of the ELECTRIC series. Select the Link/Unlink icon if you prefer to unlink the viewer so that it is not automatically updated in this way. Successive selections toggle between the linked and unlinked state. A note on the message line informs you of the state of the Time Series Viewer window.

When a Time Series Viewer window is linked, selecting View Series again makes the linked Viewer window active. When no Time Series Viewer window is linked, selecting View Series opens an additional Time Series Viewer window. You can bring up as many Time Series Viewer windows as you want.

Having seen the plot in Figure 46.2, you might suspect that the series is nonstationary and seasonal. You can gain further insight into this by examining the sample autocorrelation function (ACF), partial autocorrelation function (PACF), and inverse autocorrelation function (IACF) plots. To switch the display to the autocorrelation plots, select the second icon from the top on the vertical toolbar at the right side of the Time

Series Viewer. The plot appears as shown in Figure 46.5.

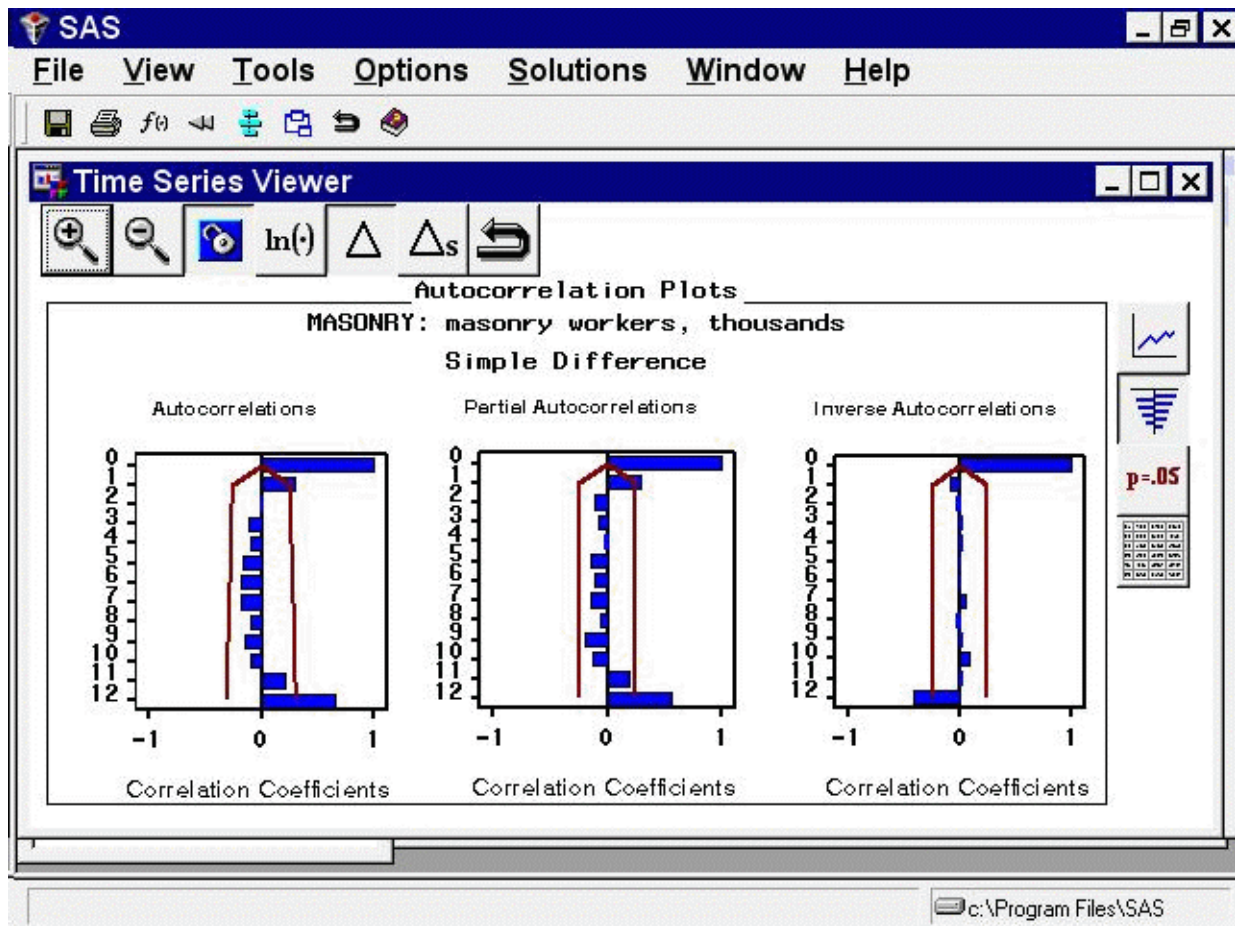

Figure 46.5 Sample Autocorrelation Plots

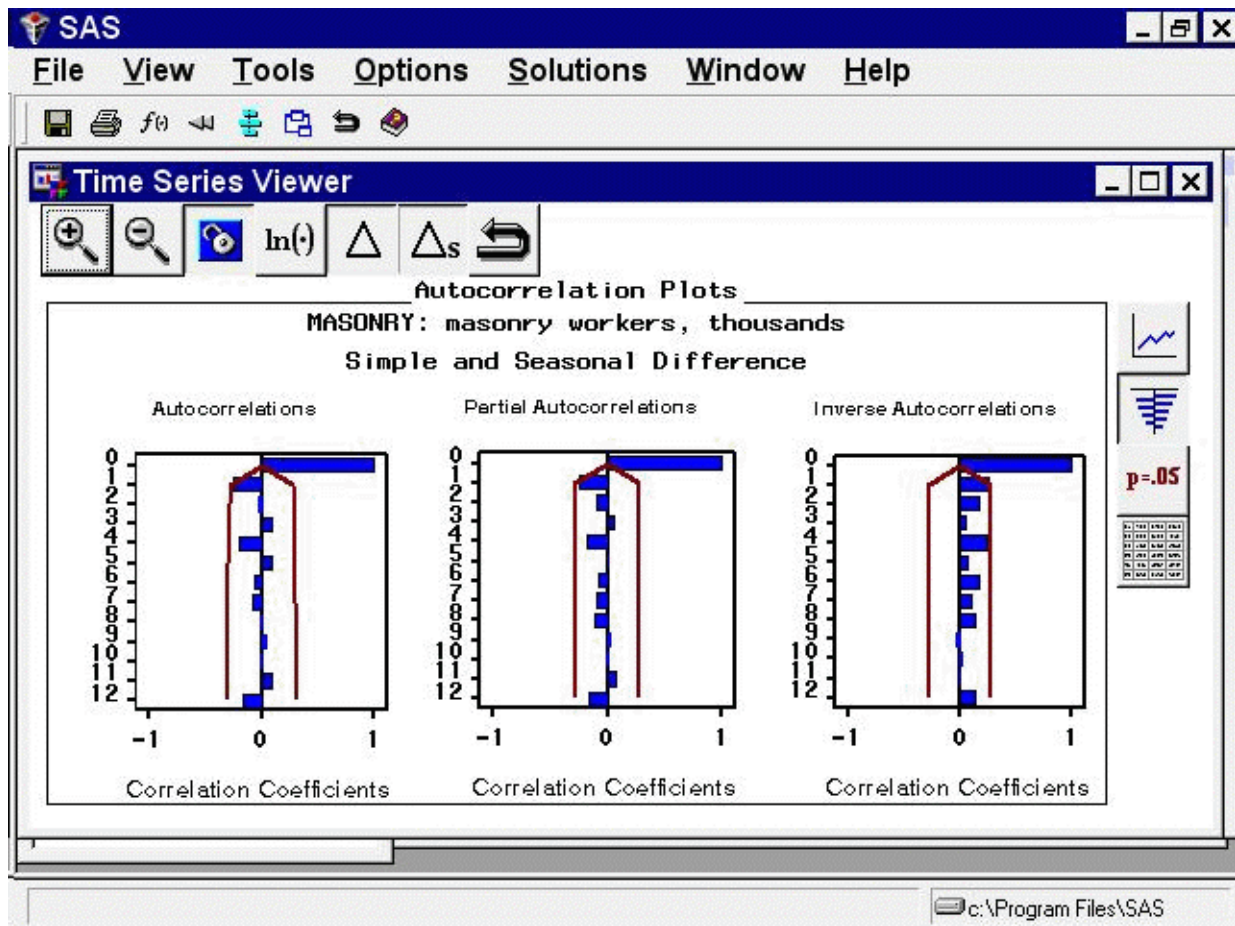

Each bar represents the value of the correlation coefficient at the given lag. The overlaid lines represent confidence limits computed at plus and minus two standard errors. You can switch the graphs to show significance probabilities by selecting **Correlation Probabilities** under the **Options** pull-down menu, or by selecting the **Toggle ACF Probabilities** toolbar icon.

The slow decline of the ACF suggests that first differencing might be warranted. To see the effect of first differencing, select the simple difference icon, the fifth icon from the left on the window's horizontal toolbar. The plot now appears as shown in Figure 46.6.

Figure 46.6 ACF Plots with First Difference Applied

Since the ACF still displays slow decline at seasonal lags, seasonal differencing is appropriate (in addition to the first differencing already applied). Select the *Seasonal Difference* icon, the sixth icon from the left on the horizontal toolbar. The plot now appears as shown in Figure 46.7.

Figure 46.7 ACF Plot with Simple and Seasonal Differencing

Model Viewer Prediction Error Analysis

Leave the Time Series Viewer open for the remainder of this exercise. Drag it out of the way or push it to the background so that you can return to the Time Series Forecasting window. Select **Develop Models**, then click an empty part of the table to bring up the pop-up menu, and select **Fit ARIMA Model**. Define the $ARIMA(0,1,0)(0,1,0)_s$ model by selecting 1 for Differencing under ARIMA Options, 1 for Differencing under Seasonal ARIMA Options, and No for Intercept, as shown in Figure 46.8.

c:\Program Files\SAS

When you select the **OK** button, the model is fit and you are returned to the Develop Models window. Click on an empty part of the table and choose **Fit Models from List** from the pop-up menu. Select **Airline Model** from the window. (Airline Model is a common name for the ARIMA(0,1,1)(0,1,1)_s model, which is often used for seasonal data with a linear trend.) Select the **OK** button. Once the model has been fit, the table shows the two models and their root mean square errors. Notice that the Airline Model provides only a slight improvement over the differencing model, ARIMA(0,1,0)(0,1,0)_s. Select the first row to highlight the differencing model, as shown in [Figure 46.9](#).

Figure 46.9 Selecting a Model

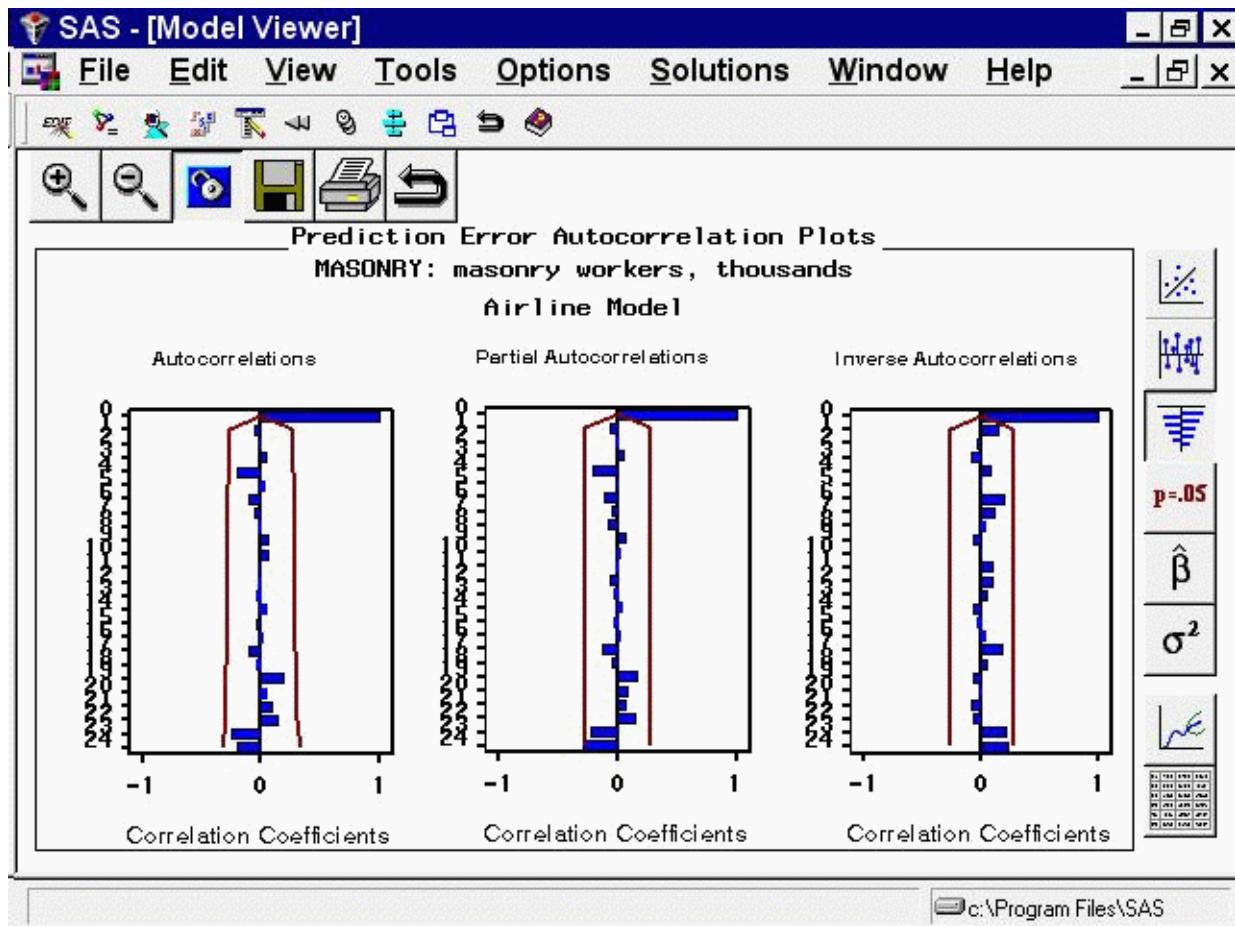

Now select the **View Selected Model Graphically** button, below the **Browse** button at the right side of the **Develop Models** window. The **Model Viewer** window appears, showing the actual data and model predictions for the **MASONRY** series. (Note that predicted values are missing for the first 13 observations due to simple and seasonal differencing.)

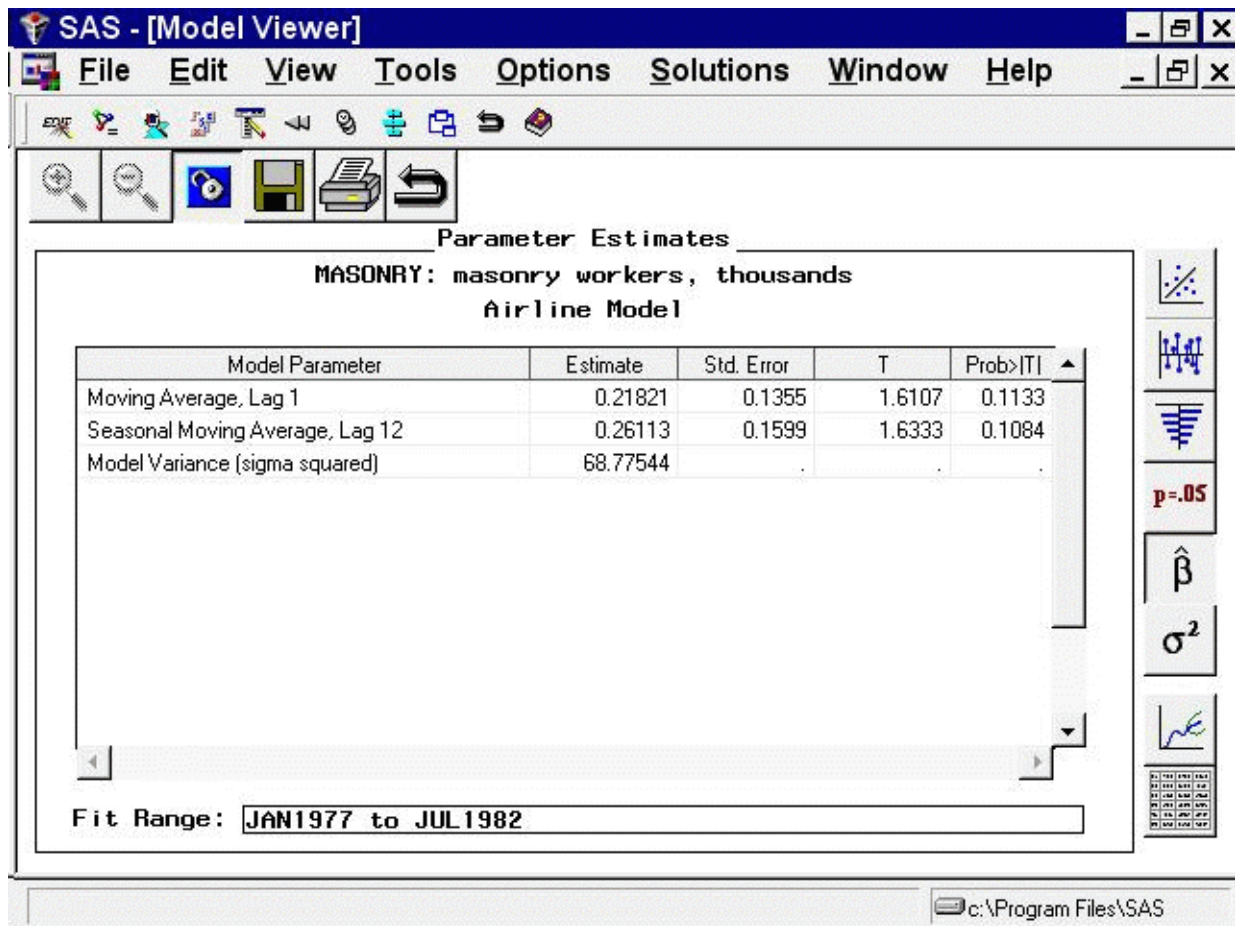

To examine the ACF plot for the model prediction errors, select the third icon from the top on the vertical toolbar. For this model, the prediction error ACF is the same as the ACF of the original data with first differencing and seasonal differencing applied. This differencing is apparent if you bring the **Time Series Viewer** back into view for comparison.

Return to the **Develop Models** Window by clicking on it or using the window pull-down menu or the **Next Viewer** toolbar icon. Select the second row of the table in the **Develop Models** window to highlight the **Airline Model**. The **Model Viewer** is automatically updated to show the prediction error ACF of the newly selected model, as shown in [Figure 46.10](#).

Figure 46.10 Prediction Error ACF Plot for the Airline Model

Another helpful tool available within the Model Viewer is the parameter estimates table. Select the fifth icon from the top of the vertical toolbar. The table gives the parameter estimates for the two moving-average terms in the Airline Model, as well as the model residual variance, as shown in Figure 46.11.

Figure 46.11 Parameter Estimates for the Airline Model

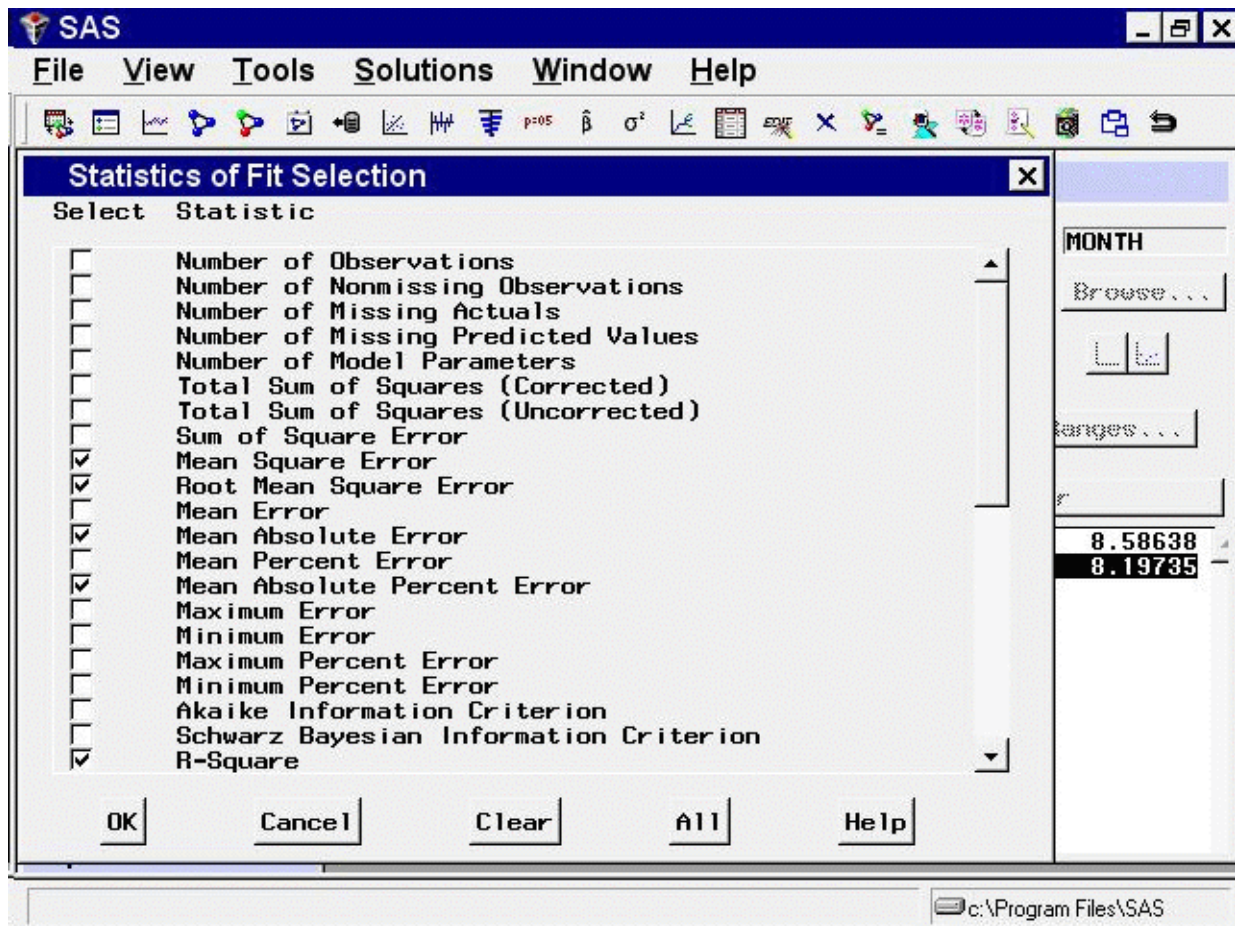

You can adjust the column widths in the table by dragging the vertical borders of the column titles with the mouse. Notice that neither of the parameter estimates is significantly different from zero at the 0.05 level of significance, since $\text{Prob}>|t|$ is greater than 0.05. This suggests that the Airline Model should be discarded in favor of the more parsimonious differencing model, which has no parameters to estimate.

The Model Selection Criterion

Return to the Develop Models window (Figure 46.9) and notice the Root Mean Square Error button at the right side of the table banner. This is the model selection criterion—the statistic used by the system to select the best fitting model. So far in this example you have fit two models and have left the default criterion, root mean square error (RMSE), in effect. Because the Airline Model has the smaller value of this criterion and because smaller values of the RMSE indicate better fit, the system has chosen this model as the forecasting model, indicated by the check box in the `Forecast Model` column.

The statistics available as model selection criteria are a subset of the statistics available for informational purposes. To access the entire set, select `Options` from the menu bar, and then select `Statistics of Fit`. The `Statistics of Fit Selection` window appears, as shown in Figure 46.12.

Figure 46.12 Statistics of Fit

By default, five of the more well known statistics are selected. You can select and deselect statistics by clicking the check boxes in the left column. For this exercise, select **All**, and notice that all the check boxes become checked. Select the **OK** button to close the window. Now if you choose **Statistics of Fit** in the **Model Viewer** window, all of the statistics will be shown for the selected model.

To change the model selection criterion, click the **Root Mean Square Error** button or select **Options** from the menu bar and then select **Model Selection Criterion**. Notice that most of the statistics of fit are shown, but those which are not relevant to model selection, such as number of observations, are not shown. Select **Schwarz Bayesian Information Criterion** and click **OK**. Since this statistic puts a high penalty on models with larger numbers of parameters, the **ARIMA(0,1,0)(0,1,0)s** model comes out with the better fit.

Notice that changing the selection criterion does not automatically select the model that is best according to that criterion. You can always choose the model you want to use for forecasts by selecting its check box in the **Forecast Model** column.

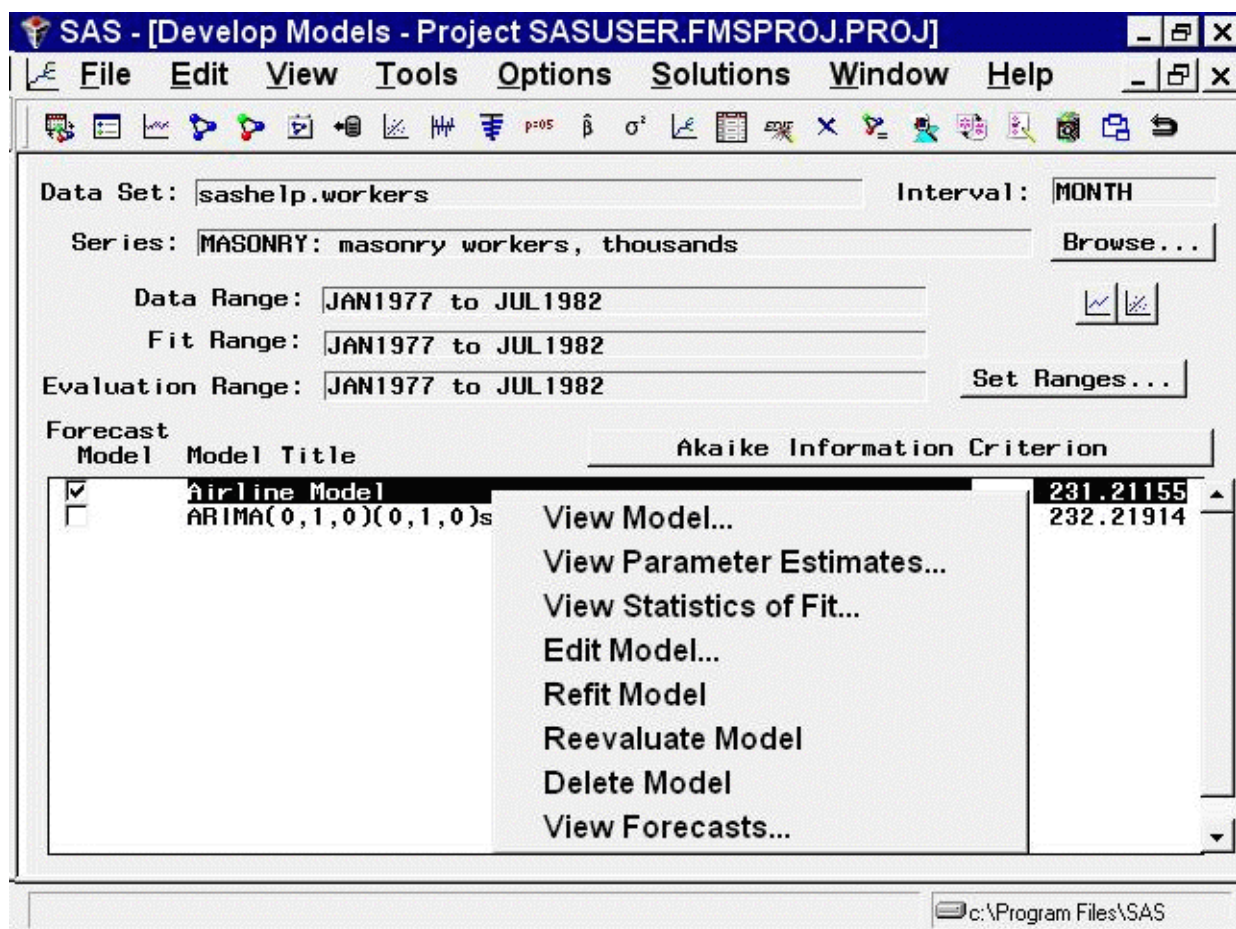

Now bring up the **Model Selection Criterion** window again and select **Akaike Information Criterion**. This statistic puts a lesser penalty on number of parameters, and the **Airline Model** comes out as the better fitting model.

Sorting and Selecting Models

Select **Sort Models** on the **Tools** menu or from the toolbar. This sorts the current list of fitted models by the current selection criterion. Although some selection criteria assign larger values to better fitting models (for example, R-square) while others assign smaller values to better fitting models, **Sort Models** always orders models with the best fitting model—in this case, the Airline Model—at the top of the list.

When you select a model in the table, its name and criterion value become highlighted, and actions that apply to that model become available. If your system supports a right mouse button, you can click it to invoke a pop-up menu, as shown in [Figure 46.13](#).

Figure 46.13 Right Mouse Button Pop-up Menu

Whether or not you have a right mouse button, the same choices are available under **Edit** and **View** from the menu bar. If the model viewer has been invoked, it is automatically updated to show the selected model, unless you have unlinked the viewer by using the **Link/Unlink** toolbar button.

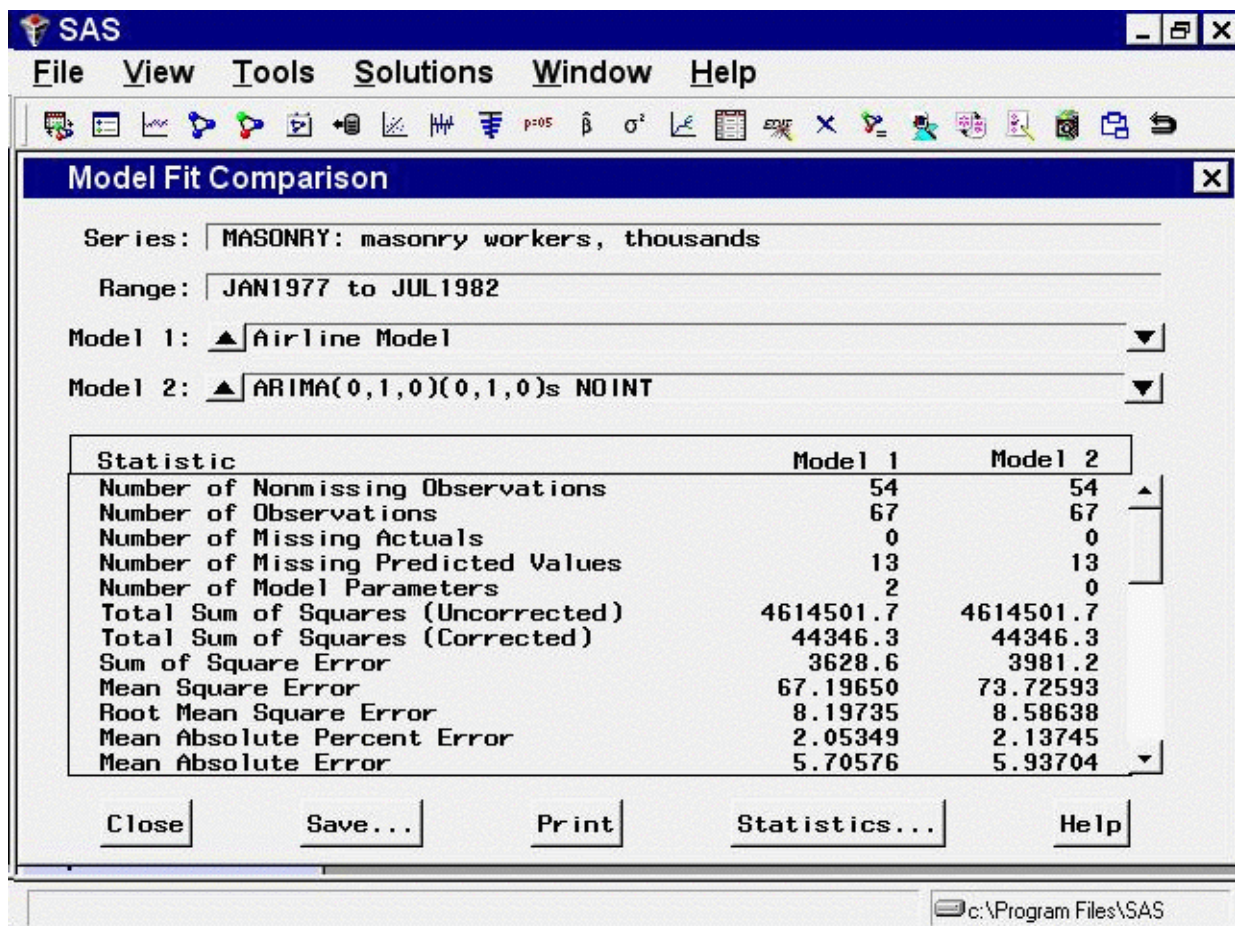

Select the highlighted model in the table again. Notice that it is no longer highlighted. When no models are highlighted, the right mouse button pop-up menu changes, and items on the menu bar that apply to a selected model become unavailable. For example, you can choose **Edit** from the menu bar, but you can't choose the **Edit Model** or **Delete Model** selections unless you have highlighted a model in the table.

When you select the check box in the `Forecast Model` column of the table, the model in that row becomes the forecasting model. This is the model that will be used the next time forecasts are generated by choosing `View Forecasts` or by using the `Produce Forecasts` window. Note that this forecasting model flag is automatically set when you use `Fit Automatic Model` or when you fit an individual model that fits better, using the current selection criterion, than the current forecasting model.

Comparing Models

Select `Tools` and `Compare Models` from the menu bar. This displays the `Model Fit Comparison` table, as shown in Figure 46.14.

Figure 46.14 Model Comparison Window

The two models you have fit are shown as `Model 1` and `Model 2`. When there are more than two models, you can bring any two of them into the table by selecting the up and down arrows. In this way, it is easy to do pairwise comparisons on any number of models, looking at as many statistics of fit as you like. Since you previously chose to display all statistics of fit, all of them are shown in the comparison table. Use the vertical scroll bar to move through the list.

After you have examined the model comparison table, select the **Close** button to return to the Develop Models window.

Controlling the Period of Evaluation and Fit

Notice the three time ranges shown on the Develop Models window (Figure 46.9). The data range shows the beginning and ending dates of the MASONRY time series. The period of fit shows the beginning and ending dates of data used to fit the models. The period of evaluation shows the beginning and ending dates of data used to compute statistics of fit. By default, the fit and evaluate ranges are the same as the data range. To change these ranges, select the **Set Ranges** button, or select **Options** and **Time Ranges** from the menu bar. This brings up the **Time Ranges Specification** window, as shown in Figure 46.15.

Figure 46.15 Time Ranges Specification Window

SAS

File View Tools Solutions Window Help

Develop Models - Project SASUSER.FMSPROJ.PROJ

Time Ranges Specification

Data Set:

Interval:

Series:

Time Ranges:

	From	To
Data Range:	<input type="text" value="JAN1977"/>	<input type="text" value="JUL1982"/>
Period of Fit:	<input type="text" value="JAN1977"/>	<input type="text" value="JUL1982"/>
Period of Evaluation:	<input type="text" value="JAN1977"/>	<input type="text" value="JUL1982"/>
Forecast Horizon:	<input type="text" value="12"/> <input type="text" value="Periods"/>	<input type="text" value="JUL1983"/>
Hold-out Sample:	<input type="text" value="0"/> <input type="text" value="Periods"/>	

c:\Program Files\SAS

For this example, suppose the early data in the series is unreliable, and you want to use the range June 1978 to the latest available for both model fitting and model evaluation. You can either type JUN1978 in the **From** column for **Period of Fit** and **Period of Evaluation**, or you can advance these dates by clicking the right pointing arrows. The outer arrow advances the date by a large amount (in this case, by a year), and the

inner arrow advances it by a single period (in this case, by a month). Once you have changed the `Period of Fit` and the `Period of Evaluation` to JUN1978 in the `From` column, select the `OK` button to return to the `Develop Models` window. Notice that these time ranges are updated at the top of the window, but the models already fit have not been affected. Your changes to the time ranges affect *subsequently fit* models.

Refitting and Reevaluating Models

If you fit the `ARIMA(0,1,0)(0,1,0)s` and `Airline` models again in the same way as before, they will be added to the model list, with the same names but with different values of the model selection criterion. Parameter estimates will be different, due to the new fit range, and statistics of fit will be different, due to the new evaluation range.

For this exercise, instead of specifying the models again, refit the existing models by selecting `Edit` from the menu bar and then selecting `Refit Models` and `All Models`. After the models have been refit, you should see the same two models listed in the table but with slightly different values for the selection criterion. The `ARIMA (0,1,0)(0,1,0)s` and `Airline` models have now been fit to the `MASONRY` series by using data from June 1978 to July 1982, since this is the period of fit you specified. The statistics of fit have been computed for the period of evaluation, which was the same as the period of fit. If you had specified a period of evaluation different from the period of fit, the statistics would have been computed accordingly.

In practice, another common reason for refitting models is the availability of new data. For example, when data for a new month become available for a monthly series, you might add them to the input data set, then invoke the forecasting system, open the project containing models fit previously, and refit the models prior to generating new forecasts. Unless you specify the period of fit and period of evaluation in the `Time Ranges Specification` window, they default to the full data range of the series found in the input data set at the time of refitting.

If you prefer to apply previously fit models to revised data without refitting, use `Reevaluate Models` instead of `Refit Models`. This recomputes the statistics of fit by using the current evaluation range, but does not re-estimate the model parameters.

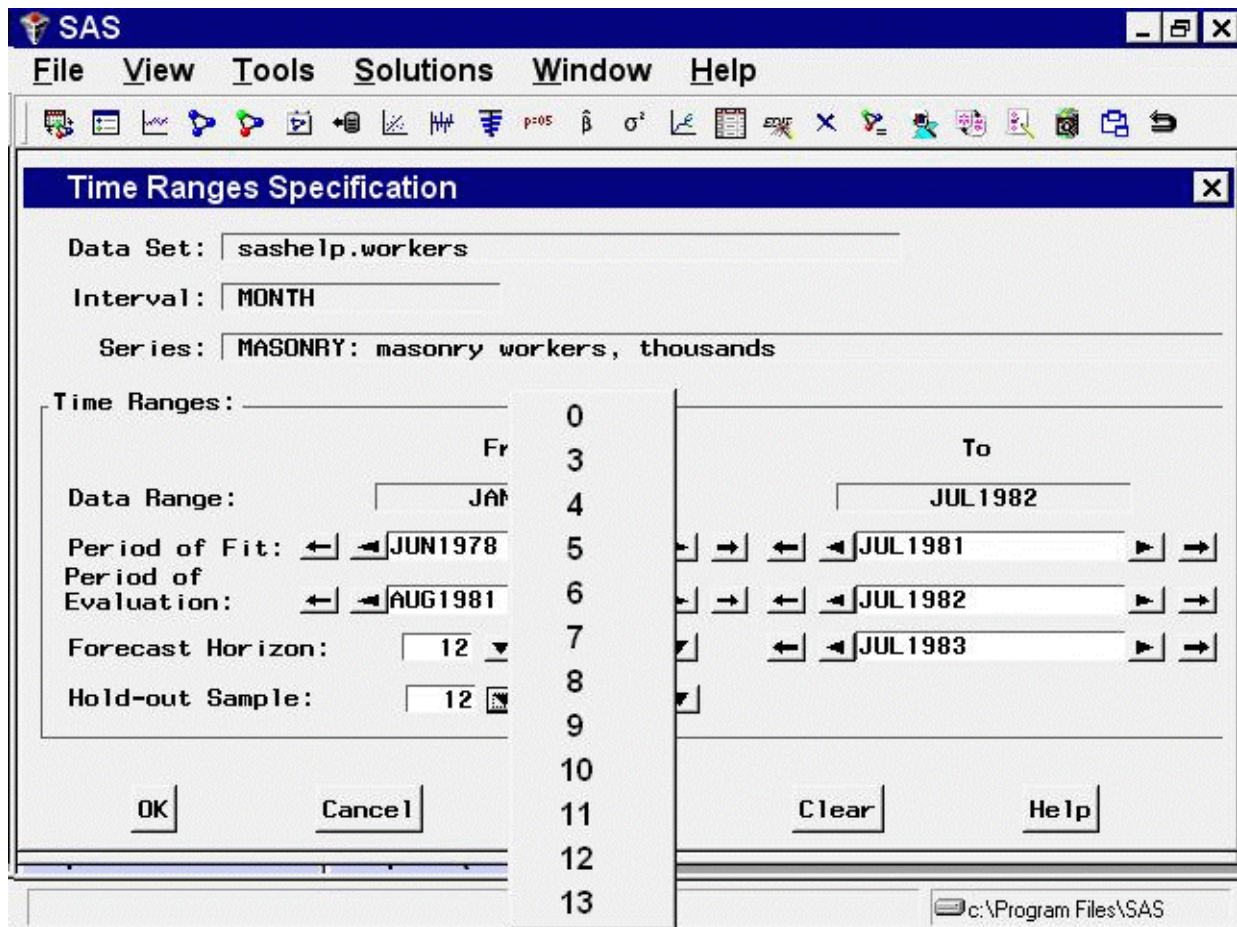

Using Hold-out Samples

One important application of model fitting where the period of fit is different from the period of evaluation is the use of hold-out samples. With this technique of model evaluation, the period of fit ends at a time point before the end of the data series, and the remainder of the data are held out as a nonoverlapping period of evaluation. With respect to the period of fit, the hold-out sample is a period in the future, used to compare the forecasting accuracy of models fit to past data.

For this exercise, use a hold-out sample of 12 months. Bring up the `Time Ranges Specification` window again by selecting the `Set Ranges` button. Set `Hold-out Sample` to 12 using the combo box, as shown in

Figure 46.16. You can also type in a value. To specify a hold-out sample period in different units, you can use the `Periods` combo box. In this case, it allows you to select years as the unit, instead of periods.

Figure 46.16 Specifying the Hold-out Sample Size

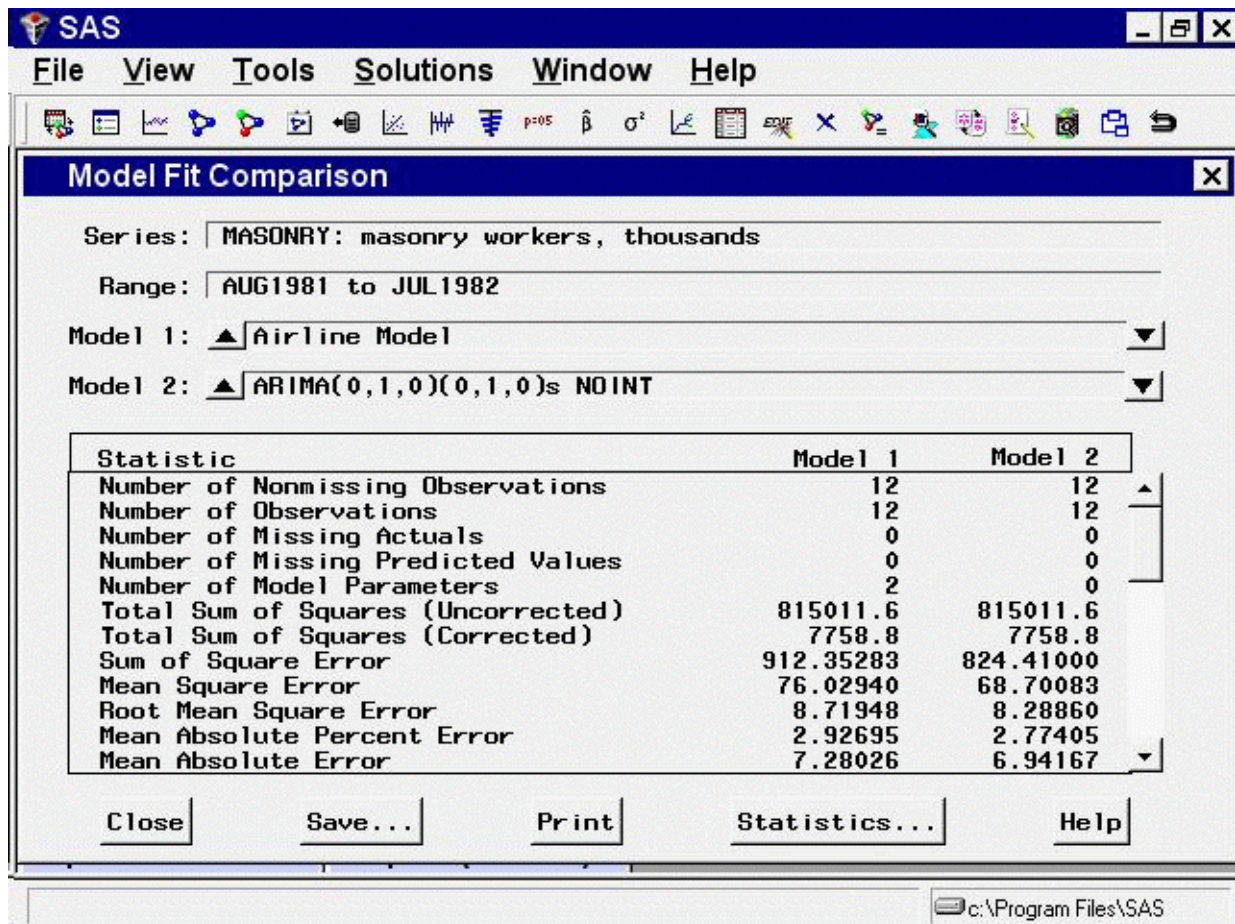

Notice that setting the hold-out sample to 12 automatically sets the fit range to JUN1978–JUL1981 and the evaluation range to AUG1981–JUL1982. If you had set the period of fit and period of evaluation to these ranges, the hold-out sample would have been automatically set to 12 periods.

Select the `OK` button to return to the `Develop Models` window. Now refit the models again. Select `Tools` and `Compare Models` to compare the models now that they have been fit to the period June 1978 through July 1981 and evaluated for the hold-out sample period August 1981 through July 1982. Note that the fit statistics for the hold-out sample are based on one-step-ahead forecasts. (See *Statistics of Fit* in Chapter 50, “Forecasting Process Details.”)

As shown in Figure 46.17, the ARIMA (0,1,0)(0,1,0)s model now seems to provide a better fit to the data than does the Airline model. It should be noted that the results can be quite different if you choose a different size hold-out sample.

Figure 46.17 Using 12 Month Hold-out Sample

Forecasting models predict the future values of a series by using two sources of information: the past values of the series and the values of other time series variables. Other variables used to predict a series are called *predictor variables*.

Predictor variables that are used to predict the dependent series can be variables in the input data set, such as regressors and adjustment variables, or they can be special variables computed by the system as functions of time, such as trend curves, intervention variables, and seasonal dummies.

You can specify seven different types of predictors in forecasting models by using the ARIMA Model or Custom Model Specification windows. You cannot specify predictor variables with the Smoothing Model Specification window.

Figure 47.1 shows the menu of options for adding predictors to an ARIMA model that is opened by clicking the **Add** button. The Add menu for the Custom Model Specification menu is similar.

Figure 47.1 Add Predictors Menu

These types of predictors are as follows.

Linear Trend	adds a variable that indexes time as a predictor series. A straight line time trend is fit to the series by regression when you specify a linear trend.
Trend Curve	provides a menu of various functions of time that you can add to the model to fit nonlinear time trends. The Linear Trend option is a special case of the Trend Curve option for which the trend curve is a straight line.
Regressors	allows you to predict the series by regressing it on other variables in the data set.
Adjustments	allows you to specify other variables in the data set that supply adjustments to the forecast.
Dynamic Regressor	allows you to select a predictor variable from the input data set and specify a complex model for the way that the predictor variable affects the dependent series.
Interventions	allows you to model the effect of special events that “intervene” to change the pattern of the dependent series. Examples of intervention effects are strikes, tax increases, and special sales promotions.
Seasonal Dummies	adds seasonal indicator or “dummy” variables as regressors to model seasonal effects.

You can add any number of predictors to a forecasting model, and you can combine predictor variables with other model options.

The following sections explain these seven kinds of predictors in greater detail and provide examples of their use. The examples illustrate these different kinds of predictors by using series in the SASHELP.USECON data set.

Select the `Develop Models` button from the main window. Select the data set `SASHELP.USECON` and select the `View Series Graphically` button from the `Develop Models` window. The plot of the example series `PETROL` appears as shown in [Figure 47.2](#).

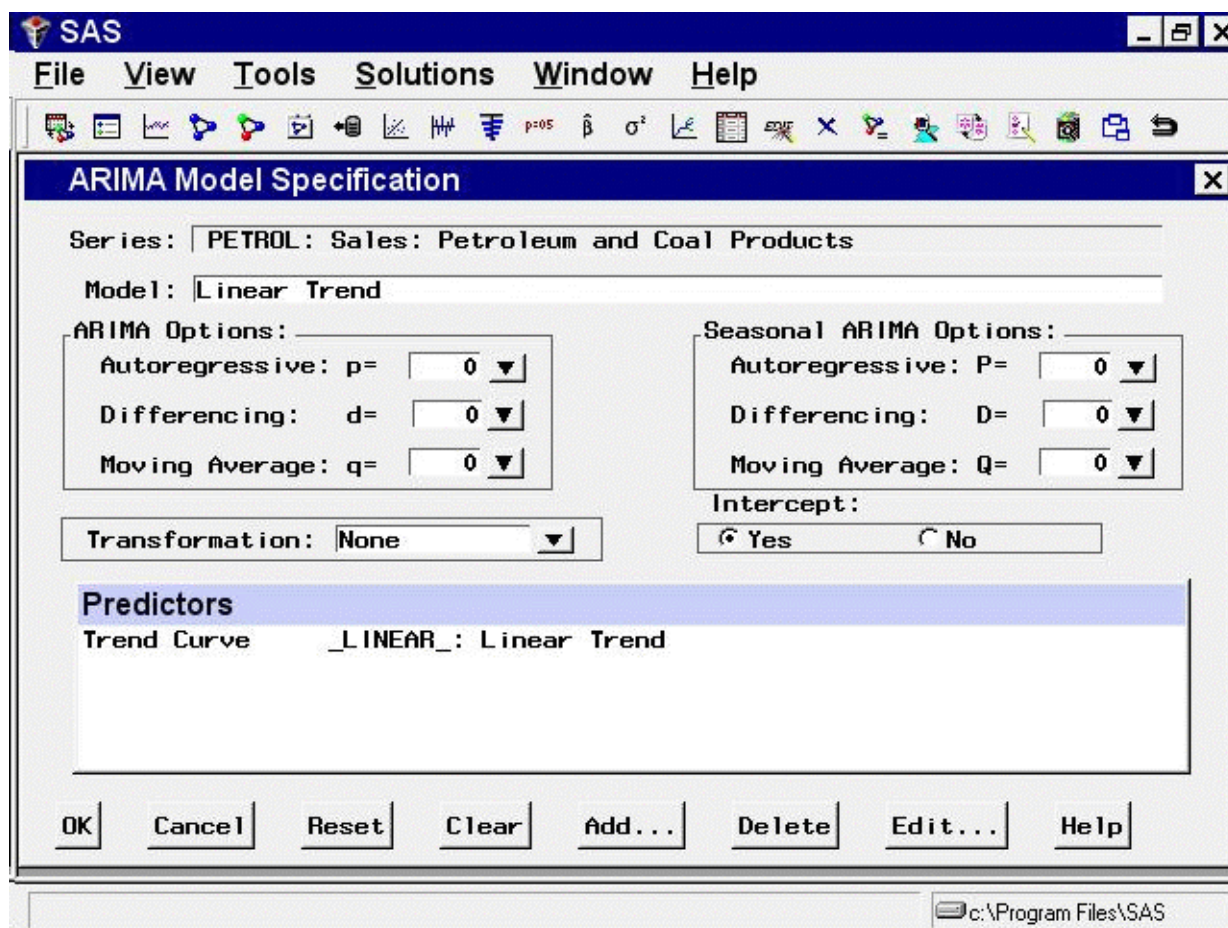

Figure 47.2 Sales of Petroleum and Coal

Linear Trend

From the `Develop Models` window, select `Fit ARIMA Model`. From the `ARIMA Model Specification` window, select `Add` and then select `Linear Trend` from the menu (shown in [Figure 47.1](#)).

A linear trend is added to the `Predictors` list, as shown in [Figure 47.3](#).

Figure 47.3 Linear Trend Predictor Specified

The description for the linear trend item shown in the Predictors list has the following meaning. The first part of the description, Trend Curve, describes the type of predictor. The second part, `_LINEAR_`, gives the variable name of the predictor series. In this case, the variable is a time index that the system computes. This variable is included in the output forecast data set. The final part, Linear Trend, describes the predictor.

Notice that the model you have specified consists only of the time index regressor `_LINEAR_` and an intercept. Although this window is normally used to specify ARIMA models, in this case no ARIMA model options are specified, and the model is a simple regression on time.

Select the **OK** button. The Linear Trend model is fit and added to the model list in the Develop Models window.

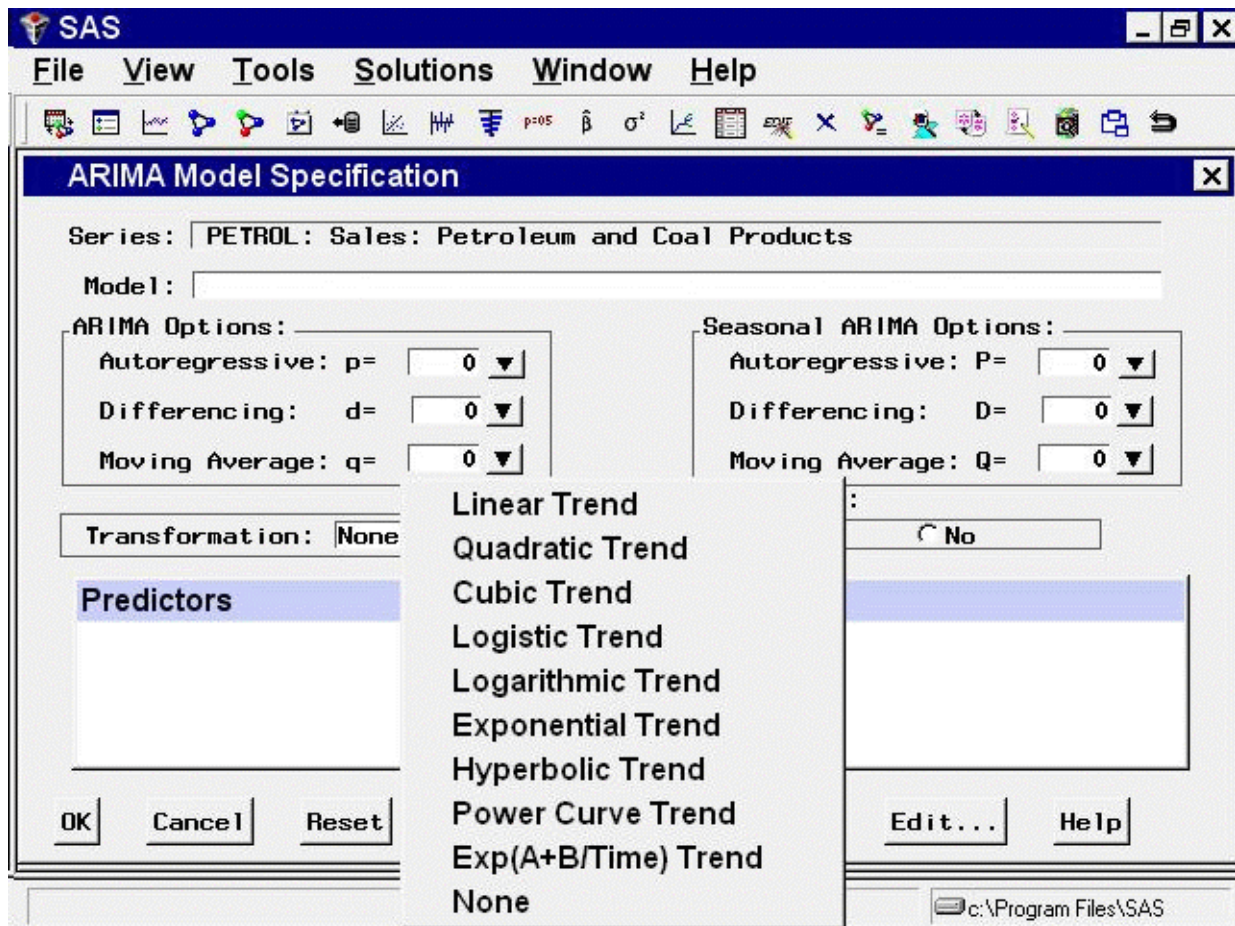

Now open the Model Viewer by using the **View Model Graphically** icon or the **Model Predictions** item under the **View** pull-down menu or toolbar. This displays a plot of the model predictions and actual series values, as shown in Figure 47.4. The predicted values lie along the least squares trend line.

Figure 47.4 Linear Trend Model

Time Trend Curves

From the Develop Models window, select **Fit ARIMA Model**. From the ARIMA Model Specification window, select **Add** and then select **Trend Curve** from the menu (shown in Figure 47.1). A menu of different kinds of trend curves is displayed, as shown in Figure 47.5.

Figure 47.5 Time Trend Curves Menu

These trend curves work in a similar way as the Linear Trend option (which is a special case of a trend curve and one of the choices on the menu), but with the Trend Curve menu you have a choice of various nonlinear time trends.

Select `Quadratic Trend`. This adds a quadratic time trend to the Predictors list, as shown in [Figure 47.6](#).

Trend Curve _QUAD_: Quadratic Trend

OK Cancel Reset Clear Add... Delete Edit... Help

c:\Program Files\SAS

Now select the **OK** button. The quadratic trend model is fit and added to the list of models in the Develop Models window. The Model Viewer displays a plot of the quadratic trend model, as shown in [Figure 47.7](#).

Figure 47.7 Quadratic Trend Model

This curve does not fit the PETROL series very well, but the View Model plot illustrates how time trend models work. You might want to experiment with different trend models to see what the different trend curves look like.

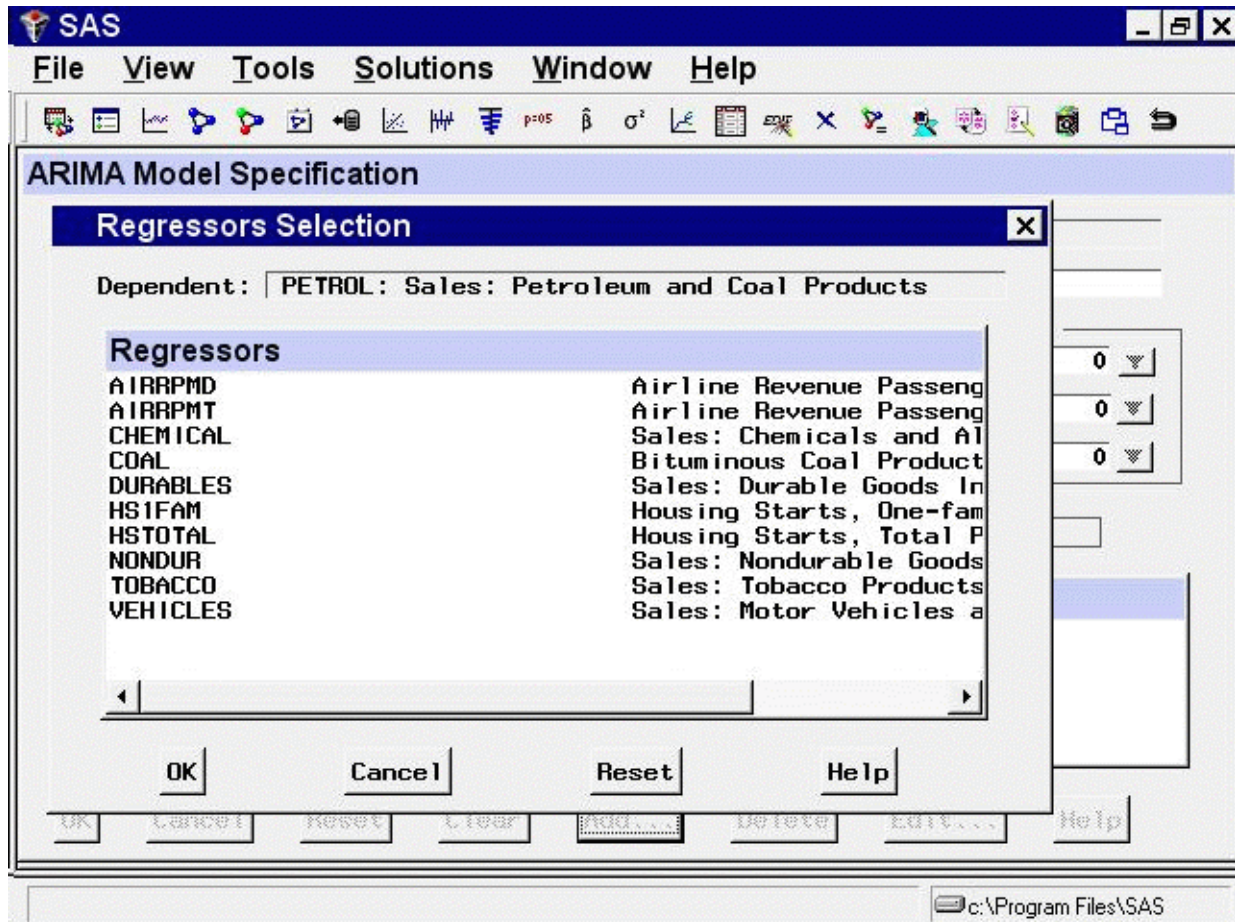

Some of the trend curves require transforming the dependent series. When you specify one of these curves, a notice is displayed reminding you that a transformation is needed, and the Transformation field is automatically filled in. Therefore, you cannot control the Transformation specification when some kinds of trend curves are specified.

See the section “[Time Trend Curves](#)” on page 2957 in Chapter 50, “[Forecasting Process Details](#),” for more information about the different trend curves.

Regressors

From the Develop Models window, select **Fit ARIMA Model**. From the ARIMA Model Specification window, select **Add** and then select **Regressors** from the menu (shown in Figure 47.1). This displays the **Regressors Selection** window, as shown in Figure 47.8. This window allows you to select any number of other series in the input data set as regressors to predict the dependent series.

Figure 47.8 Regressors Selection Window

For this example, select **CHEMICAL**, **Sales: Chemicals and Allied Products**, and **VEHICLES**, **Sales: Motor Vehicles and Parts**. (Note: You do not need to use the CTRL key when selecting more than one regressor.) Then select the **OK** button. The two variables you selected are added to the **Predictors** list as regressor type predictors, as shown in Figure 47.9.

c:\Program Files\SAS

You must have forecasts of the future values of the regressor variables in order to use them as predictors. To do this, you can specify a forecasting model for each regressor, have the system automatically select forecasting models for the regressors, or supply predicted future values for the regressors in the input data set.

Even if you have supplied future values for a regressor variable, the system requires a forecasting model for the regressor. Future values that you supply in the input data set take precedence over predicted values from the regressor's forecasting model when the system computes the forecasts for the dependent series.

Select the **OK** button. The system starts to fit the regression model but then stops and displays a warning that the regressors that you selected do not have forecasting models, as shown in [Figure 47.10](#).

Figure 47.10 Regressors Needing Models Warning

If you want the system to create forecasting models automatically for the regressor variables by using the automatic model selection process, select the **OK** button. If not, you can select the **Cancel** button to abort fitting the regression model.

For this example, select the **OK** button. The system now performs the automatic model selection process for **CHEMICAL** and **VEHICLES**. The selected forecasting models for **CHEMICAL** and **VEHICLES** are added to the model lists for those series. If you switch the current time series in the **Develop Models** window to **CHEMICAL** or **VEHICLES**, you will see the model that the system selected for that series.

Once forecasting models have been fit for all regressors, the system proceeds to fit the regression model for **PETROL**. The fitted regression model is added to the model list displayed in the **Develop Models** window.

Adjustments

An *adjustment* predictor is a variable in the input data set that is used to adjust the forecast values produced by the forecasting model. Unlike a regressor, an adjustment variable does not have a regression coefficient.

No model fitting is performed for adjustments. Nonmissing values of the adjustment series are simply added to the model prediction for the corresponding period. Missing adjustment values are ignored. If you supply adjustment values for observations within the period of fit, the adjustment values are subtracted from the actual values, and the model is fit to these adjusted values.

To add adjustments, select **Add** and then select **Adjustments** from the pop-up menu (shown in [Figure 47.1](#)). This displays the **Adjustments Selection** window. The **Adjustments Selection** window functions the same as the **Regressor Selection** window (which is shown in [Figure 47.8](#)). You can select any number of adjustment variables as predictors.

Unlike regressors, adjustments do not require forecasting models for the adjustment variables. If a variable that is used as an adjustment does have a forecasting model fit to it, the adjustment variable's forecasting model is ignored when the variable is used as an adjustment.

You can use forecast adjustments to account for expected future events that have no precedent in the past and so cannot be modeled by regression. For example, suppose you are trying to forecast the sales of a product, and you know that a special promotional campaign for the product is planned during part of the period you want to forecast. If such sales promotion programs have been frequent in the past, then you can record the past and expected future level of promotional efforts in a variable in the data set and use that variable as a regressor in the forecasting model.

However, if this is the first sales promotion of its kind for this product, you have no way to estimate the effect of the promotion from past data. In this case, the best you can do is to make an educated guess at the effect the promotion will have and add that guess to what your forecasting model would predict in the absence of the special sales campaign.

Adjustments are also useful for making judgmental alterations to forecasts. For example, suppose you have produced forecast sales data for the next 12 months. Your supervisor believes that the forecasts are too optimistic near the end and asks you to prepare a forecast graph in which the numbers that you have forecast are reduced by 1000 in the last three months. You can accomplish this task by editing the input data set so that it contains observations for the actual data range of sales plus 12 additional observations for the forecast period, and a new variable called, for example, **ADJUSTMENT**. The variable **ADJUSTMENT** contains the value 1000 for the last three observations and is missing for all other observations. You fit the same model previously selected for forecasting by using the **ARIMA Model Specification** or **Custom Model Specification** window, but with an adjustment added that uses the variable **ADJUSTMENT**. Now when you graph the forecasts by using the **Model Viewer**, the last three periods of the forecast are reduced by 1000. The confidence limits are unchanged, which helps draw attention to the fact that the adjustments to the forecast deviate from what would be expected statistically.

Dynamic Regressor

Selecting **Dynamic Regressor** from the **Add Predictors** menu (shown in [Figure 47.1](#)) allows you to specify a complex time series model of the way that a predictor variable influences the series that you are forecasting.

When you specify a predictor variable as a simple regressor, only the current period value of the predictor effects the forecast for the period. By specifying the predictor with the **Dynamic Regression** option, you can use past values of the predictor series, and you can model effects that take place gradually.

Dynamic regression models are an advanced feature that you are unlikely to find useful unless you have studied the theory of statistical time series analysis. You might want to skip this section if you are not trained in time series modeling.

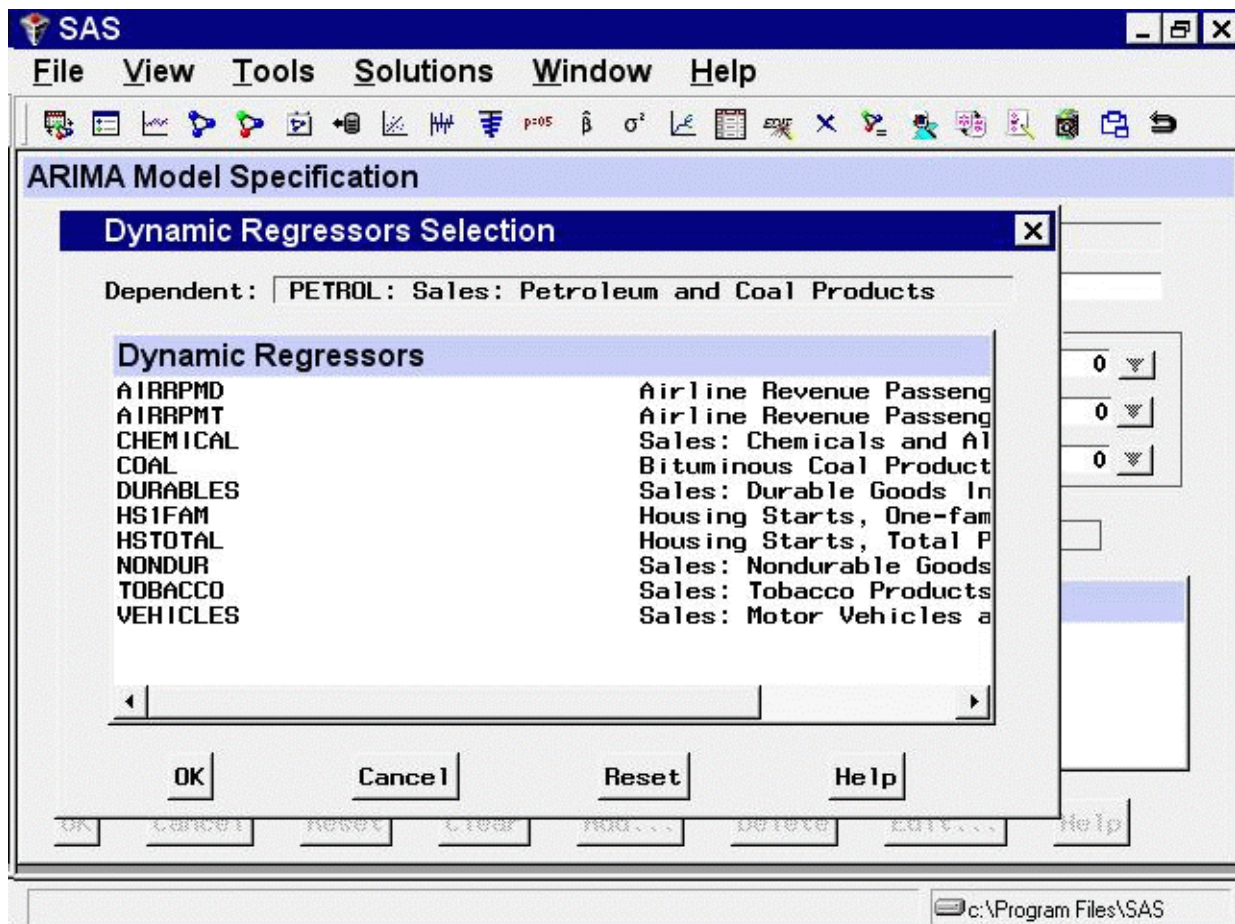

The term *dynamic regression* was introduced by Pankratz (1991) and refers to what Box and Jenkins (1976) named *transfer function models*. In dynamic regression, you have a time series model, similar to an ARIMA model, that predicts how changes in the predictor series affect the dependent series over time.

The dynamic regression model relates the predictor variable to the expected value of the dependent series in the same way that an ARIMA model relates the fluctuations of the dependent series about its conditional mean to the random error term (which is also called the innovation series). Refer to Pankratz (1991) and Box and Jenkins (1976) for more information about dynamic regression or transfer function models. See also Chapter 7, “[The ARIMA Procedure](#).”

From the Develop Models window, select **Fit ARIMA Model**. From the ARIMA Model Specification window, select **Add** and then select **Linear Trend** from the menu (shown in [Figure 47.1](#)).

Now select **Add** and select **Dynamic Regressor**. This displays the **Dynamic Regressors Selection** window, as shown in [Figure 47.11](#).

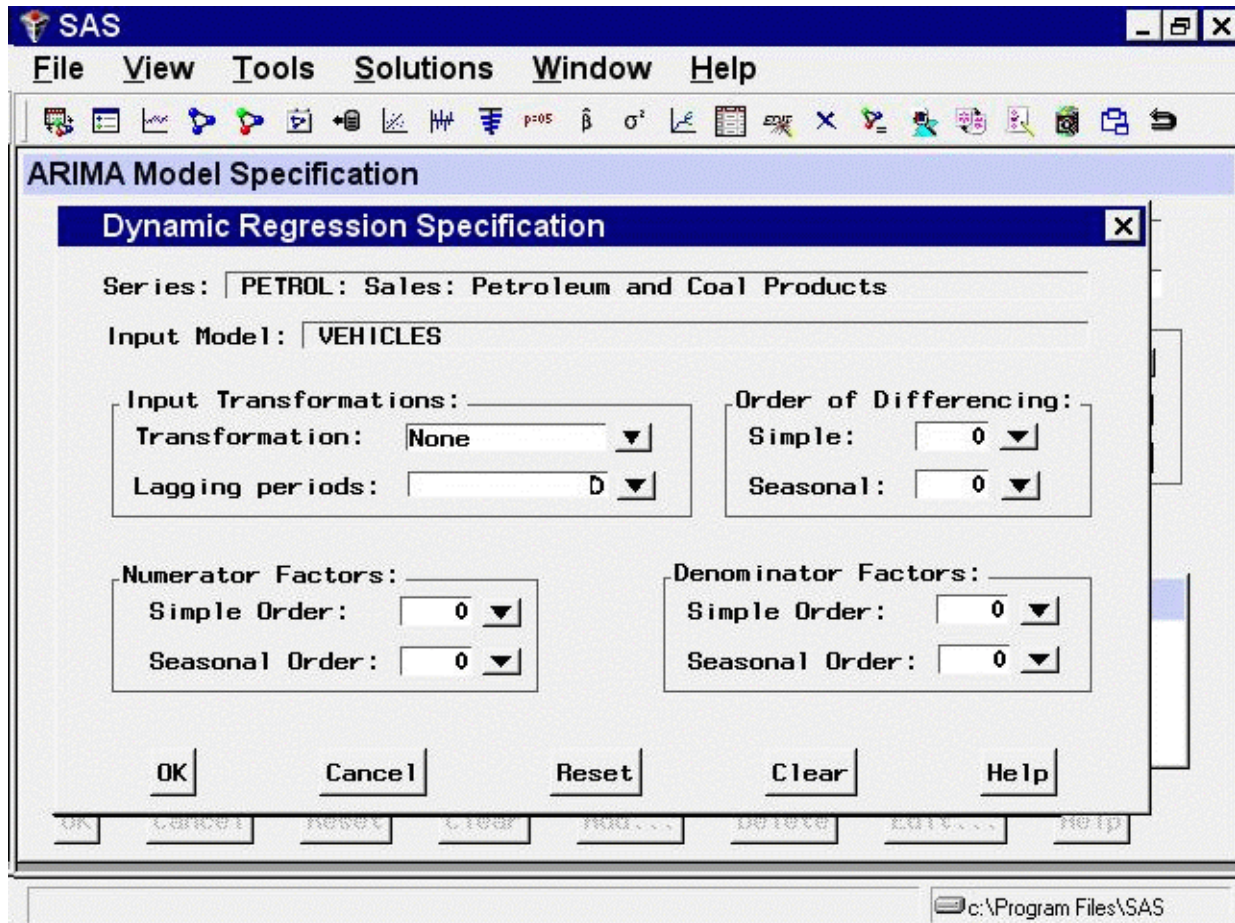

Figure 47.11 Dynamic Regressors Selection Window

You can select only one predictor series when specifying a dynamic regression model. For this example, select `VEHICLES`, Sales: Motor Vehicles and Parts. Then select the `OK` button.

This displays the `Dynamic Regression Specification` window, as shown in [Figure 47.12](#).

Figure 47.12 Dynamic Regression Specification Window

This window consists of four parts. The `Input Transformations` fields enable you to transform or lag the predictor variable. For example, you might use the lagged logarithm of the variable as the predictor series.

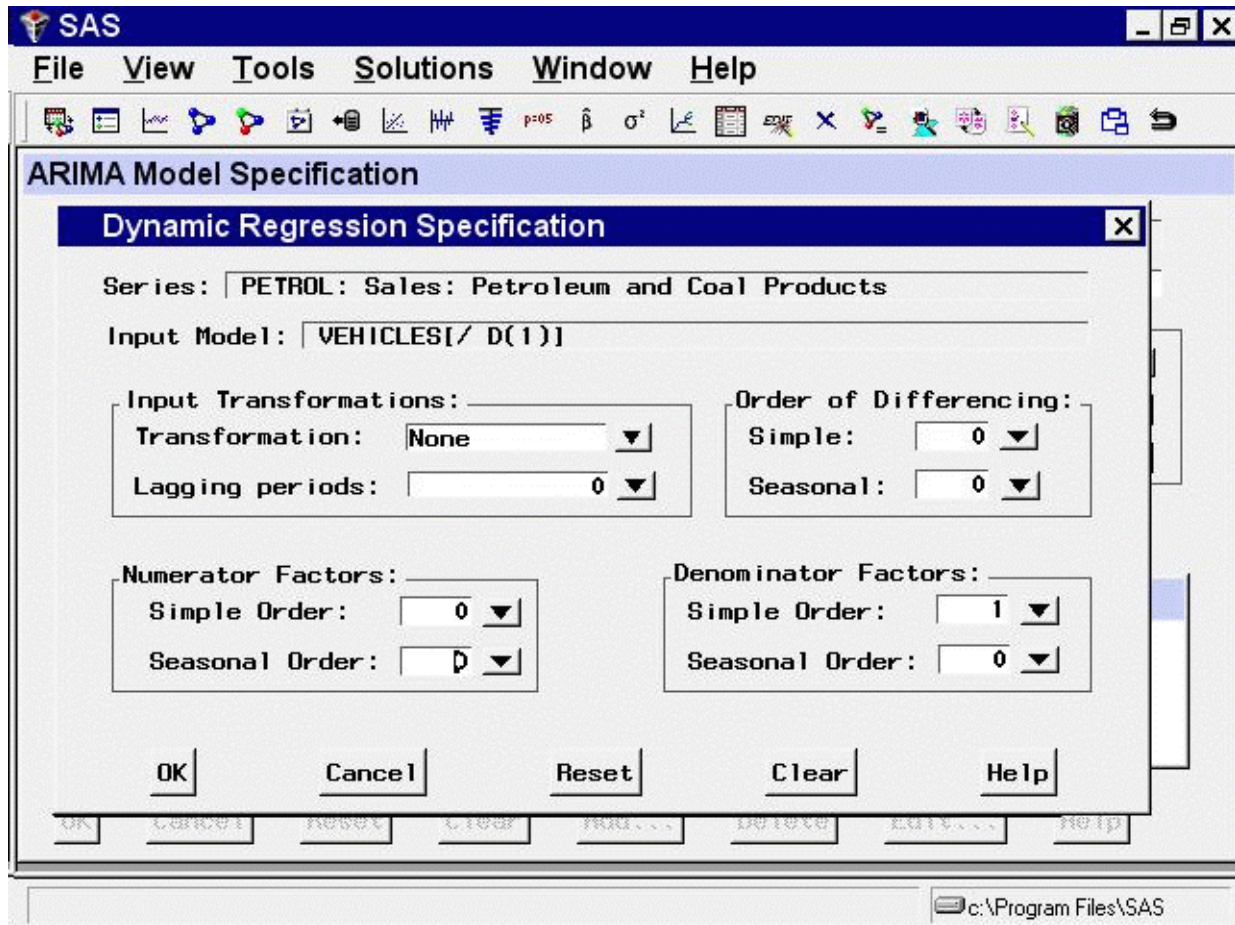

The `Order of Differencing` fields enable you to specify simple and seasonal differencing of the predictor series. For example, you might use changes in the predictor variable instead of the variable itself as the predictor series.

The `Numerator Factors` and `Denominator Factors` fields enable you to specify the orders of simple and seasonal numerator and denominator factors of the transfer function.

Simple regression is a special case of dynamic regression in which the dynamic regression model consists of only a single regression coefficient for the current value of the predictor series. If you select the `OK` button without specifying any options in the `Dynamic Regression Specification` window, a simple regressor will be added to the model.

For this example, use the `Simple Order` combo box for `Denominator Factors` and set its value to 1. The window now appears as shown in Figure 47.13.

Figure 47.13 Distributed Lag Regression Specified

This model is equivalent to regression on an exponentially weighted infinite distributed lag of `VEHICLES` (in the same way an `MA(1)` model is equivalent to single exponential smoothing).

Select the `OK` button to add the dynamic regressor to the model predictors list.

In the ARIMA Model Specification window, the Predictors list should now contain two items, a linear trend and a dynamic regressor for `VEHICLES`, as shown in Figure 47.14.

c:\Program Files\SAS

This model is a multiple regression of PETROL on a time trend variable and an infinite distributed lag of VEHICLES. Select the **OK** button to fit the model.

As with simple regressors, if VEHICLES does not already have a forecasting model, an automatic model selection process is performed to find a forecasting model for VEHICLES before the dynamic regression model for PETROL is fit.

Interventions

An *intervention* is a special indicator variable, computed automatically by the system, that identifies time periods affected by unusual events that influence or intervene in the normal path of the time series you are forecasting. When you add an intervention predictor, the indicator variable of the intervention is used as a regressor, and the impact of the intervention event is estimated by regression analysis.

To add an intervention to the Predictors list, you must use the Intervention Specification window to specify the time or times that the intervening event took place and to specify the type of intervention. You can add

interventions either through the `Interventions` item of the `Add` action or by selecting `Tools` from the menu bar and then selecting `Define Interventions`.

Intervention specifications are associated with the series. You can specify any number of interventions for each series, and once you define interventions you can select them for inclusion in forecasting models. If you select the `Include Interventions` option in the `Options` menu, any interventions that you have previously specified for a series are automatically added as predictors to forecasting models for the series.

From the `Develop Models` window, invoke the series viewer by selecting the `View Series Graphically` icon or `Series` under the `View` menu. This displays the `Time Series Viewer`, as was shown in [Figure 47.2](#).

Note that the trend in the `PETROL` series shows several clear changes in direction. The upward trend in the first part of the series reverses in 1981. There is a sharp drop in the series towards the end of 1985, after which the trend is again upwardly sloped. Finally, in 1991 the series takes a sharp upward excursion but quickly returns to the trend line.

You might have no idea what events caused these changes in the trend of the series, but you can use these patterns to illustrate the use of intervention predictors. To do this, you fit a linear trend model to the series, but modify that trend line by adding intervention effects to model the changes in trend you observe in the series plot.

The Intervention Specification Window

From the `Develop Models` window, select `Fit ARIMA` model. From the `ARIMA Model Specification` window, select `Add` and then select `Linear Trend` from the menu (shown in [Figure 47.1](#)).

Select `Add` again and then select `Interventions`. If you have any interventions already defined for the series, this selection displays the `Interventions for Series` window. However, since you have not previously defined any interventions, this list is empty. Therefore, the system assumes that you want to add an intervention and displays the `Intervention Specification` window instead, as shown in [Figure 47.15](#).

c:\Program Files\SAS

The top of the Intervention Specification window shows the current series and the label for the new intervention (initially blank). At the right side of the window is a scrollable table showing the values of the series. This table helps you locate the dates of the events you want to model.

At the left of the window is an area titled *Intervention Specification* that contains the options for defining the intervention predictor. The *Date* field specifies the time that the intervention occurs. You can type a date value in the *Date* field, or you can set the *Date* value by selecting a row from the table of series values at the right side of the window.

The area titled *Type of Intervention* controls the kind of indicator variable constructed to model the intervention effect. You can specify the following kinds of interventions:

- Point** is used to indicate an event that occurs in a single time period. An example of a point event is a strike that shuts down production for part of a time period. The value of the intervention's indicator variable is zero except for the date specified.
- Step** is used to indicate a continuing event that changes the level of the series. An example of a step event is a change in the law, such as a tax rate increase. The value of the intervention's indicator variable is zero before the date specified and 1 thereafter.
- Ramp** is used to indicate a continuing event that changes the trend of the series. The value

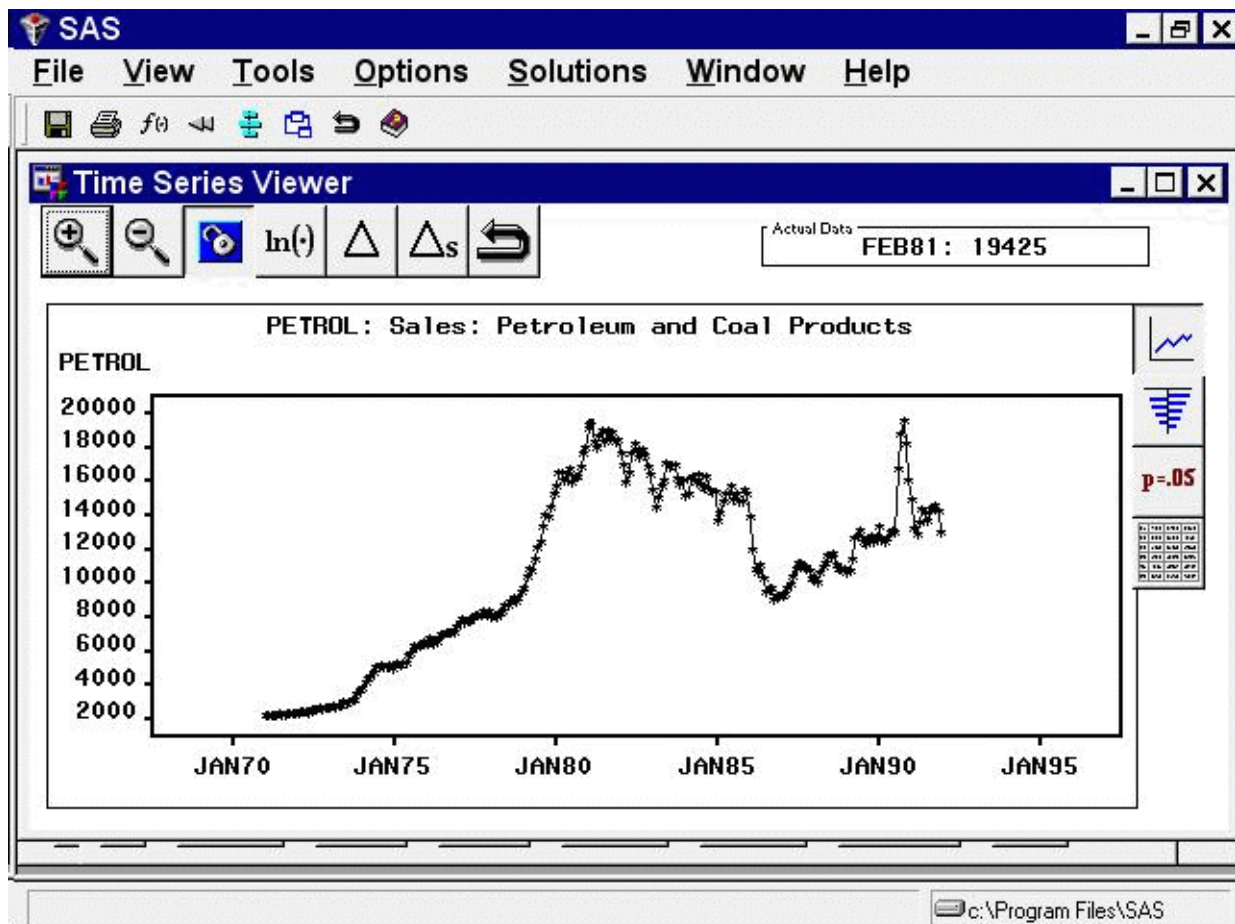

of the intervention's indicator variable is zero before the date specified, and it increases linearly with time thereafter.

The areas titled `Effect Time Window` and `Effect Decay Pattern` specify how to model the effect that the intervention has on the dependent series. These options are not used for simple interventions, they will be discussed later in this chapter.

Specifying a Trend Change Intervention

In the Time Series Viewer window position the mouse over the highest point in 1981 and select the point. This displays the data value, 19425, and date, February 1981, of that point in the upper-right corner of the Time Series Viewer, as shown in [Figure 47.16](#).

Figure 47.16 Identifying the Turning Point

Now that you know the date that the trend reversal occurred, enter that date in the `Date` field of the Intervention Specification window. Select `Ramp` as the type of intervention. The window should now appear as shown in [Figure 47.17](#).

Figure 47.17 Ramp Intervention Specified

c:\Program Files\SAS

Select the **OK** button. This adds the intervention to the list of interventions for the **PETROL** series, and returns you to the **Interventions for Series** window, as shown in Figure 47.18.

Figure 47.18 Interventions for Series Window

This window allows you to select interventions for inclusion in the forecasting model. Since you need to define other interventions, select the **Add** button. This returns you to the Intervention Specification window (shown in Figure 47.15).

Specifying a Level Change Intervention

Now add an intervention to account for the drop in the series in late 1985. You can locate the date of this event by selecting points in the Time Series Viewer plot or by scrolling through the data values table in the Interventions Specification window. Use the latter method so that you can see how this works.

Scrolling through the table, you see that the drop was from 15262 in December 1985, to 13937 in January 1986, to 12002 in February, to 10834 in March. Since the drop took place over several periods, you could use another ramp type intervention. However, this example represents the drop as a sudden event by using a step intervention and uses February 1986 as the approximate time of the drop.

Select the table row for February 1986 to set the **Date** field. Select **Step** as the intervention type. The window should now appear as shown in Figure 47.19.

Figure 47.19 Step Intervention Specified

c:\Program Files\SAS

Select the **OK** button to add this intervention to the list for the series.

Since the trend reverses again after the drop, add a ramp intervention for the same date as the step intervention. Select **Add** from the Interventions for Series window. Enter FEB86 in the *Date* field, select **Ramp**, and then select the **OK** button.

Modeling Complex Intervention Effects

You have now defined three interventions to model the changes in trend and level. The excursion near the end of the series remains to be dealt with.

Select **Add** from the Interventions for Series window. Scroll through the data values and select the date on which the excursion began, August 1990. Leave the intervention type as **Point**.

The pattern of the series from August 1990 through January 1991 is more complex than a simple shift in level or trend. For this pattern, you need a complex intervention model for an event that causes a sharp rise followed by a rapid return to the previous trend line. To specify this model, use the *Effect Time Window* and *Effect Decay Rate* options.

The `Effect Time Window` option controls the number of lags of the intervention's indicator variable used to model the effect of the intervention on the dependent series. For a simple intervention, the number of lags is zero, which means that the effect of the intervention is modeled by fitting a single regression coefficient to the intervention's indicator variable.

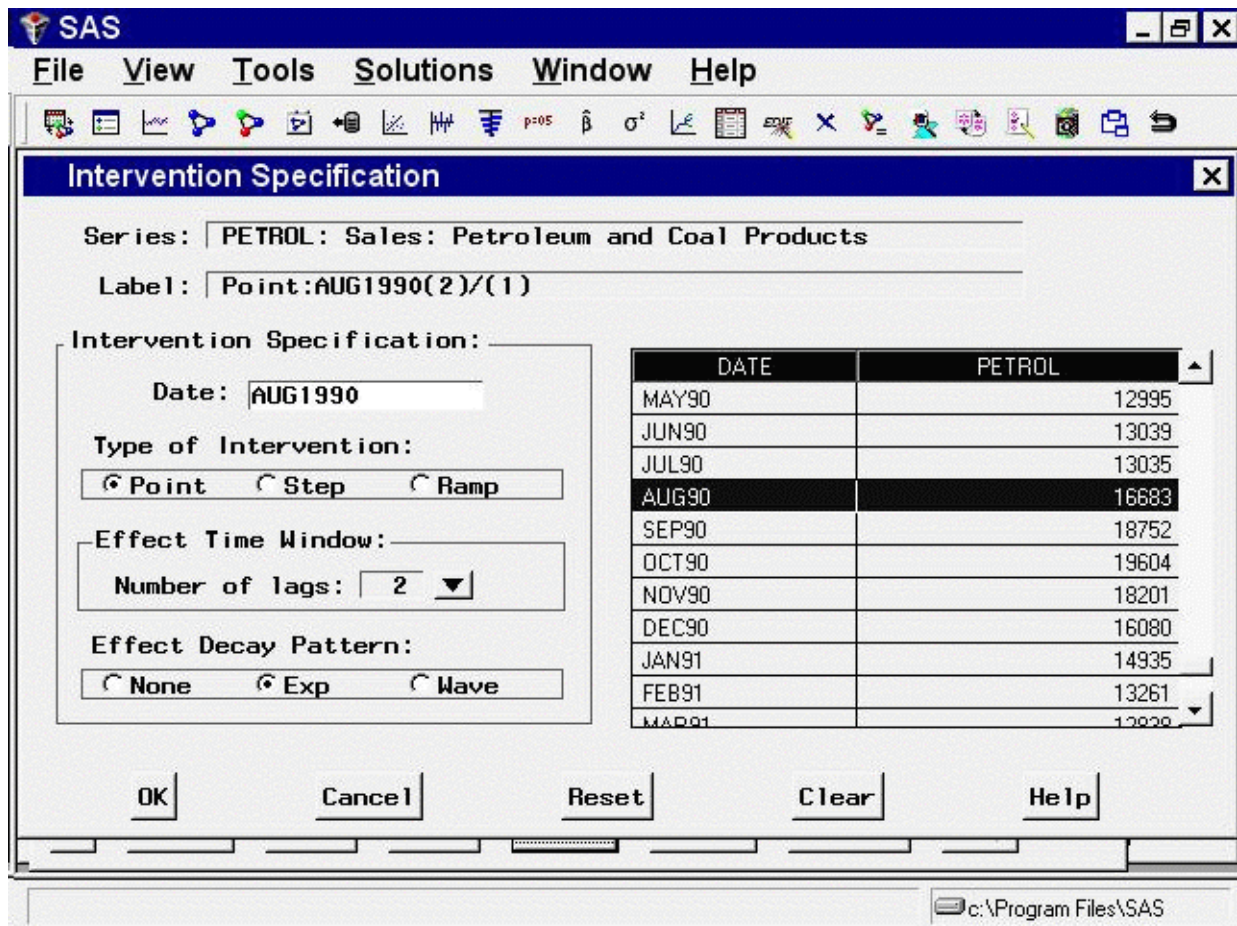

When you set the number of lags greater than zero, regression coefficients are fit to lags of the indicator variable. This allows you to model interventions whose effects take place gradually, or to model rebound effects. For example, severe weather might reduce production during one period but cause an increase in production in the following period as producers struggle to catch up. You could model this by using a point intervention with an effect time window of 1 lag. This would fit two coefficients for the intervention, one for the immediate effect and one for the delayed effect.

The `Effect Decay Pattern` option controls how the effect of the intervention dissipates over time. `None` specifies that there is no gradual decay: for point interventions, the effect ends immediately; for step and ramp interventions, the effect continues indefinitely. `Exp` specifies that the effect declines at an exponential rate. `Wave` specifies that the effect declines like an exponentially damped sine wave (or as the sum of two exponentials, depending on the fit to the data).

If you are familiar with time series analysis, these options might be clearer if you note that together the `Effect Time Window` and `Effect Decay Pattern` options define the numerator and denominator orders of a transfer function or dynamic regression model for the indicator variable of the intervention. See the section “[Dynamic Regressor](#)” on page 2964 for more information.

For this example, select 2 lags as the value of the `Event Time Window` option, and select `Exp` as the `Effect Decay Pattern` option. The window should now appear as shown in [Figure 47.20](#).

Figure 47.20 Complex Intervention Model

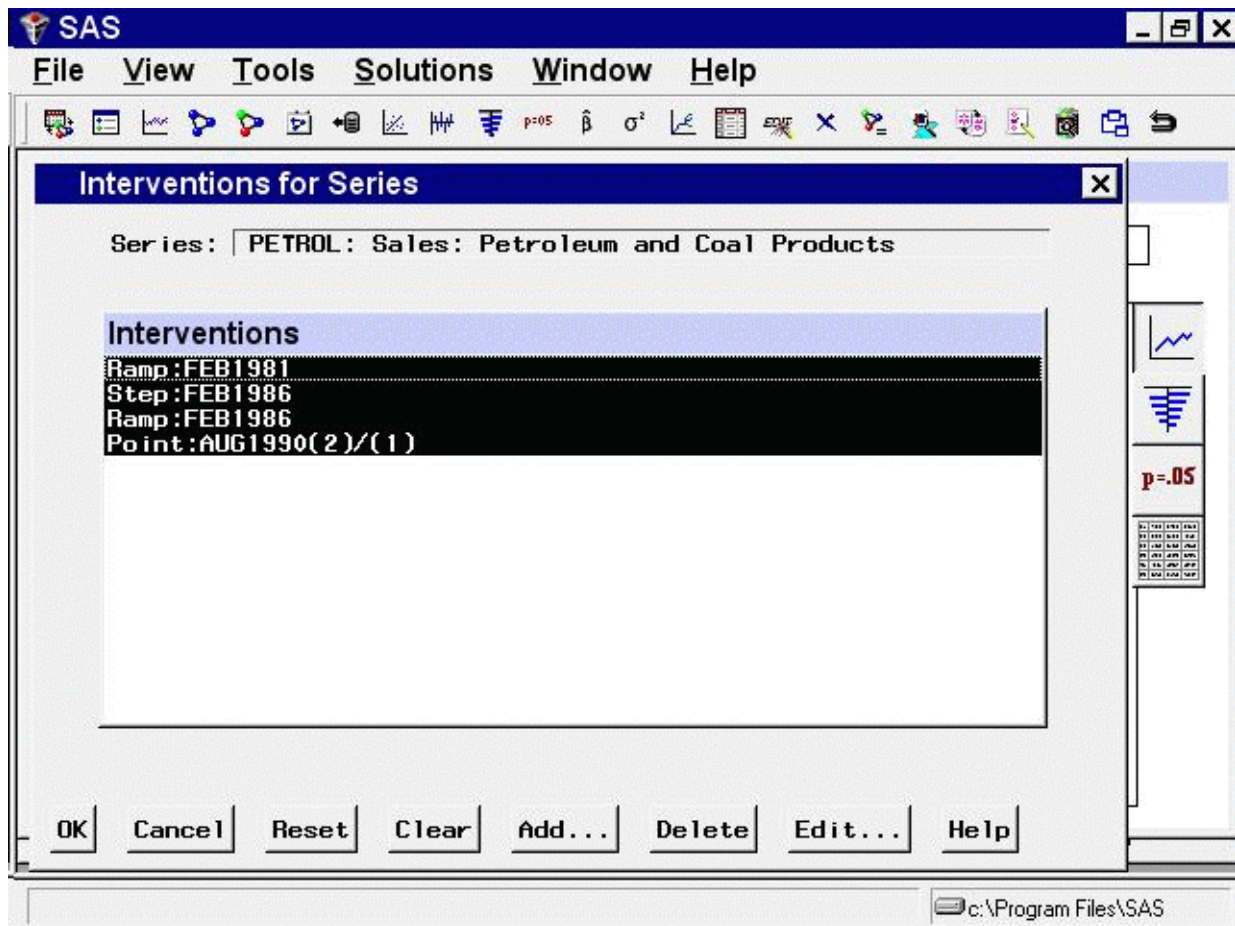

Select the **OK** button to add the intervention to the list.

Fitting the Intervention Model

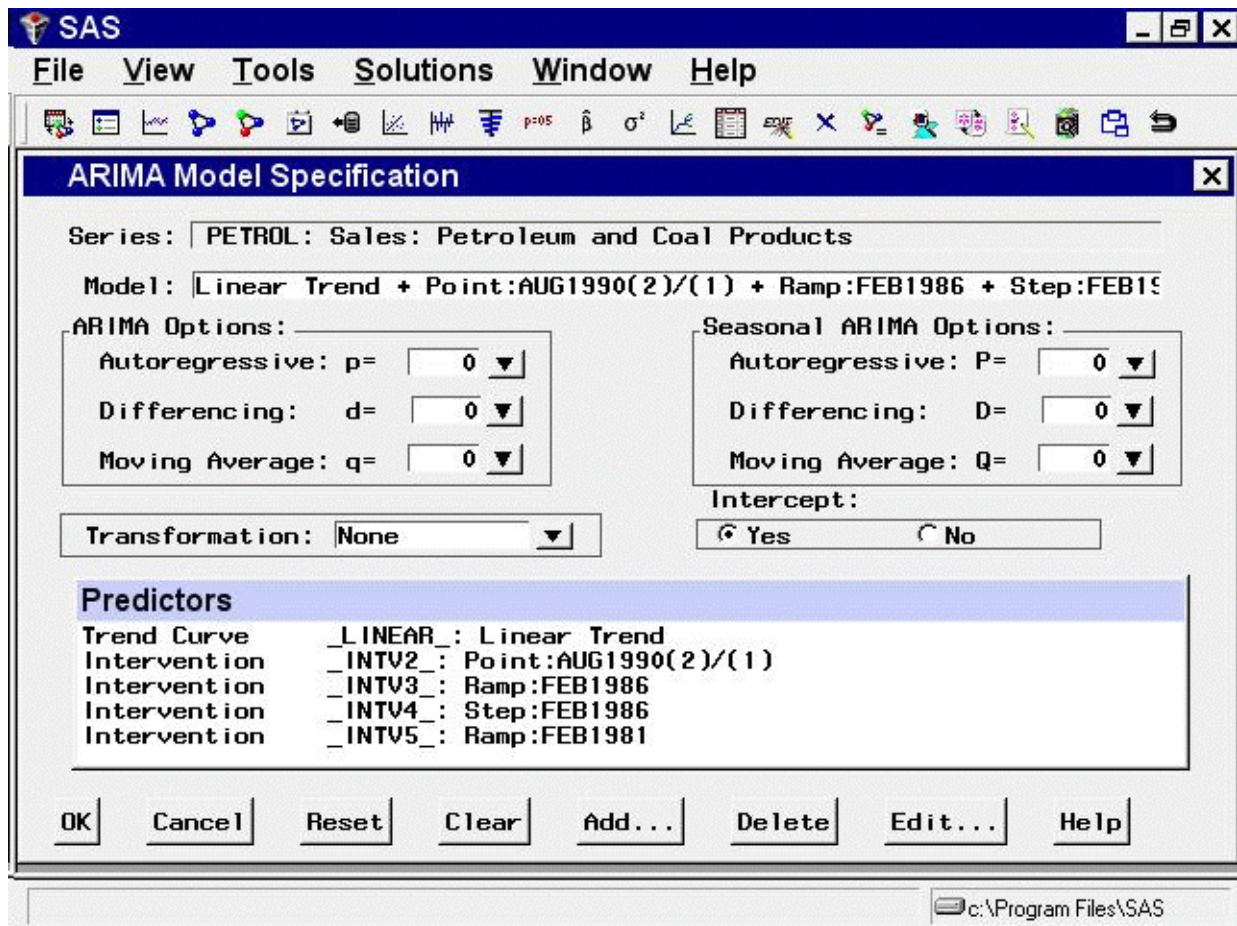

The Interventions for Series window now contains definitions for four intervention predictors. Select all four interventions, as shown in [Figure 47.21](#).

Figure 47.21 Interventions for Series Window

Select the **OK** button. This returns you to the ARIMA Model Specification window, which now lists items in the Predictors list, as shown in Figure 47.22.

Figure 47.22 Linear Trend with Interventions Specified

Select the **OK** button to fit this model. After the model is fit, bring up the Model Viewer. You will see a plot of the model predictions, as shown in [Figure 47.23](#).

Figure 47.23 Linear Trend with Interventions Model

You can use the Zoom In feature to take a closer look at how the complex intervention effect fits the excursion in the series starting in August 1990.

Limitations of Intervention Predictors

Note that the model you have just fit is intended only to illustrate the specification of interventions. It is not intended as an example of good forecasting practice.

The use of continuing (step and ramp type) interventions as predictors has some limitations that you should consider. If you model a change in trend with a simple ramp intervention, then the trend in the data before the date of the intervention has no influence on the forecasts. Likewise, when you use a step intervention, the average level of the series before the intervention has no influence on the forecasts.

Only the final trend and level at the end of the series are extrapolated into the forecast period. If a linear trend is the only pattern of interest, then instead of specifying step or ramp interventions, it would be simpler to adjust the period of fit so that the model ignores the data before the final trend or level change.

Step and ramp interventions are valuable when there are other patterns in the data—such as seasonality, autocorrelated errors, and error variance—that are stable across the changes in level or trend. Step and ramp interventions enable you to fit seasonal and error autocorrelation patterns to the whole series while fitting the trend only to the latter part of the series.

Point interventions are a useful tool for dealing with outliers in the data. A point intervention will fit the series value at the specified date exactly, and it has the effect of removing that point from the analysis. When you specify an effect time window, a point intervention will exactly fit as many additional points as the number of lags specified.

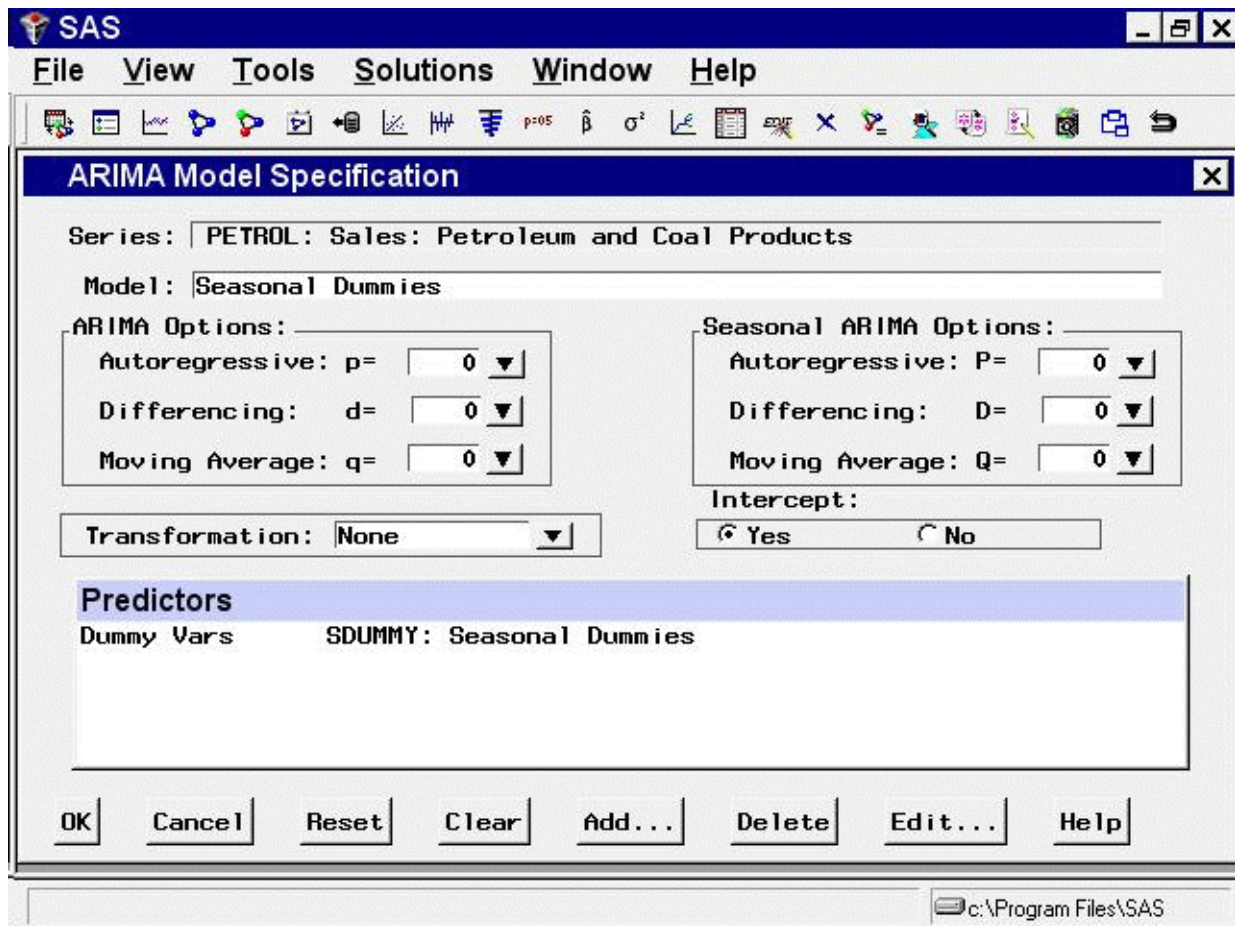

Seasonal Dummies

A *Seasonal Dummies* predictor is a special feature that adds to the model seasonal indicator or “dummy” variables to serve as regressors for seasonal effects.

From the Develop Models window, select **Fit ARIMA Model**. From the ARIMA Model Specification window, select **Add** and then select **Seasonal Dummies** from the menu (shown in [Figure 47.1](#)).

A Seasonal Dummies input is added to the Predictors list, as shown in [Figure 47.24](#).

Figure 47.24 Seasonal Dummies Specified

Select the **OK** button. A model consisting of an intercept and 11 seasonal dummy variables is fit and added to the model list in the Develop Models window. This is effectively a mean model with a separate mean for each month.

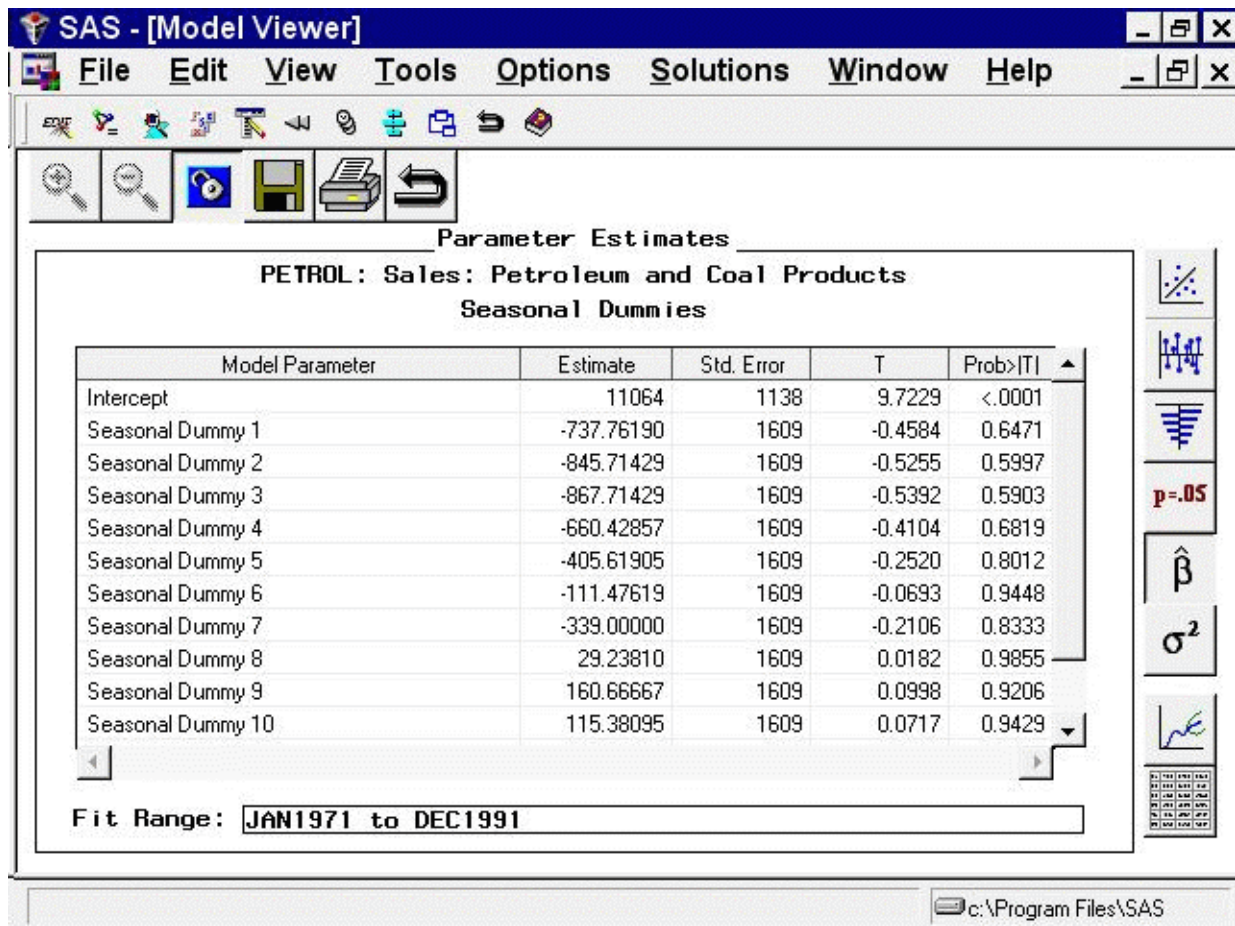

Now return to the Model Viewer, which displays a plot of the model predictions and actual series values, as shown in Figure 47.25. This is obviously a poor model for this series, but it serves to illustrate how seasonal dummy variables work.

Figure 47.25 Seasonal Dummies Model

Now select the parameter estimates icon, the fifth from the top on the vertical toolbar. This displays the Parameter Estimates table, as shown in Figure 47.26.

Figure 47.26 Parameter Estimates for Seasonal Dummies Model

Since the data for this example are monthly, the Seasonal Dummies option added 11 seasonal dummy variables. These include a dummy regressor variable that is 1.0 for January and 0 for other months, a regressor that is 1.0 only for February, and so forth through November.

Because the model includes an intercept, no dummy variable is added for December. The December effect is measured by the intercept, while the effect of other seasons is measured by the difference between the intercept and the estimated regression coefficient for the season's dummy variable.

The same principle applies for other data frequencies: the "Seasonal Dummy 1" parameter always refers to the first period in the seasonal cycle; and, when an intercept is present in the model, there is no seasonal dummy parameter for the last period in the seasonal cycle.

Examples	2986
FORECAST Command and Macro	2986
Syntax	2987
Examples	2990

TSVIEW Command and Macro

The TSVIEW command invokes the Time Series Viewer. This is a component of the Time Series Forecasting System that can also be used as a standalone graphical viewer for any time series data set or view. See the section “Time Series Viewer Window” in Chapter 49, “[Window Reference](#),” for more information.

The TSVIEW command must be specified from the command line or an SCL program. If you need to submit from the program editor, use the %TSVIEW macro instead. You can use the macro within a data step program, but you must submit it within the SAS windowing environment.

If the TSVIEW command or %TSVIEW macro is issued without arguments, the Series Selection window appears to enable you to select an input data set and series. This is equivalent to selecting “Time Series Viewer” from the Analysis submenu of the Solutions menu. By specifying the DATA= and VAR= arguments, you can bring up the Time Series Viewer window directly. The ID= and INTERVAL= arguments are useful when the system cannot determine them automatically from the data.

Syntax

The TSVIEW command has the following form:

```
TSVIEW [options] ;
```

The %TSVIEW macro has the following form:

```
%TSVIEW [(option, ..., option) ] ;
```

The following options can be specified for the command and the macro.

DATA=*data set name*

specifies the name of the SAS data set containing the input data.

VAR=*time series variable name*

specifies the series variable name. It must be a numeric variable contained in the data set.

ID=*time id variable name*

specifies the time ID variable name for the data set. If the ID= option is not specified, the system attempts to locate the variables named DATE, DATETIME, and TIME in the data set specified by the DATA= option.

INTERVAL=*interval name*

specifies the time ID interval between observations in the data set.

Examples

TSVIEW Command

```
tview data=sashelp.air var=air
tview data=dept.prod var=units id=period interval=qtr
```

%TSVIEW Macro

```
%tview( data=sashelp.air, var=air);
%tview( data=dept.prod, var=units, id=period, interval=qtr);
```

FORECAST Command and Macro

The FORECAST command invokes the Time Series Forecasting System. The command must be specified from the command line or an SCL program. If you need to submit from the program editor, use the %FORECAST macro instead. You can use the macro within a data step program, but you must submit it within the SAS windowing environment.

If the FORECAST command or %FORECAST macro is issued without arguments, the Time Series Forecasting window appears. This is equivalent to selecting “Time Series Forecasting System” from the Analysis submenu of the Solutions menu.

Using the arguments, it is possible to do the following:

- Bring up the system with information already filled into some of the fields

- Bring up the system starting at a different window than the default Time Series Forecasting window
- Run the system in unattended mode so that a task such as creating a forecast data set is accomplished without any user interaction. By submitting such commands repeatedly from a SAS/AF or SAS/EIS application, it is possible to do “batch” processing for many data sets or by-group processing for many subsets of a data set. You can create a project in unattended mode and later open it for inspection interactively. You can also create a project interactively in order to set options, fit a model, or edit the list of models, and then use this project later in unattended mode.

The `Forecast Command Builder`, a point-and-click SAS/AF application, makes it easy to specify, run, save, and rerun forecasting jobs by using the `FORECAST` command. To use it, enter the following on the command line (not the program editor):

```
%FCB
```

or

```
AF C=SASHELP.FORCAST.FORCCMD.FRAME.
```

Syntax

The `FORECAST` command has the following form:

FORECAST [*options*] ;

The `%FORECAST` macro has the following form:

%FORECAST [(*option*, ..., *option*)] ;

The following options can be specified for the command and the macro.

PROJECT=*project name*

specifies the name of the SAS catalog entry in which forecasting models and other results are stored and from which previously stored results are loaded into the forecasting system.

DATA=*data set name*

specifies the name of the SAS data set containing the input data.

VAR=*time series variable name*

specifies the series variable name. It must be a numeric variable contained in the data set.

ID=*time id variable name*

specifies the time ID variable name for the data set. If the `ID=` option is not specified, the system attempts to locate the variables named `DATE`, `DATETIME`, and `TIME` in the data set specified by the `DATA=` option. However, it is recommended that you specify the time ID variable whenever you are using the `ENTRY=` argument.

INTERVAL=*interval name*

specifies the time ID interval between observations in the data set. Commonly used intervals

are `year`, `semyear`, `qtr`, `month`, `semimonth`, `week`, `weekday`, `day`, `hour`, `minute`, and `second`. See Chapter 4, “[Date Intervals, Formats, and Functions](#),” for information about more complex interval specifications. If the `INTERVAL=` option is not specified, the system attempts to determine the interval based on the time ID variable. However, it is recommended that you specify the interval whenever you are using the `ENTRY=` argument.

STAT=statistic

specifies the name of the goodness-of-fit statistic to be used as the model selection criterion. The default is `RMSE`. Valid names are

<code>sse</code>	sum of square error
<code>mse</code>	mean square error
<code>rmse</code>	root mean square error
<code>mae</code>	mean absolute error
<code>mape</code>	mean absolute percent error
<code>aic</code>	Akaike information criterion
<code>sbc</code>	Schwarz Bayesian information criterion
<code>rsquare</code>	R-square
<code>ajdrsqr</code>	adjusted R-square
<code>rwrsqr</code>	random walk R-square
<code>arsqr</code>	Amemiya's adjusted R-square
<code>apc</code>	Amemiya's prediction criterion

CLIMIT=integer

specifies the level of the confidence limits to be computed for the forecast. This integer represents a percentage; for example, `925` indicates 92.5% confidence limits. The default is `95`—that is, 95% confidence limits.

HORIZON=integer

specifies the number of periods into the future for which forecasts are computed. The default is `12` periods. The maximum is `9999`.

ENTRY=name

The name of an entry point into the system. Valid names are

<code>main</code>	starts the system at the Time Series Forecasting window (default).
<code>devmod</code>	starts the system at the Develop Models window.
<code>viewmod</code>	starts the system at the Model Viewer window. Specify a project that contains a forecasting model by using the <code>PROJECT=</code> option. If a project containing a model is not specified, the message “No forecasting model to view” appears.
<code>viewer</code>	starts the system at the Time Series Viewer window.
<code>autofit</code>	runs the system in unattended mode, fitting a forecasting model automatically and saving it in a project. If <code>PROJECT=</code> is not specified, the default project name <code>SASUSER.FMSPROJ.PROJ</code> is used.

forecast runs the system in unattended mode to generate a forecast data set. The name of this data set is specified by the **OUT=** parameter. If **OUT=** is not specified, a window appears to prompt for the name and label of the output data set. If **PROJECT=** is not specified, the default project name **SASUSER.FMSPROJ.PROJ** is used. If the project does not exist or does not contain a forecasting model for the specified series, automatic model fitting is performed and the forecast is computed by using the automatically selected model. If the project exists and contains a forecasting model for the specified series, the forecast is computed by using this model. If the series covers a different time range than it did when the project was created, use the **REFIT** or **REEVAL** keyword to reset the time ranges.

OUT=argument

specifies one or two-level name of a SAS data set in which forecasts are saved. Use in conjunction with **ENTRY=FORECAST**. If omitted, the system prompts for the name of the forecast data set.

KEEP=argument

specifies the number of models to keep in the project when automatic model fitting is performed. This corresponds to **Models to Keep** in the Automatic Model Selection Options window. A value greater than 9 indicates that all models are kept. The default is 1.

DIAG=YES|NO

specifies which models to search with regard to series diagnostics. **DIAG= YES** causes the automatic model selection process to search only over those models that are consistent with the series diagnostics. **DIAG= NO** causes the automatic model selection process to search over all models in the selection list, without regard for the series diagnostics. This corresponds to **Models to Fit** in the Automatic Model Selection Options window. The default is **YES**.

REFIT=keyword

(for macro usage) refits a previously saved forecasting model by using the current fit range; that is, it reestimates the model parameters. Refitting also causes the model to be reevaluated (statistics of fit recomputed), and it causes the time ranges to be reset if the data range has changed (for example, if new observations have been added to the series). This keyword has no effect if you do not use the **PROJECT=** argument to reference an existing project containing a forecasting model. Use the **REFIT** keyword if you have added new data to the input series and you want to refit the forecasting model and update the forecast by using the new time ranges. Be sure to use the same project, data set, and series names that you used previously.

REEVAL=keyword

(for macro usage) reevaluates a previously saved forecasting model by using the current evaluation range; that is, it recomputes the statistics of fit. Reevaluating also causes the time ranges to be reset if the data range has changed (for example, if new observations have been added to the series). It does not refit the model parameters. This keyword has no effect if you also specify **REFIT**, or if you do not use the **PROJECT=** argument to reference an existing project containing a forecasting model. Use the **REEVAL** keyword if you have added new data to the input series and want to update your forecast by using a previously fit forecasting model and the same project, data set, and series names that you used previously.

Examples

FORECAST Command

The following command opens the Time Series Forecasting window with the data set name and series name filled in. The time ID variable is also filled in since the data set contains the variable DATE. The interval is filled in because the system recognizes that the observations are monthly.

```
forecast data=sashelp.air var=air
```

The following command opens the Time Series Forecasting window with the project, data set name, series, time ID, and interval fields filled in, assuming that the project SAMPROJ was previously saved either interactively or by using unattended mode as depicted below. Previously fit models appear when the Develop Models or Manage Projects window is opened.

```
forecast project=samproj
```

The following command runs the system in unattended mode, fitting a model automatically, storing it in the project SAMPROJ in the default catalog SASUSER.FMSPROJ, and placing the forecasts in the data set WORK.SAMPOUT.

```
forecast data=sashelp.workers var=electric id=date interval=month  
project=samproj entry=forecast out=sampout
```

The following command assumes that a new month's data have been added to the data set from the previous example and that an updated forecast is needed that uses the previously fit model. Time ranges are automatically updated to include the new data since the REEVAL keyword is included. Substitute REFIT for REEVAL if you want the system to reestimate the model parameters.

```
forecast data=sashelp.workers var=electric id=date interval=month  
project=samproj entry=forecast out=sampout reeval
```

The following command opens the model viewer with the project created in the previous example and with 99 percent confidence limits in the forecast graph.

```
forecast data=sashelp.workers var=electric id=date interval=month  
project=samproj entry=viewmod climit=99
```

The final example illustrates using unattended mode with an existing project that has been defined interactively. In this example, the goal is to add a model to the model selection list, to specify that all models in that list be fit, and that all models which are fit successfully be retained.

First open the Time Series Forecasting window and specify a new project name, WORKPROJ. Then select Develop Models, choosing SASHELP.WORKERS as the data set and MASONRY as the series. Now

select “Model Selection List” from the Options menu. In the Model Selection List window, click **Actions**, then **Add**, and then **ARIMA Model**. Define the model `ARIMA(0,1,0) (0,1,0)s NOINT` by setting the differencing value to 1 under both **ARIMA Options** and **Seasonal ARIMA Options**. Select **OK** to save the model and **OK** to close the Model Selection List window. Now select “Automatic Fit” from the Options menu. In the Automatic Model Selection Options window, select “All autofit models in selection list” in the **Models to fit** radio box, select “All models” from the **Models to keep** combo box, and then click **OK** to close the window. Select “Save Project” from the File menu, and then close the Develop Models window and the Time Series Forecasting window. You now have a project with a new model added to the selection list, options set for automatic model fitting, and one series selected but no models fit.

Now enter the command:

```
forecast data=sashelp.workers var=electric id=date interval=month
project=workproj entry=forecast out=workforc
```

The system runs in unattended mode to update the project and create the forecast data set **WORKFORC**. Check the messages in the Log window to find out if the run was successful and which model was selected for forecasting. To see the forecast data set, issue the command `viewtable WORKFORC`. To see the contents of the project, open the Time Series Forecasting window, open the project **WORKPROJ**, and select “Manage Projects.” You will see that the variable **ELECTRIC** was added to the project and has a forecasting model. Select this row in the table and then select **List Models** from the Tools menu. You will see that all of the models in the selection list which fit successfully are there, including the new model you added to the selection list.

%FORECAST Macro

This example demonstrates the use of the `%FORECAST` macro to start the Time Series Forecasting System from a SAS program submitted from the Editor window. The SQL procedure is used to create a view of a subset of a products data set. Then the `%FORECAST` macro is used to produce forecasts.

```
proc sql;
  create view selprod as
  select * from products
  where type eq 'A'
  order by date;
run;

%forecast(data=selprod, var=amount, id=date, interval=day,
  entry=forecast, out=typea, project=proda, refit= );
```

Overview

This chapter provides a reference to the various windows of the Time Series Forecasting System. The windows are presented in alphabetical order by name. Each section describes the purpose of the window, how to open it, its controls, fields, and menus. For windows that have their own menus, there is a description of each menu item under the heading “Menu Bar.” These windows also have a toolbar with icons that duplicate the more commonly used menu items. Each icon has a *screen tip*: a brief description that appears when you hover the mouse cursor over the icon. If you don’t see the screen tips, open the SAS Preferences window, under the Options submenu of the Tools menu. Select the View tab and make sure the “Screen tips” check box is checked.

Adjustments Selection Window

Use the Adjustments Selection window to select input variables for use as adjustments to the forecasts and add them to the Predictors list. Invoke this window from the pop-up menu that appears when you select the Add button of the ARIMA Model Specification window or Custom Model Specification window. For more information, see the “Adjustments” section in Chapter 47, “Using Predictor Variables.”

Controls and Fields

Dependent

is the name and variable label of the current series.

Adjustments

is a table that lists the names and labels in the input data set available for selection as adjustments. The variables you select are highlighted. Selecting a highlighted row again deselects that variable.

OK

closes the Adjustments Selection window and adds the selected variables as adjustments in the model.

Cancel

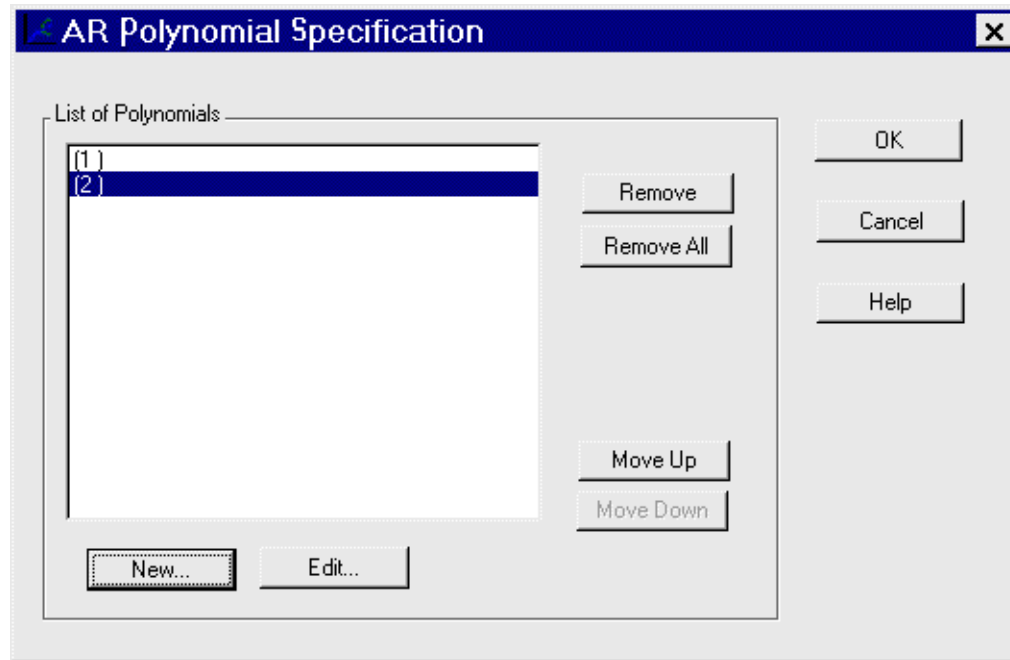

closes the window without adding any adjustments.

Reset

resets all selections to their initial values upon entry to the window.

AR/MA Polynomial Specification Window

Use these windows to specify the autoregressive and moving-average terms in a factored ARIMA model. Access the AR Polynomial Specification window from the Set button next to the Autoregressive term in the Factored ARIMA Model Specification window. Access the MA Polynomial Specification window from the Set button next to the Moving Average term.

Controls and Fields

List of Polynomials

Lists the polynomials that have been specified. Each polynomial is represented by a comma-delimited list of lag values enclosed in parentheses.

New

Opens the Polynomial Specification window to add a new polynomial to the model.

Edit

Opens the Polynomial Specification window to edit a polynomial that has been selected. If no polynomial is selected, this button is unavailable.

Remove

Removes a selected polynomial from the list. If none are selected, this button is unavailable.

Remove All

Clears the list of polynomials.

Move Up

Moves a selected polynomial up one position in the list. If no polynomial is selected, or the first one is selected, this button is unavailable.

Move Down

Moves a selected polynomial down one position in the list. If no polynomial is selected, or the last one is selected, this button is unavailable.

OK

Closes the window and returns the specified list of polynomials to the Factored ARIMA Model Specification window.

Cancel

Closes the window and discards any changes made to the list of polynomials.

ARIMA Model Specification Window

Use the ARIMA Model Specification window to specify and fit an ARIMA model with or without predictor effects as inputs. Access it from the Develop Models menu, where it is invoked from the Fit Model item under Edit in the menu bar, or from the pop-up menu when you click an empty area of the model table.

ARIMA Model Specification

Series:

Model:

ARIMA Options:

Autoregressive: p=

Differencing: d=

Moving Average: q=

Seasonal ARIMA Options:

Autoregressive: P=

Differencing: D=

Moving Average: Q=

Controls and Fields

Series

is the name and variable label of the current series.

Model

is a descriptive label for the model that you specify. You can type a label in this field or allow the system to provide a label. If you leave the label blank, a label is generated automatically based on the options you specify.

ARIMA Options

specify the orders of the ARIMA model. You can either type in a value or click the arrow to select from a list.

Autoregressive

defines the order of the autoregressive part of the model.

Differencing

defines the order of simple differencing—for example, first difference or second difference.

Moving Average

defines the order of the moving-average part of the model.

Seasonal ARIMA Options

specify the orders of the seasonal part of the ARIMA model. You can either type in a value or click the arrow to select from a list.

Autoregressive

defines the order of the seasonal autoregressive part of the model.

Differencing

defines the order of seasonal differencing—for example, first difference or second difference at the seasonal lags.

Moving Average

defines the order of the seasonal moving-average part of the model.

Transformation

defines the series transformation for the model. When a transformation is specified, the ARIMA model is fit to the transformed series, and forecasts are produced by applying the inverse transformation to the ARIMA model predictions. The available transformations are: Log, Logistic, Square Root, Box-Cox, and None.

Intercept

specify whether a mean or intercept parameter is included in the ARIMA model. By default, the Intercept option is set to No when the model includes differencing and Yes when there is no differencing.

Predictors

lists the predictor effects included as inputs in the model.

OK

closes the ARIMA Model Specification window and fits the model.

Cancel

closes the ARIMA Model Specification window without fitting the model. Any options you specified are lost.

Reset

resets all options to their initial values upon entry to the ARIMA Model Specification window. This might be useful when editing an existing model specification; otherwise, Reset has the same function as Clear.

Clear

resets all options to their default values.

Add

opens a menu of types of predictors to add to the Predictors list.

Delete

deletes the selected (highlighted) entry from the Predictors list.

Edit

edits the selected (highlighted) entry in the Predictors list.

Mouse Button Actions

You can select or deselect entries in the Predictors list by clicking them. The selected (highlighted) predictor effect is acted on by the Delete and Edit buttons. Double-clicking on a predictor in the list invokes an appropriate edit action for that predictor.

If you right-click an entry in the Predictors list, the system displays the following menu of actions that encompass the features of the Add, Delete, and Edit buttons.

Add Linear Trend

adds a Linear Trend item to the Predictors list.

Add Trend Curve

opens a menu of different time trend curves and adds the curve you select to the Predictors list. Certain trend curve specifications also set the Transformation field.

Add Regressors

opens the Regressors Selection window to enable you to select other series in the input data set as regressors to predict the dependent series and add them to the Predictors list.

Add Adjustments

opens the Adjustments Selection window to enable you to select other series in the input data set for use as adjustments to the forecasts and add them to the Predictors list.

Add Dynamic Regressor

opens the Dynamic Regressor Selection window to enable you to select a series in the input data set as a predictor of the dependent series and also specify a transfer function model for the effect of the predictor series.

Add Interventions

opens the Interventions for Series window to enable you to define and select intervention effects and add them to the Predictors list.

Add Seasonal Dummies

adds a Seasonal Dummies predictor item to the Predictors list.

Edit Predictor

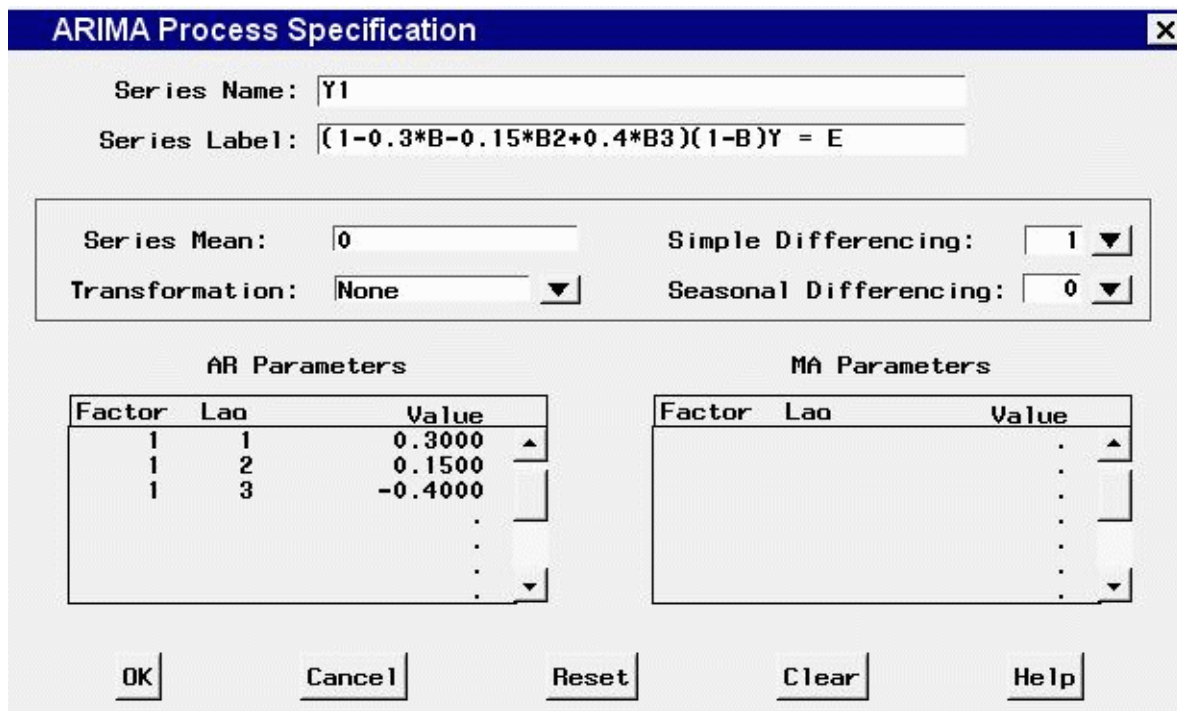

edits the selected (highlighted) entry in the Predictors list.

Delete Predictors

deletes the selected (highlighted) entry from the Predictors list.

ARIMA Process Specification Window

Use the ARIMA Process Specification window to define ARIMA processes for simulation. Invoke this window from the Add Series button in the Time Series Simulation window.

The dialog box is titled "ARIMA Process Specification". It contains the following fields and controls:

- Series Name:** Y1
- Series Label:** $(1-0.3*B-0.15*B^2+0.4*B^3)(1-B)Y = E$
- Series Mean:** 0
- Transformation:** None (dropdown menu)
- Simple Differencing:** 1 (dropdown menu)
- Seasonal Differencing:** 0 (dropdown menu)
- AR Parameters Table:**

Factor	Lag	Value
1	1	0.3000
1	2	0.1500
1	3	-0.4000
		.
		.
		.
- MA Parameters Table:**

Factor	Lag	Value
		.
		.
		.
		.
		.
- Buttons:** OK, Cancel, Reset, Clear, Help

Controls and Fields

Series Name

is the variable name for the series to be simulated.

Series Label

is the variable label for the series to be simulated.

Series Mean

is the mean of the simulated series.

Transformation

defines the series transformation.

Simple Differencing

is the order of simple differencing for the series.

Seasonal Differencing

is the order of seasonal differencing for the series.

AR Parameters

is a table of autoregressive terms for the simulated ARIMA process. Enter a value for Factor, Lag, and Value for each term of the AR part of the process you want to simulate. For a non-factored AR model, make the Factor values the same for all terms. For a factored AR model, use different Factor values to group the terms into the factors.

MA Parameters

is a table of moving-average terms for the simulated ARIMA process. Enter a value for Factor, Lag, and Value for each term of the MA part of the process you want to simulate. For a non-factored MA model, make the Factor values the same for all terms. For a factored MA model, use different Factor values to group the terms into the factors.

OK

closes the ARIMA Process Specification window and adds the specified process to the Series to Generate list in the Time Series Simulation window.

Cancel

closes the window without adding to the Series to Generate list. Any options you specified are lost.

Reset

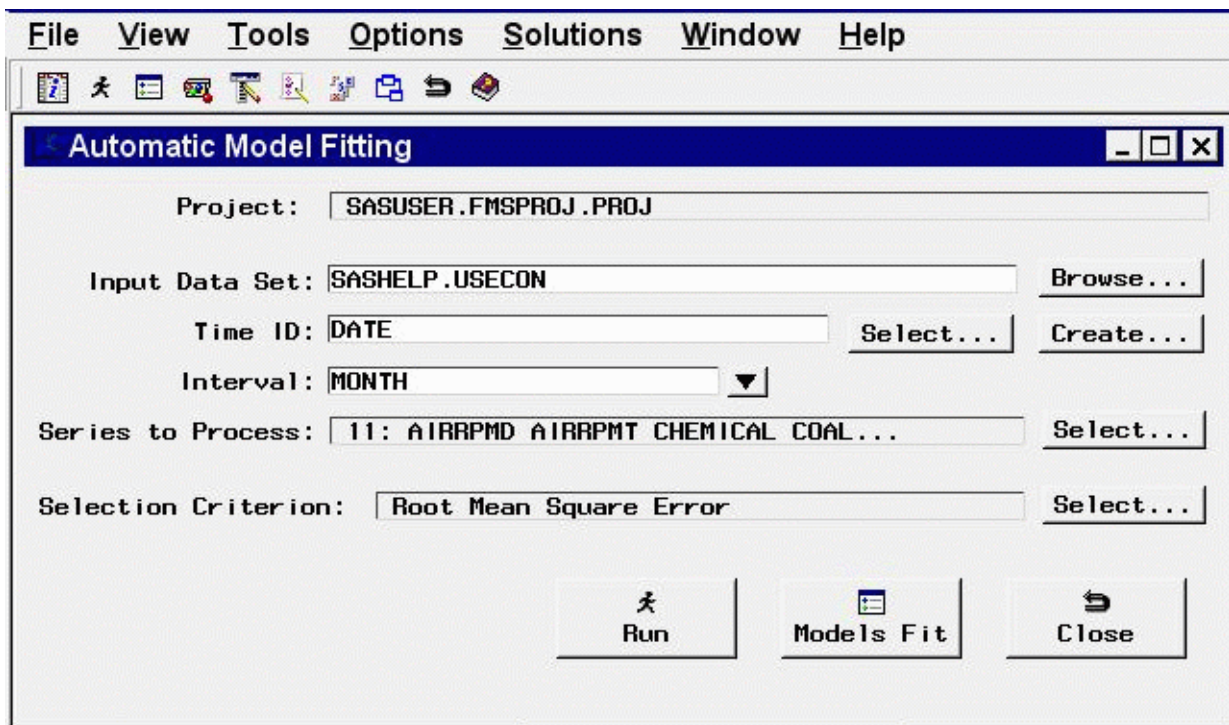

resets all the fields to their initial values upon entry to the window.

Clear

resets all the fields to their default values.

Automatic Model Fitting Window

Use the Automatic Model Fitting window to perform automatic model selection on all series or selected series in an input data set. Invoke this window by using the Fit Models Automatically button on the Time Series Forecasting window. Note that you can also perform automatic model fitting, one series at a time, from the Develop Models window.

Controls and Fields

Project

the name of the SAS catalog entry in which the results of the model search process are stored.

Input Data Set

is the name of the current input data set. You can type in a one-level or two-level data set name here.

Browse button

opens the Data Set Selection window for selecting an input data set.

Time ID

is the name of the ID variable for the input data set. You can type in the variable name here or use the Select or Create button.

time ID Select button

opens the Time ID Variable Specification window.

time ID Create button

opens a menu of choices of methods for creating a time ID variable for the input data set. Use this feature if the input data set does not already contain a valid time ID variable.

Interval

is the time interval between observations (data frequency) in the current input data set. You can type in an interval name or select one by using the combo box pop-up menu.

Series to Process

indicates the number and names of time series variables for which forecasting model selection will be applied.

Series to Process Select button

opens the Series to Process window to let you select the series for which you want to fit models.

Selection Criterion

shows the goodness-of-fit statistic that will be used to determine the best fitting model for each series.

Selection Criterion Select button

opens the Model Selection Criterion window to enable you to select the goodness-of-fit statistic that will be used to determine the best fitting model for each series.

Run button

begins the automatic model fitting process.

Models Fit button

opens the Automatic Model Fitting Results window to display the models fit during the current invocation of the Automatic Model Fitting window. The results appear automatically when model fitting is complete, but this button enables you to redisplay the results window.

Close button

Closes the Automatic Model Fitting window.

Menu Bar

File**Import Data**

is available if you license SAS/Access software. It opens an Import Wizard, which you can use to import your data from an external spreadsheet or data base to a SAS data set for use in the Time Series Forecasting System.

Export Data

is available if you license SAS/Access software. It opens an Export Wizard, which you can use to export a SAS data set, such as a forecast data set created with the Time Series Forecasting System, to an external spreadsheet or data base.

Print Setup

opens the Print Setup window, which allows you to access your operating system print setup.

Close

closes the Automatic Model Fitting window.

View**Input Data Set**

opens a Viewtable window to browse the current input data set.

Models Fit

opens Automatic Model Fitting Results window to show the forecasting models fit during the current invocation of the Automatic Model Fitting window. This is the same as the Models Fit button.

Tools**Fit Models**

performs the automatic model selection process for the selected series. This is the same as the Run button.

Options**Default Time Ranges**

opens the Default Time Ranges window to enable you to control how the system sets the time ranges for series.

Model Selection List

opens the Model Selection List editor window. Use this action to control the forecasting models considered by the automatic model selection process and displayed in the Models to Fit window.

Model Selection Criterion

opens the Model Selection Criterion window, which presents a list of goodness-of-fit statistics and enables you to select the fit statistic that is displayed in the table and used by the automatic model selection process to determine the best fitting model. This action is the same as the Selection Criterion Select button.

Statistics of Fit

opens the Statistics of Fit Selection window, which presents a list of statistics that the system can display. Use this action to customize the list of statistics shown in the Statistics of Fit table and available for selection in the Model Selection Criterion menu.

Forecast Options

opens the Forecast Options window, which enables you to control the widths of forecast confidence limits and control the kind of predicted values computed for models that include series transformations.

Forecast Data Set

see Produce Forecasts window.

Alignment of Dates**Beginning**

aligns dates that the system generates to identify forecast observations in output data sets to the beginning of the time intervals.

Middle

aligns dates that the system generates to identify forecast observations in output data sets to the midpoints of the time intervals.

End

aligns dates that the system generates to identify forecast observations in output data sets to the end of the time intervals.

Automatic Fit

opens the Automatic Model Selection Options window, which enables you to control the number of models retained by the automatic model selection process and whether the models considered for automatic selection are subset according to the series diagnostics.

Tool Bar Type**Image Only**

displays the toolbar items as icons without text.

Label Only

displays the toolbar items as text without icon images.

Both

displays the toolbar items with both text and icon images.

Include Interventions

controls whether intervention effects defined for the current series are automatically added as predictors to the models considered by the automatic selection process. A check mark or filled check box next to this item indicates that the option is turned on.

Print Audit Trail

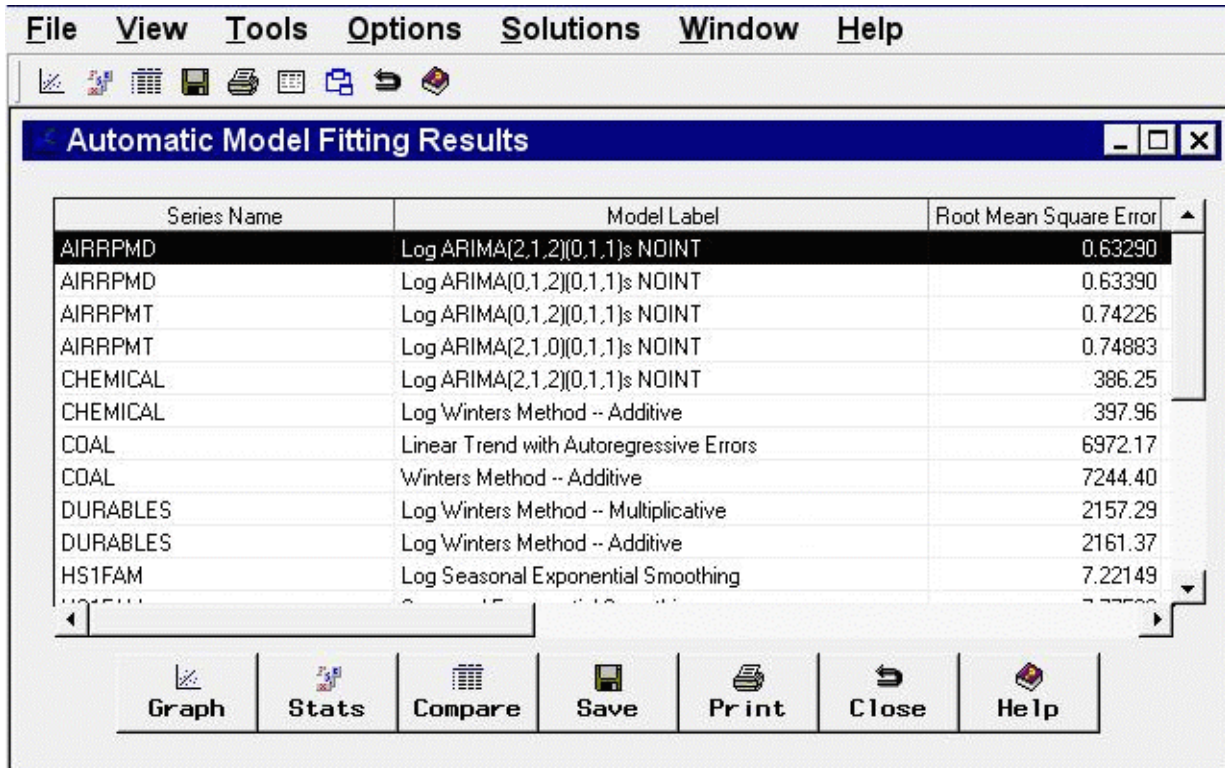

prints to the SAS log information about the models fit by the system. A check mark or filled check box next to this item indicates that the audit option is turned on.

Show Source Statements

controls whether SAS statements submitted by the forecasting system are printed in the SAS log. When the Show Source Statements option is selected, the system sets the SAS system option SOURCE before submitting SAS statements; otherwise, the system uses the NOSOURCE option. Note that only some of the functions performed by the forecasting system are accomplished by submitting SAS statements. A check mark or filled check box next to this item indicates that the option is turned on.

Automatic Model Fitting Results Window

This resizable window displays the models fit by the most recent invocation of the Automatic Model Fitting window. It appears automatically after Automatic Model Fitting runs, and can be opened repeatedly from that window by using the Models Fit button or by selecting Models Fit from the View menu. Once you exit the Automatic Model Fitting window, the Automatic Model Fitting Results window cannot be opened again until you fit additional models by using Automatic Model Fitting.

Series Name	Model Label	Root Mean Square Error
AIRRPM	Log ARIMA(2,1,2)(0,1,1)s NOINT	0.63290
AIRRPM	Log ARIMA(0,1,2)(0,1,1)s NOINT	0.63390
AIRRPM	Log ARIMA(0,1,2)(0,1,1)s NOINT	0.74226
AIRRPM	Log ARIMA(2,1,0)(0,1,1)s NOINT	0.74883
CHEMICAL	Log ARIMA(2,1,2)(0,1,1)s NOINT	386.25
CHEMICAL	Log Winters Method -- Additive	397.96
COAL	Linear Trend with Autoregressive Errors	6972.17
COAL	Winters Method -- Additive	7244.40
DURABLES	Log Winters Method -- Multiplicative	2157.29
DURABLES	Log Winters Method -- Additive	2161.37
HS1FAM	Log Seasonal Exponential Smoothing	7.22149

Table Contents The results table displays the series name in the first column and the model label in the second column. If you have chosen to retain more than one model by using the Automatic Model Selection Options window, more than one row appears in the table for each series; that is, there is a row for each model fit. If you have already fit models to the same series before invoking the Automatic Model Fitting window, those models do not appear here, since the Automatic Model Fitting Results window is intended to show the results of the current operation of Automatic Model Fitting. To see all models that have been fit, use the Manage Projects window.

The third column of the table shows the values of the current model selection criterion statistic. Additional columns show the values of other fit statistics. The set of statistics shown are selectable by using the Statistics of Fit Selection window.

The table can be sorted by any column other than Series Name by clicking on the column heading.

Controls and Fields

Graph

opens the Model Viewer window on the model currently selected in the table.

Stats

opens the Statistics of Fit Selection window. This controls the set of goodness-of-fit statistics displayed in the table and in other parts of the Time Series Forecasting System.

Compare

opens the Model Fit Comparison window for the series currently selected in the table. This button is unavailable if the currently selected row in the table represents a series for which fewer than two models have been fit.

Save

opens an output data set dialog, enabling you to specify a SAS data set to which the contents of the table is saved. Note that this operation saves what you see in the table. If you want to save the models themselves for use in a future session, use the Manage Projects window.

Print

prints the contents of the table.

Close

closes the window and returns to the Automatic Model Fitting window.

Menu Bar

File

Save

opens an output data set dialog, enabling you to specify a SAS data set to which the contents of the table is saved. This is the same as the Save button.

Print

prints the contents of the table. This is the same as the Print button.

Import Data

is available if you license SAS/Access software. It opens an Import Wizard, which you can use to import your data from an external spreadsheet or data base to a SAS data set for use in the Time Series Forecasting System.

Export Data

is available if you license SAS/Access software. It opens an Export Wizard, which you can use to export a SAS data set, such as a forecast data set created with the Time Series Forecasting System, to an external spreadsheet or data base.

Print Setup

opens the Print Setup window, which allows you to access your operating system print setup.

Close

closes the window and returns to the Automatic Model Fitting window.

View

Model Predictions

opens the Model Viewer to display a predicted and actual plot for the currently highlighted model.

Prediction Errors

opens the Model Viewer to display the prediction errors for the currently highlighted model.

Prediction Error Autocorrelations

opens the Model Viewer to display the prediction error autocorrelations, partial autocorrelations, and inverse autocorrelations for the currently highlighted model.

Prediction Error Tests

opens the Model Viewer to display graphs of white noise and stationarity tests on the prediction errors of the currently highlighted model.

Parameter Estimates

opens the Model Viewer to display the parameter estimates table for the currently highlighted model.

Statistics of Fit

opens the Model Viewer window to display goodness-of-fit statistics for the currently highlighted model.

Forecast Graph

opens the Model Viewer to graph the forecasts for the currently highlighted model.

Forecast Table

opens the Model Viewer to display forecasts for the currently highlighted model in a table.

Tools

Compare Models

opens the Model Fit Comparison window to display fit statistics for selected pairs of forecasting models. This item is unavailable until you select a series in the table for which the automatic model fitting run selected two or more models.

Options

Statistics of Fit

opens the Statistics of Fit Selection window. This is the same as the Stats button.

Column Labels

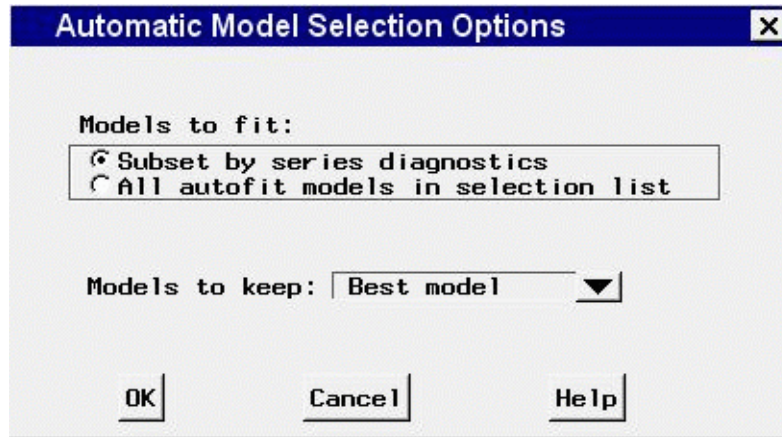

selects long or short column labels for the table. Long column labels are used by default.

ID Columns

freezes or unfreezes the series and model columns. By default they are frozen so that they remain visible when you scroll the table horizontally to view other columns.

Automatic Model Selection Options Window

Use the Automatic Model Selection Options window to control the automatic selection process. This window is available from the Automatic Fit item of the Options menu in the Develop Models window, Automatic Model Fitting window, and Produce Forecasts window.

Controls and Fields

Models to fit

Subset by series diagnostics

when selected, causes the automatic model selection process to search only over those models consistent with the series diagnostics.

All models in selection list

when selected, causes the automatic model selection process to search over all models in the search list, without regard for the series diagnostics.

Models to keep

specifies how many of the models tried by the automatic model selection process are retained and added to the model list for the series. You can specify the best fitting model only, the best n models, where n can be 1 through 9, or all models tried.

OK

closes the window and saves the automatic model selection options you specified.

Cancel

closes the window without changing the automatic model selection options.

Custom Model Specification Window

Use the Custom Model Specification window to specify and fit an ARIMA model with or without predictor effects as inputs. Access it from the Develop Models window, where it is invoked from the Fit Model item under the Edit menu, or from the pop-up menu when you click an empty area of the model table.

Controls and Fields

Series

is the name and variable label of the current series.

Model

is a descriptive label for the model that you specify. You can type a label in this field or allow the system to provide a label. If you leave the label blank, a label is generated automatically based on the options you specify.

Transformation

defines the series transformation for the model. When a transformation is specified, the model is fit to the transformed series, and forecasts are produced by applying the inverse transformation to the resulting forecasts. The following transformations are available:

Log

specifies a logarithmic transformation.

Logistic

specifies a logistic transformation.

Square Root

specifies a square root transformation.

Box-Cox

specifies a Box-Cox transform and opens a window to specify the Box-Cox λ parameter.

None

specifies no series transformation.

Trend Model

controls the model options to model and forecast the series trend. Select from the following:

Linear Trend

adds a Linear Trend item to the Predictors list.

Trend Curve

brings a menu of different time trend curves and adds the curve you select to the Predictors list.

First Difference

specifies differencing the series.

Second Difference

specifies second-order differencing of the series.

None

specifies no model for the series trend.

Seasonal Model

controls the model options to model and forecast the series seasonality. Select from the following:

Seasonal ARIMA

opens the Seasonal ARIMA Model Options window to enable you to specify an ARIMA model for the seasonal pattern in the series.

Seasonal Difference

specifies differencing the series at the seasonal lag.

Seasonal Dummy Regressors

adds a Seasonal Dummies predictor item to the Predictors list.

None

specifies no seasonal model.

Error Model

displays the current settings of the autoregressive and moving-average terms, if any, for modeling the prediction error autocorrelation pattern in the series.

Set button

opens the Error Model Options window to enable you to set the autoregressive and moving-average terms for modeling the prediction error autocorrelation pattern in the series.

Intercept

specifies whether a mean or intercept parameter is included in the model. By default, the Intercept option is set to No when the model includes differencing and set to Yes when there is no differencing.

Predictors

is a list of the predictor effects included as inputs in the model.

OK

closes the Custom Model Specification window and fits the model.

Cancel

closes the Custom Model Specification window without fitting the model. Any options you specified are lost.

Reset

resets all options to their initial values upon entry to the Custom Model Specification window. This might be useful when editing an existing model specification; otherwise, Reset has the same function as Clear.

Clear

resets all options to their default values.

Add

opens a menu of types of predictors to add to the Predictors list. Select from the following:

Linear Trend

adds a Linear Trend item to the Predictors list.

Trend Curve

opens a menu of different time trend curves and adds the curve you select to the Predictors list.

Regressors

opens the Regressors Selection window to enable you to select other series in the input data set as regressors to predict the dependent series and add them to the Predictors list.

Adjustments

opens the Adjustments Selection window to enable you to select other series in the input data set for use as adjustments to the forecasts and add them to the Predictors list.

Dynamic Regressor

opens the Dynamic Regressor Selection window to enable you to select a series in the input data set as a predictor of the dependent series and also specify a transfer function model for the effect of the predictor series.

Interventions

opens the Interventions for Series window to enable you to define and select intervention effects and add them to the Predictors list.

Seasonal Dummies

adds a Seasonal Dummies predictor item to the Predictors list. This is unavailable if the series interval is not one which has a seasonal cycle.

Delete

deletes the selected (highlighted) entry from the Predictors list.

Edit

edits the selected (highlighted) entry in the Predictors list.

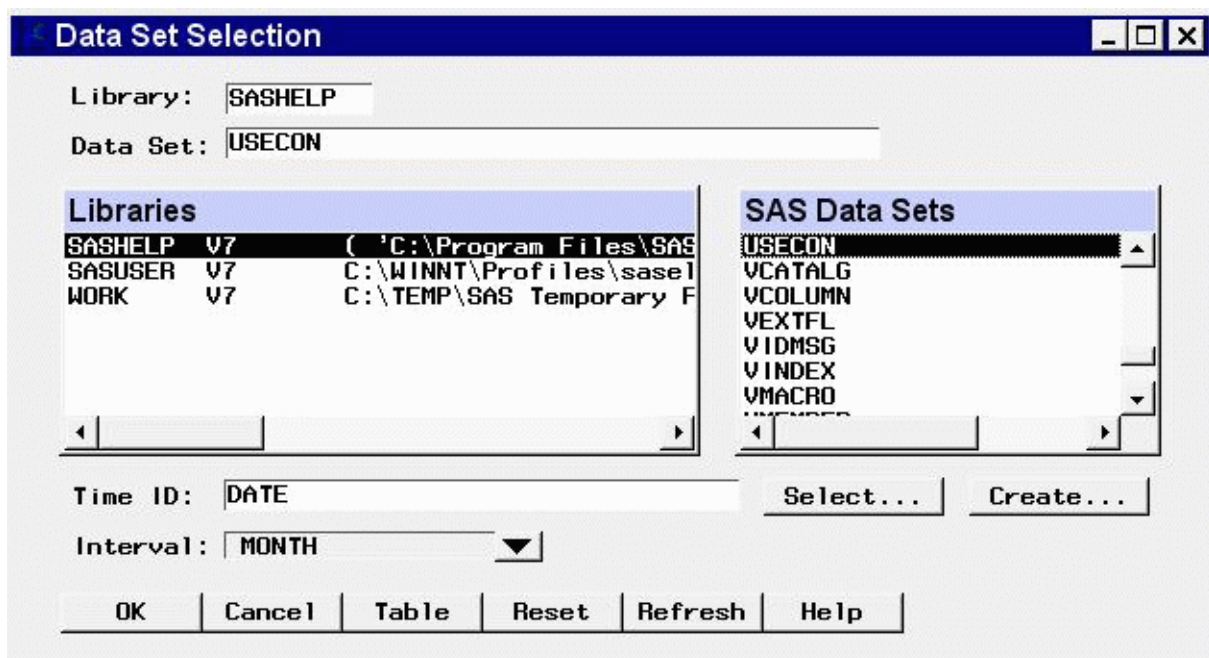

Mouse Button Actions

You can select or deselect entries in the Predictors list by clicking them. The selected (highlighted) predictor effect is acted on by the Delete and Edit buttons. Double-clicking on a predictor in the list invokes an appropriate edit action for that predictor.

If you right-click an entry in the Predictors list and press the right mouse button, the system displays a menu of actions that encompass the features of the Add, Delete, and Edit buttons.

Data Set Selection Window

Use this resizable window to select a data set to process by specifying a library and a SAS data set or view. These selections can be made by typing, by selecting from lists, or by a combination of the two. In addition, you can control the time ID variable and time interval, and you can browse the data set.

Access this window by using the Browse button to the right of the Data Set field in the Time Series Forecasting, Automatic Model Fitting, and Produce Forecasts windows. It functions in the same way as the Series Selection window, except that it does not allow you to select or view a time series variable.

Controls and Fields

Library

is a SAS libname assigned within the current SAS session. If you know the libname associated with the data set of interest, you can type it in this field. If it is a valid choice, it will appear in the libraries

list and will be highlighted. The SAS Data Sets list will be populated with data sets associated with that libname. See also Libraries under Selection Lists.

Data Set

is the name of a SAS data set (data file or data view) that resides under the selected libname. If you know the name, you can type it in and press Return. If it is a valid choice, it will appear in the SAS Data Sets list and will be highlighted.

Time ID

is the name of the ID variable for the selected input data set. To specify the ID variable, you can type the ID variable name in this field or select the control arrows to the right of the field.

Time ID `Select` button

opens the Time ID Variable Specification window.

Time ID `Create` button

opens a menu of methods for creating a time ID variable for the input data set. Use this feature if the data set does not already contain a valid time ID variable.

Interval

is the time interval between observations (data frequency) in the selected data set. If the interval is not automatically identified by the system, you can type in the interval name or select it from a list by clicking the combo box arrow. For more information about intervals, see Chapter 4, “[Date Intervals, Formats, and Functions](#),” in this book.

OK

closes the Data Set Selection window and makes the selected data set the current input data set.

Cancel

closes the window without applying any selections made.

Table

opens a Viewtable window for browsing the selected data set.

Reset

resets the fields to their initial values upon entry to the window.

Refresh

updates all fields and lists in the window. If you assign a new libname without exiting the Data Set Selection window, use the refresh action to update the Libraries list so that it will include the newly assigned libname.

Selection Lists

Libraries

displays a list of currently assigned libnames. You can select a libname by clicking it with the left mouse button, which is equivalent to typing its name in the Library field.

If you cannot locate the library or directory you are interested in, go to the SAS Explorer window, select “New” from the File menu, then select “Library” and “OK.” This opens the New Library window. You also assign a libname by submitting a libname statement from the Editor window. Select the Refresh button to make the new libname available in the libraries list.

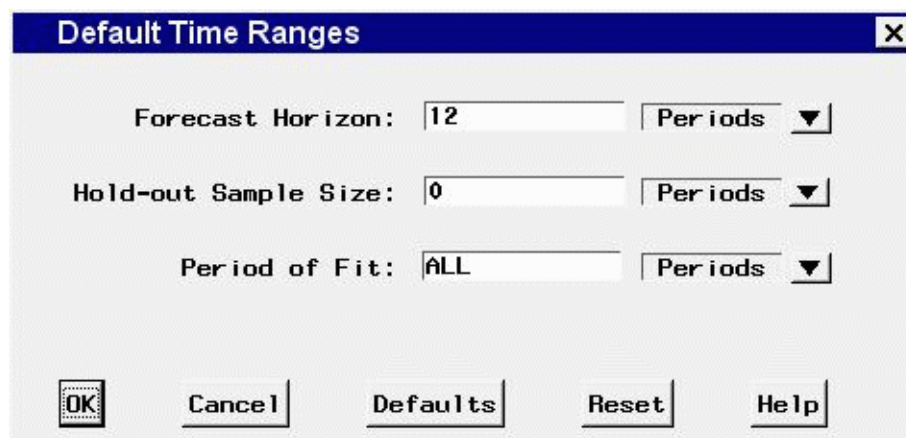

SAS Data Sets

displays a list of the SAS data sets (data files or data views) contained in the selected library. You can

select one of these by clicking with the left mouse button, which is equivalent to typing its name in the Data set field. You can double-click a data set name to select it and exit the window.

Default Time Ranges Window

Use the Default Time Ranges window to control how the period of fit and evaluation and the forecasting horizon are determined for each series when you do not explicitly set these ranges for a particular series. Invoke this window from the Options menu of the Develop Models, Automatic Model Fitting, Produce Forecasts, and Manage Forecasting Project windows. The settings you make in this window affect subsequently selected series; they do not alter the time ranges of series you have already selected.

Controls and Fields

Forecast Horizon

specifies the forecast horizon as either a number of periods or years from the last nonmissing data value or as a fixed date. You can type a number or date value in this field. Date value must be entered in a form recognized by a SAS date informat. (See *SAS Language Reference: Concepts* for information about SAS date informats.)

Forecast Horizon Units

indicates whether the value in the forecast horizon field represents periods or years or a date. Click the arrow and select one from the pop-up list.

Hold-out Sample Size

specifies that a number of observations, number of years, or percent of the data at the end of the data range be used for the period of evaluation with the remainder of data used as the period of fit.

Hold-out Sample Size Units

indicates whether the hold-out sample size represents periods or years or percent of data range.

Period of Fit

specifies how much of the data range for a series is to be used as the period of fit for models fit to the series. ALL indicates that all the available data is used. You can specify a number of periods, number

of years, or a fixed date, depending on the value of the units field to the right. When you specify a date, the start of the period of fit is the specified date or the first nonmissing series value, whichever is more recent. Date value must be entered in a form recognized by a SAS date informat. (See *SAS Language Reference: Concepts* for information about SAS date informats.) When you specify the number of periods or years, the start of the period of fit is computed as the date that number of periods or years from the end of the data.

Period of Fit Units

indicates whether the period-of-fit value represents periods or years or a date.

OK

closes the window and stores the specified changes.

Cancel

closes the window without saving changes. Any options you specified are lost.

Defaults

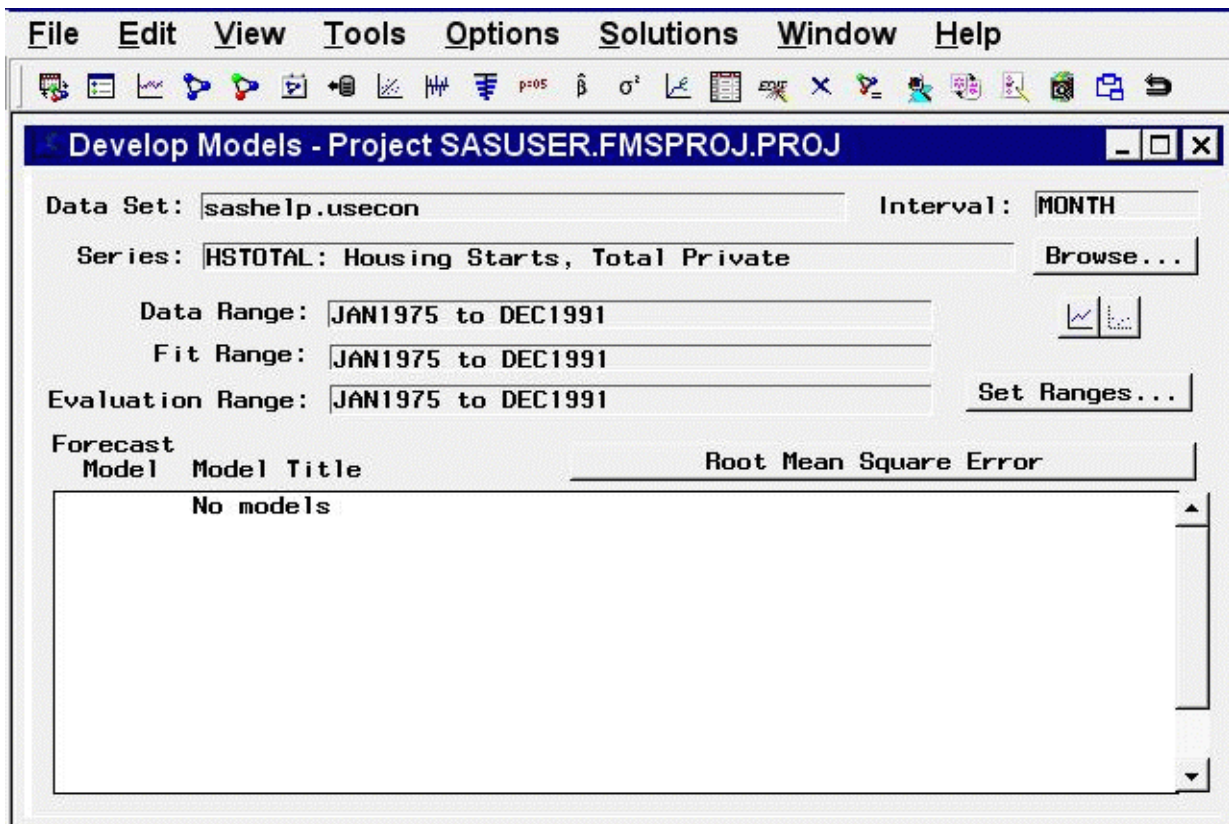

resets all options to their default values.

Reset

resets the options to their initial values upon entry to the window.

Develop Models Window

This resizable window provides access to all of the Forecasting System's interactive model fitting and graphical tools. Use it to fit forecasting models to an individual time series and choose the best model to use to produce the final forecasts of the series. Invoke this window by using the Develop Models button on the Time Series Forecasting window.

Controls and Fields

Data Set

is the name of the current input data set.

Interval

is the time interval (data frequency) for the input data set.

Series

is the variable name and label of the current time series.

Browse button

opens the Series Selection window to enable you to change the current input data set or series.

Data Range

is the date of the first and last nonmissing data values available for the current series in the input data set.

Fit Range

is the current period of fit setting. This is the range of data that will be used to fit models to the series.

Evaluation Range

is the current period of evaluation setting. This is the range of data that will be used to calculate the goodness-of-fit statistics for models fit to the series.

Set Ranges button

opens the Time Ranges Specification window to enable you to change the fit range or evaluation range. Note: A new fit range is applied when new models are fit or when existing models are refit. A new

evaluation range is applied when new models are fit or when existing models are refit or reevaluated. Changing the ranges does not automatically refit or reevaluate any models in the table: Use the Refit Models or Reevaluate Models items under the Edit menu.

View Series Graphically icon

opens the Time Series Viewer window to display plots of the current series.

View Selected Model Graphically icon

opens the Model Viewer to display graphs and tables for the currently highlighted model.

Forecast Model

is the column of the model table that contains check boxes to select which model is used to produce the final forecasts for the current series.

Model Title

is the column of the model table that contains the descriptive labels of the forecasting models fit to the current series.

Root Mean Square Error (or other statistic name) button

is the button above the right side of the table. It displays the name of the current model selection criterion: a statistic that measures how well each model in the table fits the values of the current series for observations within the evaluation range. Clicking this button opens the Model Selection Criterion window to let you to select a different statistic. When you select a statistic, the model table the Develop Models window is updated to show current values of that statistic.

Menu Bar

File

New Project

opens a dialog that lets you create a new project, assign it a name and description, and make it the active project.

Open Project

opens a dialog that lets you select and load a previously saved project.

Save Project

saves the current state of the system (including all the models fit to a series) to the current project catalog entry.

Save Project as

saves the current state of the system with a prompt for the name of the catalog entry in which to store the information.

Clear Project

clears the system, deleting all the models for all series.

Save Forecast

writes forecasts from the currently highlighted model to an output data set.

Save Forecast As

prompts for an output data set name and saves the forecasts from the currently highlighted model.

Output Forecast Data Set

opens a dialog for specifying the default data set used when you select “Save Forecast.”

Import Data

is available if you license SAS/Access software. It opens an Import Wizard, which you can use to import your data from an external spreadsheet or data base to a SAS data set for use in the Time Series Forecasting System.

Export Data

is available if you license SAS/Access software. It opens an Export Wizard, which you can use to export a SAS data set, such as a forecast data set created with the Time Series Forecasting System, to an external spreadsheet or data base.

Print Setup

opens the Print Setup window, which enables you to access your operating system print setup.

Close

closes the Develop Models window and returns to the main window.

Edit**Fit Model****Automatic Fit**

invokes the automatic model selection process.

Select From List

opens the Models to Fit window.

Smoothing Model

opens the Smoothing Model Specification window.

ARIMA Model

opens the ARIMA Model Specification window.

Custom Model

opens the Custom Model Specification window.

Combine Forecasts

opens the Forecast Combination Model Specification window.

External Forecasts

opens the External Forecast Model Specification window.

Edit Model

enables you to modify the specification of the currently highlighted model in the table and fit the modified model. The new model replaces the current model in the table.

Delete Model

deletes the currently highlighted model from the model table.

Refit Models**All Models**

refits all models in the table by using data within the current fit range.

Selected Model

refits the currently highlighted model by using data within the current fit range.

Reevaluate Models

All Models

recomputes statistics of fit for all models in the table by using data within the current evaluation range.

Selected Model

recomputes statistics of fit for the currently highlighted model by using data within the current evaluation range.

View

Project

opens the Manage Forecasting Project window.

Data Set

opens a Viewtable window to display the current input data set.

Series

opens the Time Series Viewer window to display plots of the current series. This is the same as the View Series Graphically icon.

Model Predictions

opens the Model Viewer to display a predicted versus actual plot for the currently highlighted model. This is the same as the View Selected Model Graphically icon.

Prediction Errors

opens the Model Viewer to display the prediction errors for the currently highlighted model.

Prediction Error Autocorrelations

opens the Model Viewer to display the prediction error autocorrelations, partial autocorrelations, and inverse autocorrelations for the currently highlighted model.

Prediction Error Tests

opens the Model Viewer to display graphs of white noise and stationarity tests on the prediction errors of the currently highlighted model.

Parameter Estimates

opens the Model Viewer to display the parameter estimates table for the currently highlighted model.

Statistics of Fit

opens the Model Viewer window to display goodness-of-fit statistics for the currently highlighted model.

Forecast Graph

opens the Model Viewer to graph the forecasts for the currently highlighted model.

Forecast Table

opens the Model Viewer to display forecasts for the currently highlighted model in a table.

Tools

Diagnose Series

opens the Series Diagnostics window to determine the kinds of forecasting models appropriate for the current series.

Define Interventions

opens the Interventions for Series window to enable you to edit or add intervention effects for use in modeling the current series.

Sort Models

sorts the models in the table by the values of the currently displayed fit statistic.

Compare Models

opens the Model Fit Comparison window to display fit statistics for selected pairs of forecasting models. This is unavailable if there are fewer than two models in the table.

Generate Data

opens the Time Series Simulation window. This window enables you to simulate ARIMA time series processes and is useful for educational exercises or testing the system.

Options

Time Ranges

opens the Time Ranges Specification window to enable you to change the fit and evaluation time ranges and the forecast horizon. This action is the same as the Set Ranges button.

Default Time Ranges

opens the Default Time Ranges window to enable you to control how the system sets the time ranges for series when you do not explicitly set time ranges with the Time Ranges Specification window. Settings made by using this window do not affect series you are already working with; they take effect when you select a new series.

Model Selection List

opens the Model Selection List editor window. Use this action to edit the set of forecasting models considered by the automatic model selection process and displayed by the Models to Fit window.

Model Selection Criterion

opens the Model Selection Criterion window, which presents a list of goodness-of-fit statistics and enables you to select the fit statistic that is displayed in the table and used by the automatic model selection process to determine the best fitting model. This action is the same as clicking the button above the table which displays the name of the current model selection criterion.

Statistics of Fit

opens the Statistics of Fit Selection window, which presents a list of statistics that the system can display. Use this action to customize the list of statistics shown in the Model Viewer, Automatic Model Fitting Results, and Model Fit Comparison windows and available for selection in the Model Selection Criterion menu.

Forecast Options

opens the Forecast Options window, which enables you to control the widths of forecast con-

fidence limits and control the kind of predicted values computed for models that include series transformations.

Alignment of Dates

Beginning

aligns dates that the system generates to identify forecast observations in output data sets to the beginning of the time intervals.

Middle

aligns dates that the system generates to identify forecast observations in output data sets to the midpoints of the time intervals.

End

aligns dates that the system generates to identify forecast observations in output data sets to the end of the time intervals.

Automatic Fit

opens the Automatic Model Selection Options window, which enables you to control the number of models retained by the automatic model selection process and whether the models considered for automatic selection are subset according to the series diagnostics.

Include Interventions

controls whether intervention effects defined for the current series are automatically added as predictors to the models considered by the automatic selection process and displayed by the Models to Fit window. When the Include Interventions option is selected, the series interventions are also automatically added to the predictors list when you specify a model in the ARIMA and Custom Models Specification windows. A check mark or filled check box next to this item indicates that the option is turned on.

Print Audit Trail

prints to the SAS log information about the models fit by the system. A check mark or filled check box next to this item indicates that the audit option is turned on.

Show Source Statements

Controls whether SAS statements submitted by the forecasting system are printed in the SAS log. When the Show Source Statements option is selected, the system sets the SAS system option SOURCE before submitting SAS statements; otherwise, the system uses the NOSOURCE option. Note that only some of the functions performed by the forecasting system are accomplished by submitting SAS statements. A check mark or filled check box next to this item indicates that the option is turned on.

Left Mouse Button Actions for the Model Table

When the cursor is over the description of a model in the table, the left mouse button selects (highlights) or deselects that model. On some computer systems, you can double-click to open the Model Viewer window for the selected model.

When the cursor is over an empty part of the model table, the left mouse button opens a menu of model fitting choices. These choices are the same as those in the Fit Model submenu of the Edit menu.

Right Mouse Button Actions for the Model Table

When a model in the table is selected, the right mouse opens a menu of actions that apply to the highlighted model. The actions available in this menu are as follows.

View Model

opens the Model Viewer for the selected model. This action is the same as the View Model Graphically icon.

View Parameter Estimates

opens the Model Viewer to display the parameter estimates table for the currently highlighted model. This is the same as the Parameter Estimates item in the View menu.

View Statistics of Fit

opens the Model Viewer to display a table of goodness-of-fit statistics for the currently highlighted model. This is the same as the Statistics of Fit item in the View menu.

Edit Model

enables you to modify the specification of the currently highlighted model in the table and fit the modified model. This is the same as the Edit Model item in the Edit menu.

Refit Model

refits the highlighted model by using data within the current fit range. This is the same as the Selected Model item under the Refit Models submenu of the Edit menu.

Reevaluate Model

reevaluates the highlighted model by using data within the evaluation fit range. This is the same as the Selected Model item under the Reevaluate Models submenu of the Edit menu.

Delete Model

deletes the currently highlighted model from the model table. This is the same as the Delete Model item under the Edit menu.

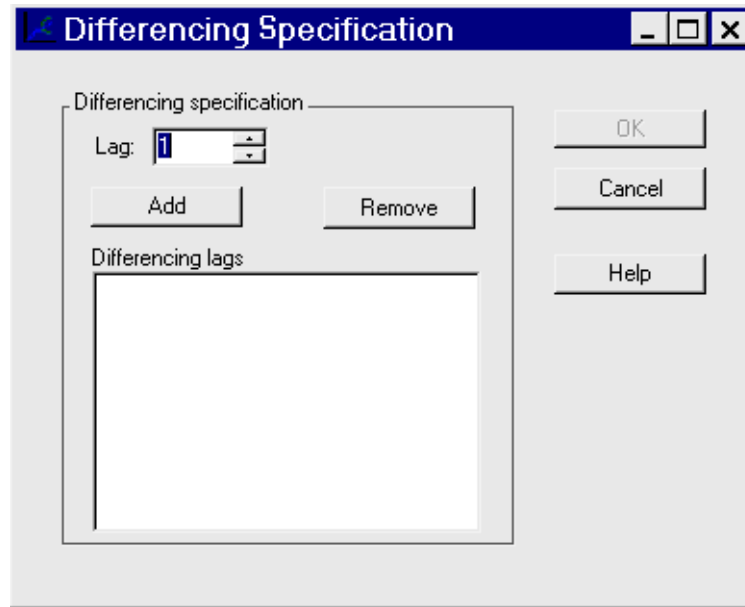

View Forecasts

opens the Model Viewer to display the forecasts for the currently highlighted model. This is the same as the Forecast Graph item under the View menu.

When the model list is empty or when no model is selected, the right mouse button opens the same menu of model fitting actions as the left mouse button.

Differencing Specification Window

Use the Differencing Specification window to specify the list of differencing lags $d=(lag, \dots, lag)$ in a factored ARIMA model. To specify a first difference, add the value 1 ($d=(1)$). To specify a second difference (difference twice at lag 1), add the value 1 again ($d=(1, 1)$). For first differencing at lags 1 and 12, use the values 1 and 12 ($d=(1, 12)$).

Controls and Fields

Lag

specifies a lag value to add to the list. Type in a positive integer or select one by clicking the spin box arrows. Duplicates are allowed.

Add

adds the value in the `Lag` spin box to the list of differencing lags.

Remove

deletes a selected lag from the list of differencing lags.

OK

closes the window and returns the specified list to the Factored ARIMA Model Specification window.

Cancel

closes the window and discards any lags added to the list.

Dynamic Regression Specification Window

Use the Dynamic Regression Specification window to specify a dynamic regression or transfer function model for the effect of the predictor variable. It is invoked from the Dynamic Regressors Selection window.

Dynamic Regression Specification

Series:

Input Model:

Input Transformations:

Transformation:

Lagging periods:

Order of Differencing:

Simple:

Seasonal:

Numerator Factors:

Simple Order:

Seasonal Order:

Denominator Factors:

Simple Order:

Seasonal Order:

Controls and Fields

Series

is the name and variable label of the current series.

Input Model

is a descriptive label for the dynamic regression model. You can type a label in this field or allow the system to provide the label. If you leave the label blank, a label is generated automatically based on the options you specify. When no options are specified, the label is the name and variable label of the predictor variable.

Input Transformation

displays the transformation specified for the predictor variable. When a transformation is specified, the transfer function model is fit to the transformed input variable.

Lagging periods

is the pure delay in the effect of the predictor, l .

Simple Order of Differencing

is the order of differencing, d . Set this field to 1 to use the changes in the predictor variable.

Seasonal Order of Differencing

is the order of seasonal differencing, D . Set this field to 1 to difference the predictor variable at the seasonal lags—for example, to use the year-over-year or week-over-week changes in the predictor variable.

Simple Order Numerator Factors

is the order of the numerator factor of the transfer function, p .

Seasonal Order Numerator Factors

is the order of the seasonal numerator factor of the transfer function, P .

Simple Order Denominator Factors

is the order of the denominator factor of the transfer function, q .

Seasonal Order Denominator Factors

is the order of the seasonal denominator factor of the transfer function, Q .

OK

closes the window and adds the dynamic regression model specified to the model predictors list.

Cancel

closes the window without adding the dynamic regression model. Any options you specified are lost.

Reset

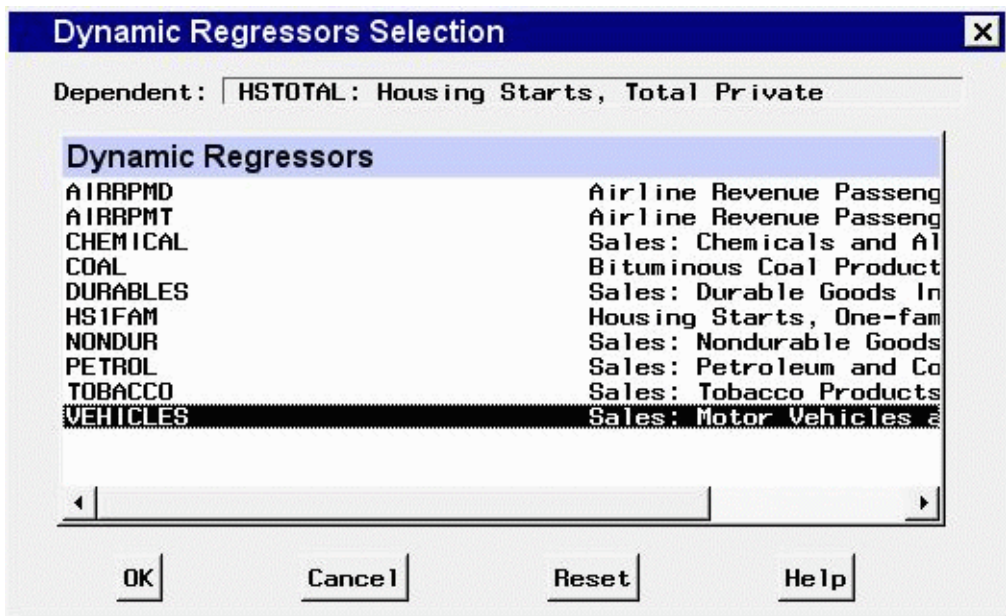

resets all options to their initial values upon entry to the window. This might be useful when editing a predictor specification; otherwise, Reset has the same function as Clear.

Clear

resets all options to their default values.

Dynamic Regressors Selection Window

Use the Dynamic Regressors Selection window to select an input variable as a dynamic regressor. Access this window from the pop-up menu which appears when you select the Add button of the ARIMA Model Specification window or Custom Model Specification window.

Controls and Fields

Dependent

is the name and variable label of the current series.

Dynamic Regressors

is a table listing the variables in the input data set. Select one variable in this list as the predictor series.

OK

opens the Dynamic Regression Specification window for you to specify the form of the dynamic regression for the selected predictor series, and then closes the Dynamic Regressors Selection window and adds the specified dynamic regression to the model predictors list.

Cancel

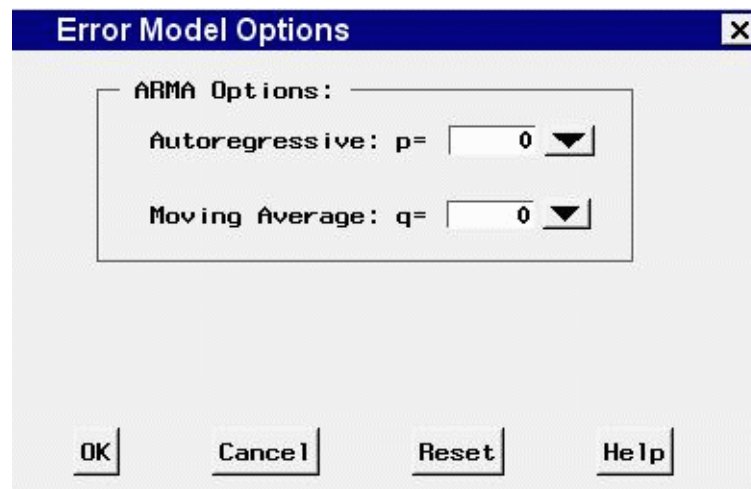

closes the window without adding the dynamic regression model. Any options you specified are lost.

Reset

resets all options to their initial values upon entry to the window.

Error Model Options Window

Use the Error Model Options window to specify the autoregressive and moving-average orders for the residual autocorrelation part of a model defined by using the Custom Model Specification window. Access it by using the Set button of that window.

Controls and Fields

ARIMA Options

Use these combo boxes to specify the orders of the ARIMA model. You can either type in a value or click the combo box arrow to select from a pop-up list.

Autoregressive

defines the order of the autoregressive part of the model.

Moving Average

defines the order of the moving-average term.

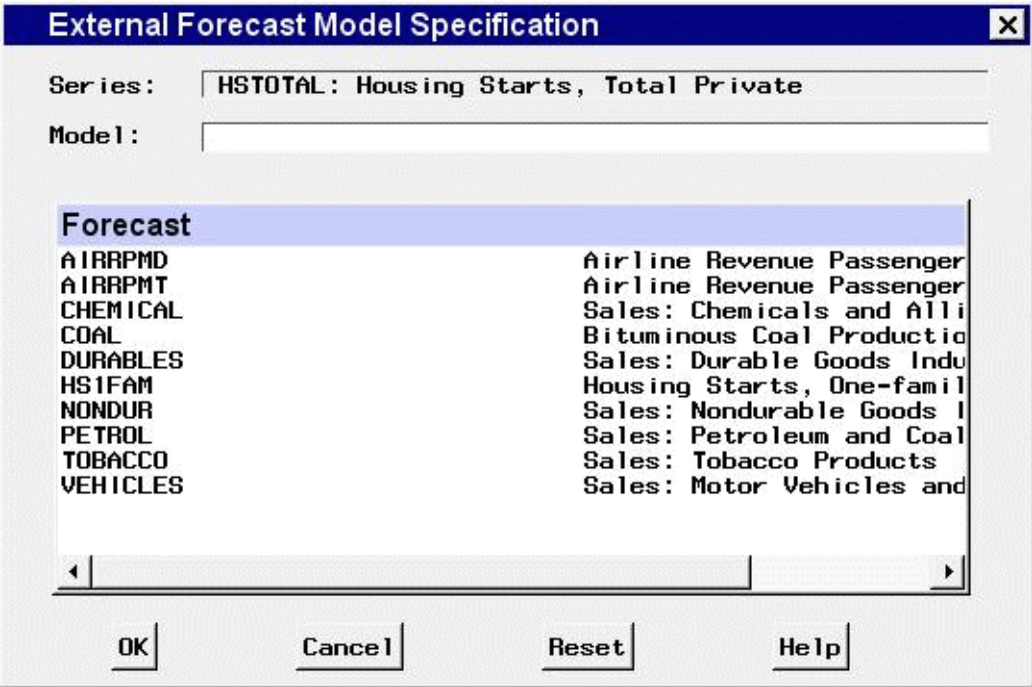

OK

closes the Error Model Options window and returns to the Custom Model Specification window.

- Cancel**
closes the Error Model Options window and returns to the Custom Model Specification window, discarding any changes made.
- Reset**
resets all options to their initial values upon entry to the window.

External Forecast Model Specification Window

Use the External Forecast Model Specification window to add to the current project forecasts produced externally to the Time Series Forecasting System. To add an external forecast, select a variable from the selection list and choose the OK button. The name of the selected variable will be added to the list of models fit, and the values of this variable will be used as the forecast. For more information, see “Incorporating Forecasts from Other Sources” in the “Specifying Forecasting Models” chapter.

Controls and Fields

- OK**
closes the window and adds the external forecast to the project.
- Cancel**
closes the window without adding an external forecast to the project.
- Reset**
deselects any selection made in the selection list.

Factored ARIMA Model Specification Window

Use the ARIMA Model Specification window to specify an ARIMA model by using the notation:

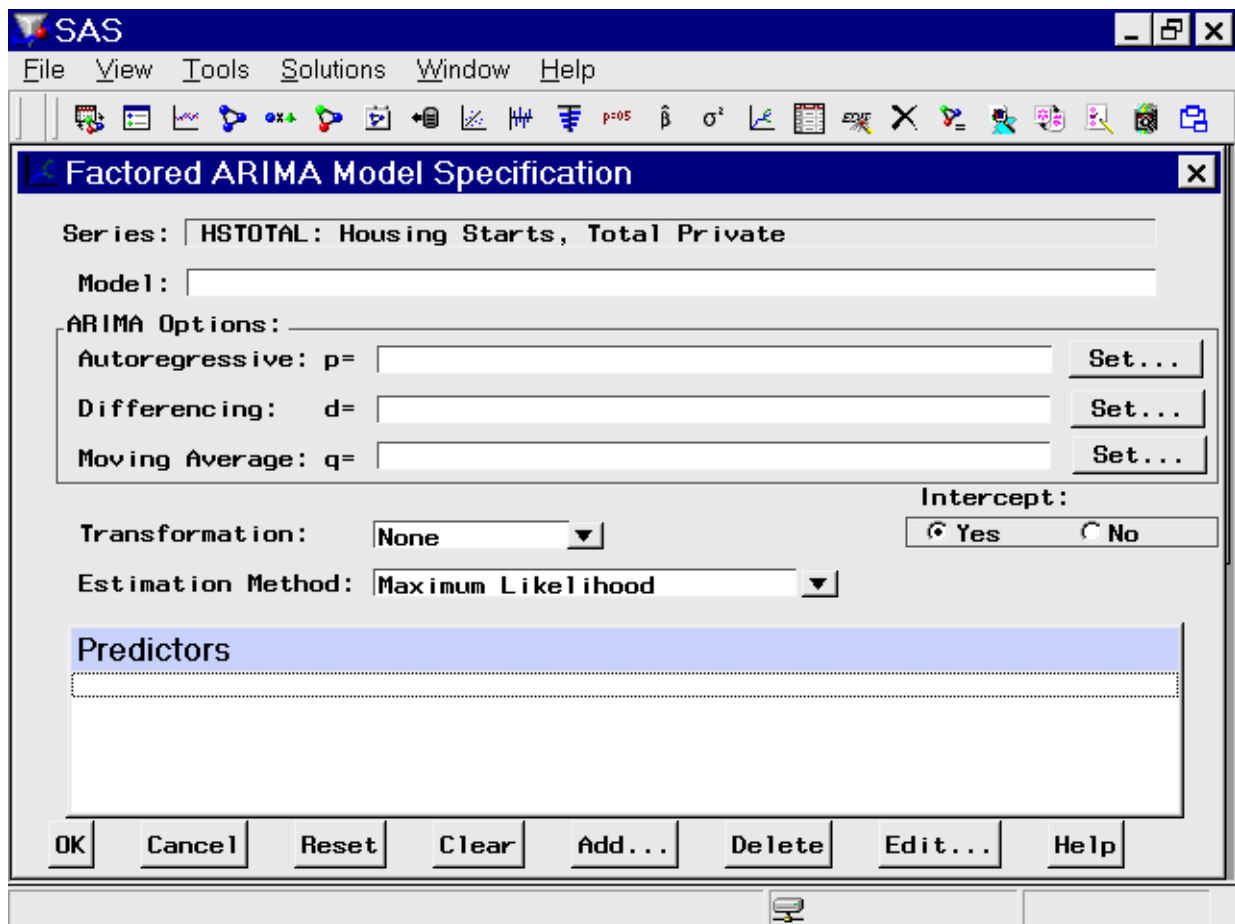

$$p = (\text{lag}, \dots, \text{lag}) \dots (\text{lag}, \dots, \text{lag})$$

$$d = (\text{lag}, \dots, \text{lag})$$

$$q = (\text{lag}, \dots, \text{lag}) \dots (\text{lag}, \dots, \text{lag})$$

where p , d , and q represent autoregressive, differencing, and moving-average terms, respectively.

Access it from the Develop Models menu, where it is invoked from the Fit Model item under Edit in the menu bar, or from the pop-up menu when you click an empty area of the model table.

The Factored ARIMA Model Specification window is identical to the ARIMA Model Specification window, except that the p , d , and q terms are specified in a more general and less limited way. Only those controls and fields that differ from the ARIMA Model Specification window are described here.

Controls and Fields

Model

is a descriptive label for the model. You can type a label in this field or allow the system to provide a label. If you leave the label blank, a label is generated automatically based on the p, d, and q terms that you specify. For example, if you specify $p=(1,2,3)$, $d=(1)$, $q=(12)$ and no intercept, the model label is `ARIMA p=(1,2,3) d=(1) q=(12) NOINT`. For monthly data, this is equivalent to the model `ARIMA(3,1,0)(0,0,1)s NOINT` as specified in the ARIMA Model Specification window or the Custom Model Specification window.

ARIMA Options

Specifies the ARIMA model in terms of the autoregressive lags (p), differencing lags (d), and moving-average lags (q).

Autoregressive

defines the autoregressive part of the model. Select the Set button to open the AR Polynomial Specification window, where you can add any set of autoregressive lags grouped into any number of factors.

Differencing

specifies differencing to be applied to the input data. Select the Set button to open the Differencing Specification window, where you can specify any set of differencing lags.

Moving Average

defines the moving-average part of the model. Select the Set button to open the MA Polynomial Specification window, where you can add any set of moving-average lags grouped into any number of factors.

Estimation Method

specifies the method used to estimate the model parameters. The Conditional Least Squares and Unconditional Least Squares methods generally require fewer computing resources and are more likely to succeed in fitting complex models. The Maximum Likelihood method requires more resources but provides a better fit in some cases. See also Estimation Details in Chapter 7, “[The ARIMA Procedure](#).”

Forecast Combination Model Specification Window

Use the Forecast Combination Model Specification window to produce forecasts by averaging the forecasts of two or more forecasting models. The specified combination of models is added to the model list for the series. Access this window from the Develop Models window whenever two or more models have been fit to the current series. It is invoked by selecting Combine Forecasts from the Fit Model submenu of the Edit menu, or from the pop-up menu which appears when you click an empty part of the model table.

Forecast Combination Model Specification

Series:

Model:

Weight	Model Description	Root Mean Square Error
.	Linear Trend	37.01371
.	Linear Trend with Autoregressive Errors	14.13055

Controls and Fields

Series

is the name and variable label of the current series.

Model

is a descriptive label for the model that you specify. You can type a label in this field or allow the system to provide a label. If you leave the label blank, a label is generated automatically based on the options you specify.

Weight

is a column of the forecasting model table that contains the weight values for each model. The forecasts for the combined model are computed as a weighted average of the predictions from the models in the table that use these weights. Models with missing weight values are not included in the forecast combination. You can type weight values in these fields or you can use other features of the window to set the weights.

Model Description

is a column of the forecasting model table that contains the descriptive labels of the forecasting models fit to the current series that are available for combination.

Root Mean Square Error (or other statistic name) button

is the button above the right side of the table. It displays the name of the current model selection criterion: a statistic that measures how well each model in the table fits the values of the current series for observations within the evaluation range. Clicking this button opens the Model Selection Criterion window to enable you to select a different statistic.

Normalize Weights button

replaces each nonmissing value in the Weights column with the current value divided by the sum of the weights. The resulting weights are proportional to original weights and sum to 1.

Fit Regression Weights button

computes weight values for the models in the table by regressing the series on the predictions from the models. The values in the Weights column are replaced by the estimated coefficients produced by this linear regression. If some weight values are nonmissing and some are missing, only models with nonmissing weight values are included in the regression. If all weights are missing, all models are used.

OK

closes the Forecast Combination Model Specification window and fits the model.

Cancel

closes the Forecast Combination Model Specification window without fitting the model. Any options you specified are lost.

Reset

resets all options to their initial values upon entry to the Forecast Combination Model Specification window. This might be useful when editing an existing model specification; otherwise, Reset has the same function as Clear.

Clear

resets all options to their default values.

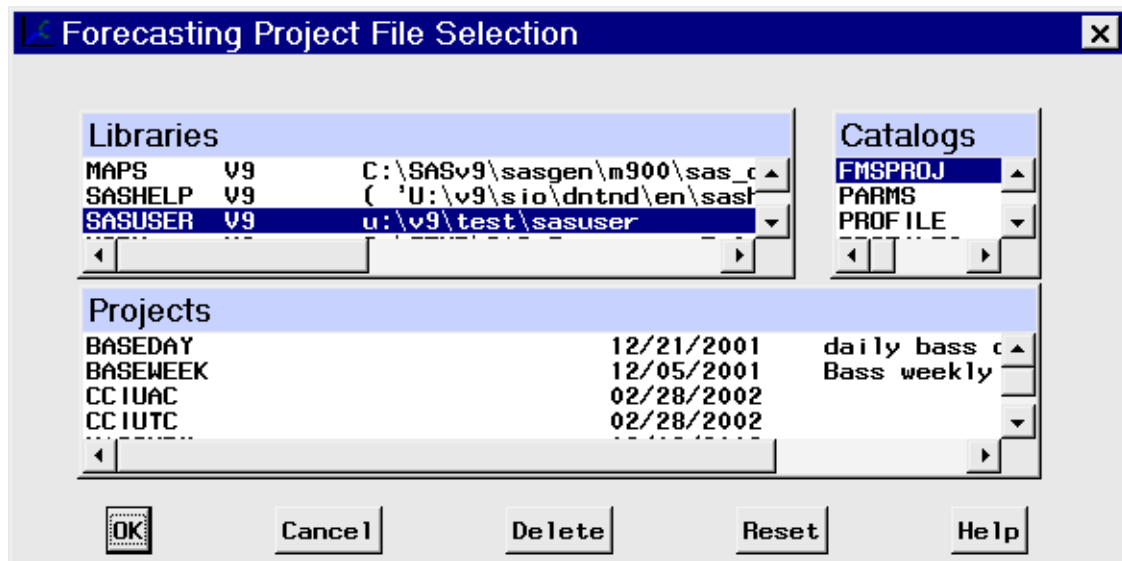

Mouse Button Actions

You can select or deselect models for inclusion in the combination model by positioning the mouse cursor over the model description and pressing the left mouse button. When you select a model in this way, the weights are automatically updated.

The newly selected model is given a weight equal to the average weight of the previously selected models, and all the nonmissing weights are normalized to sum to 1. When you use the mouse to remove a model from the combination, the weight of the deselected model is set to missing and the remaining nonmissing weights are normalized to sum to 1.

Forecasting Project File Selection Window

Use the Forecasting Project File Selection window to locate and load a previously stored forecasting project. Access it from the project Browse button of the Manage Forecasting Project window or the Time Series Forecasting window or from the Open Project item under the File menu of the Develop Models window.

Selection Lists

Libraries

is a list of currently assigned libraries. When you select a library from this list, the catalogs in that library are shown in the catalog selection list.

Catalogs

is a list of catalogs contained in the currently selected library. When you select a catalog from this list, any forecasting project entries stored in that catalog are shown in the projects selection list.

Projects

is a list of forecasting project entries contained in the currently selected catalog.

Controls and Fields

OK

closes the window and opens the selected project.

Cancel

closes the window without selecting a project.

Delete

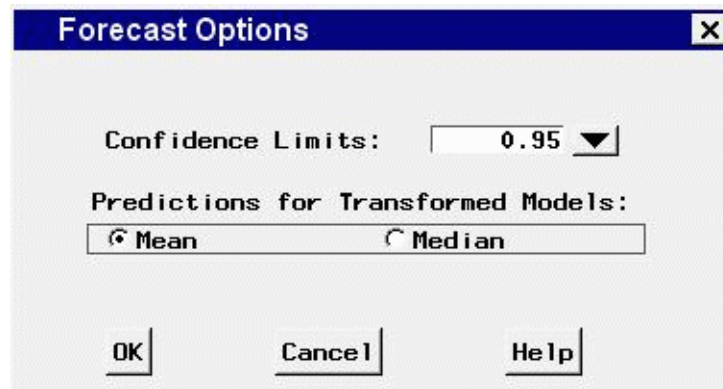

deletes the selected project file.

Reset

restores selections to those which were set before the window was opened.

Forecast Options Window

Use the Forecast Options window to set options to control how forecasts and confidence limits are computed. It is available from the Forecast Options item in the Options menu of the Develop Models window, Automatic Model Fitting window, Produce Forecasts, and Manage Projects windows.

Controls and Fields

Confidence Limits

specifies the size of the confidence limits for the forecast values. For example, a value of 0.95 specifies 95% confidence intervals. You can type in a number or select from the pop-up list.

Predictions for transformed models

controls how forecast values are computed for models that employ a series transformation. See the section [Predictions for Transformed Models](#) in Chapter 50, “Forecasting Process Details,” for more information. The values are as follows.

Mean

specifies that forecast values be predictions of the conditional mean of the series.

Median

specifies that forecast values be predictions of the conditional median of the series.

OK

closes the window and saves the option settings you specified.

Cancel

closes the window without changing the forecast options. Any options you specified are lost.

Intervention Specification Window

Use the Intervention Specification window to specify intervention effects to model the impact on the series of unusual events. Access it from the Intervention for Series window. For more information, see the section “Interventions” on page 2968.

Intervention Specification

Series:

Label:

Intervention Specification:

Date:

Type of Intervention:

☒ Point ☐ Step ☐ Ramp

Effect Time Window:

Number of lags: ▼

Effect Decay Pattern:

☒ None ☐ Exp ☐ Wave

DATE	HSTOTAL
JAN75	56.1000
FEB75	54.7000
MAR75	80.2000
APR75	97.9000
MAY75	116.1000
JUN75	110.3000
JUL75	119.3000

OK Cancel Reset Clear Help

Controls and Fields

Series

is the name and variable label of the current series.

Label

is a descriptive label for the intervention effect that you specify. You can type a label in this field or allow the system to provide the label. If you leave the label blank, a label is generated automatically based on the options you specify.

Date

is the date that the intervention occurs. You can type a date value in this field, or you can set the date by selecting a row of the data table on the right side of the window.

Type of Intervention

Point

specifies that the intervention variable is zero except for the specified date.

Step

specifies that the intervention variable is zero before the specified date and a constant 1.0 after the date.

Ramp

specifies that the intervention variable is an increasing linear function of time after the date of the intervention and zero before the intervention date.

Number of lags

specifies the numerator order for the transfer function model for the intervention effect. Select a value from the pop-up list.

Effect Decay Pattern

specifies the denominator order for the transfer function model for the intervention effect. The value “Exp” specifies a single lag denominator factor; the value “Wave” specifies a two-lag denominator factor.

OK

closes the window and adds the intervention effect specified to the series interventions list.

Cancel

closes the window without adding the intervention. Any options you specified are lost.

Reset

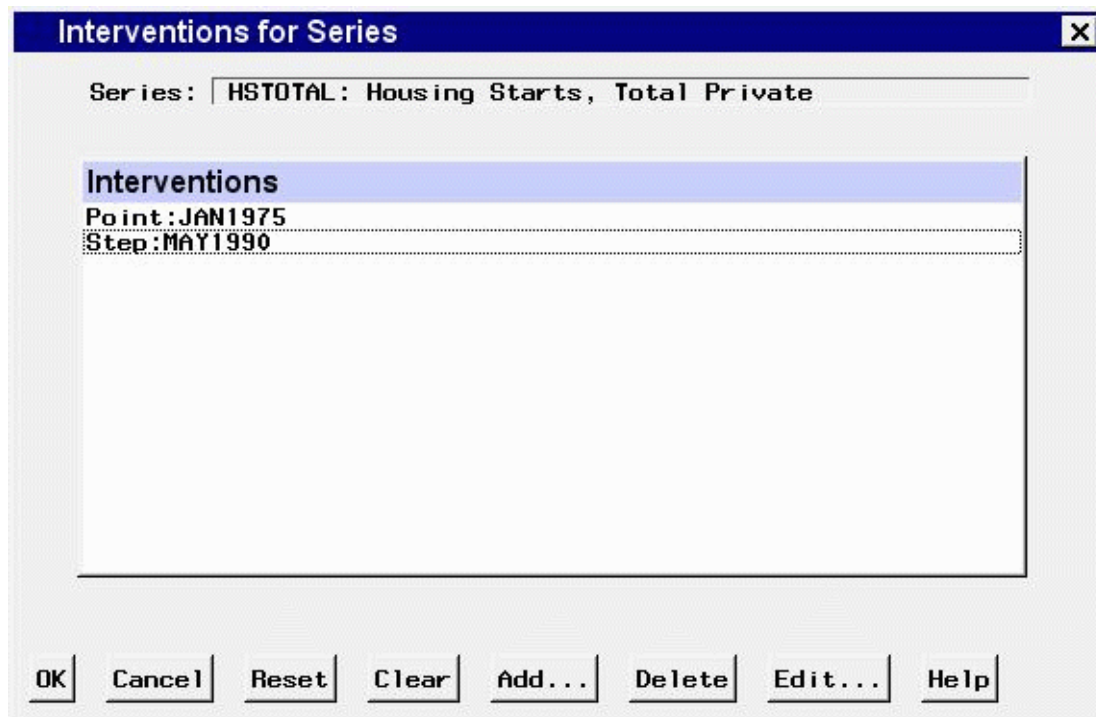

resets all options to their initial values upon entry to the window. This might be useful when editing an intervention specification; otherwise, Reset has the same function as Clear.

Clear

resets all options to their default values.

Interventions for Series Window

Use the Interventions for Series window to create and edit a list of intervention effects to model the impact on the series of unusual events and to select intervention effects as predictors for forecasting models. Access it from the Add button pop-up menu of the ARIMA Model Specification or Custom Model Specification window, or by selecting Define Interventions from the Tools in the Develop Models window. For more information, see the section “[Interventions](#)” on page 2968.

Controls and Fields

Series

is the name and variable label of the current series.

OK

closes the window. If you access this window from the ARIMA Model Specification window or the Custom Model Specification window, any interventions that are selected (highlighted) in the list are added to the model. If you access this window from the Tools menu, all interventions in the list are saved for the current series.

Cancel

closes the window without returning a selection or changing the interventions list. Any options you specified are lost.

Reset

resets the list as it was on entry to the window.

Clear

deletes all interventions from the list.

Add

opens the Intervention Specification window to specify a new intervention effect and add it to the list.

Delete

deletes the currently selected (highlighted) entries from the list.

Edit

opens the Intervention Specification window to edit the currently selected (highlighted) intervention.

Mouse Button Actions

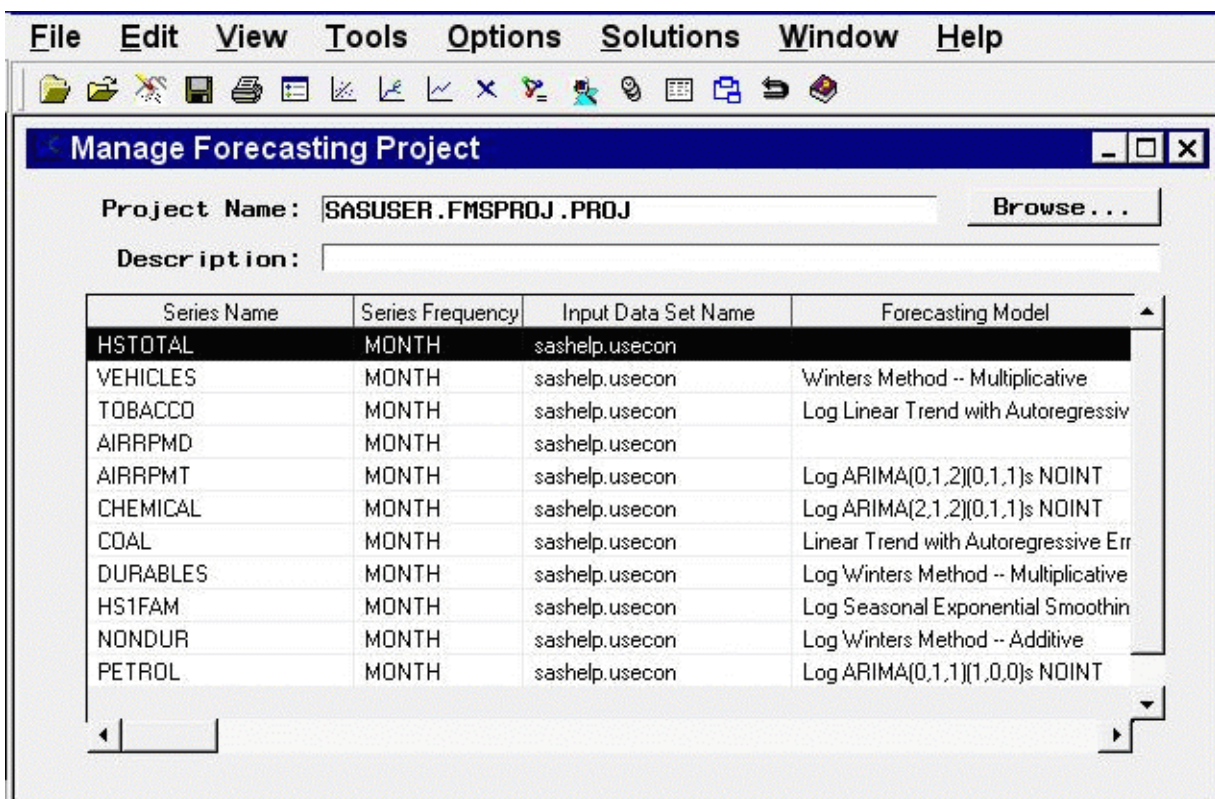

To select or deselect interventions, position the mouse cursor over the intervention's label in the Interventions list and press the left mouse button.

When you position the mouse cursor in the Interventions list and press the right mouse button, a menu containing the actions Add, Delete, and Edit appears. These actions are the same as the Add, Delete, and Edit buttons.

Double-clicking on an intervention in the list invokes an Edit action for that intervention specification.

Manage Forecasting Project Window

Use this resizable window to work with collections of series, models, and options called *projects*. The window contains a project name, a description field, and a table of information about all the series for which you have fit forecasting models. Access it by using the Manage Projects button on the Time Series Forecasting window.

Controls and Fields

Project Name

is the name of the SAS catalog entry in which forecasting models and other results will be stored and from which previously stored results are loaded into the forecasting system. You can specify the project by typing a SAS catalog entry name in this field or by selecting the Browse button to the right of this field. If you specify the name of an existing catalog entry, the information in the project file is loaded. If you specify a one-level name, it is assumed to be the name of a project in the “fmsproj” catalog in the “sasuser” library. For example, typing `samproj` is equivalent to typing `sasuser.fmsproj.samproj`.

project Browse button

opens the Forecasting Project File Selection window to enable you to select and load the project from a list of previously stored project files.

Description

is a descriptive label for the forecasting project. The description you type in this field will be stored with the catalog entry shown in the Project field if you save the project.

Series List Table

The table of series for which forecasting models have been fit contains the following columns.

Series Name

is the name of the time series variable represented in the given row of the table.

Series Frequency

is the time interval (data frequency) for the time series.

Input Data Set Name

is the input data set that provided the data for the series.

Forecasting Model

is the descriptive label for the forecasting model selected for the series.

Statistic Name

is the statistic of fit for the forecasting model selected for the series.

Number of Models

is the total number of forecasting models fit to the series. If there is more than one model for a series, use the Model List window to see a list of models.

Series Label

is the variable label for the series.

Time ID Variable Name

is the time ID variable for the input data set for the series.

Series Data Range

is the time range of the nonmissing values of the series.

Model Fit Range

is the period of fit used for the series.

Model Evaluation Range

is the evaluation period used for the series.

Forecast Range

is the forecast period set for the series.

Menu Bar

File

New

opens a dialog which lets you create a new project, assign it a name and description, and make it the active project.

Open

opens a dialog that lets you select and load a previously saved project.

Close

closes the Manage Forecasting Project window and returns to the main window.

Save

saves the current state of the system (including all the models fit to a series) to the current project catalog entry.

Save As

saves the current state of the system with a prompt for the name of the catalog entry in which to store the information.

Save to Data Set

saves the current project file information in a SAS data set. The contents of the data set are the same as the information displayed in the series list table.

Delete

deletes the current project file.

Import Data

is available if you license SAS/Access software. It opens an Import Wizard, which you can use to import your data from an external spreadsheet or data base to a SAS data set for use in the Time Series Forecasting System.

Export Data

is available if you license SAS/Access software. It opens an Export Wizard, which you can use to export a SAS data set, such as a forecast data set created with the Time Series Forecasting System, to an external spreadsheet or data base.

Print

prints the current project file information.

Print Setup

opens the Print Setup window, which allows you to access your operating system print setup.

Edit

Delete Series

deletes all models for the selected (highlighted) row of the table and removes the series from the project.

Clear

resets the system, deleting all series and models from the project.

Reset

restores the Manage Forecasting Project window to its initial state.

View

Data Set

opens a Viewtable window to display the input data set for the selected (highlighted) series.

Series

opens the Time Series Viewer window to display plots of the selected (highlighted) series.

Model

opens the Model Viewer window to show the current forecasting model for the selected series.

Forecast

opens the Model Viewer to display plots of the forecasts produced by the forecasting model for the selected (highlighted) series.

Tools

Diagnose Series

opens the Series Diagnostics window to perform the automatic series diagnostic process to determine the kinds of forecasting models appropriate for the selected (highlighted) series.

List Models

opens the Model List window for the selected (highlighted) series, which displays a list of all the models that you fit for the series. This action is the same as double-clicking the mouse on the table row.

Generate Data

opens the Time Series Simulation window. This window enables you to simulate ARIMA time series processes and is useful for educational exercises or testing the system.

Refit Models

All Series

refits all the models for all the series in the project by using data within the current fit range.

Selected Series

refits all the models for the currently highlighted series by using data within the current fit range.

Reevaluate Models

All Series

reevaluates all the models for all the series in the project by using data within the current evaluation fit range.

Selected Series

reevaluates all the models for the currently highlighted series by using data within the current evaluation range.

Options

Time Ranges

opens the Time Ranges Specification window to enable you to change the fit and evaluation time ranges and the forecast horizon.

Default Time Ranges

opens the Default Time Ranges window to enable you to control how the system sets the time ranges for series when you do not explicitly set time ranges with the Time Ranges Specification window. Settings made by using this window do not affect series you are already working with; they take effect when you select a new series.

Model Selection List

opens the Model Selection List editor window. Use this to edit the set of forecasting models considered by the automatic model selection process and displayed by the Models to Fit window.

Statistics of Fit

opens the Statistics of Fit Selection window, which controls which of the available statistics will be displayed.

Forecast Options

opens the Forecast Options window, which enables you to control the widths of forecast confidence limits and control the kind of predicted values computed for models that include series transformations.

Column Labels

enables you to set long or short column labels. Long labels are used by default.

Include Interventions

controls whether intervention effects defined for the current series are automatically added as predictors to the models considered by the automatic selection process and displayed by the Model Selection List editor window. When the Include Interventions option is selected, the series interventions are also automatically added to the predictors list when you specify a model in the ARIMA and Custom Models Specification windows.

Print Audit Trail

prints to the SAS log information about the models fit by the system. A check mark or filled check box next to this item indicates that the audit option is turned on.

Show Source Statements

controls whether SAS statements submitted by the forecasting system are printed in the SAS log. When the Show Source Statements option is selected, the system sets the SAS system option SOURCE before submitting SAS statements; otherwise, the system uses the NOSOURCE

option. Note that only some of the functions performed by the forecasting system are accomplished by submitting SAS statements. A check mark or filled check box next to this item indicates that the option is turned on.

Left Mouse Button Actions

If you select a series in the table by positioning the cursor over the table row and clicking with the left mouse button once, that row of the table is highlighted. Menu bar actions such as Delete Series will apply to the highlighted row of the table.

If you select a series in the table by positioning the cursor over the table row and double-clicking with the left mouse button, the system opens the Model List window for that series, which displays a list of all the models that you fit for the series. This is the same as the List Models action under Tools in the menu bar.

Right Mouse Button Actions

Clicking the right mouse button invokes a pop-up menu of actions applicable to the highlighted series. The actions in this menu are as follows.

Delete Series

deletes the highlighted series and its models from the project. This is the same as Delete Series in the Edit menu.

Refit All Models

refits all models attached to the highlighted series by using data within the current fit range. This is the same as the Selected Series item under Refit Models in the Tools menu.

Reevaluate All Models

reevaluates all models attached to the highlighted series by using data within the current evaluation range. This is the same as the Selected Series item under Reevaluate Models in the Tools menu.

List Models

invokes the Model List window. This is the same as List Models under the Tools menu.

View Series

opens the Time Series Viewer window to display plots of the highlighted series. This is the same as the Series item under the View menu.

View Forecasting Model

invokes the Model Viewer window to display the forecasting model for the highlighted series. This is the same as the Model item under the View menu.

View Forecast

opens the Model Viewer window to display the forecasts for the highlighted series. This is the same as the Forecast item under the View menu.

Refresh

updates information shown in the Manage Forecasting Project window.

Model Fit Comparison Window

Use the Model Fit Comparison window to compare goodness-of-fit statistics for any two models fit to the current series. Access it from the Tools menu of the Develop Models window and the Automatic Model Fitting Results window whenever two or more models have been fit to the series.

The screenshot shows the 'Model Fit Comparison' window with the following settings and data:

Series: HSTOTAL: Housing Starts, Total Private
 Range: JAN1975 to DEC1991
 Model 1: ▲ Linear Trend ▼
 Model 2: ▲ Linear Trend with Autoregressive Errors ▼

Statistic	Model 1	Model 2
Mean Square Error	1370.0	199.67245
Root Mean Square Error	37.01371	14.13055
Mean Absolute Percent Error	28.95517	9.76610
Mean Absolute Error	31.39690	10.90707
R-Square	0.031	0.859

Buttons at the bottom: Close, Save..., Print, Statistics..., Help

Controls and Fields

Series

identifies the current time series variable.

Range

displays the starting and ending dates of the series data range.

Model 1

shows the model currently identified as Model 1.

Model 1 upward arrow button

enables you to change the model identified as Model 1 if it is not already the first model in the list of models associated with the series. Select this button to cycle upward through the list of models.

Model 1 downward arrow button

enables you to change the model identified as Model 1 if it is not already the last model in the list of models. Select this button to cycle downward through the list of models.

Model 2

shows the model currently identified as Model 2.

Model 2 upward arrow button

enables you to change the model identified as Model 2 if it is not already the first model in the list of models associated with the series. Select this button to cycle upward through the list of models.

Model 2 downward arrow button

enables you to change the model identified as Model 2 if it is not already the last model in the list of models. Select this button to cycle downward through the list of models.

Close

closes the Model Fit Comparison window.

Save

opens a dialog for specifying the name and label of a SAS data set to which the statistics will be saved. The data set will contain all available statistics and their values for Model 1 and Model 2, as well as a flag variable that is set to 1 for those statistics that were displayed.

Print

prints the contents of the table to the SAS Output window. If you find that the contents do not appear immediately in the Output window, you need to set scrolling options. Select “Preferences” under the Options submenu of the Tools menu. In the Preferences window, select the Advanced tab, then set output scroll lines to a number greater than zero.

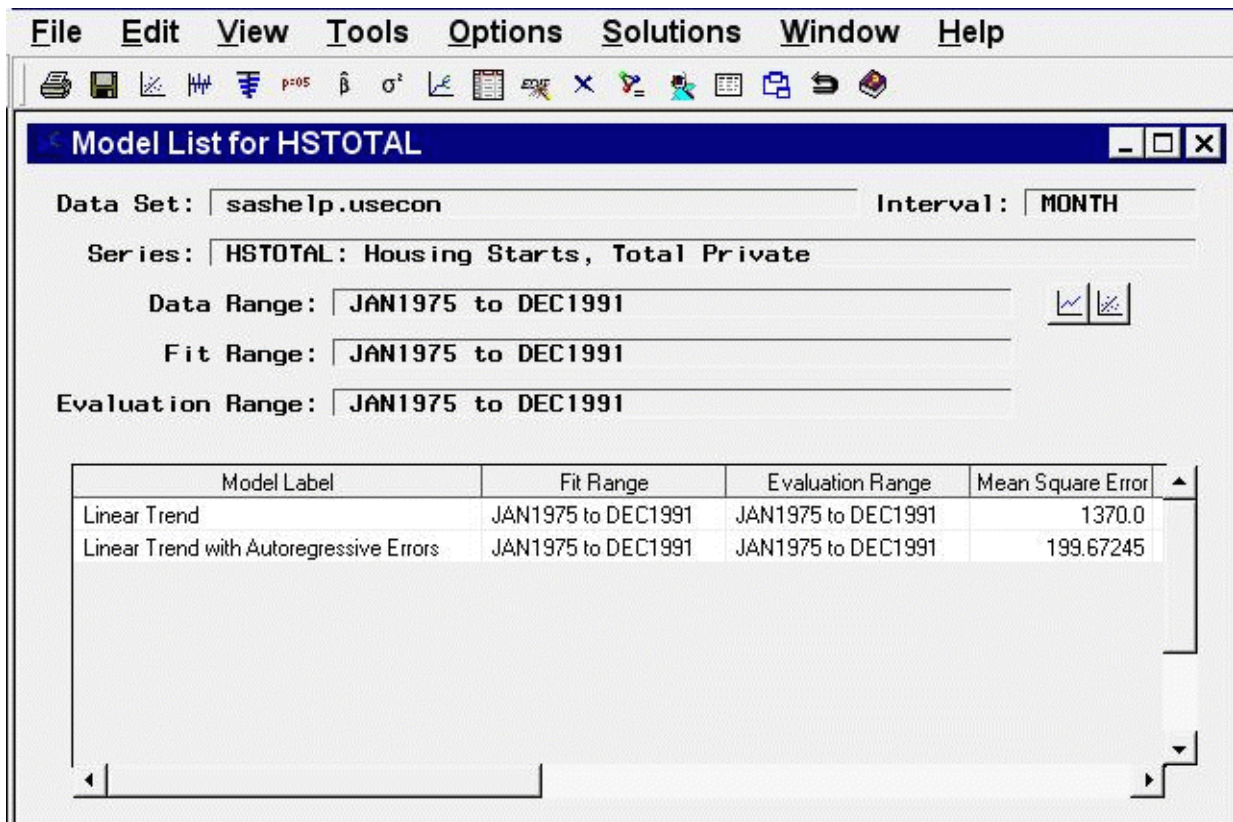

If you want to route the contents to a printer, go to the Output window and select “Print” from the File menu.

Statistics

opens the Statistics of Fit Selection window for controlling which statistics are displayed.

Model List Window

This resizable window shows all of the models that have been fit to a particular series in a project. Access it from the Manage Forecasting Project window by selecting a series in the series list table and choosing “List Models” from the Tools menu or by double-clicking the series.

Controls and Fields

Data Set

is the name of the current input data set.

Interval

is the time interval (data frequency) for the input data set.

Series

is the variable name and label of the current time series.

Data Range

is the date of the first and last nonmissing data values available for the current series in the input data set.

Fit Range

is the current period of fit setting. This is the range of data that will be used to fit models to the series. It might be different from the fit ranges shown in the table, which were in effect when the models were fit.

Evaluation Range

is the current period of evaluation setting. This is the range of data that will be used to calculate the goodness-of-fit statistics for models fit to the series. It might be different from the evaluation ranges shown in the table, which were in effect when the models were fit.

View Series Graphically icon

opens the Time Series Viewer window to display plots of the current series.

View Model Graphically icon

opens the Model Viewer to display graphs and tables for the currently highlighted model.

Model List Table

The table of models fit to the series contains columns that show the model label, the fit range and evaluation range used to fit the models, and all of the currently selected fit statistics. You can change the selection of fit statistics by using the Statistics of Fit Selection window.

Click on column headings to sort the table by a particular column. If a model is highlighted, clicking with the right mouse button invokes a pop-up menu that provides actions applicable to the highlighted model. It includes the following items.

View Model

opens the Model Viewer on the selected model. This is the same as “Model Predictions” under the View menu.

View Parameter Estimates

opens the Model Viewer to display the parameter estimates table for the currently highlighted model. This is the same as “Parameter Estimates” under the View menu.

View Statistics of Fit

opens the Model Viewer to display the statistics of fit table for the currently highlighted model. This is the same as “Statistics of Fit” under the View menu.

Edit Model

opens the appropriate model specification window for changing the attributes of the highlighted model and fitting the modified model.

Refit Model

refits the highlighted model using the current fit range.

Reevaluate Model

reevaluates the highlighted model using the current evaluation range.

Delete Model

deletes the highlighted model from the project.

View Forecasts

opens the Model Viewer to show the forecasts for the highlighted model. This is the same as “Forecast Graph” under the View menu.

Menu Bar

File

Save

opens a dialog which lets you save the contents of the table to a specified SAS data set.

Import Data

is available if you license SAS/Access software. It opens an Import Wizard, which you can use

to import your data from an external spreadsheet or data base to a SAS data set for use in the Time Series Forecasting System.

Export Data

is available if you license SAS/Access software. It opens an Export Wizard, which you can use to export a SAS data set, such as a forecast data set created with the Time Series Forecasting System, to an external spreadsheet or data base.

Print

sends the contents of the table to a printer as defined through Print Setup.

Print Setup

opens the Print Setup window, which allows you to access your operating system print setup.

Close

closes the window and returns to the Manage Forecasting Projects window.

Edit

Edit Model

enables you to modify the specification of the currently highlighted model in the table and fit the modified model. The new model replaces the current model in the table.

Refit Model

refits the currently highlighted model using data within the current fit range.

Reevaluate Model

recomputes statistics of fit for the currently highlighted model using data within the current evaluation range.

Delete Model

deletes the currently highlighted model from the model table.

Reset

restores the contents of the Model List window to the state initially displayed.

View

Series

opens the Time Series Viewer window to display plots of the current series. This is the same as the View Series Graphically icon.

Model Predictions

opens the Model Viewer to display a predicted and actual plot for the currently highlighted model. This is the same as the View Model Graphically icon.

Prediction Errors

opens the Model Viewer to display the prediction errors for the currently highlighted model.

Prediction Error Autocorrelations

opens the Model Viewer to display the prediction error autocorrelations, partial autocorrelations, and inverse autocorrelations for the currently highlighted model.

Prediction Error Tests

opens the Model Viewer to display graphs of white noise and stationarity tests on the prediction errors of the currently highlighted model.

Parameter Estimates

opens the Model Viewer to display the parameter estimates table for the currently highlighted model.

Statistics of Fit

opens the Model Viewer window to display goodness-of-fit statistics for the currently highlighted model.

Forecast Graph

opens the Model Viewer to graph the forecasts for the currently highlighted model.

Forecast Table

opens the Model Viewer to display forecasts for the currently highlighted model in a table.

Options**Statistics of Fit**

opens the Statistics of Fit Selection window, which presents a list of statistics that the system can display. Use this action to customize the list of statistics shown in the Model Viewer, Automatic Model Fitting Results, and Model Fit Comparison windows and available for selection in the Model Selection Criterion menu.

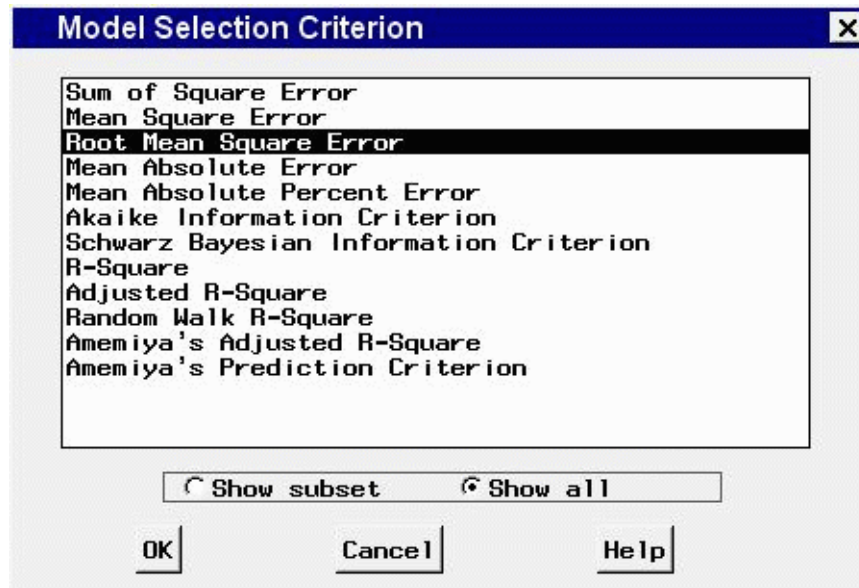

Column Labels

enables you to set long or short column labels. Long labels are used by default.

Model Selection Criterion Window

Use the Model Selection Criterion window to select the model selection criterion statistic used by the automatic selection process to determine the best fitting forecasting model. Model selection criterion statistics are a subset of those shown in the Statistics of Fit Selection window, since some statistics of fit, such as number of observations, are not useful for model selection.

This window is available from the Model Selection Criterion item of the Options menu of the Develop Models window, Automatic Model Fitting window, and Produce Forecasts window.

Controls and Fields

Show subset

when selected, lists only those model selection criterion statistics that are selected in the Statistics of Fit Selection window.

Show all

when selected, lists all available model selection criterion statistics.

OK

closes the window and sets the model selection criterion to the statistic you specified.

Cancel

closes the window without changing the model selection criterion.

Model Selection List Editor Window

Use the Model Selection List Editor window to edit the model selection list, including adding your own custom models, and to specify which models in the list are to be used in the automatic fitting process. Access it from the Options menu in the Develop Models, Automatic Model Fitting window, Produce Forecasts, and Manage Projects windows.

The window initially displays the current model list for your project. You can modify this set of models in several ways:

- Open one or more alternate model lists to replace or append to the current model list. These can be either model lists included with the software or model lists previously saved by you or other users.

- Turn the autofit option on or off for individual models. Those that are not flagged for autofit will be available by using the Models to Fit window but not by using automatic model fitting.
- Delete models from the list that are not needed for your project.
- Reorder the models in the list.
- Edit models in the list.
- Create a new empty list.
- Add new models to the list.

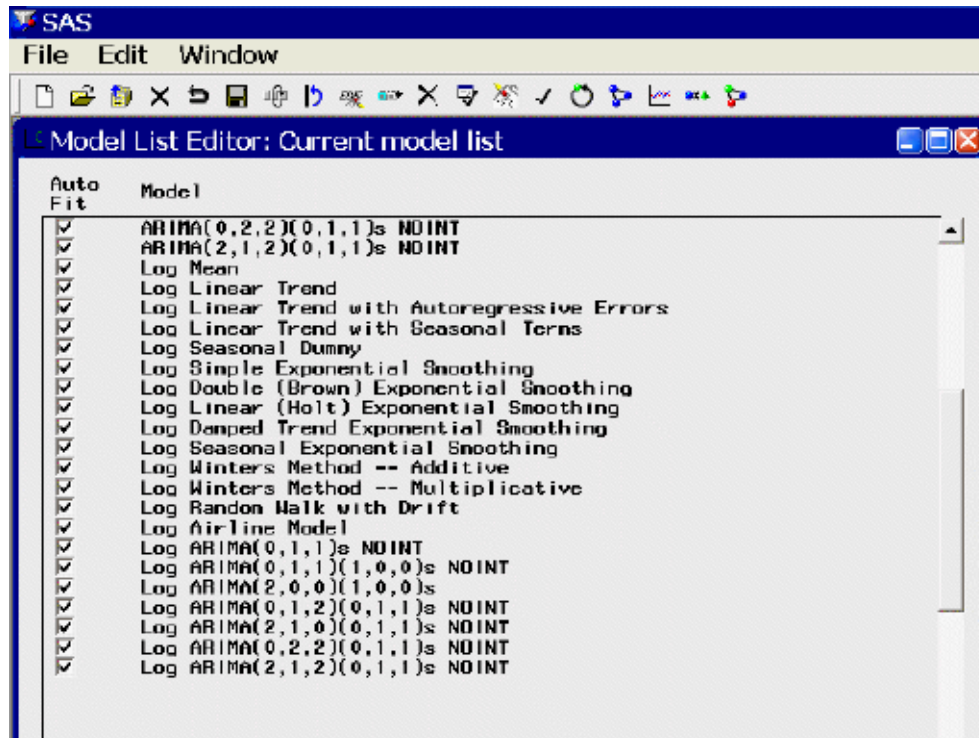

Having modified the current model list, you can save it for future use in several ways:

- Save it in a catalog so it can be opened later in the Model Selection List Editor.
- Save it as the user default to be used automatically when new projects are created.
- Select *close* to close the Model Selection List Editor and attach the modified model selection list to the current project.
- Select *cancel* to close the Model Selection List Editor without changing the current project's model selection list.

Since model selection lists are not bound to specific data sources, care must be taken when including data-specific features such as interventions and regressors. When you add an ARIMA, Factored ARIMA, or Custom model to the list, you can add regressors by selecting from the variables in the current data set. If there is no current data set, you will be prompted to specify a data set so you can select regressors from the series it contains.

If you use a model list that has models with a particular regressor name on a data set that does not contain a series of that name, model fitting will fail. However, you can make global changes to the regressor names in the model list by using *Set regressor names*. For example, you might use the list of dynamic regression models found in the sashelp.forecast catalog. It uses the regressor name “price.” If your regressor series is named “x,” you can specify “price” as the current regressor name and “x” as the “change to” name. The change will be applied to all models in the list that contain the specified regressor name.

Interventions cannot be defined for models defined from the Model Selection List Editor. However, you can define interventions by using the Intervention Specification Window and apply them to your models by turning on the Include Interventions option.

Auto Fit

The auto fit column of check boxes enables you to eliminate some of the models from being used in the automatic fitting process without having to delete them from the list. By default, all models are checked, meaning that they are all used for automatic fitting.

Model

This column displays the descriptions of all models in the model selection list. You can select one or more models by clicking them. Selected models are highlighted and become the object of the actions Edit, Move, and Delete.

Menu Bar

File

New

creates a new empty model selection list.

Open

opens a dialog for selecting one or more existing model selection lists to open. If you select multiple lists, they are all opened at once as a concatenated list. This helps you build large specialized model lists quickly by mixing and matching various existing lists such as the various

ARIMA model lists included in SASHELP.FORCAST. By default, the lists you open replace the current model list. Select the “append” radio button if you want to append them to the current model list.

Open System Default

opens the default model list supplied with the product.

Cancel

exits the window without applying any changes to the current project’s model selection list.

Close

closes the window and applies any changes made to the project’s model selection list.

Save

opens a dialog for saving the edited model selection list in a catalog of your choice.

Save as User Default

saves your edited model list as a default list for new projects. The location of this saved list is shown on the message line. When you create new projects, the system searches for this model list and uses it if it is found. If it is not found, the system uses the original default model list supplied with the product.

Edit

Reset

restores the list to its initial state when the window was invoked.

Add Model

enables you to add new models to the selection list. You can use the Smoothing Model Specification window, the ARIMA Model Specification window, the Factored ARIMA Model Specification window, or the Custom Model Specification window.

Edit Selected

opens the appropriate model specification window for changing the attributes of the highlighted model and adding the modified model to the selection list. The original model is not deleted.

Move Selected

enables you to reorder the models in the list. Select one or more models, then select Move Selected from the menu or toolbar. A note appears on the message line: “Select the row after which the selected models are to be moved.” Then select any unhighlighted row in the table. The selected models will be moved after this row.

Delete

deletes any highlighted models from the list. This item is not available if no models are selected.

Set Regressor Names

opens a dialog for changing all occurrences of a given regressor name in the models of the current model selection list to a name that you specify.

Select All

selects all models in the list.

Clear Selections

deselects all models in the list.

Select All for Autofit

checks the autofit check boxes of all models in the list.

Clear Autofit Selections

deselects the autofit check boxes of all models in the list.

Mouse Button Actions

Clicking any model description in the table selects (highlights) that model. Clicking the same model again deselects it. Multiple selections are allowed.

Clicking the auto fit check box in any row toggles the associated model's eligibility for use in automatic model fitting.

Right-clicking the right mouse button opens a pop-up menu.

Model Viewer Window

This resizable window provides plots and tables of actual values, model predictions, forecasts, and related statistics. The various plots and tables available are referred to as *views*. The section “[View Selection Icons](#)” on page 3055 explains how to change the view.

You can access Model Viewer in a number of ways, including the View Model Graphically icon of the Develop Models and Model List windows, the Graph button of the Automatic Model Fitting Results window, and the Model item under the View menu in the Manage Forecasting Project window. In addition, you can go directly to a selected view in the Model Viewer window by selecting Model Predictions, Prediction Errors, Statistics of Fit, Prediction Error Autocorrelations, Prediction Error Tests, Parameter Estimates, Forecast Graph, or Forecast Table from the View menu or corresponding toolbar icon or pop-up menu item in the Develop Models, Model List, or Automatic Model Fitting Results windows.

The state of the Model Viewer window is controlled by the current model and the currently selected view. You can resize this window, and you can use other windows without closing the Model Viewer window. By default, the Model Viewer window is automatically updated to display the new model when you switch to working with another model (that is, when you highlight a different model). You can unlink the Model Viewer window from the current model selection by selecting the Link/Unlink icon from the window's horizontal toolbar. See “Link/Unlink” in the section “[Toolbar Icons](#)” on page 3054.

For more information, see the section “[Model Viewer](#)” on page 2869.

Toolbar Icons

The Model Viewer window contains a horizontal row of icons called the Toolbar. Corresponding menu items appear under various menus. The function of each icon is explained in the following list.

Zoom in

In the Model Predictions, Prediction Errors, and Forecast Graph views, the Zoom In action changes the mouse cursor into cross hairs that you can use with the left mouse button to define a region of the graph to zoom in on. In the Prediction Error Autocorrelations and Prediction Error Tests views, Zoom In reduces the number of lags displayed.

Zoom out

reverses the previous Zoom In action.

Link/Unlink viewer

disconnects or connects the Model Viewer window to the model table (Develop Models window, Model List window, or Automatic Model Fitting Results window). When the viewer is linked, selecting another model in the model table causes the model viewer to be updated to show the selected model. When the Viewer is unlinked, selecting another model does not affect the viewer. This feature is useful for comparing two or more models graphically. You can display a model of interest in the Model Viewer, unlink it, then select another model and open another Model Viewer window for that model. Position the viewer windows side by side for convenient comparisons of models, or use the Next Viewer icon or F12 function key to switch between them.

Save

saves the contents of the Model Viewer window. By default, an HTML page is created. This enables you to display graphs and tables by using the Results Viewer or publish them on the Web or your intranet. See also “Save Graph As” and “Save Data As” under “Menu Bar” below.

Print

prints the contents of the viewer window.

Close

closes the Model Viewer window and returns to the window from which it was invoked.

View Selection Icons

At the right hand side of the Model Viewer window is a vertical toolbar to select the view—that is, the kind of plot or table that the viewer displays. Corresponding menu items appear under View in the menu bar. The function of each icon is explained in the following list.

Model Predictions

displays a plot of actual series values and model predictions over time. Click individual points in the graph to get a display of the type (actual or predicted), ID value, and data value in the upper right corner of the window.

Prediction Errors

displays a plot of model prediction errors (residuals) over time. Click individual points in the graph to get a display of the prediction error value in the upper right corner of the window.

Prediction Error Autocorrelations

displays horizontal bar charts of the sample autocorrelation, partial autocorrelation, and inverse autocorrelation functions for the model prediction errors. Overlaid line plots represent confidence limits computed at plus and minus two standard errors. Click any of the bars to display its value.

Prediction Error Tests

displays horizontal bar charts that represent results of white noise and stationarity tests on the model prediction errors. The first bar chart shows the significance probability of the Ljung-Box chi-square statistic computed on autocorrelations up to the given lag. Longer bars favor rejection of the null hypothesis that the series is white noise. Click any of the bars to display an interpretation.

The second bar chart shows tests of stationarity of the model prediction errors, where longer bars favor the conclusion that the series is stationary. Each bar displays the significance probability of the augmented Dickey-Fuller unit root test to the given autoregressive lag. Long bars represent higher levels of significance against the null hypothesis that the series contains a unit root. For seasonal data, a third bar chart appears for seasonal root tests. Click on any of the bars to display an interpretation.

Parameter Estimates

displays a table showing model parameter estimates along with standard errors and t tests for the null hypothesis that the parameter is zero.

Statistics of Fit

displays a table of statistics of fit for the selected model. The set of statistics shown can be changed by using the Statistics of Fit item under Options in the menu bar.

Forecast Graph

displays a plot of actual and predicted values for the series data range, followed by a horizontal reference line and forecasted values with confidence limits. Click individual points in the graph to get a display of the type, date/time, and value of the data point in the upper right corner of the window.

Forecast Table

displays a data table with columns containing the date/time, actual, predicted, error (residual), lower confidence limit, and upper confidence limit values, together with any predictor series.

Menu Bar

File

Save Graph

saves the plot displayed in viewer window as a SAS/GRAPH grseg catalog entry. When the current view is a table, this menu item is not available. See also “Save” in the section “[Toolbar Icons](#)” on page 3054. If a graphics catalog entry name has not already been specified, this action functions like “Save Graph As.”

Save Graph As

saves the current graph as a SAS/GRAPH grseg catalog entry in a SAS catalog that you specify and/or as an Output Delivery System (ODS) object. By default, an HTML page is created, with the graph embedded as a gif image.

Save Data

saves the data displayed in the viewer window in a SAS data set, where applicable.

Save Data As

saves the data in a SAS data set that you specify and/or as an Output Delivery System (ODS) object. By default, an HTML page is created, with the data displayed as a table.

Import Data

is available if you license SAS/Access software. It opens an Import Wizard, which you can use to import your data from an external spreadsheet or data base to a SAS data set for use in the Time Series Forecasting System.

Export Data

is available if you license SAS/Access software. It opens an Export Wizard, which you can use to export a SAS data set, such as a forecast data set created with the Time Series Forecasting System, to an external spreadsheet or data base.

Print Graph

prints the contents of the viewer window if the current view is a graph. This is the same as the Print toolbar icon. If the current view is a table, this menu item is not available.

Print Data

prints the data displayed in the viewer window, where applicable.

Print Setup

opens the Print Setup window, which allows you to access your operating system print setup.

Print Preview

opens a preview window to show how your plots will appear when printed.

Close

closes the Model Viewer window and returns to the window from which it was invoked.

Edit

Edit Model

enables you to modify the specification of the current model and to fit the modified model, which is then displayed in the viewer.

Refit Model

refits the current model by using data within the current fit range. This action also causes the ranges to be reset if the data range has changed.

Reevaluate Model

reevaluates the current model by using data within the current evaluation range. This action also causes the ranges to be reset if the data range has changed.

View

See “[View Selection Icons](#)” on page 3055. It describes each of the items available under “View,” except “Zoom Way Out.”

Zoom Way Out

zooms the plot out as far as it will go, undoing all prior zoom in operations.

Tools**Link Viewer**

See “Link/Unlink” in the section “[Toolbar Icons](#)” on page 3054.

Options**Time Ranges**

opens the Time Ranges Specification window to enable you to change the period of fit, period of evaluation, or forecast horizon to be applied to subsequently fit models.

Statistics of Fit

opens the Statistics of Fit Selection window, which presents a list of statistics that the system can display. Use this action to customize the list of statistics shown in the statistics of fit table and available for selection in the Model Selection Criterion menu.

Forecast Options

opens the Forecast Options window, which enables you to control the widths of forecast confidence limits and control the kind of predicted values computed for models that include series transformations.

Residual Plot Options

Provides a choice of four methods of computing prediction errors for models which include a data transformation.

Prediction Errors

computes the difference between the transformed series actual values and model predictions.

Normalized Prediction Errors

computes prediction errors in normalized form.

Model Residuals

computes the difference between the untransformed series values and the untransformed model predictions.

Normalized Model Residuals

computes model residuals in normalized form.

Number of Lags

opens a window to enable you to specify the number of lags shown in the Prediction Error Autocorrelations and Prediction Error Tests views. You can also use the Zoom In and Zoom Out actions to control the number of lags displayed.

Correlation Probabilities

controls whether the bar charts in the Prediction Error Autocorrelations view represent significance probabilities or values of the correlation coefficient. A check mark or filled check box next to this item indicates that significance probabilities are displayed. In each case the bar graph horizontal axis label changes accordingly.

Include Interventions

controls whether intervention effects defined for the current series are automatically added as predictors to the models considered by the automatic selection process. A check mark or filled check box next to this item indicates that the option is turned on.

Print Audit Trail

prints to the SAS log information about the models fit by the system. A check mark or filled check box next to this item indicates that the audit option is turned on.

Show Source Statements

controls whether SAS statements submitted by the forecasting system are printed in the SAS log. When the Show Source Statements option is selected, the system sets the SAS system option SOURCE before submitting SAS statements; otherwise, the system uses the NOSOURCE option. Note that only some of the functions performed by the forecasting system are accomplished by submitting SAS statements. A check mark or filled check box next to this item indicates that the option is turned on.

Mouse Button Actions

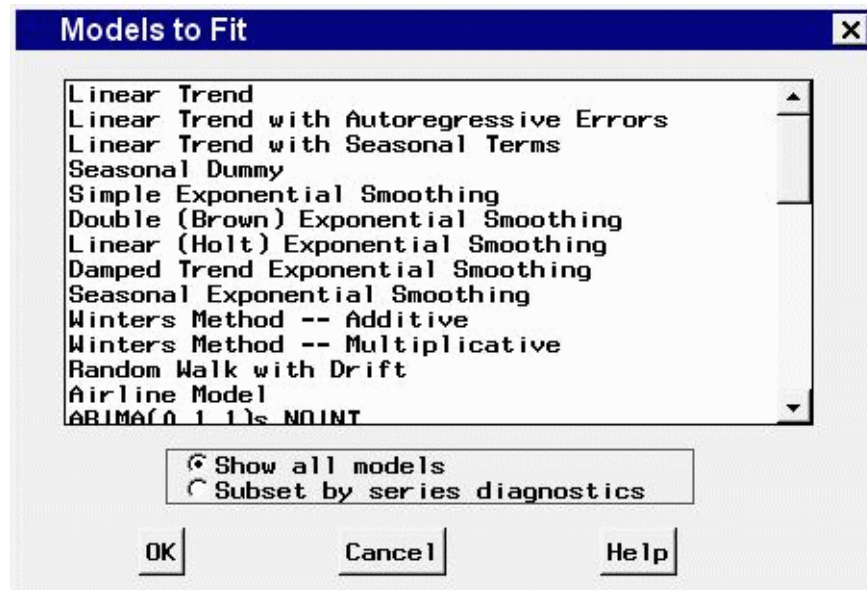

You can examine the data values of individual points in the Model Predictions, Model Prediction Errors, and Forecast Graph views of the Model Viewer by clicking the point. The date/time and data values as well as the type (actual, predicted, and so forth) are displayed in a box that appears in the upper right corner of the Viewer window. Click the mouse elsewhere or select any action to dismiss the data box.

Similarly, you can display values in the Prediction Error Autocorrelations view by clicking any of the bars. Clicking bars in the Prediction Error Tests view displays a Recommendation for Current View window which explains the test represented by the bar.

When you select the Zoom In action in the Predicted Values, Model Prediction Errors, and Forecasted Values views, you can use the mouse to define a region of the graph to zoom. Position the mouse cursor at one corner of the region, press the left mouse button, and move the mouse cursor to the opposite corner of the region while holding the left mouse button down. When you release the mouse button, the plot is redrawn to show an expanded view of the data within the region you selected.

Models to Fit Window

Use the Models to Fit window to fit models by choosing them from the current model selection list. Access it by using “Fit Models from List” under the Fit Model submenu of the Edit menu in the Develop Models window, or the pop-up menu that appears when you click an empty area of the model table in the Develop Models window. If you want to alter the list of models that appears here, use the Model Selection List editor window.

To select a model to be fit, use the left mouse button. To select more than one model to fit, drag with the mouse, or select the first model, then press the shift key while selecting the last model. For noncontiguous selections, press the control key while selecting with the mouse. To begin fitting the models, double-click the last selection or select the OK button.

If series diagnostics have been performed, the radio box is available. If the Subset by series diagnostics radio button is selected, only those models in the selection list that fit the diagnostic criteria will be shown for selection. If you want to choose models that do not fit the diagnostic criteria, select the Show all models button.

Controls and Fields

Show all models

when selected, lists all available models, regardless of the setting of the series diagnostics options.

Subset by series diagnostics

when selected, lists only the available models that are consistent with the series diagnostics options.

OK

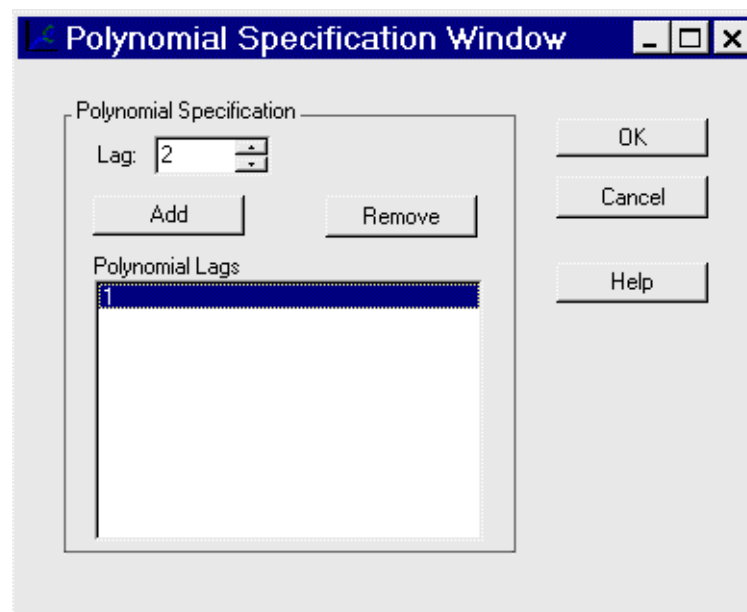

closes the Models to Fit window and fits the selected models.

Cancel

closes the window without fitting any models. Any selections you made are lost.

Polynomial Specification Window

Use the Polynomial Specification window to add a polynomial to an ARIMA model. The set of lags defined here become a polynomial factor, denoted by a list of lags in parentheses, when you select “OK.” If you accessed this window from the AR Polynomial Specification window, then it is added to the autoregressive part of the model. If you accessed it from the MA Polynomial Specification window, it is added to the moving-average part of the model.

Controls and Fields

Lag

specifies a lag value to add to the list. Type in a positive integer or select one by clicking the spin box arrows.

Add

adds the value in the Lag spin box to the list of polynomial lags. Duplicate values are not allowed.

Remove

deletes a selected lag from the list of polynomial lags.

Polynomial Lags

is a list of unique integers that represent lags to be added to the model.

OK

closes the window and returns the specified polynomial to the AR or MA polynomial specification

window.

Cancel

closes the window and discards any polynomial lags added to the list.

Produce Forecasts Window

Use the Produce Forecasts window to produce forecasts for the series in the current input data set for which you have fit forecasting models. Access it by using the Produce Forecasts button of the Time Series Forecasting window.

Produce Forecasts - Project SASUSER.FMSPROJ.PROJ

Input:

Data Set:

Time ID:

Interval:

Series:

Forecast Output:

Data Set:

Format:

Horizon:

Controls and Fields

Input Data Set

is the name of the current input data set. To specify the input data set, you can type a one-level or two-level SAS data set name in this field or select the Browse button to the right of the field.

Input data set Browse button

opens the Data Set Selection window to enable you to select the input data set.

Time ID

is the name of the time ID variable for the input data set. To specify this variable, you can type the ID variable name in this field or use the Select button.

Time ID Select button

opens the Time ID Variable Specification window.

Create button

opens a menu of choices of methods for creating a time ID variable for the input data set. Use this feature if the input data set does not already contain a valid time ID variable.

Interval

is the time interval between observations (data frequency) in the current input data set. If the interval is not automatically filled in by the system, you can type in an interval name here, or select one from the pop-up list.

Series

indicates the number and names of time series variables for which forecasts will be produced.

Series Select button

opens the Series to Process window to let you select the series for which you want to produce forecasts.

Forecast Output Data Set

is the name of the output data set that will contain the forecasts. Type the name of the output data set in this field or click the Browse button.

Forecast Output Browse button

opens a dialog to let you locate an existing data set to which to save the forecasts.

Format

enables you to select one of three formats for the forecast data set:

Simple

specifies the simple format for the output data set. The data set contains the time ID variable and the forecast variables and contains one observation per time period. Observations for earlier time periods contain actual values copied from the input data set; later observations contain the forecasts.

Interleaved

specifies the interleaved format for the output data set. The data set contains the time ID variable, the variable TYPE, and the forecast variables. There are several observations per time period, with the meaning of each observation identified by the TYPE variable.

Concatenated

specifies the concatenated format for the output data set. The data set contains the variable SERIES, the time ID variable, and the variables ACTUAL, PREDICT, ERROR, LOWER, and UPPER. There is one observation per time period per forecast series. The variable SERIES contains the name of the forecast series, and the data set is sorted by SERIES and DATE.

Horizon

is the number of periods or years to forecast beyond the end of the input data range. To specify the forecast horizon, you can type a value in this field or select one from the pop-up list.

Horizon periods

selects the units to apply to the horizon. By default, the horizon value represents number of periods. For example, if the interval is month, the horizon represents the number of months to forecast. Depending on the interval, you can also select weeks or years, so that the horizon is measured in those units.

Horizon date

is the ending date of the forecast horizon. You can type in a date that uses a form recognized by a SAS date informat, or you can increment or decrement the date shown by using the left and right arrows. The outer arrows change the date by a larger amount than the inner arrows. The date field and the horizon field reset each other, so you can use either one to specify the forecasting horizon.

Run button

produces forecasts for the selected series and stores the forecasts in the specified output SAS data set.

Output button

opens a Viewtable window to display the output data set. This button becomes available once the forecasts have been written to the data set.

Close button

closes the Produce Forecasts window and returns to the Time Series Forecasting window.

Menu Bar

File**Import Data**

is available if you license SAS/Access software. It opens an Import Wizard, which you can use to import your data from an external spreadsheet or data base to a SAS data set for use in the Time Series Forecasting System.

Export Data

is available if you license SAS/Access software. It opens an Export Wizard, which you can use to export a SAS data set, such as a forecast data set created with the Time Series Forecasting System, to an external spreadsheet or data base.

Print Setup

opens the Print Setup window, which allows you to access your operating system print setup.

Close

closes the Produce Forecasts window and returns to the Time Series Forecasting window.

View**Input Data Set**

opens a Viewtable window to browse the current input data set.

Output Data Set

opens a Viewtable window to browse the output data set. This is the same as the Output button.

Tools**Produce Forecasts**

produces forecasts for the selected series and stores the forecasts in the specified output SAS data set. This is the same as the Run button.

Options

Default Time Ranges

opens the Default Time Ranges window to enable you to control how the system sets the time ranges when new series are selected.

Model Selection List

opens the Model Selection List editor window. Use this to edit the set of forecasting models considered by the automatic model selection process and displayed by the Models to Fit window.

Model Selection Criterion

opens the Model Selection Criterion window, which presents a list of goodness-of-fit statistics and enables you to select the fit statistic that is displayed in the table and used by the automatic model selection process to determine the best fitting model.

Statistics of Fit

opens the Statistics of Fit Selection window, which presents a list of statistics that the system can display. Use this action to customize the list of statistics shown in the Statistics of Fit table and available for selection in the Model Selection Criterion window.

Forecast Options

opens the Forecast Options window, which enables you to control the widths of forecast confidence limits and control the kind of predicted values computed for models that include series transformations.

Forecast Data Set

enables you to select one of three formats for the forecast data set. See `Format`, which is described previously in this section.

Alignment of Dates

Beginning

aligns dates that the system generates to identify forecast observations in output data sets to the beginning of the time intervals.

Middle

aligns dates that the system generates to identify forecast observations in output data sets to the midpoints of the time intervals.

End

aligns dates that the system generates to identify forecast observations in output data sets to the end of the time intervals.

Automatic Fit

opens the Automatic Model Selection Options window, which enables you to control the number of models retained by the automatic model selection process and whether the models considered for automatic selection are subset according to the series diagnostics.

Set Toolbar Type

Image Only

displays the toolbar items as icons without text.

Label Only

displays the toolbar items as text without icon images.

Both

displays the toolbar items as both text and icon images.

Include Interventions

controls whether intervention effects defined for the current series are automatically added as predictors to the models considered by the automatic selection process. A check mark or filled check box next to this item indicates that the option is turned on.

Print Audit Trail

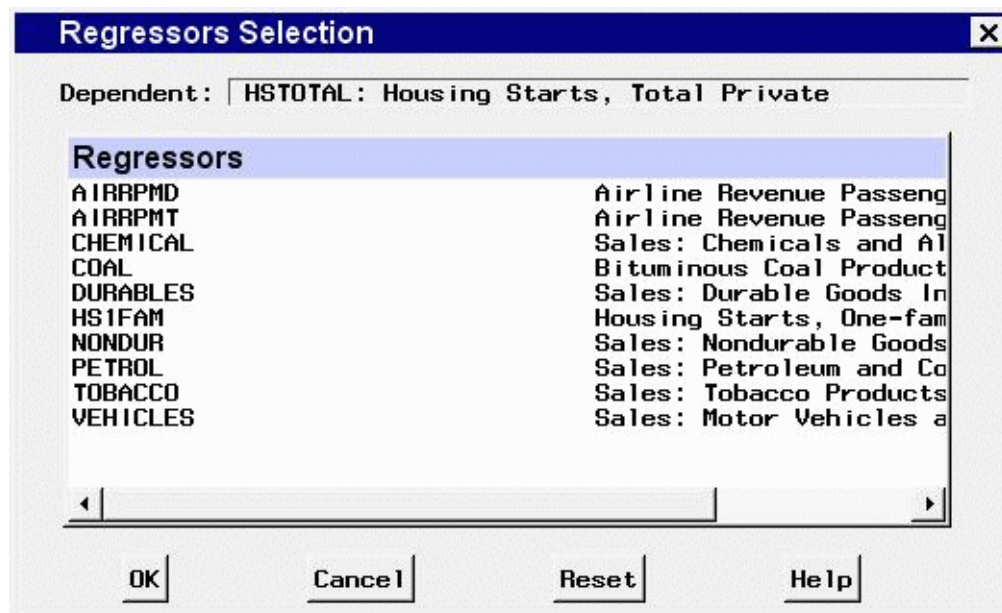

prints to the SAS log information about the models fit by the system. A check mark or filled check box next to this item indicates that the audit option is turned on.

Show Source Statements

controls whether SAS statements submitted by the forecasting system are printed in the SAS log. When the Show Source Statements option is selected, the system sets the SAS system option SOURCE before submitting SAS statements; otherwise, the system uses the NOSOURCE option. Note that only some of the functions performed by the forecasting system are accomplished by submitting SAS statements. A check mark or filled check box next to this item indicates that the option is turned on.

Regressors Selection Window

Use the Regressors Selection window to select one or more time series variables in the input data set to include as regressors in the forecasting model to predict the dependent series. Access it from the pop-up menu that appears when you select the Add button of the ARIMA Model Specification window or Custom Model Specification window.

Controls and Fields

Dependent

is the name and variable label of the current series.

Regressors

is a table listing the names and labels of the variables in the input data set available for selection as regressors. The variables that you select are highlighted. Selecting a highlighted row again deselects that variable.

OK

closes the Regressors Selection window and adds the selected variables as regressors in the model.

Cancel

closes the window without adding any regressors. Any selections you made are lost.

Reset

resets all options to their initial values upon entry to the window.

Save Data As

Use Save Data As from the Time Series Viewer Window or the Model Viewer Window to save data displayed in a table to a SAS data set or external file.

Use Save Forecast As from the Develop Models Window to save forecasts and related data including the series name, model, and interval. It supports append mode, enabling you to accumulate the forecasts of multiple series in a single data set.

Save Data as

SAS Library Output

Library:

Data Set:

Label:

External File Output

☒ Save External File

Title 1:

Title 2:

Title 3:

To save your data in a SAS data set, provide a library name or assign one by using the Browse button, then provide a data set name or accept the default. Enter a descriptive label for the data set in the Label field. Click OK to save the data set. If you specify an existing data set, it will be overwritten, except in the case of Save Forecast As.

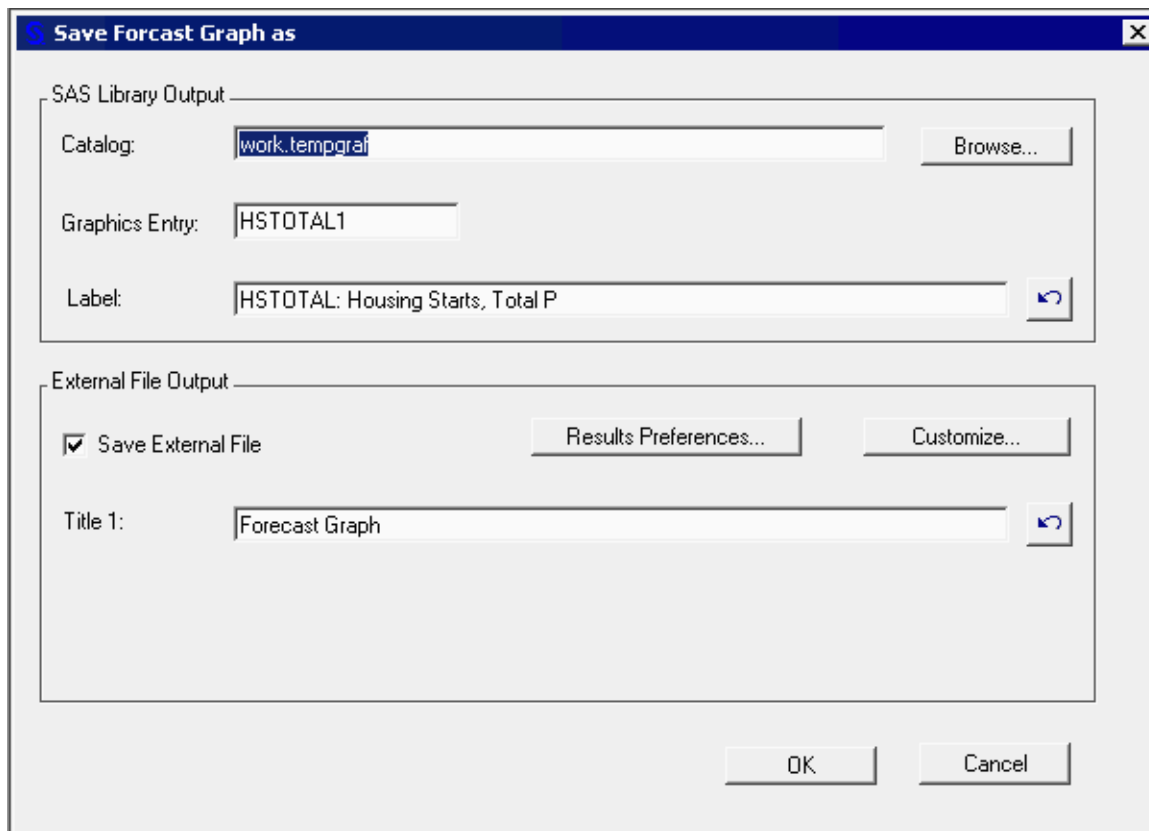

External file output takes advantage of the Output Delivery System (ODS) and is designed primarily for creating HTML tables for Web reporting. You can build a set of Web pages quickly and use the ODS Results window to view and organize them. To use this feature, check Save External File in the External File Output box. To set ODS options, click Results Preferences, then select the Results tab in the Preferences dialog.

If you have previously saved data of the current type, the system remembers your previous labels and titles. To reuse them, click the arrow button to the right of each of these window fields.

Use the Customize button if you need to specify the name of a custom macro that contains ODS statements. The default macro simply runs the PRINT procedure. A custom macro can be used to add PRINT procedure and/or ODS statements to customize the type and organization of output files produced.

Save Graph As

Use Save Graph As from the Time Series Viewer Window or the Model Viewer Window to save any of the graphs in a catalog or external file.

The dialog box is titled "Save Forecast Graph as" and contains two main sections: "SAS Library Output" and "External File Output".

SAS Library Output:

- Catalog:** A text field containing "work.tempgraf" with a "Browse..." button to its right.
- Graphics Entry:** A text field containing "HSTOTAL1".
- Label:** A text field containing "HSTOTAL: Housing Starts, Total P" with a circular arrow button to its right.

External File Output:

- Save External File:** A checked checkbox.
- Results Preferences...** and **Customize...** buttons are located to the right of the checkbox.
- Title 1:** A text field containing "Forecast Graph" with a circular arrow button to its right.

At the bottom of the dialog are **OK** and **Cancel** buttons.

To save your graph as a grseg catalog entry, enter a two level name for the catalog or select Browse to open an Open dialog. Use it to select an existing library or assign a new one and then select a catalog to contain the graph. Click the Open button to open the catalog and close the dialog. Then enter a graphics entry name (eight characters or less) and a label or accept the defaults and click the OK button to save the graph.

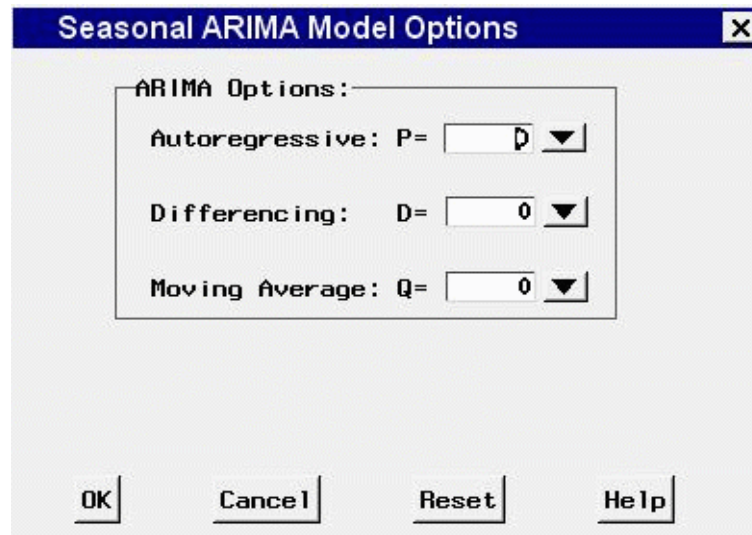

External file output takes advantage of the Output Delivery System (ODS) and is designed primarily for creating gif images and HTML for Web reporting. You can build a set of Web pages that contain graphs and use the Results window to view and organize them. To use this feature, check Save External File in the External File Output box. To set ODS options, click Results Preferences, then select the Results tab in the Preferences dialog.

If you have previously saved graphs of the current type, the system remembers your previous labels and titles. To reuse them, click the arrow button to the right of each of these window fields.

Use the Customize button if you need to specify the name of a custom macro that contains ODS statements. The default macro simply runs the GREPLAY procedure. Users familiar with ODS might want to add statements to the macro to customize the type and organization of output files produced.

Seasonal ARIMA Model Options Window

Use the Seasonal ARIMA Model Options window to specify the autoregressive, differencing, and moving-average orders for the seasonal part of a model defined by using the Custom Model Specification window. Access it by selecting “Seasonal ARIMA...” from the Seasonal Model combo box of that window.

Controls and Fields

ARIMA Options

Use these combo boxes to specify the orders of the ARIMA model. You can either type in a value or click the combo box arrow to select from a pop-up list.

Autoregressive

defines the order of the seasonal autoregressive part of the model.

Differencing

defines the order of seasonal differencing.

Moving Average

defines the order of the seasonal moving-average term.

OK

closes the Seasonal ARIMA Model Options window and returns to the Custom Model Specification window.

Cancel

closes the Seasonal ARIMA Model Options window and returns to the Custom Model Specification window, discarding any changes made.

Reset

resets all options to their initial values upon entry to the window.

Series Diagnostics Window

Use the Series Diagnostics window to set options to limit the kinds of forecasting models considered for the series according to series characteristics. Access it by selecting “Diagnose Series” from the Tools menu in the Develop Models, Manage Project, and Time Series Viewer window menu bars. You can let the system diagnose the series characteristics automatically or you can specify series characteristics according to your judgment by using the radio buttons.

Series Diagnostics

Series:

Series Characteristics:

Log Transform: ☐ Yes ☐ No ☒ Maybe

Trend: ☐ Yes ☐ No ☒ Maybe

Seasonality: ☐ Yes ☐ No ☒ Maybe

For each of the options Log Transform, Trend, and Seasonality, the value “Yes” means that only models appropriate for series with that characteristic should be considered. The value “No” means that only models appropriate for series without that characteristic should be considered. The value “Maybe” means that models should be considered without regard for that characteristic.

Controls and Fields

Series

is the name and variable label of the current series.

Series Characteristics

Log Transform

specifies whether forecasting models with or without a logarithmic series transformation are appropriate for the series.

Trend

specifies whether forecasting models with or without a trend component are appropriate for the series.

Seasonality

specifies whether forecasting models with or without a seasonal component are appropriate for the series.

Automatic Series Diagnostics

performs the automatic series diagnostic process. The options Log Transform, Trend, and Seasonality are set according to the results of statistical tests.

OK

closes the Series Diagnostics window.

Cancel

closes the Series Diagnostics window without changing the series diagnostics options. Any options you specified are lost.

Reset

resets all options to their initial values upon entry to the Series Diagnostics window.

Clear

resets all options to their default values.

Series Selection Window

Use this resizable window to select a time series variable by specifying a library, a SAS data set or view, and a variable. These selections can be made by typing, by selecting from lists, or by a combination of the two. In addition, you can control the time ID variable and time interval, and you can browse the data set or view plots of the series from this window.

Series Selection

Library: Data Set:
Variable:

Libraries		SAS Data Sets	
SASHELP	V7	TABLE	
SASUSER	V7	USECON	

Time Series Variables	
HSIFAM	Housing Starts, One-family structures
HSTOTAL	Housing Starts, Total Private
NONDUR	Sales: Nondurable Goods Industries Total
PETROL	Sales: Petroleum and Coal Products

Time ID:

Interval:

This window appears automatically when you select the View Series Graphically or Develop Models buttons in the Time Series Forecasting window and no series has been selected, and when you open the Time Series Viewer as a standalone tool. It is also invoked by using the Browse button in the Develop Models window.

The system requires that series names be unique for each frequency (interval) within the forecasting project. If you select a series from the current input data set that already exists in the project with the same interval but a different input data set name, the system warns you and gives you the option to cancel the selection, to refit all models associated with the series by using the data from the current input data set, to delete the models for the series, or to inherit the existing models.

Controls and Fields

Library

is a SAS libname assigned within the current SAS session. If you know the libname associated with the data set of interest, you can type it in this field and press Return. If it is a valid choice, it will appear in the libraries list and will be highlighted. The SAS Data Sets list will be populated with data sets associated with that libname.

Data Set

is the name of a SAS data set (data file or data view) that resides under the selected libname. If you know the name, you can type it in and press Return. If it is a valid choice, it will appear in the SAS Data Sets list and will be highlighted, and the Time Series Variables list will be populated with the numeric variables in the data set.

Variable

is the name of a numeric variable contained in the selected data set. You can type the variable name in this field or you can select the variable with the mouse from the Time Series Variables list.

Time ID

is the name of the ID variable for the input data set. To specify the ID variable, you can type the ID variable name in this field or click the Select button.

Select button

opens the Time ID Variable Specification window to let you select an existing variable in the data set as the Time ID.

Create button

opens a menu of methods for creating a time ID variable for the input data set. Use this feature if the data set does not already contain a valid time ID variable.

Interval

is the time interval between observations (data frequency) in the selected data set. If the interval is not automatically filled in by the system, you can type in an interval name or select one from the pop-up list. For more information about intervals, see Chapter 4, “[Date Intervals, Formats, and Functions](#),” in this book.

OK

This button is present when you have selected “Develop Models” from the Time Series Forecasting window. It closes the Series Selection window and makes the selected series the current series.

Close

If you have selected the View Series Graphically icon from the Time Series Forecasting window, this

button returns you to that window. If you have selected a series, it remains selected as the current series.

If you are using the Time Series Viewer as a standalone application, this button closes the application.

Cancel

This button is present when you have selected “Develop Models” from the Time Series Forecasting window. It closes the Series Selection window without applying any selections made.

Reset

resets the fields to their initial values at entry to the window.

Table

opens a Viewtable window for browsing the selected data set. This can assist you in locating the variable containing data you are looking for.

Graph

opens the Time Series Viewer window to display the selected time series variable. You can switch to a different series in the Series Selection window without closing the Time Series Viewer window. Position the windows so they are both visible, or use the Next Viewer toolbar icon or F12 function key to switch between windows.

Refresh

updates all fields and lists on the window. If you assign a new libname without exiting the Series Selection window, use the refresh action to update the Libraries list so that it will include the newly assigned libname. Also use the Refresh action to update the variables list if the input data set is changed.

Selection Lists

Libraries

displays a list of currently assigned libnames. You can select a libname by clicking it, which is equivalent to typing its name in the Library field. If you cannot locate the library or directory you are interested in, go to the SAS Explorer window, select “New” from the File menu, then select “Library” and “OK.” This opens the New Library dialog window. You also assign a libname by submitting a libname statement from the Editor window. Select the Refresh button to make the new libname available in the libraries list.

SAS Data Sets

displays a list of the SAS data sets (data files or data views) located under the selected libname. You can select one of these by clicking it, which is equivalent to typing its name in the Data Set field.

Time Series Variables

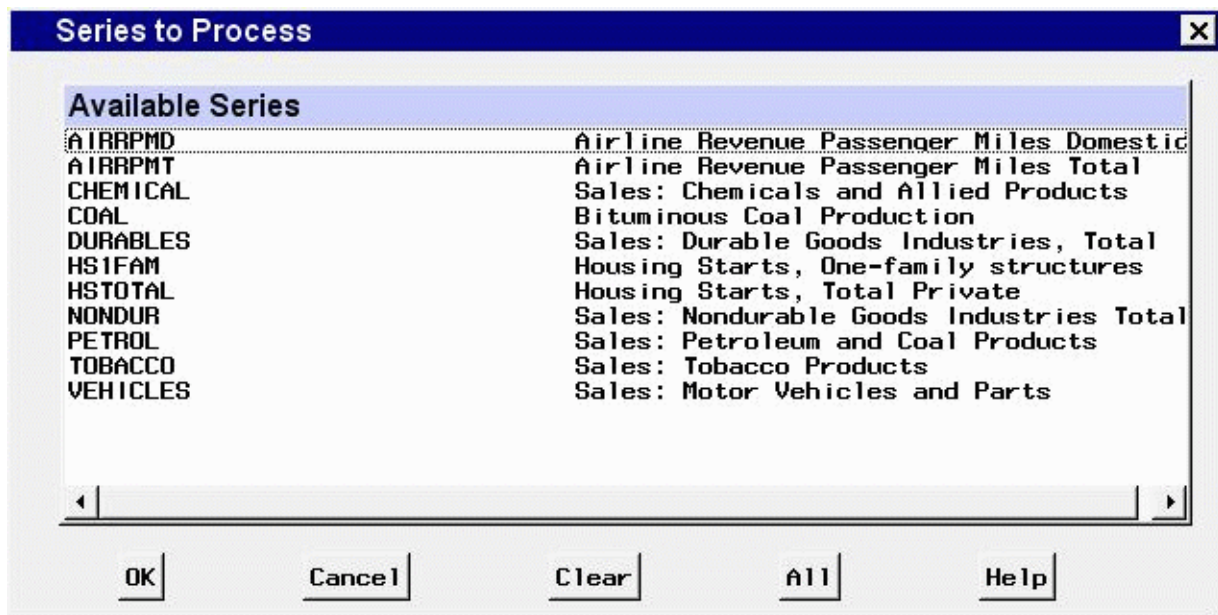

displays a list of numeric variables contained within the selected data set. You can select one of these by clicking it, which is equivalent to typing its name in the Variable field. You can double-click a series to select it and exit the window.

Series to Process Window

Use the Series to Process window to select series for model fitting or forecasting. Access it by using the Select button in the Automatic Model Fitting and Produce Forecasts windows. Hold down the shift key or drag with the left mouse button for multiple selections. Use the control key for noncontiguous multiple selections. Once you make selections and select OK, the number of selected series and their names are listed in the Series to Process field of the calling window (with ellipses if not all the names will fit).

When invoked from Automatic Model Fitting, the Series to Process window shows all the numeric variables in the input data set except the time ID variable. These are the series which are currently available for model fitting.

When invoked from Produce Forecasts, the Series to Process window shows all the series in the input data set for which models have been fit. These are the series which are currently available for forecasting.

Controls and Fields

OK

closes the window and applies the series selection(s) which have been made. At least one series must be selected.

Cancel

closes the window, ignoring series selections which have been made, if any.

Clear

deselects all series in the selection list.

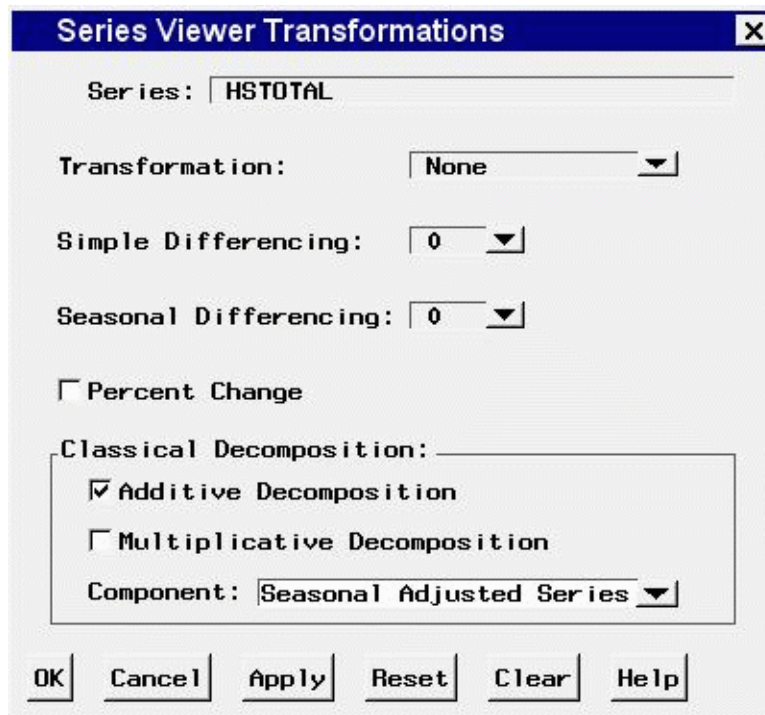

All

selects all series in the selection list.

Series Viewer Transformations Window

Use the Series Viewer Transformations window to view plots of transformations of the current series in the Time Series Viewer window. It provides a larger set of transformations than those available from the viewer window's toolbar. It is invoked by using "Other Transformations" under the Tools menu of the Time Series Viewer window. The options that you specify in this window are applied to the series displayed in the Time Series Viewer window when you select "OK" or "Apply."

Use the Apply button if you want to make repeated transformations to a series without having to close and reopen the Series Viewer Transformations window each time.

Controls and Fields

Series

is the variable name for the current time series.

Transformation

is the transformation applied to the time series displayed in the Time Series Viewer window. Select Log, Logistic, Square Root, Box-Cox, or none from the pop-up list.

Simple Differencing

is the order of differencing applied to the time series displayed in the Time Series Viewer window. Select a number from 0 to 5 from the pop-up list.

Seasonal Differencing

is the order of seasonal differencing applied to the time series displayed in the Time Series Viewer window. Select a number from 0 to 3 from the pop-up list.

Percent Change

is a check box that if selected displays the series in terms of percent change from the previous period.

Additive Decomposition

is a check box that produces a display of a selected series component derived by using additive decomposition.

Multiplicative Decomposition

is a check box that produces a display of a selected series component derived using multiplicative decomposition.

Component

selects a series component to display when either additive or multiplicative decomposition is turned on. You can display the seasonally adjusted component, the trend-cycle component, the seasonal component, or the irregular component—that is, the residual that remains after removal of the other components. The heading in the viewer window shows which component is currently displayed.

OK

applies the transformation options you selected to the series displayed in the Time Series Viewer window and closes the Series Viewer Transformations window.

Cancel

closes the Series Viewer Transformations window without changing the series displayed by the Time Series Viewer window.

Apply

applies the transformation options you selected to the series displayed in the Time Series Viewer window without closing the Series Viewer Transformations window.

Reset

resets the transformation options to their initial values upon entry to the Series Viewer Transformations window.

Clear

resets the transformation options to their default values (no transformations).

Smoothing Model Specification Window

Use the Smoothing Model Specification window to specify and fit exponential smoothing and Winters method models. Access it from the Develop Models window by using the Fit Model submenu of the Edit menu or from the pop-up menu when you click an empty area of the model table.

Smoothing Model Specification

Series:

Model:

Smoothing Methods:

- ☐ Simple Smoothing
- ☐ Double (Brown) Smoothing
- ☐ Seasonal Smoothing
- ☐ Linear (Holt) Smoothing
- ☐ Damped-Trend Smoothing
- ☐ Winters Method - Additive
- ☒ Winters Method - Multiplicative

Transformation: ▼

Smoothing Weights:

Level:

Trend:

Damping:

Season:

Bounds: ▼

Controls and Fields

Series

is the name and variable label of the current series.

Model

is a descriptive label for the model that you specify. You can type a label in this field or allow the system to provide a label. If you leave the label blank, a label is generated automatically based on the options you specify.

Smoothing Methods

Simple Smoothing

specifies simple (single) exponential smoothing.

Double (Brown) Smoothing

specifies double exponential smoothing by using Brown's one parameter model (single exponential smoothing applied twice).

Seasonal Smoothing

specifies seasonal exponential smoothing. (This is like Winters method with the trend term omitted.)

Linear (Holt) Smoothing

specifies exponential smoothing of both the series level and trend (Holt's two parameter model).

Damped-Trend Smoothing

specifies exponential smoothing of both the series level and trend with a trend damping weight.

Winters Method - Additive

specifies Winters method with additive seasonal factors.

Winters Method - Multiplicative

specifies Winters method with multiplicative seasonal factors.

Smoothing Weights

displays the values used for the smoothing weights. By default, the Smoothing Weights fields are set to “optimize,” which means that the system will compute the weight values that best fit the data. You can also type smoothing weight values in these fields.

Level

is the smoothing weight used for the level of the series.

Trend

is the smoothing weight used for the trend of the series.

Damping

is the smoothing weight used by the damped-trend method to damp the forecasted trend towards zero as the forecast horizon increases.

Season

is the smoothing weight used for the seasonal factors in Winters method and seasonal exponential smoothing.

Transformation

displays the series transformation specified for the model. When a transformation is specified, the model is fit to the transformed series, and forecasts are produced by applying the inverse transformation to the model predictions. Select *Log*, *Logistic*, *Square Root*, *Box-Cox*, or *None* from the pop-up list.

Bounds

displays the constraints imposed on the fitted smoothing weights. Select one of the following from the pop-up list:

Zero-One/Additive

sets the smoothing weight optimization region to the intersection of the region bounded by the intervals from zero (0.001) to one (0.999) and the additive invertible region. This is the default.

Zero-One Boundaries

sets the smoothing weight optimization region to the region bounded by the intervals from zero (0.001) to one (0.999).

Additive Invertible

sets the smoothing weight optimization region to the additive invertible region.

Unrestricted

sets the smoothing weight optimization region to be unbounded.

Custom

opens the *Smoothing Weights* window to enable you to customize the constraints for smoothing weights optimization.

OK

closes the Smoothing Model Specification window and fits the model you specified.

Cancel

closes the Smoothing Model Specification window without fitting the model. Any options you specified are lost.

Reset

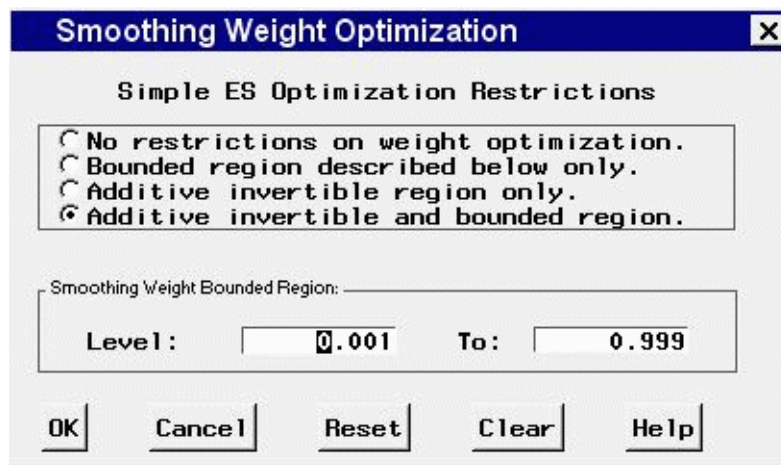

resets all options to their initial values upon entry to the window. This might be useful when editing an existing model specification; otherwise, Reset has the same function as Clear.

Clear

resets all options to their default values.

Smoothing Weight Optimization Window

Use the Smoothing Weight Optimization window to specify constraints for the automatic fitting of smoothing weights for exponential smoothing and Winters method models. Access it from the Smoothing Models Specification window when you select “Custom” in the “Bounds” combo box.

Controls and Fields

No restrictions

when selected, specifies unrestricted smoothing weights.

Bounded region

when selected, restricts the fitted smoothing weights to be within the bounds that you specify with the “Smoothing Weight Bounded Region” options.

Additive invertible region

when selected, restricts the fitted smoothing weights to be within the additive invertible region of the parameter space of the ARIMA model equivalent to the smoothing model. (See the section “[Smoothing Models](#)” on page 3107 for details.)

Additive invertible and bounded region

when selected, restricts the fitted smoothing weights to be both within the additive invertible region and within bounds that you specify.

Smoothing Weight Bounded Region

is a group of numeric entry fields that enable you to specify lower and upper limits on the fitted value

of each smoothing weight. The fields that appear in this part of the window depend on the kind of smoothing model that you specified.

OK

closes the window and sets the options that you specified.

Cancel

closes the window without changing any options. Any values you specified are lost.

Reset

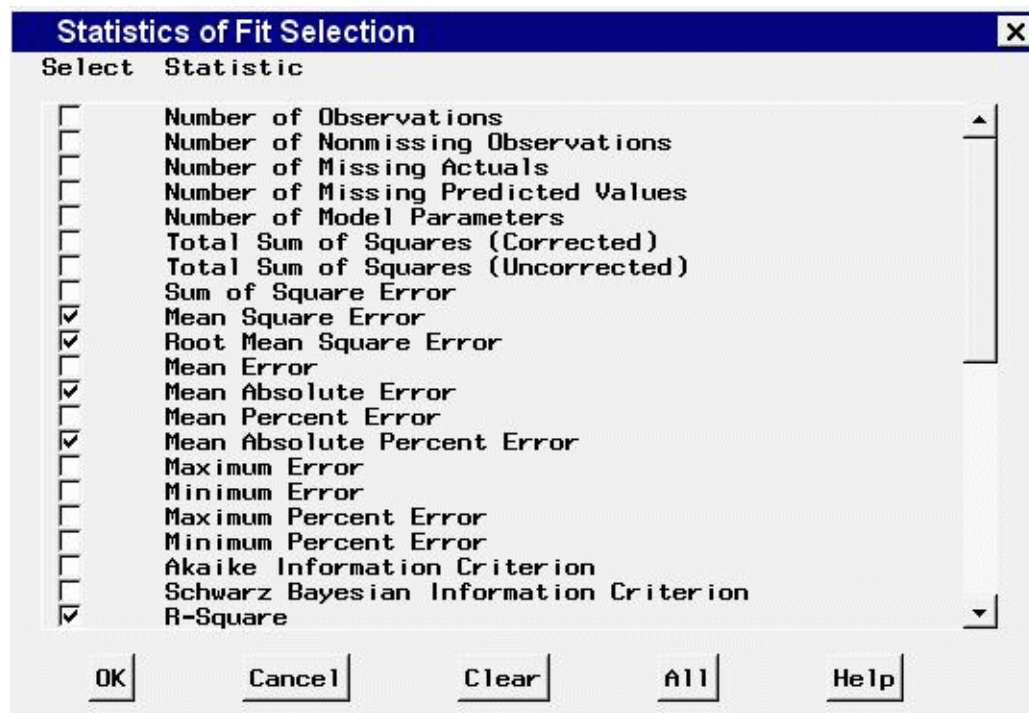

resets all options to their initial values upon entry to the window.

Clear

resets all options to their default values.

Statistics of Fit Selection Window

Use the Statistics of Fit Selection window to specify which of the available goodness-of-fit statistics are reported for models you fit and are available for selection as the model selection criterion used by the automatic selection process. This window is available under the Options menu in the Develop Models, Automatic Model Fitting, Produce Forecasts, and Model List windows, and from the Statistics button of the Model Fit Comparison window and Automatic Model Fitting results windows.

Controls and Fields

Select Statistics Table

list the available statistics. Select a row of the table to select or deselect the statistic shown in that row.

OK

closes the window and applies the selections made.

Cancel

closes the window without applying any selections.

Clear

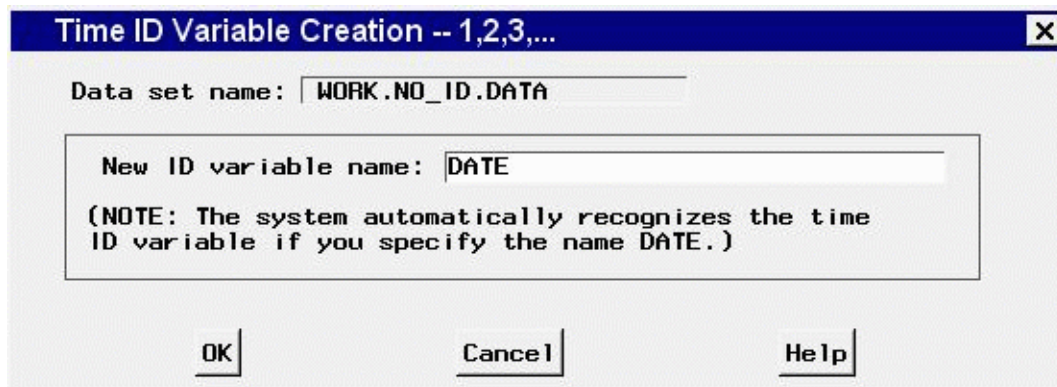

deselects all statistics.

All

selects all statistics.

Time ID Creation – 1,2,3 Window

Use the Time ID Creation – 1,2,3 window to add a time ID variable to an input data set with observation numbers as the ID values. The interval for the series will be 1. Use this approach if the data frequency does not match any of the system's date or date-time intervals, or if other methods of assigning a time ID do not work. To access this window, select "Create from observation numbers" from the Create pop-up list in any window where you can select a Time ID variable. For more information, see Chapter 4, "Date Intervals, Formats, and Functions," in this book.

Controls and Fields

Data set name

is the name of the input data set.

New ID variable name

is the name of the time ID variable to be created. You can type any valid SAS variable name in this field.

OK

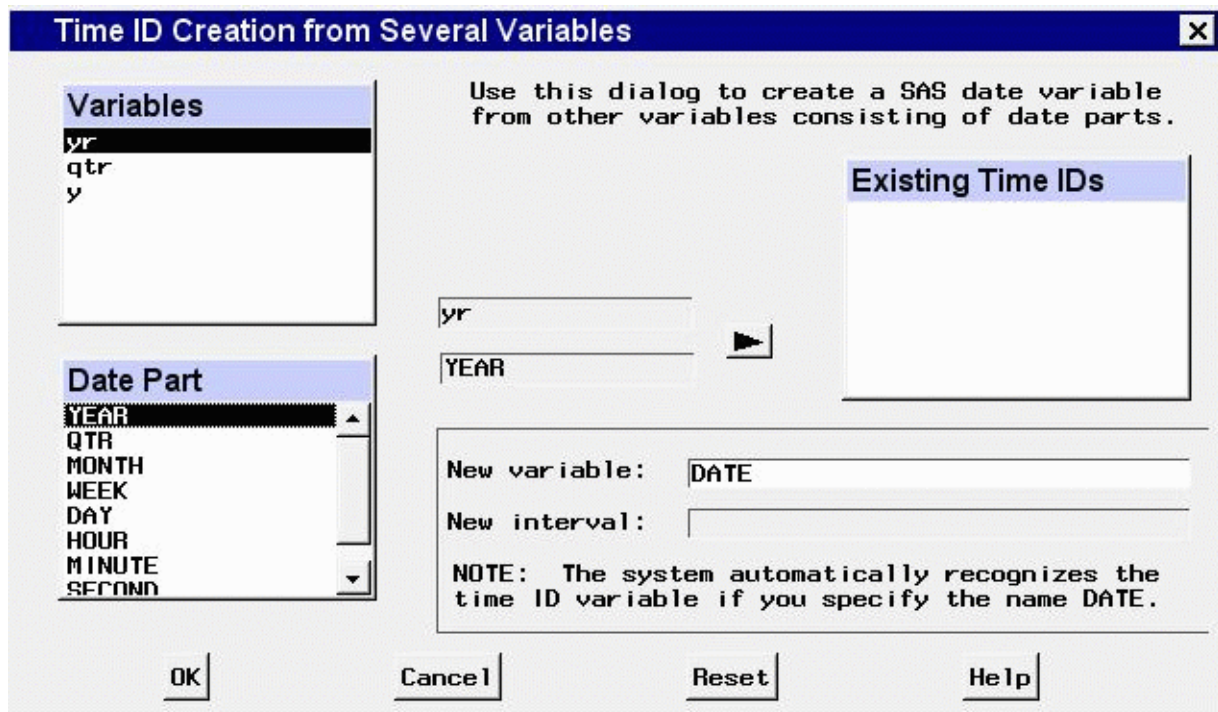

closes the window and proceeds to the next step in the time ID creation process.

Cancel

closes the window without creating a Time ID variable. Any options you specified are lost.

Time ID Creation from Several Variables Window

Use the Time ID Creation from Several Variables window to add a SAS date valued time ID variable to an input data set when the input data set already contains several dating variables, such as day, month, and year. To access this window, select “Create from existing variables” from the Create pop-up list in any window where you can select a Time ID variable. For more information, see Chapter 44, “Creating Time ID Variables.”

Controls and Fields

Variables

is a list of variables in the input data set. Select existing ID variables from this list.

Date Part

is a list of date parts that you can specify for the selected ID variable. For each ID variable that you select from the Variables list, select the Date Part value that describes what the values of the ID variable represent.

arrow button

moves the selected existing ID variable and date part specification to the “Existing Time IDs” list. Once you have done this, you can select another ID variable from the Variables list.

New variable

is the name of the time ID variable to be created. You can type any valid SAS variable name in this field.

New interval

is the time interval between observations in the input data set implied by the date part ID variables you have selected.

OK

closes the window and proceeds to the next step in the time ID creation process.

Cancel

closes the window without creating a time ID. Any options you specified are lost.

Reset

resets the options to their initial values upon entry to the window.

Time ID Creation from Starting Date Window

Use the Time ID Creation from Starting Date window to add a SAS date valued time ID variable to an input data set. This is a convenient way to add a time ID of any interval as long as you know the starting date of the series. To access this window, select “Create from starting date and frequency” from the Create pop-up list in any window where you can select a Time ID variable. For more information, see Chapter 44, “Creating Time ID Variables.”

Time ID Creation from Starting Date

Data set name:

Starting Date:

Interval:

New ID variable name:

(NOTE: The system automatically recognizes the time ID variable if you specify the name DATE.)

Controls and Fields

Data set name

is the name of the input data set.

Starting Date

is the starting date for the time series in the data set. Enter a date value in this field, using a form recognizable by a SAS date informat, for example, 1998:1, feb1997, or 03mar1998.

Interval

is the time interval between observations in the data set. Select an interval from the pop-up list.

New ID variable name

is the name of the time ID variable to be created. You can type any valid SAS variable name in this field.

OK

closes the window and proceeds to the next step in the time ID creation process.

Cancel

closes the window without changing the input data set. Any options you specified are lost.

Time ID Creation Using Informat Window

Use the Time ID Creation using Informat window to add a SAS date valued time ID variable to an input data set. Use this window if your data set contains a date variable that is stored as a character string. Using the appropriate SAS date informat, the date string is read in and used to create a date or date-time variable. To access this window, select “Create from existing variable/informat” from the Create pop-up list in any window where you can select a Time ID variable.

Time Id Creation using Informat [X]

Existing Variable and Informat: _____

Variable Name: _____ **Select...**

Informat: _____ ▼

First obs: _____

Date Value: _____

New ID variable name: **DATE**

NOTE: The system automatically recognizes the time ID variable if you specify the name DATE.

OK **Cancel** **Reset** **Help**

Controls and Fields

Variable Name

is the name of an existing ID variable in the input data set. Click the Select button to select a variable.

Select button

opens a list of variables in the input data set for you to select from.

Informat

is a SAS date or datetime informat for reading date or datetime value from the values of the specified existing ID variable. You can type in an informat or select one from the pop-up list.

First Obs

is the value of the variable you selected from the first observation in the data set, displayed here for convenience.

Date Value

is the SAS date or datetime value read from the first observation value that uses the informat that you specified.

New ID variable name

is the name of the time ID variable to be created. You can type any valid SAS variable name in this field.

OK

closes the window and proceeds to the next step in the time ID creation process.

Cancel

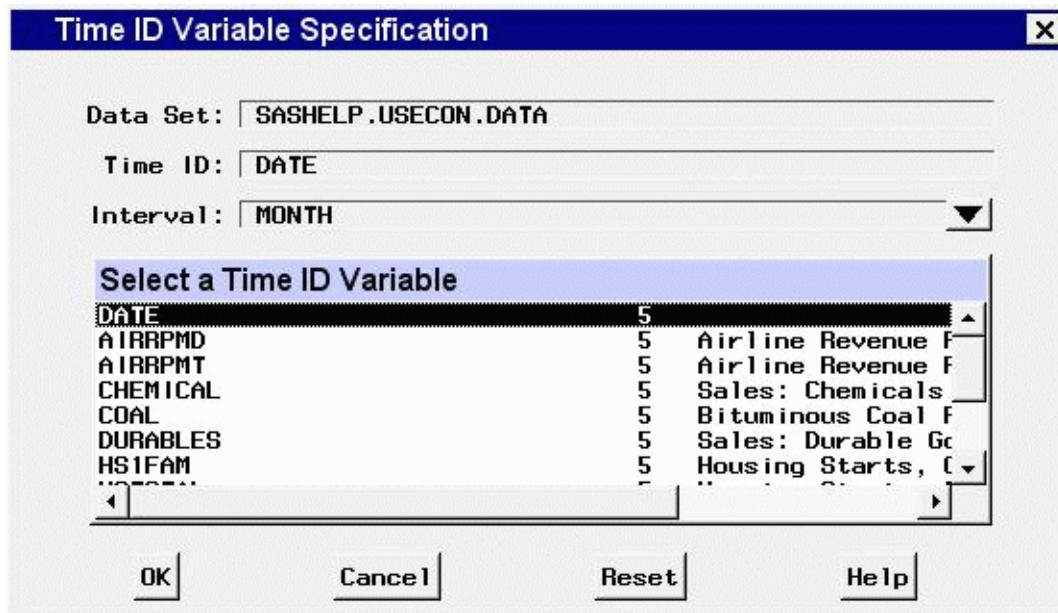

closes the window without changing the input data set. Any options you specified are lost.

Reset

resets the options to their initial values upon entry to the window.

Time ID Variable Specification Window

Use the Time ID Variable Specification window to specify a variable in the input data set that contains the SAS date or datetime value of each observation. You do not need to use this window if your time ID variable is named `date`, `time`, or `datetime`, since these are picked up automatically. Invoke the window from the Select button to the right of the Time ID field in the Data Set Selection, Automatic Model Fitting, Produce Forecasts, Series Selection, and Time Series Forecasting windows.

Controls and Fields

Data Set

is the name of the current input data set.

Time ID

is the name of the currently selected Time ID variable, if any.

Interval

is the time interval between observations (data frequency) in the input data set.

Select a Time ID Variable

is a selection list of variables in the input set. Select one variable to assign it as the Time ID variable.

OK

closes the window and retains the selection made, if it is a valid time ID.

Cancel

closes the window and ignores any selection made.

Reset

restores the time ID variable to the one assigned when the window was initially opened, if any.

Time Ranges Specification Window

Use the Time Ranges Specification window to control the period of fit and evaluation and the forecasting horizon. Invoke this window from the Options menu in the Develop Models, Manage Forecasting Project, and Model Viewer windows or the Set Ranges button in the Develop Models window.

Time Ranges Specification

Data Set:

Interval:

Series:

Time Ranges:

	From	To
Data Range:	<input type="text" value="JAN1975"/>	<input type="text" value="DEC1991"/>
Period of Fit:	<input type="text" value="JAN1975"/>	<input type="text" value="DEC1991"/>
Period of Evaluation:	<input type="text" value="JAN1975"/>	<input type="text" value="DEC1991"/>
Forecast Horizon:	<input type="text" value="12"/> <input type="text" value="Periods"/>	<input type="text" value="DEC1992"/>
Hold-out Sample:	<input type="text" value="0"/> <input type="text" value="Periods"/>	

OK Cancel Reset Clear Help

Controls and Fields

Data Set

is the name of the current input data set.

Interval

is the time interval (data frequency) for the input data set.

Series

is the variable name and label of the current time series.

Data Range

gives the date of the first and last nonmissing data values available for the current series in the input data set.

Period of Fit

gives the starting and ending dates of the period of fit. This is the time range used for estimating model parameters. By default, it is the same as the data range. You can type dates in these fields, or you can use the arrow buttons to the left and right of the date fields to decrement or increment the date values shown. Date values must be entered in a form recognized by a SAS date informat. (See *SAS Language Reference: Concepts* for information about SAS date informats.) The inner arrows increment by periods, the outer arrows increment by larger amounts, depending on the data interval.

Period of Evaluation

gives the starting and ending dates of the period of evaluation. This is the time range used for evaluating models in terms of statistics of fit. By default, it is the same as the data range. You can type dates in these fields, or you can use the control arrows to the left and right of the date fields to decrement or increment the date values shown. Date values must be entered in a form recognized by a SAS date informat. (See *SAS Language Reference: Concepts* for information about SAS date informats.) The

inner arrows increment by periods, the outer arrows increment by larger amounts, depending on the data interval.

Forecast Horizon

is the forecasting horizon expressed as a number of forecast periods or number of years (or number of weeks for daily data). You can type a number or select one from the pop-up list. The ending date for the forecast period is automatically updated when you change the number of forecasts periods.

Forecast Horizon - Units

indicates whether the Forecast Horizon value represents periods or years (or weeks for daily data).

Forecast Horizon Date Value

is the date of the last forecast observation. You can type a date in this field, or you can use the arrow buttons to the left and right of the date field to decrement or increment the date values shown. Date values must be entered in a form recognized by a SAS date informat. (See *SAS Language Reference: Concepts* for information about SAS date informats.) The Forecast Horizon is automatically updated when you change the ending date for the forecast period.

Hold-out Sample

specifies that a number of observations or years (or weeks) of data at the end of the data range are used for the period of evaluation with the remainder of data used as the period of fit. You can type a number in this field or select one from the pop-up list. When the hold-out sample value is changed, the Period of Fit and Period of Evaluation ranges are changed to reflect the hold-out sample specification.

Hold-out Sample - Units

indicates whether the hold-out sample field represents periods or years (or weeks for daily data).

OK

closes the window and stores the specified changes.

Cancel

closes the window without saving changes. Any options you specified are lost.

Reset

resets the options to their initial values upon entry to the window.

Clear

resets all options to their default values.

Time Series Forecasting Window

The Time Series Forecasting window is the main application window that appears when you invoke the Time Series Forecasting System. It enables you to specify a project file and an input data set and provides access to the other windows described in this chapter.

Time Series Forecasting

Project:

Description:

Data Set:

Time ID:

Interval:

Controls and Fields

Project

is the name of the SAS catalog entry in which forecasting models and other results will be stored and from which previously stored results are loaded into the forecasting system. You can specify the project by typing a SAS catalog entry name in this field or by selecting the Browse button to right of this field. If you specify the name of an existing catalog entry, the information in the project file is loaded. If you specify a one-level name, the catalog name is assumed to be `fmsproj` and the library is assumed to be `sasuser`. For example, `samproj` is equivalent to `sasuser.fmsproj.samproj`.

Project Browse button

opens the Forecasting Project File Selection window to enable you to select and load the project from a list of previously stored projects.

Description

is a descriptive label for the forecasting project. The description you type in this field will be stored with the catalog entry shown in the Project field.

Data Set

is the name of the current input data set. To specify the input data set, you can type the data set name in this field or use the Browse button to the right of the field.

Data set Browse button

opens the Data Set Selection window to enable you to select the input data set.

Time ID

is the name of the ID variable for the input data set. To specify the ID variable, you can type the ID variable name in this field or use the Select button. If the time ID variable is named `date`, `time`, or `datetime`, it is automatically picked up by the system.

Select button

opens the Time ID Variable Specification window.

Create button

opens a menu of choices of methods for creating a time ID variable for the input data set. Use this feature if the input data set does not already contain a valid time ID variable.

Interval

is the time interval between observations (data frequency) in the current input data set. If the interval is not automatically filled in, you can type an interval name or select one from the pop-up list. For more information about intervals, see the section “[Time Series Data Sets, ID Variables, and Time Intervals](#)” on page 2837.

View Series Graphically icon

opens the Time Series Viewer window to display plots of series in the current input data set.

View Data as a Table

opens a Viewtable window for browsing the selected input data set.

Develop Models

opens the Develop Models window to enable you to fit forecasting models to individual time series and choose the best models to use to produce the final forecasts of each series.

Fit Models Automatically

opens the Automatic Model Fitting window for applying the automatic model selection process to all series or to selected series in an input data set.

Produce Forecast

opens the Produce Forecasts window for producing forecasts for the series in the current input data set for which you have fit forecasting models.

Manage Projects

opens the Manage Forecasting Project window for viewing or editing information stored in projects.

Exit

closes the Time Series Forecasting system.

Help

accesses the help system.

Time Series Simulation Window

Use the Time Series Simulation window to create a data set of simulated series generated by ARIMA processes. Access this window from the Tools menu in the Develop Models and Manage Forecasting Project windows.

Time Series Simulation

Output Data Set:

Interval: <input type="text" value="WEEKDAY"/>	N Observations: <input type="text" value="60"/>
ID Name: <input type="text" value="DATE"/>	Starting Date: <input type="text" value="Mon, 1 Jan 90"/>
Seed: <input type="text" value="123456789"/>	Ending Date: <input type="text" value="Fri, 23 Mar 90"/>

Series to Generate

Controls and Fields

Output Data Set

is the name of the data set to be created. Type in a one-level or two-level SAS data set name.

Interval

is the time interval between observations (data frequency) in the simulated data set. Type in an interval name or select one from the pop-up list.

Seed

is the seed for the random number generator used to produce the simulated time series.

N Observations

is the number of time periods to simulate.

Starting Date

is the starting date for the simulated observations. Type in a date in a form recognizable by a SAS data informat, for example, 1998:1, feb1997, or 03mar1998.

Ending Date

is the ending date for the simulated observations. Type in a date in a form recognizable by a SAS data informat.

Series to Generate

is the list of variable names and ARIMA processes to simulate.

Add Series

opens the ARIMA Process Specification window to enable you to add entries to the Series to Generate list.

Delete Series

deletes selected (highlighted) entries from the Series to Generate list.

OK

closes the Time Series Simulation window and performs the specified simulations and creates the specified data set.

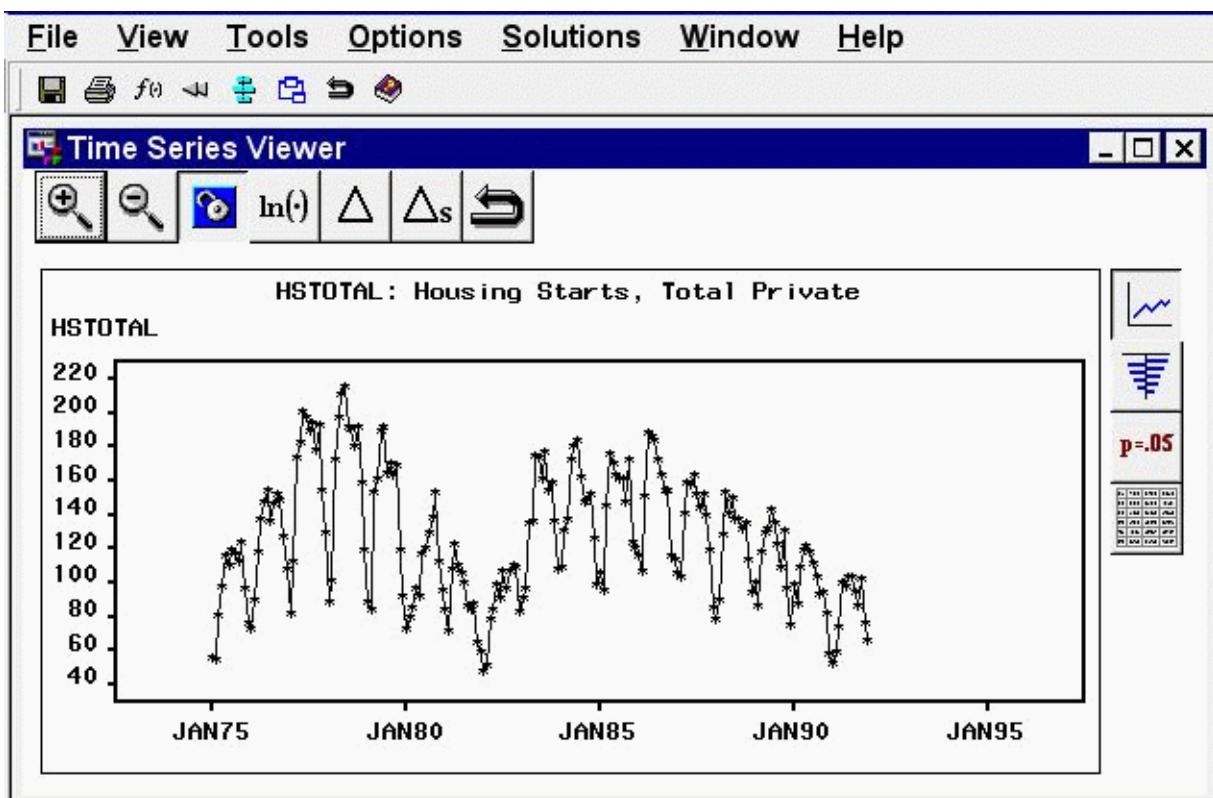

Cancel

closes the window without creating a simulated data set. Any options you specified are lost.

Time Series Viewer Window

Use the Time Series Viewer window to explore time series data using plots, transformations, statistical tests, and tables. It is available as a standalone application and as part of the Time Series Forecasting System. To use it as a standalone application, select it from the Analysis submenu of the Solutions menu, or use the `tsview` command (see Chapter 48, “[Command Reference](#),” in this book). To use it within the Time Series Forecasting System, select the View Series Graphically icon in the Time Series Forecasting, Develop Models, or Model List window, or select “Series” from the View menu of the Develop Models, Manage Project, or Model List window.

The various plots and tables available are referred to as *views*. The section “[View Selection Icons](#)” on page 3055 explains how to change the view.

The state of the Time Series Viewer window is controlled by the current series, the current series transformation specification, and the currently selected view. You can resize this window, and you can use other

windows without closing the Time Series Viewer window. You can explore a number of series conveniently by keeping the Series Selection window open. Each time you make a selection, the viewer window is updated to show the selected series. Keep both windows visible, or switch between them by using the Next Viewer toolbar icon or the F12 function key.

You can open multiple Time Series Viewer windows. This enables you to “freeze” a plot so you can come back to it later, or compare two plots side by side on your screen. To do this, unlink the viewer by using the Link/Unlink icon on the window’s toolbar or the corresponding item in the Tools menu. While the viewer window remains unlinked, it is not updated when other selections are made in the Series Selection window. Instead, when you select a series and click the Graph button, a new Time Series Viewer window is invoked. You can continue this process to open as many viewer windows as you want. The Next Viewer icon and corresponding F12 function key are useful for navigating between windows when they are not simultaneously visible on your screen.

A wide range of series transformations is available. Basic transformations are available from the window’s horizontal toolbar, and others are available by selecting “Other Transformations” from the Tools menu.

Horizontal Tool Bar

The Time Series Viewer window contains a horizontal toolbar with the following icons:

Zoom in

changes the mouse cursor into cross hairs that you can use with the left mouse button to drag out a region of the time series plot to zoom in on. In the Autocorrelations view and the White Noise and Stationarity Tests view, Zoom In reduces the number of lags displayed.

Zoom out

reverses the previous Zoom In action and expands the time range of the plot to show more of the series. In the Autocorrelations view and the White Noise and Stationarity Tests view, Zoom Out increases the number of lags displayed.

Link/Unlink viewer

disconnects or connects the Time Series Viewer window to the window in which the series was selected. When the Viewer is linked, it always shows the current series. If you select another series, linked Viewers are updated. Unlinking a Viewer freezes its current state, and changing the current series has no effect on the Viewer’s display. The View Series action creates a new Series Viewer window if there is no linked Viewer. By using the unlink feature, you can open several Time Series Viewer windows and display several different series simultaneously.

Log Transform

applies a log transform to the current view. This can be combined with other transformations; the current transformations are shown in the title.

Difference

applies a simple difference to the current view. This can be combined with other transformations; the current transformations are shown in the title.

Seasonal Difference

applies a seasonal difference to the current view. For example, if the data are monthly, the seasonal cycle is one year. Each value has subtracted from it the value from one year previous. This can be combined with other transformations; the current transformations are shown in the title.

Close

closes the Time Series Viewer window and returns to the window from which it was invoked.

Vertical Toolbar View Selection Icons

At the right-hand side of the Time Series Viewer window is a vertical toolbar used to select the kind of plot or table that the Viewer displays.

Series

displays a plot of series values over time.

Autocorrelations

displays plots of the sample autocorrelations, partial autocorrelation, and inverse autocorrelation functions for the series, with lines overlaid at plus and minus two standard errors.

White Noise and Stationarity Tests

displays horizontal bar charts that represent results of white noise and stationarity tests. The first bar chart shows the significance probability of the Ljung-Box chi-square statistic computed on autocorrelations up to the given lag. Longer bars favor rejection of the null hypothesis that the series is white noise. Click any of the bars to display an interpretation.

The second bar chart shows tests of stationarity, where longer bars favor the conclusion that the series is stationary. Each bar displays the significance probability of the augmented Dickey-Fuller unit root test to the given autoregressive lag. Long bars represent higher levels of significance against the null hypothesis that the series contains a unit root. For seasonal data, a third bar chart appears for seasonal root tests. Click any of the bars to display an interpretation.

Data Table

displays a data table containing the values in the input data set.

Menu Bar

File**Save Graph**

saves the current plot as a SAS/GRAPH grseg catalog entry in a default or most recently specified catalog. This item is unavailable in the Data Table view.

Save Graph as

saves the current graph as a SAS/GRAPH grseg catalog entry in a SAS catalog that you specify and/or as an Output Delivery System (ODS) object. By default, an HTML page is created, with the graph embedded as a gif image. This item is unavailable in the Data Table view.

Save Data

saves the data displayed in the viewer window to an output SAS data set. This item is unavailable in the Series view.

Save Data as

saves the data in a SAS data set that you specify and/or as an Output Delivery System (ODS) object. By default, an HTML page is created, with the data displayed as a table.

Import Data

is available if you license SAS/Access software. It opens an Import Wizard, which you can use to import your data from an external spreadsheet or data base to a SAS data set for use in the Time Series Forecasting System.

Export Data

is available if you license SAS/Access software. It opens an Export Wizard, which you can use to export a SAS data set, such as a forecast data set created with the Time Series Forecasting System, to an external spreadsheet or data base.

Print Graph

prints the plot displayed in the viewer window. This item is unavailable in the Data Table view.

Print Data

prints the data displayed in the viewer window. This item is unavailable in the Series view.

Print Setup

opens the Print Setup window, which allows you to access your operating system print setup.

Print Preview

opens a preview window to show how your plots will look when printed.

Close

closes the Time Series Viewer window and returns to the window from which it was invoked.

View**Series**

displays a plot of series values over time. This is the same as the Series icon in the vertical toolbar.

Autocorrelations

displays plots of the sample autocorrelation, partial autocorrelation, and inverse autocorrelation functions for the series. This is the same as the Autocorrelations icon in the vertical toolbar.

White Noise and Stationarity Tests

displays horizontal bar charts representing results of white noise and stationarity tests. This is the same as the White Noise and Stationarity Tests icon in the vertical toolbar.

Data Table

displays a data table containing the values in the input data set. This is the same as the Data Table icon in the vertical toolbar.

Zoom In

zooms the display. This is the same as the Zoom In icon in the window's horizontal toolbar.

Zoom Out

undoes the last zoom in action. This is the same as the Zoom Out icon in the window's horizontal toolbar.

Zoom Way Out

reverses all previous Zoom In actions and expands the time range of the plot to show all of the series, or shows the maximum number of lags in the Autocorrelations View or the White Noise and Stationarity Tests view.

Tools

Log Transform

applies a log transformation. This is the same as the Log Transform icon in the window's horizontal toolbar.

Difference

applies simple differencing. This is the same as the Difference icon in the window's horizontal toolbar.

Seasonal Difference

applies seasonal differencing. This is the same as the Seasonal Difference icon in the window's horizontal toolbar.

Other Transformations

opens the Series Viewer Transformations window to enable you to apply a wide range of transformations.

Diagnose Series

opens the Series Diagnostics window to determine the kinds of forecasting models appropriate for the current series.

Define Interventions

opens the Interventions for Series window to enable you to edit or add intervention effects for use in modeling the current series.

Link Viewer

connects or disconnects the Time Series Viewer window to the window from which series are selected. This is the same as the Link item in the window's horizontal toolbar.

Options

Number of Lags

opens a window to let you specify the number of lags shown in the Autocorrelations view and the White Noise and Stationarity Tests view. You can also use the Zoom In and Zoom Out actions to control the number of lags displayed.

Correlation Probabilities

controls whether the bar charts in the Autocorrelations view represent significance probabilities or values of the correlation coefficient. A check mark or filled check box next to this item indicates that significance probabilities are displayed. In each case the bar graph horizontal axis label changes accordingly.

Mouse Button Actions

You can examine the data value and date of individual points in the Series view by clicking them. The date and value are displayed in a box that appears in the upper right corner of the Viewer window. Click the mouse elsewhere or select any action to dismiss the data box.

You can examine the values of the bars and confidence limits at different lags in the Autocorrelations view by clicking individual bars in the vertical bar charts.

You can display an interpretation of the tests in the White Noise and Stationarity Tests view by clicking the bars.

When you select the Zoom In action, you can use the mouse to define a region of the graph to take a closer look at. Position the mouse cursor at one corner of the region, press the left mouse button, and move the mouse cursor to the opposite corner of the region while holding the left mouse button down. When you release the mouse button, the plot is redrawn to show an expanded view of the data within the region you selected.

This chapter provides computational details on several aspects of the Time Series Forecasting System.

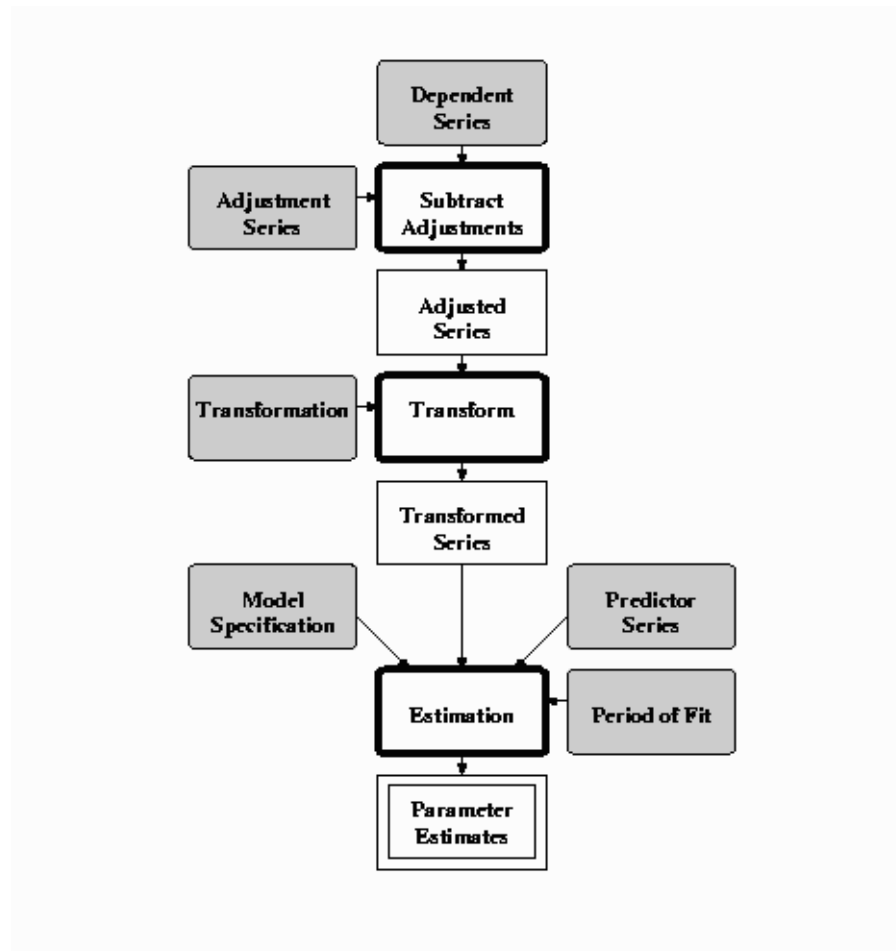

Forecasting Process Summary

This section summarizes the forecasting process.

Parameter Estimation

The parameter estimation process for ARIMA and smoothing models is described graphically in [Figure 50.1](#).

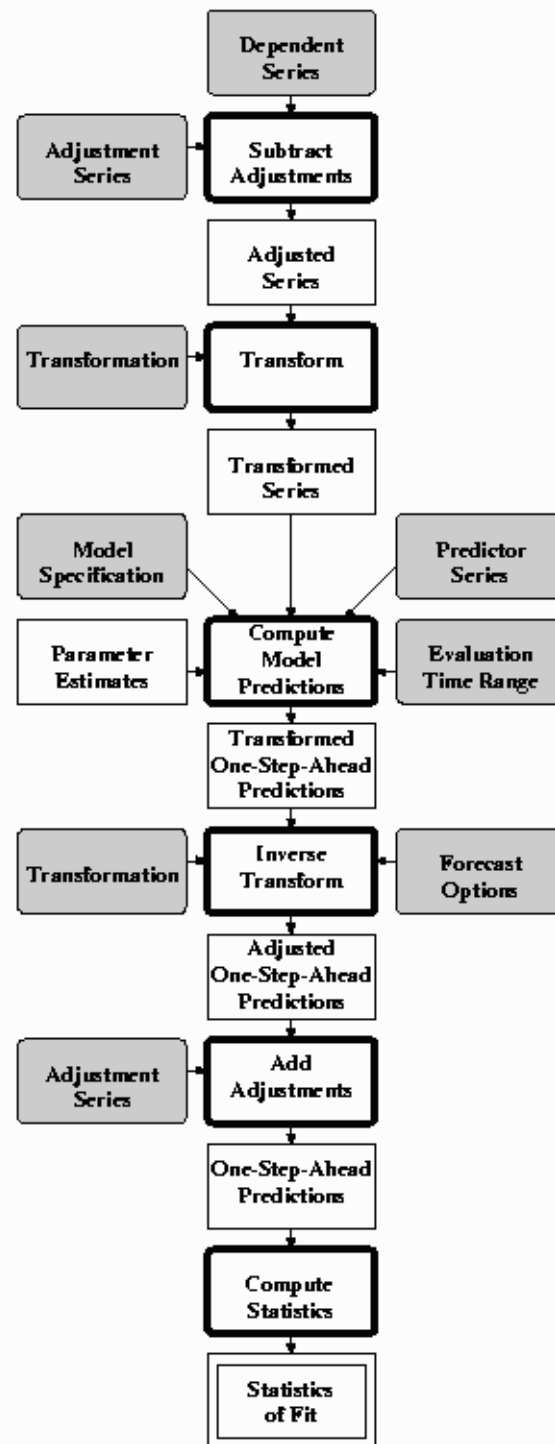

Figure 50.1 Model Fitting Flow Diagram

The specification of smoothing and ARIMA models is described in Chapter 45, “[Specifying Forecasting Models](#).” Computational details for these kinds of models are provided in the following sections “[Smoothing Models](#)” on page 3107 and “[ARIMA Models](#)” on page 3118. The results of the parameter estimation process are displayed in the Parameter Estimates table of the Model Viewer windows along with the estimate of the model variance and the final smoothing state.

Model Evaluation

The model evaluation process is described graphically in [Figure 50.2](#).

Figure 50.2 Model Evaluation Flow Diagram

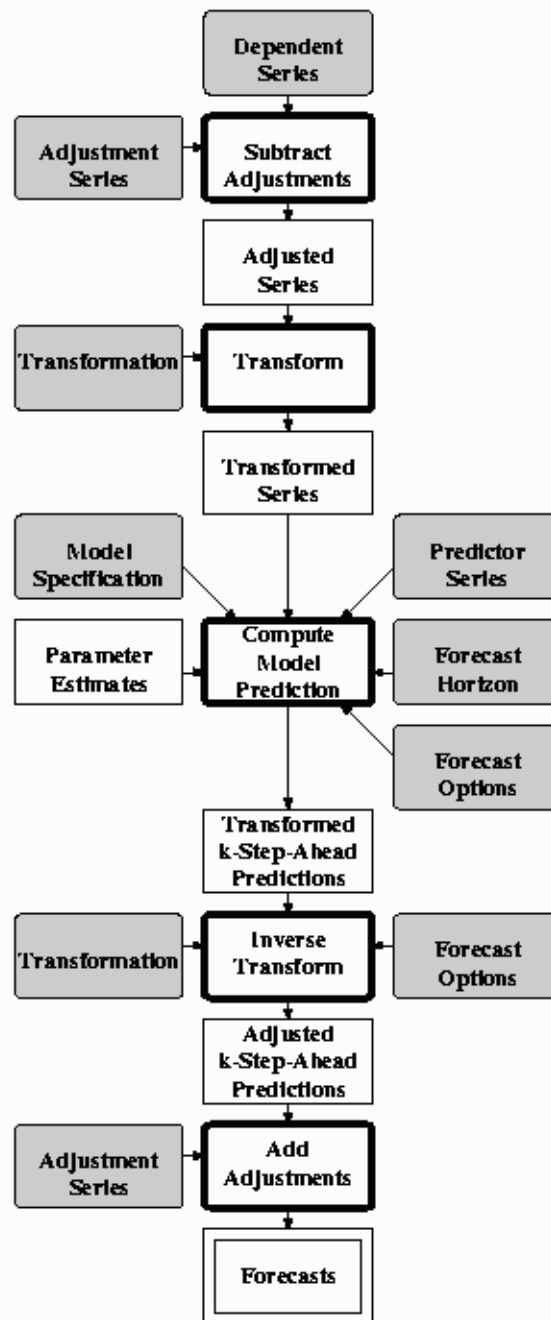

Model evaluation is based on the one-step-ahead prediction errors for observations within the period of evaluation. The one-step-ahead predictions are generated from the model specification and parameter estimates.

The predictions are inverse transformed (median or mean) and adjustments are removed. The prediction errors (the difference of the dependent series and the predictions) are used to compute the statistics of fit, which are described in the section “[Series Diagnostic Tests](#)” on page 3125. The results generated by the evaluation process are displayed in the Statistics of Fit table of the Model Viewer window.

Forecasting

The forecasting generation process is described graphically in Figure 50.3.

Figure 50.3 Forecasting Flow Diagram

The forecasting process is similar to the model evaluation process described in the preceding section, except that k -step-ahead predictions are made from the end of the data through the specified forecast horizon, and prediction standard errors and confidence limits are calculated. The forecasts and confidence limits are displayed in the Forecast plot or table of the Model Viewer window.

Forecast Combination Models

This section discusses the computation of predicted values and confidence limits for forecast combination models. See Chapter 45, “[Specifying Forecasting Models](#),” for information about how to specify forecast combination models and their combining weights.

Given the response time series $\{y_t : 1 \leq t \leq n\}$ with previously generated forecasts for the m component models, a combined forecast is created from the component forecasts as follows:

$$\begin{aligned} \text{Predictions:} \quad & \hat{y}_t = \sum_{i=1}^m w_i \hat{y}_{i,t} \\ \text{Prediction Errors:} \quad & \hat{e}_t = y_t - \hat{y}_t \end{aligned}$$

where $\hat{y}_{i,t}$ are the forecasts of the component models and w_i are the combining weights.

The estimate of the root mean square prediction error and forecast confidence limits for the combined forecast are computed by assuming independence of the prediction errors of the component forecasts, as follows:

$$\begin{aligned} \text{Standard Errors:} \quad & \hat{\sigma}_t = \sqrt{\sum_{i=1}^m w_i^2 \hat{\sigma}_{i,t}^2} \\ \text{Confidence Limits:} \quad & \pm \hat{\sigma}_t Z_{\alpha/2} \end{aligned}$$

where $\hat{\sigma}_{i,t}$ are the estimated root mean square prediction errors for the component models, α is the confidence limit width, $1-\alpha$ is the confidence level, and $Z_{\alpha/2}$ is the $\frac{\alpha}{2}$ quantile of the standard normal distribution.

Since, in practice, there might be positive correlation between the prediction errors of the component forecasts, these confidence limits may be too narrow.

External or User-Supplied Forecasts

This section discusses the computation of predicted values and confidence limits for external forecast models.

Given a response time series y_t and external forecast series \hat{y}_t , the prediction errors are computed as $\hat{e}_t = y_t - \hat{y}_t$ for those t for which both y_t and \hat{y}_t are nonmissing. The mean squared error (MSE) is computed from the prediction errors.

The variance of the k -step-ahead prediction errors is set to k times the MSE. From these variances, the standard errors and confidence limits are computed in the usual way. If the supplied predictions contain so many missing values within the time range of the response series that the MSE estimate cannot be computed, the confidence limits, standard errors, and statistics of fit are set to missing.

Adjustments

Adjustment predictors are subtracted from the response time series prior to model parameter estimation, evaluation, and forecasting. After the predictions of the adjusted response time series are obtained from the forecasting model, the adjustments are added back to produce the forecasts.

If y_t is the response time series and $X_{i,t}$, $1 \leq i \leq m$ are m adjustment predictor series, then the adjusted response series w_t is

$$w_t = y_t - \sum_{i=1}^m X_{i,t}$$

Parameter estimation for the model is performed by using the adjusted response time series w_t . The forecasts \hat{w}_t of w_t are adjusted to obtain the forecasts \hat{y}_t of y_t .

$$\hat{y}_t = \hat{w}_t + \sum_{i=1}^m X_{i,t}$$

Missing values in an adjustment series are ignored in these computations.

Series Transformations

For pure ARIMA models, transforming the response time series can aid in obtaining stationary noise series. For general ARIMA models with inputs, transforming the response time series or one or more of the input time series can provide a better model fit. Similarly, the fit of smoothing models can improve when the response series is transformed.

There are four transformations available, for strictly positive series only. Let $y_t > 0$ be the original time series, and let w_t be the transformed series. The transformations are defined as follows:

Log is the logarithmic transformation,

$$w_t = \ln(y_t)$$

Logistic is the logistic transformation,

$$w_t = \ln(cy_t/(1 - cy_t))$$

where the scaling factor c is

$$c = (1 - 10^{-6})10^{-\text{ceil}(\log_{10}(\max(y_t)))}$$

and $\text{ceil}(x)$ is the smallest integer greater than or equal to x .

Square Root is the square root transformation,

$$w_t = \sqrt{y_t}$$

Box Cox is the Box-Cox transformation,

$$w_t = \begin{cases} \frac{y_t^\lambda - 1}{\lambda}, & \lambda \neq 0 \\ \ln(y_t), & \lambda = 0 \end{cases}$$

Parameter estimation is performed by using the transformed series. The transformed model predictions and confidence limits are then obtained from the transformed time series and these parameter estimates.

The transformed model predictions \hat{w}_t are used to obtain either the minimum mean absolute error (MMAE) or minimum mean squared error (MMSE) predictions \hat{y}_t , depending on the setting of the forecast options. The model is then evaluated based on the residuals of the original time series and these predictions. The transformed model confidence limits are inverse-transformed to obtain the forecast confidence limits.

Predictions for Transformed Models

Since the transformations described in the previous section are monotonic, applying the inverse-transformation to the transformed model predictions results in the *median* of the conditional probability density function at each point in time. This is the minimum mean absolute error (MMAE) prediction.

If $w_t = F(y_t)$ is the transform with inverse-transform $y_t = F^{-1}(w_t)$, then

$$\text{median}(\hat{y}_t) = F^{-1}(E[w_t]) = F^{-1}(\hat{w}_t)$$

The minimum mean squared error (MMSE) predictions are the *mean* of the conditional probability density function at each point in time. Assuming that the prediction errors are normally distributed with variance σ_t^2 , the MMSE predictions for each of the transformations are as follows:

Log is the conditional expectation of inverse-logarithmic transformation,

$$\hat{y}_t = E[e^{w_t}] = \exp(\hat{w}_t + \sigma_t^2/2)$$

Logistic is the conditional expectation of inverse-logistic transformation,

$$\hat{y}_t = E\left[\frac{1}{c(1 + \exp(-w_t))}\right]$$

where the scaling factor $c = (1 - e^{-6})10^{-\text{ceil}(\log_{10}(\max(y_t)))}$.

Square Root is the conditional expectation of the inverse-square root transformation,

$$\hat{y}_t = E[w_t^2] = \hat{w}_t^2 + \sigma_t^2$$

Box Cox is the conditional expectation of the inverse Box-Cox transformation,

$$\hat{y}_t = \begin{cases} E[(\lambda w_t + 1)^{1/\lambda}], & \lambda \neq 0 \\ E[e^{w_t}] = \exp(\hat{w}_t + \frac{1}{2}\sigma_t^2), & \lambda = 0 \end{cases}$$

The expectations of the inverse logistic and Box-Cox ($\lambda \neq 0$) transformations do not generally have explicit solutions and are computed by using numerical integration.

Smoothing Models

This section details the computations performed for the exponential smoothing and Winters method forecasting models.

Smoothing Model Calculations

The descriptions and properties of various smoothing methods can be found in Gardner (1985), Chatfield (1978), and Bowerman and O'Connell (1979). The following section summarizes the smoothing model computations.

Given a time series $\{Y_t : 1 \leq t \leq n\}$, the underlying model assumed by the smoothing models has the following (additive seasonal) form:

$$Y_t = \mu_t + \beta_t t + s_p(t) + \epsilon_t$$

where

μ_t	represents the time-varying mean term.
β_t	represents the time-varying slope.
$s_p(t)$	represents the time-varying seasonal contribution for one of the p seasons.
ϵ_t	are disturbances.

For smoothing models without trend terms, $\beta_t = 0$; and for smoothing models without seasonal terms, $s_p(t) = 0$. Each smoothing model is described in the following sections.

At each time t , the smoothing models estimate the time-varying components described above with the *smoothing state*. After initialization, the smoothing state is updated for each observation using the *smoothing equations*. The smoothing state at the last nonmissing observation is used for predictions.

Smoothing State and Smoothing Equations

Depending on the smoothing model, the *smoothing state* at time t consists of the following:

- L_t is a smoothed level that estimates μ_t .
- T_t is a smoothed trend that estimates β_t .
- S_{t-j} , $j = 0, \dots, p-1$, are seasonal factors that estimate $s_p(t)$.

The smoothing process starts with an initial estimate of the smoothing state, which is subsequently updated for each observation by using the *smoothing equations*.

The smoothing equations determine how the smoothing state changes as time progresses. Knowledge of the smoothing state at time $t-1$ and that of the time series value at time t uniquely determine the smoothing

state at time t . The *smoothing weights* determine the contribution of the previous smoothing state to the current smoothing state. The smoothing equations for each smoothing model are listed in the following sections.

Smoothing State Initialization

Given a time series $\{Y_t : 1 \leq t \leq n\}$, the smoothing process first computes the smoothing state for time $t = 1$. However, this computation requires an initial estimate of the smoothing state at time $t = 0$, even though no data exists at or before time $t = 0$.

An appropriate choice for the initial smoothing state is made by backcasting from time $t = n$ to $t = 1$ to obtain a prediction at $t = 0$. The initialization for the backcast is obtained by regression with constant and linear terms and seasonal dummies (additive or multiplicative) as appropriate for the smoothing model. For models with linear or seasonal terms, the estimates obtained by the regression are used for initial smoothed trend and seasonal factors; however, the initial smoothed level for backcasting is always set to the last observation, Y_n .

The smoothing state at time $t = 0$ obtained from the backcast is used to initialize the smoothing process from time $t = 1$ to $t = n$ (Chatfield and Yar 1988).

For models with seasonal terms, the smoothing state is normalized so that the seasonal factors S_{t-j} for $j = 0, \dots, p - 1$ sum to zero for models that assume additive seasonality and average to one for models (such as Winters method) that assume multiplicative seasonality.

Missing Values

When a missing value is encountered at time t , the smoothed values are updated using the *error-correction form* of the smoothing equations with the one-step-ahead prediction error, e_t , set to zero. The missing value is estimated using the one-step-ahead prediction at time $t - 1$, that is $\hat{Y}_{t-1}(1)$ (Aldrin 1989). The error-correction forms of each of the smoothing models are listed in the following sections.

Predictions and Prediction Errors

Predictions are made based on the last known smoothing state. Predictions made at time t for k steps ahead are denoted $\hat{Y}_t(k)$ and the associated prediction errors are denoted $e_t(k) = Y_{t+k} - \hat{Y}_t(k)$. The *prediction equation* for each smoothing model is listed in the following sections.

The *one-step-ahead predictions* refer to predictions made at time $t - 1$ for one time unit into the future—that is, $\hat{Y}_{t-1}(1)$. The *one-step-ahead prediction errors* are more simply denoted $e_t = e_{t-1}(1) = Y_t - \hat{Y}_{t-1}(1)$. The one-step-ahead prediction errors are also the model residuals, and the sum of squares of the one-step-ahead prediction errors is the objective function used in smoothing weight optimization.

The *variance of the prediction errors* are used to calculate the confidence limits (Sweet 1985, McKenzie 1986, Yar and Chatfield 1990, and Chatfield and Yar 1991). The equations for the variance of the prediction errors for each smoothing model are listed in the following sections.

Note: $\text{var}(\epsilon_t)$ is estimated by the mean square of the one-step-ahead prediction errors.

Smoothing Weights

Depending on the smoothing model, the smoothing weights consist of the following:

α	is a level smoothing weight.
γ	is a trend smoothing weight.
δ	is a seasonal smoothing weight.
ϕ	is a trend damping weight.

Larger smoothing weights (less damping) permit the more recent data to have a greater influence on the predictions. Smaller smoothing weights (more damping) give less weight to recent data.

Specifying the Smoothing Weights

Typically the smoothing weights are chosen to be from zero to one. (This is intuitive because the weights associated with the past smoothing state and the value of current observation would normally sum to one.) However, each smoothing model (except Winters Method—Multiplicative Version) has an ARIMA equivalent. Weights chosen to be within the ARIMA additive-invertible region will guarantee stable predictions (Archibald 1990 and Gardner 1985). The ARIMA equivalent and the additive-invertible region for each smoothing model are listed in the following sections.

Optimizing the Smoothing Weights

Smoothing weights are determined so as to minimize the sum of squared, one-step-ahead prediction errors. The optimization is initialized by choosing from a predetermined grid the initial smoothing weights that result in the smallest sum of squared, one-step-ahead prediction errors. The optimization process is highly dependent on this initialization. It is possible that the optimization process will fail due to the inability to obtain stable initial values for the smoothing weights (Greene 1993 and Judge et al. 1980), and it is possible for the optimization to result in a local minima.

The optimization process can result in weights to be chosen outside both the zero-to-one range and the ARIMA additive-invertible region. By restricting weight optimization to additive-invertible region, you can obtain a local minimum with stable predictions. Likewise, weight optimization can be restricted to the zero-to-one range or other ranges. It is also possible to fix certain weights to a specific value and optimize the remaining weights.

Standard Errors

The standard errors associated with the smoothing weights are calculated from the Hessian matrix of the sum of squared, one-step-ahead prediction errors with respect to the smoothing weights used in the optimization process.

Weights Near Zero or One

Sometimes the optimization process results in weights near zero or one.

For simple or double (Brown) exponential smoothing, a level weight near zero implies that simple differencing of the time series might be appropriate.

For linear (Holt) exponential smoothing, a level weight near zero implies that the smoothed trend is constant and that an ARIMA model with deterministic trend might be a more appropriate model.

For damped-trend linear exponential smoothing, a damping weight near one implies that linear (Holt) exponential smoothing might be a more appropriate model.

For Winters method and seasonal exponential smoothing, a seasonal weight near one implies that a nonseasonal model might be more appropriate and a seasonal weight near zero implies that deterministic seasonal factors might be present.

Equations for the Smoothing Models

Simple Exponential Smoothing

The model equation for simple exponential smoothing is

$$Y_t = \mu_t + \epsilon_t$$

The smoothing equation is

$$L_t = \alpha Y_t + (1 - \alpha)L_{t-1}$$

The error-correction form of the smoothing equation is

$$L_t = L_{t-1} + \alpha e_t$$

(Note: For missing values, $e_t = 0$.)

The k -step prediction equation is

$$\hat{Y}_t(k) = L_t$$

The ARIMA model equivalency to simple exponential smoothing is the ARIMA(0,1,1) model

$$(1 - B)Y_t = (1 - \theta B)\epsilon_t$$

$$\theta = 1 - \alpha$$

The moving-average form of the equation is

$$Y_t = \epsilon_t + \sum_{j=1}^{\infty} \alpha \epsilon_{t-j}$$

For simple exponential smoothing, the additive-invertible region is

$$\{0 < \alpha < 2\}$$

The variance of the prediction errors is estimated as

$$\text{var}(e_t(k)) = \text{var}(\epsilon_t) \left[1 + \sum_{j=1}^{k-1} \alpha^2 \right] = \text{var}(\epsilon_t)(1 + (k-1)\alpha^2)$$

Double (Brown) Exponential Smoothing

The model equation for double exponential smoothing is

$$Y_t = \mu_t + \beta_t t + \epsilon_t$$

The smoothing equations are

$$\begin{aligned} L_t &= \alpha Y_t + (1 - \alpha)L_{t-1} \\ T_t &= \alpha(L_t - L_{t-1}) + (1 - \alpha)T_{t-1} \end{aligned}$$

This method can be equivalently described in terms of two successive applications of simple exponential smoothing:

$$\begin{aligned} S_t^{[1]} &= \alpha Y_t + (1 - \alpha)S_{t-1}^{[1]} \\ S_t^{[2]} &= \alpha S_t^{[1]} + (1 - \alpha)S_{t-1}^{[2]} \end{aligned}$$

where $S_t^{[1]}$ are the smoothed values of Y_t , and $S_t^{[2]}$ are the smoothed values of $S_t^{[1]}$. The prediction equation then takes the form:

$$\hat{Y}_t(k) = (2 + \alpha k / (1 - \alpha))S_t^{[1]} - (1 + \alpha k / (1 - \alpha))S_t^{[2]}$$

The error-correction forms of the smoothing equations are

$$\begin{aligned} L_t &= L_{t-1} + T_{t-1} + \alpha e_t \\ T_t &= T_{t-1} + \alpha^2 e_t \end{aligned}$$

(Note: For missing values, $e_t = 0$.)

The k -step prediction equation is

$$\hat{Y}_t(k) = L_t + ((k-1) + 1/\alpha)T_t$$

The ARIMA model equivalency to double exponential smoothing is the ARIMA(0,2,2) model,

$$(1 - B)^2 Y_t = (1 - \theta B)^2 \epsilon_t$$

$$\theta = 1 - \alpha$$

The moving-average form of the equation is

$$Y_t = \epsilon_t + \sum_{j=1}^{\infty} (2\alpha + (j-1)\alpha^2) \epsilon_{t-j}$$

For double exponential smoothing, the additive-invertible region is

$$\{0 < \alpha < 2\}$$

The variance of the prediction errors is estimated as

$$\text{var}(e_t(k)) = \text{var}(\epsilon_t) \left[1 + \sum_{j=1}^{k-1} (2\alpha + (j-1)\alpha^2)^2 \right]$$

Linear (Holt) Exponential Smoothing

The model equation for linear exponential smoothing is

$$Y_t = \mu_t + \beta_t t + \epsilon_t$$

The smoothing equations are

$$L_t = \alpha Y_t + (1 - \alpha)(L_{t-1} + T_{t-1})$$

$$T_t = \gamma(L_t - L_{t-1}) + (1 - \gamma)T_{t-1}$$

The error-correction form of the smoothing equations is

$$L_t = L_{t-1} + T_{t-1} + \alpha e_t$$

$$T_t = T_{t-1} + \alpha \gamma e_t$$

(Note: For missing values, $e_t = 0$.)

The k -step prediction equation is

$$\hat{Y}_t(k) = L_t + kT_t$$

The ARIMA model equivalency to linear exponential smoothing is the ARIMA(0,2,2) model,

$$(1 - B)^2 Y_t = (1 - \theta_1 B - \theta_2 B^2) \epsilon_t$$

$$\theta_1 = 2 - \alpha - \alpha \gamma$$

$$\theta_2 = \alpha - 1$$

The moving-average form of the equation is

$$Y_t = \epsilon_t + \sum_{j=1}^{\infty} (\alpha + j\alpha\gamma)\epsilon_{t-j}$$

For linear exponential smoothing, the additive-invertible region is

$$\{0 < \alpha < 2\}$$

$$\{0 < \gamma < 4/\alpha - 2\}$$

The variance of the prediction errors is estimated as

$$\text{var}(e_t(k)) = \text{var}(\epsilon_t) \left[1 + \sum_{j=1}^{k-1} (\alpha + j\alpha\gamma)^2 \right]$$

Damped-Trend Linear Exponential Smoothing

The model equation for damped-trend linear exponential smoothing is

$$Y_t = \mu_t + \beta_t t + \epsilon_t$$

The smoothing equations are

$$L_t = \alpha Y_t + (1 - \alpha)(L_{t-1} + \phi T_{t-1})$$

$$T_t = \gamma(L_t - L_{t-1}) + (1 - \gamma)\phi T_{t-1}$$

The error-correction form of the smoothing equations is

$$L_t = L_{t-1} + \phi T_{t-1} + \alpha e_t \quad T_t = \phi T_{t-1} + \alpha \gamma e_t$$

(Note: For missing values, $e_t = 0$.)

The k -step prediction equation is

$$\hat{Y}_t(k) = L_t + \sum_{i=1}^k \phi^i T_t$$

The ARIMA model equivalency to damped-trend linear exponential smoothing is the ARIMA(1,1,2) model,

$$(1 - \phi B)(1 - B)Y_t = (1 - \theta_1 B - \theta_2 B^2)\epsilon_t$$

$$\theta_1 = 1 + \phi - \alpha - \alpha\gamma\phi$$

$$\theta_2 = (\alpha - 1)\phi$$

The moving-average form of the equation (assuming $|\phi| < 1$) is

$$Y_t = \epsilon_t + \sum_{j=1}^{\infty} (\alpha + \alpha\gamma\phi(\phi^j - 1)/(\phi - 1))\epsilon_{t-j}$$

For damped-trend linear exponential smoothing, the additive-invertible region is

$$\{0 < \alpha < 2\}$$

$$\{0 < \phi\gamma < 4/\alpha - 2\}$$

The variance of the prediction errors is estimated as

$$\text{var}(e_t(k)) = \text{var}(\epsilon_t) \left[1 + \sum_{j=1}^{k-1} (\alpha + \alpha\gamma\phi(\phi^j - 1)/(\phi - 1))^2 \right]$$

Seasonal Exponential Smoothing

The model equation for seasonal exponential smoothing is

$$Y_t = \mu_t + s_p(t) + \epsilon_t$$

The smoothing equations are

$$L_t = \alpha(Y_t - S_{t-p}) + (1 - \alpha)L_{t-1}$$

$$S_t = \delta(Y_t - L_t) + (1 - \delta)S_{t-p}$$

The error-correction form of the smoothing equations is

$$L_t = L_{t-1} + \alpha e_t$$

$$S_t = S_{t-p} + \delta(1 - \alpha)e_t$$

(Note: For missing values, $e_t = 0$.)

The k -step prediction equation is

$$\hat{Y}_t(k) = L_t + S_{t-p+k}$$

The ARIMA model equivalency to seasonal exponential smoothing is the $\text{ARIMA}(0,1,p+1)(0,1,0)_p$ model,

$$(1 - B)(1 - B^p)Y_t = (1 - \theta_1 B - \theta_2 B^p - \theta_3 B^{p+1})\epsilon_t$$

$$\theta_1 = 1 - \alpha$$

$$\theta_2 = 1 - \delta(1 - \alpha)$$

$$\theta_3 = (1 - \alpha)(\delta - 1)$$

The moving-average form of the equation is

$$Y_t = \epsilon_t + \sum_{j=1}^{\infty} \psi_j \epsilon_{t-j}$$

$$\psi_j = \begin{cases} \alpha & \text{for } j \bmod p \neq 0 \\ \alpha + \delta(1 - \alpha) & \text{for } j \bmod p = 0 \end{cases}$$

For seasonal exponential smoothing, the additive-invertible region is

$$\{\max(-p\alpha, 0) < \delta(1 - \alpha) < (2 - \alpha)\}$$

The variance of the prediction errors is estimated as

$$\text{var}(e_t(k)) = \text{var}(\epsilon_t) \left[1 + \sum_{j=1}^{k-1} \psi_j^2 \right]$$

Multiplicative Seasonal Smoothing

In order to use the multiplicative version of seasonal smoothing, the time series and all predictions must be strictly positive.

The model equation for the multiplicative version of seasonal smoothing is

$$Y_t = \mu_t s_p(t) + \epsilon_t$$

The smoothing equations are

$$\begin{aligned} L_t &= \alpha(Y_t/S_{t-p}) + (1 - \alpha)L_{t-1} \\ S_t &= \delta(Y_t/L_t) + (1 - \delta)S_{t-p} \end{aligned}$$

The error-correction form of the smoothing equations is

$$\begin{aligned} L_t &= L_{t-1} + \alpha e_t / S_{t-p} \\ S_t &= S_{t-p} + \delta(1 - \alpha) e_t / L_t \end{aligned}$$

(Note: For missing values, $e_t = 0$.)

The k -step prediction equation is

$$\hat{Y}_t(k) = L_t S_{t-p+k}$$

The multiplicative version of seasonal smoothing does not have an ARIMA equivalent; however, when the seasonal variation is small, the ARIMA additive-invertible region of the additive version of seasonal described in the preceding section can approximate the stability region of the multiplicative version.

The variance of the prediction errors is estimated as

$$\text{var}(e_t(k)) = \text{var}(\epsilon_t) \left[\sum_{i=0}^{\infty} \sum_{j=0}^{p-1} (\psi_{j+ip} S_{t+k} / S_{t+k-j})^2 \right]$$

where ψ_j are as described for the additive version of seasonal method, and $\psi_j = 0$ for $j \geq k$.

Winters Method—Additive Version

The model equation for the additive version of Winters method is

$$Y_t = \mu_t + \beta_t t + s_p(t) + \epsilon_t$$

The smoothing equations are

$$L_t = \alpha(Y_t - S_{t-p}) + (1 - \alpha)(L_{t-1} + T_{t-1})$$

$$T_t = \gamma(L_t - L_{t-1}) + (1 - \gamma)T_{t-1}$$

$$S_t = \delta(Y_t - L_t) + (1 - \delta)S_{t-p}$$

The error-correction form of the smoothing equations is

$$L_t = L_{t-1} + T_{t-1} + \alpha e_t$$

$$T_t = T_{t-1} + \alpha \gamma e_t$$

$$S_t = S_{t-p} + \delta(1 - \alpha)e_t$$

(Note: For missing values, $e_t = 0$.)

The k -step prediction equation is

$$\hat{Y}_t(k) = L_t + kT_t + S_{t-p+k}$$

The ARIMA model equivalency to the additive version of Winters method is the $\text{ARIMA}(0,1,p+1)(0,1,0)_p$ model,

$$(1 - B)(1 - B^p)Y_t = \left[1 - \sum_{i=1}^{p+1} \theta_i B^i \right] \epsilon_t$$

$$\theta_j = \begin{cases} 1 - \alpha - \alpha\gamma & j = 1 \\ -\alpha\gamma & 2 \leq j \leq p - 1 \\ 1 - \alpha\gamma - \delta(1 - \alpha) & j = p \\ (1 - \alpha)(\delta - 1) & j = p + 1 \end{cases}$$

The moving-average form of the equation is

$$Y_t = \epsilon_t + \sum_{j=1}^{\infty} \psi_j \epsilon_{t-j}$$

$$\psi_j = \begin{cases} \alpha + j\alpha\gamma & \text{for } j \bmod p \neq 0 \\ \alpha + j\alpha\gamma + \delta(1 - \alpha), & \text{for } j \bmod p = 0 \end{cases}$$

For the additive version of Winters method (see Archibald 1990), the additive-invertible region is

$$\{\max(-p\alpha, 0) < \delta(1 - \alpha) < (2 - \alpha)\}$$

$$\{0 < \alpha\gamma < 2 - \alpha - \delta(1 - \alpha)(1 - \cos(\vartheta))\}$$

where ϑ is the smallest nonnegative solution to the equations listed in Archibald (1990).

The variance of the prediction errors is estimated as

$$\text{var}(e_t(k)) = \text{var}(\epsilon_t) \left[1 + \sum_{j=1}^{k-1} \psi_j^2 \right]$$

Winters Method—Multiplicative Version

In order to use the multiplicative version of Winters method, the time series and all predictions must be strictly positive.

The model equation for the multiplicative version of Winters method is

$$Y_t = (\mu_t + \beta_t t) s_p(t) + \epsilon_t$$

The smoothing equations are

$$\begin{aligned} L_t &= \alpha(Y_t/S_{t-p}) + (1 - \alpha)(L_{t-1} + T_{t-1}) \\ T_t &= \gamma(L_t - L_{t-1}) + (1 - \gamma)T_{t-1} \\ S_t &= \delta(Y_t/L_t) + (1 - \delta)S_{t-p} \end{aligned}$$

The error-correction form of the smoothing equations is

$$\begin{aligned} L_t &= L_{t-1} + T_{t-1} + \alpha e_t / S_{t-p} \\ T_t &= T_{t-1} + \alpha \gamma e_t / S_{t-p} \\ S_t &= S_{t-p} + \delta(1 - \alpha) e_t / L_t \end{aligned}$$

NOTE: For missing values, $e_t = 0$.

The k -step prediction equation is

$$\hat{Y}_t(k) = (L_t + kT_t)S_{t-p+k}$$

The multiplicative version of Winters method does not have an ARIMA equivalent; however, when the seasonal variation is small, the ARIMA additive-invertible region of the additive version of Winters method described in the preceding section can approximate the stability region of the multiplicative version.

The variance of the prediction errors is estimated as

$$\text{var}(e_t(k)) = \text{var}(\epsilon_t) \left[\sum_{i=0}^{\infty} \sum_{j=0}^{p-1} (\psi_{j+ip} S_{t+k} / S_{t+k-j})^2 \right]$$

where ψ_j are as described for the additive version of Winters method and $\psi_j = 0$ for $j \geq k$.

ARIMA Models

Autoregressive integrated moving-average (ARIMA) models predict values of a dependent time series with a linear combination of its own past values, past errors (also called shocks or innovations), and current and past values of other time series (predictor time series).

The Time Series Forecasting System uses the ARIMA procedure of SAS/ETS software to fit and forecast ARIMA models. The maximum likelihood method is used for parameter estimation. Refer to Chapter 7, “The ARIMA Procedure,” for details of ARIMA model estimation and forecasting.

This section summarizes the notation used for ARIMA models.

Notation for ARIMA Models

A dependent time series that is modeled as a linear combination of its own past values and past values of an error series is known as a (pure) ARIMA model.

Nonseasonal ARIMA Model Notation

The order of an ARIMA model is usually denoted by the notation $\text{ARIMA}(p,d,q)$, where

p	is the order of the autoregressive part.
d	is the order of the differencing (rarely should $d > 2$ be needed).
q	is the order of the moving-average process.

Given a dependent time series $\{Y_t : 1 \leq t \leq n\}$, mathematically the ARIMA model is written as

$$(1 - B)^d Y_t = \mu + \frac{\theta(B)}{\phi(B)} a_t$$

where

t	indexes time.
μ	is the mean term.
B	is the backshift operator; that is, $BX_t = X_{t-1}$.
$\phi(B)$	is the autoregressive operator, represented as a polynomial in the back shift operator: $\phi(B) = 1 - \phi_1 B - \dots - \phi_p B^p$.
$\theta(B)$	is the moving-average operator, represented as a polynomial in the back shift operator: $\theta(B) = 1 - \theta_1 B - \dots - \theta_q B^q$.
a_t	is the independent disturbance, also called the random error.

For example, the mathematical form of the ARIMA(1,1,2) model is

$$(1 - B)Y_t = \mu + \frac{(1 - \theta_1 B - \theta_2 B^2)}{(1 - \phi_1 B)} a_t$$

Seasonal ARIMA Model Notation

Seasonal ARIMA models are expressed in factored form by the notation $\text{ARIMA}(p, d, q)(P, D, Q)_s$, where

P	is the order of the seasonal autoregressive part.
D	is the order of the seasonal differencing (rarely should $D > 1$ be needed).
Q	is the order of the seasonal moving-average process.
s	is the length of the seasonal cycle.

Given a dependent time series $\{Y_t : 1 \leq t \leq n\}$, mathematically the ARIMA seasonal model is written as

$$(1 - B)^d (1 - B^s)^D Y_t = \mu + \frac{\theta(B)\theta_s(B^s)}{\phi(B)\phi_s(B^s)} a_t$$

where

$\phi_s(B^s)$	is the seasonal autoregressive operator, represented as a polynomial in the back shift operator: $\phi_s(B^s) = 1 - \phi_{s,1} B^s - \dots - \phi_{s,P} B^{sP}$
$\theta_s(B^s)$	is the seasonal moving-average operator, represented as a polynomial in the back shift operator: $\theta_s(B^s) = 1 - \theta_{s,1} B^s - \dots - \theta_{s,Q} B^{sQ}$

For example, the mathematical form of the $\text{ARIMA}(1,0,1)(1,1,2)_{12}$ model is

$$(1 - B^{12})Y_t = \mu + \frac{(1 - \theta_1 B)(1 - \theta_{s,1} B^{12} - \theta_{s,2} B^{24})}{(1 - \phi_1 B)(1 - \phi_{s,1} B^{12})} a_t$$

Abbreviated Notation for ARIMA Models

If the differencing order, autoregressive order, or moving-average order is zero, the notation is further abbreviated as

$I(d)(D)_s$	integrated model or $\text{ARIMA}(0, d, 0)(0, D, 0)$
$\text{AR}(p)(P)_s$	autoregressive model or $\text{ARIMA}(p, 0, 0)(P, 0, 0)$
$\text{IAR}(p, d)(P, D)_s$	integrated autoregressive model or $\text{ARIMA}(p, d, 0)(P, D, 0)_s$
$\text{MA}(q)(Q)_s$	moving average model or $\text{ARIMA}(0, 0, q)(0, 0, Q)_s$
$\text{IMA}(d, q)(D, Q)_s$	integrated moving average model or $\text{ARIMA}(0, d, q)(0, D, Q)_s$
$\text{ARMA}(p, q)(P, Q)_s$	autoregressive moving-average model or $\text{ARIMA}(p, 0, q)(P, 0, Q)_s$.

Notation for Transfer Functions

A transfer function can be used to filter a predictor time series to form a dynamic regression model.

Let Y_t be the dependent series, let X_t be the predictor series, and let $\Psi(B)$ be a linear filter or transfer function for the effect of X_t on Y_t . The ARIMA model is then

$$(1 - B)^d (1 - B^s)^D Y_t = \mu + \Psi(B) (1 - B)^d (1 - B^s)^D X_t + \frac{\theta(B)\theta_s(B^s)}{\phi(B)\phi_s(B^s)} a_t$$

This model is called a *dynamic regression* of Y_t on X_t .

Nonseasonal Transfer Function Notation

Given the i th predictor time series $\{X_{i,t} : 1 \leq t \leq n\}$, the transfer function is written as

$$\text{Dif}(d_i)\text{Lag}(k_i)\text{N}(q_i)/\text{D}(p_i)$$

where

d_i	is the simple order of the differencing for the i th predictor time series, $(1 - B)^{d_i} X_{i,t}$ (rarely should $d_i > 2$ be needed).
k_i	is the pure time delay (lag) for the effect of the i th predictor time series, $X_{i,t} B^{k_i} = X_{i,t-k_i}$.
p_i	is the simple order of the denominator for the i th predictor time series.
q_i	is the simple order of the numerator for the i th predictor time series.

The mathematical notation used to describe a transfer function is

$$\Psi_i(B) = \frac{\omega_i(B)}{\delta_i(B)} (1 - B)^{d_i} B^{k_i}$$

where

B	is the backshift operator; that is, $BX_t = X_{t-1}$.
$\delta_i(B)$	is the denominator polynomial of the transfer function for the i th predictor time series: $\delta_i(B) = 1 - \delta_{i,1}B - \dots - \delta_{i,p_i}B^{p_i}$.
$\omega_i(B)$	is the numerator polynomial of the transfer function for the i th predictor time series: $\omega_i(B) = 1 - \omega_{i,1}B - \dots - \omega_{i,q_i}B^{q_i}$.

The numerator factors for a transfer function for a predictor series are like the MA part of the ARMA model for the noise series. The denominator factors for a transfer function for a predictor series are like the AR part of the ARMA model for the noise series. Denominator factors introduce exponentially weighted, infinite distributed lags into the transfer function.

For example, the transfer function for the i th predictor time series with

$k_i = 3$	time lag is 3
$d_i = 1$	simple order of differencing is one
$p_i = 1$	simple order of the denominator is one
$q_i = 2$	simple order of the numerator is two

would be written as [Dif(1)Lag(3)N(2)/D(1)]. The mathematical notation for the transfer function in this example is

$$\Psi_i(B) = \frac{(1 - \omega_{i,1}B - \omega_{i,2}B^2)}{(1 - \delta_{i,1}B)}(1 - B)B^3$$

Seasonal Transfer Function Notation

The general transfer function notation for the i th predictor time series $X_{i,t}$ with seasonal factors is [Dif(d_i)(D_i)_s Lag(k_i) N(q_i)(Q_i)_s/ D(p_i)(P_i)_s] where

D_i	is the seasonal order of the differencing for the i th predictor time series (rarely should $D_i > 1$ be needed).
P_i	is the seasonal order of the denominator for the i th predictor time series (rarely should $P_i > 2$ be needed).
Q_i	is the seasonal order of the numerator for the i th predictor time series, (rarely should $Q_i > 2$ be needed).
s	is the length of the seasonal cycle.

The mathematical notation used to describe a seasonal transfer function is

$$\Psi_i(B) = \frac{\omega_i(B)\omega_{s,i}(B^s)}{\delta_i(B)\delta_{s,i}(B^s)}(1 - B)^{d_i}(1 - B^s)^{D_i}B^{k_i}$$

where

$\delta_{s,i}(B^s)$	is the denominator seasonal polynomial of the transfer function for the i th predictor time series: $\delta_{s,i}(B) = 1 - \delta_{s,i,1}B - \dots - \delta_{s,i,P_i}B^{sP_i}$
$\omega_{s,i}(B^s)$	is the numerator seasonal polynomial of the transfer function for the i th predictor time series: $\omega_{s,i}(B) = 1 - \omega_{s,i,1}B - \dots - \omega_{s,i,Q_i}B^{sQ_i}$

For example, the transfer function for the i th predictor time series $X_{i,t}$ whose seasonal cycle $s = 12$ with

$d_i = 2$	simple order of differencing is two
$D_i = 1$	seasonal order of differencing is one
$q_i = 2$	simple order of the numerator is two
$Q_i = 1$	seasonal order of the numerator is one

would be written as $[\text{Dif}(2)(1)_s \text{N}(2)(1)_s]$. The mathematical notation for the transfer function in this example is

$$\Psi_i(B) = (1 - \omega_{i,1}B - \omega_{i,2}B^2)(1 - \omega_{s,i,1}B^{12})(1 - B)^2(1 - B^{12})$$

Note: In this case, $[\text{Dif}(2)(1)_s \text{N}(2)(1)_s] = [\text{Dif}(2)(1)_s \text{Lag}(0)\text{N}(2)(1)_s/\text{D}(0)(0)_s]$.

Predictor Series

This section discusses time trend curves, seasonal dummies, interventions, and adjustments.

Time Trend Curves

When you specify a time trend curve as a predictor in a forecasting model, the system computes a predictor series that is a deterministic function of time. This variable is then included in the model as a regressor, and the trend curve is fit to the dependent series by linear regression, in addition to other predictor series.

Some kinds of nonlinear trend curves are fit by transforming the dependent series. For example, the exponential trend curve is actually a linear time trend fit to the logarithm of the series. For these trend curve specifications, the series transformation option is set automatically, and you cannot independently control both the time trend curve and transformation option.

The computed time trend variable is included in the output data set in a variable named in accordance with the trend curve type. Let t represent the observation count from the start of the period of fit for the model, and let X_t represent the value of the time trend variable at observation t within the period of fit. The names and definitions of these variables are as follows. (Note: These deterministic variables are reserved variable names.)

Linear trend	variable name <code>_LINEAR_</code> , with $X_t = t - c$
Quadratic trend	variable name <code>_QUAD_</code> , with $X_t = (t - c)^2$. Note that a quadratic trend implies a linear trend as a special case and results in two regressors: <code>_QUAD_</code> and <code>_LINEAR_</code> .
Cubic trend	variable name <code>_CUBE_</code> , with $X_t = (t - c)^3$. Note that a cubic trend implies a quadratic trend as a special case and results in three regressors: <code>_CUBE_</code> , <code>_QUAD_</code> , and <code>_LINEAR_</code> .
Logistic trend	variable name <code>_LOGIT_</code> , with $X_t = t$. The model is a linear time trend applied to the logistic transform of the dependent series. Thus, specifying a logistic trend is equivalent to specifying the logistic series transformation and a linear time trend. A logistic trend predictor can be used only in conjunction with the logistic transformation, which is set automatically when you specify logistic trend.
Logarithmic trend	variable name <code>_LOG_</code> , with $X_t = \ln(t)$

Exponential trend	variable name <code>_EXP_</code> , with $X_t = t$. The model is a linear time trend applied to the logarithms of the dependent series. Thus, specifying an exponential trend is equivalent to specifying the log series transformation and a linear time trend. An exponential trend predictor can be used only in conjunction with the log transformation, which is set automatically when you specify exponential trend.
Hyperbolic trend	variable name <code>_HYP_</code> , with $X_t = 1/t$
Power curve trend	variable name <code>_POW_</code> , with $X_t = \ln(t)$. The model is a logarithmic time trend applied to the logarithms of the dependent series. Thus, specifying a power curve is equivalent to specifying the log series transformation and a logarithmic time trend. A power curve predictor can be used only in conjunction with the log transformation, which is set automatically when you specify a power curve trend.
EXP(A+B/TIME) trend	variable name <code>_ERT_</code> , with $X_t = 1/t$. The model is a hyperbolic time trend applied to the logarithms of the dependent series. Thus, specifying this trend curve is equivalent to specifying the log series transformation and a hyperbolic time trend. This trend curve can be used only in conjunction with the log transformation, which is set automatically when you specify this trend.

Intervention Effects

Interventions are used for modeling events that occur at specific times. That is, they are known changes that affect the dependent series or outliers.

The i th intervention series is included in the output data set with variable name `_INTVi_`, which is a reserved variable name.

Point Interventions

The point intervention is a one-time event. The i th intervention series $X_{i,t}$ has a point intervention at time t_{int} when the series is nonzero only at time t_{int} —that is,

$$X_{i,t} = \begin{cases} 1, & t = t_{int} \\ 0, & \text{otherwise} \end{cases}$$

Step Interventions

Step interventions are continuing, and the input time series flags periods after the intervention. For a step intervention, before time t_{int} , the i th intervention series $X_{i,t}$ is zero and then steps to a constant level thereafter—that is,

$$X_{i,t} = \begin{cases} 1, & t \geq t_{int} \\ 0, & \text{otherwise} \end{cases}$$

Ramp Interventions

A ramp intervention is a continuing intervention that increases linearly after the intervention time. For a ramp intervention, before time t_{int} , the i th intervention series $X_{i,t}$ is zero and increases linearly thereafter—that is, proportional to time.

$$X_{i,t} = \begin{cases} t - t_{int}, & t \geq t_{int} \\ 0, & \text{otherwise} \end{cases}$$

Intervention Effect

Given the i th intervention series $X_{i,t}$, you can define how the intervention takes effect by filters (transfer functions) of the form

$$\Psi_i(B) = \frac{1 - \omega_{i,1}B - \dots - \omega_{i,q_i}B^{q_i}}{1 - \delta_{i,1}B - \dots - \delta_{i,p_i}B^{p_i}}$$

where B is the backshift operator $By_t = y_{t-1}$.

The denominator of the transfer function determines the decay pattern of the intervention effect, whereas the numerator terms determine the size of the intervention effect time window.

For example, the following intervention effects are associated with the respective transfer functions.

Immediately	$\Psi_i(B) = 1$
Gradually	$\Psi_i(B) = 1/(1 - \delta_{i,1}B)$
1 lag window	$\Psi_i(B) = 1 - \omega_{i,1}B$
3 lag window	$\Psi_i(B) = 1 - \omega_{i,1}B - \omega_{i,2}B^2 - \omega_{i,3}B^3$

Intervention Notation

The notation used to describe intervention effects has the form *type* : t_{int} (q_i)/(p_i), where *type* is point, step, or ramp; t_{int} is the time of the intervention (for example, OCT87); q_i is the transfer function numerator order; and p_i is the transfer function denominator order. If $q_i = 0$, the part “(q_i)” is omitted; if $p_i = 0$, the part “/(p_i)” is omitted.

In the Intervention Specification window, the **Number of Lags** option specifies the transfer function numerator order q_i , and the **Effect Decay Pattern** option specifies the transfer function denominator order p_i . In the **Effect Decay Pattern** options, values and resulting p_i are: **None**, $p_i = 0$; **Exp**, $p_i = 1$; **Wave**, $p_i = 2$.

For example, a step intervention with date 08MAR90 and effect pattern **Exp** is denoted “Step:08MAR90/(1)” and has a transfer function filter $\Psi_i(B) = 1/(1 - \delta_1 B)$. A ramp intervention immediately applied on 08MAR90 is denoted “Ramp:08MAR90” and has a transfer function filter $\Psi_i(B) = 1$.

Seasonal Dummy Inputs

For a seasonal cycle of length s , the seasonal dummy regressors include

$$\{X_{i,t} : 1 \leq i \leq (s-1), 1 \leq t \leq n\}$$

for models that include an intercept term and

$$\{X_{i,t} : 1 \leq i \leq s, 1 \leq t \leq n\}$$

for models that exclude an intercept term. Each element of a seasonal dummy regressor is either zero or one, based on the following rule:

$$X_{i,t} = \begin{cases} 1, & \text{when } i = t \pmod{s} \\ 0, & \text{otherwise} \end{cases}$$

Note that if the model includes an intercept term, the number of seasonal dummy regressors is one less than s to ensure that the linear system is full rank.

The seasonal dummy variables are included in the output data set with variable names prefixed with “SDUMMY i ” and sequentially numbered. They are reserved variable names.

Series Diagnostic Tests

This section describes the diagnostic tests that are used to determine the kinds of forecasting models appropriate for a series.

The series diagnostics are a set of heuristics that provide recommendations on whether or not the forecasting model should contain a log transform, trend terms, and seasonal terms. These recommendations are used by the automatic model selection process to restrict the model search to a subset of the model selection list. (You can disable this behavior by using the Automatic Model Selection Options window.)

The tests that are used by the series diagnostics do not always produce the correct classification of the series. They are intended to accelerate the process of searching for a good forecasting model for the series, but you should not rely on them if finding the very best model is important to you.

If you have information about the appropriate kinds of forecasting models (perhaps from studying the plots and autocorrelations shown in the Series Viewer window), you can set the series diagnostic flags in the Series Diagnostics window. Select the YES, NO, or MAYBE values for the `Log Transform`, `Trend`, and `Seasonality` options in the Series Diagnostics window as you think appropriate.

The series diagnostics tests are intended as a heuristic tool only, and no statistical validity is claimed for them. These tests might be modified and enhanced in future releases of the Time Series Forecasting System. The testing strategy is as follows:

1. **Log transform test.** The log test fits a high-order autoregressive model to the series and to the log of the series and compares goodness-of-fit measures for the prediction errors of the two models. If this test finds that log transforming the series is suitable, the `Log Transform` option is set to YES, and the subsequent diagnostic tests are performed on the log transformed series.
2. **Trend test.** The resultant series is tested for presence of a trend by using an augmented Dickey-Fuller test and a random walk with drift test. If either test finds that the series appears to have a trend, the `Trend` option is set to YES, and the subsequent diagnostic tests are performed on the differenced series.
3. **Seasonality test.** The resultant series is tested for seasonality. A seasonal dummy model with AR(1) errors is fit and the joint significance of the seasonal dummy estimates is tested. If the seasonal dummies are significant, the AIC statistic for this model is compared to the AIC for and AR(1) model without seasonal dummies. If the AIC for the seasonal model is lower than that of the nonseasonal model, the `Seasonal` option is set to YES.

Statistics of Fit

This section explains the goodness-of-fit statistics reported to measure how well different models fit the data. The statistics of fit for the various forecasting models can be viewed or stored in a data set by using the Model Viewer window.

Statistics of fit are computed by using the actual and forecasted values for observations in the period of evaluation. One-step forecasted values are used whenever possible, including the case when a hold-out sample contains no missing values. If a one-step forecast for an observation cannot be computed due to missing values for previous series observations, a multi-step forecast is computed, using the minimum number of steps as the previous nonmissing values in the data range permit.

The various statistics of fit reported are as follows. In these formulas, n is the number of nonmissing observations and k is the number of fitted parameters in the model.

Number of Nonmissing Observations.

The number of nonmissing observations used to fit the model.

Number of Observations.

The total number of observations used to fit the model, including both missing and nonmissing observations.

Number of Missing Actuals.

The number of missing actual values.

Number of Missing Predicted Values.

The number of missing predicted values.

Number of Model Parameters.

The number of parameters fit to the data. For combined forecast, this is the number of forecast components.

Total Sum of Squares (Uncorrected).

The total sum of squares for the series, SST, uncorrected for the mean: $\sum_{t=1}^n y_t^2$.

Total Sum of Squares (Corrected).

The total sum of squares for the series, SST, corrected for the mean: $\sum_{t=1}^n (y_t - \bar{y})^2$, where \bar{y} is the series mean.

Sum of Square Errors.

The sum of the squared prediction errors, SSE. $SSE = \sum_{t=1}^n (y_t - \hat{y}_t)^2$, where \hat{y} is the one-step predicted value.

Mean Squared Error.

The mean squared prediction error, MSE, calculated from the one-step-ahead forecasts. $MSE = \frac{1}{n} SSE$. This formula enables you to evaluate small hold-out samples.

Root Mean Squared Error.

The root mean square error (RMSE), \sqrt{MSE} .

Mean Absolute Percent Error.

The mean absolute percent prediction error (MAPE), $\frac{100}{n} \sum_{t=1}^n |(y_t - \hat{y}_t)/y_t|$.

The summation ignores observations where $y_t = 0$.

Mean Absolute Error.

The mean absolute prediction error, $\frac{1}{n} \sum_{t=1}^n |y_t - \hat{y}_t|$.

R-Square.

The R^2 statistic, $R^2 = 1 - SSE/SST$. If the model fits the series badly, the model error sum of squares, SSE, can be larger than SST and the R^2 statistic will be negative.

Adjusted R-Square.

The adjusted R^2 statistic, $1 - (\frac{n-1}{n-k})(1 - R^2)$.

Amemiya's Adjusted R-Square.

Amemiya's adjusted R^2 , $1 - (\frac{n+k}{n-k})(1 - R^2)$.

Random Walk R-Square.

The random walk R^2 statistic (Harvey's R^2 statistic by using the random walk model for comparison), $1 - (\frac{n-1}{n})SSE/RWSSE$, where $RWSSE = \sum_{t=2}^n (y_t - y_{t-1} - \mu)^2$, and $\mu = \frac{1}{n-1} \sum_{t=2}^n (y_t - y_{t-1})$.

Akaike's Information Criterion.

Akaike's information criterion (AIC), $n \ln(MSE) + 2k$.

Schwarz Bayesian Information Criterion.

Schwarz Bayesian information criterion (SBC or BIC), $n \ln(MSE) + k \ln(n)$.

Amemiya's Prediction Criterion.

Amemiya's prediction criterion, $\frac{1}{n} SST(\frac{n+k}{n-k})(1 - R^2) = (\frac{n+k}{n-k})\frac{1}{n} SSE$.

Maximum Error.

The largest prediction error.

Minimum Error.

The smallest prediction error.

Maximum Percent Error.

The largest percent prediction error, $100 \max((y_t - \hat{y}_t)/y_t)$. The summation ignores observations where $y_t = 0$.

Minimum Percent Error.

The smallest percent prediction error, $100 \min((y_t - \hat{y}_t)/y_t)$. The summation ignores observations where $y_t = 0$.

Mean Error.

The mean prediction error, $\frac{1}{n} \sum_{t=1}^n (y_t - \hat{y}_t)$.

Mean Percent Error.

The mean percent prediction error, $\frac{100}{n} \sum_{t=1}^n \frac{(y_t - \hat{y}_t)}{y_t}$. The summation ignores observations where $y_t = 0$.

About Investment Analysis

The Investment Analysis system is an interactive environment for the time-value of money of a variety of investments:

- loans
- savings
- depreciations
- bonds
- generic cashflows

Various analyses are provided to help analyze the value of investment alternatives: time value, periodic equivalent, internal rate of return, benefit-cost ratio, and breakeven analysis.

These analyses can help answer a number of questions you may have about your investments:

- Which option is more profitable or less costly?
- Is it better to buy or rent?
- Are the extra fees for refinancing at a lower interest rate justified?
- What is the balance of this account after saving this amount periodically for so many years?
- How much is legally tax-deductible?

- Is this a reasonable price?

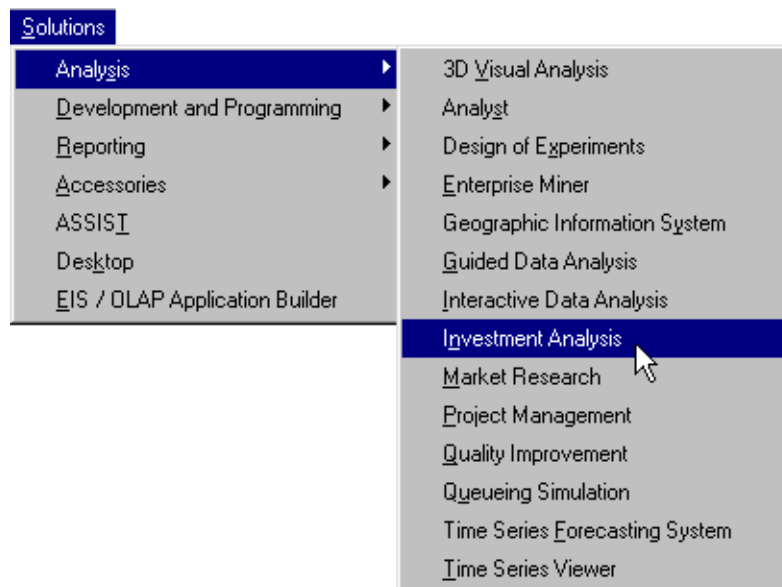

Investment Analysis can be beneficial to users in many industries for a variety of decisions:

- manufacturing: cost justification of automation or any capital investment, replacement analysis of major equipment, or economic comparison of alternative designs
- government: setting funds for services
- finance: investment analysis and portfolio management for fixed-income securities

Starting Investment Analysis

There are two ways to invoke Investment Analysis from the main SAS window. One way is to select **Solutions** → **Analysis** → **Investment Analysis** from the main SAS menu, as displayed in Figure 51.1.

Figure 51.1 Initializing Investment Analysis with the Menu Bar

The other way is to type **INVEST** into the toolbar's command prompt, as displayed in Figure 51.2.

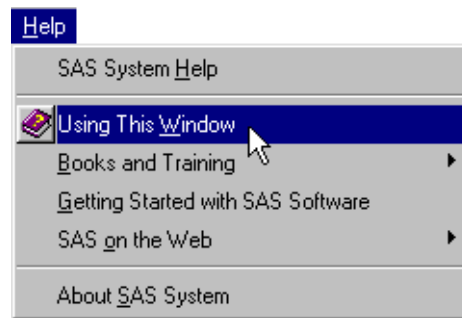

Figure 51.2 Initializing Investment Analysis with the Toolbar

Getting Help

You can get help in Investment Analysis in three ways. One way is to use the Help Menu, as displayed in Figure 51.3. This is the right-most menu item on the menu bar.

Figure 51.3 The Help Menu

Help buttons, as in Figure 51.4, provide another way to access help. Most dialog boxes provide help buttons in their lower-right corners.

Figure 51.4 A Help Button

Also, the toolbar has a button (see Figure 51.5) that invokes the help system. This is the right-most icon on the toolbar.

Figure 51.5 The Help Icon

Each of these methods invokes a browser that gives specific help for the active window.

Using Help

The chapters pertaining to Investment Analysis in this document typically have a section that introduces you to a menu and summarizes the options available through the menu. Such chapters then have sections titled Task and Dialog Box Guides. The Task section provides a description of how to perform many useful tasks. The Dialog Box Guide lists all dialog boxes pertinent to those tasks and gives a brief description of each element of each dialog box.

Software Requirements

Investment Analysis uses the following SAS software:

- Base SAS
- SAS/ETS
- SAS/GRAPH (optional, to view bond pricing and breakeven graphs)

Chapter 52

Portfolios

Contents

The File Menu	3139
Tasks	3140
Creating a New Portfolio	3140
Saving a Portfolio	3141
Opening an Existing Portfolio	3141
Saving a Portfolio to a Different Name	3142

Right-Clicking within the Portfolio Area	3145

The File Menu

Investment Analysis stores portfolios as catalog entries. Portfolios contain a collection of investments, providing a structure to collect investments with a common purpose or goal (like a retirement or building fund portfolio). It may be advantageous also to collect investments into a common portfolio if they are competing investments you want to perform a comparative analysis upon. Within this structure you can perform computations and analyses on a collection of investments in a portfolio, just as you would perform them on a single investment.

Investment Analysis provides many tools to aid in your manipulation of portfolios through the **File** menu, shown in [Figure 52.1](#).

Figure 52.1 File Menu

The **File** menu offers the following items:

New Portfolio creates an empty portfolio with a new name.

Open Portfolio opens the standard SAS Open dialog box where you select a portfolio to open.

Save Portfolio saves the current portfolio to its current name.

Save Portfolio As opens the standard SAS Save As dialog box where you supply a new portfolio name for the current portfolio.

Close closes Investment Analysis.

Exit closes SAS (Windows only).

Tasks

Creating a New Portfolio

From the Investment Analysis dialog box, select **File** → **New Portfolio**.

Figure 52.2 Creating a New Portfolio

The screenshot shows a window titled "Investment Analysis". Inside, there are two text input fields: "Portfolio Name:" with the value "WORK.INVEST.INVEST1" and "Portfolio Description:" with the value "Default portfolio". Below these is a table with the following structure:

Portfolio		
Name	Label	Type

The table has a scrollbar on the right side, indicating it can hold multiple rows.

The **Portfolio Name** is WORK.INVEST.INVEST1 as displayed in Figure 52.2, unless you have saved a portfolio to that name in the past. In that case, some other unused portfolio name is given to the new portfolio.

Saving a Portfolio

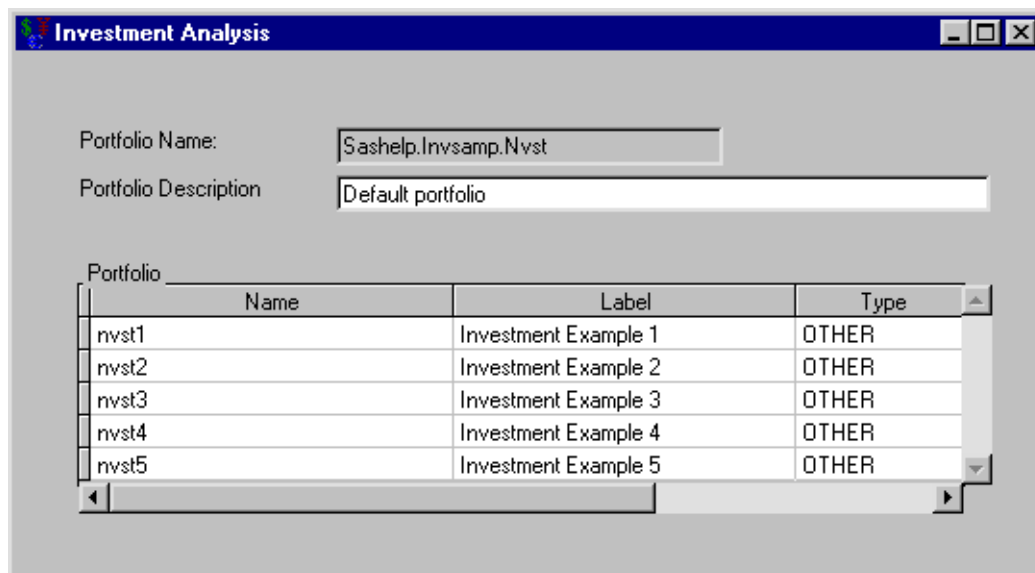

From the Investment Analysis dialog box, select **File** → **Save Portfolio**. The portfolio is saved to a catalog-entry with the name in the **Portfolio Name** box.

Opening an Existing Portfolio

From the Investment Analysis dialog box, select **File** → **Open Portfolio**. This opens the standard SAS Open dialog box. You enter the name of a SAS portfolio to open in the **Entry Name** box. For example, enter SASHELP.INVSAMP.NVST as displayed in Figure 52.3.

Figure 52.3 Opening an Existing Portfolio

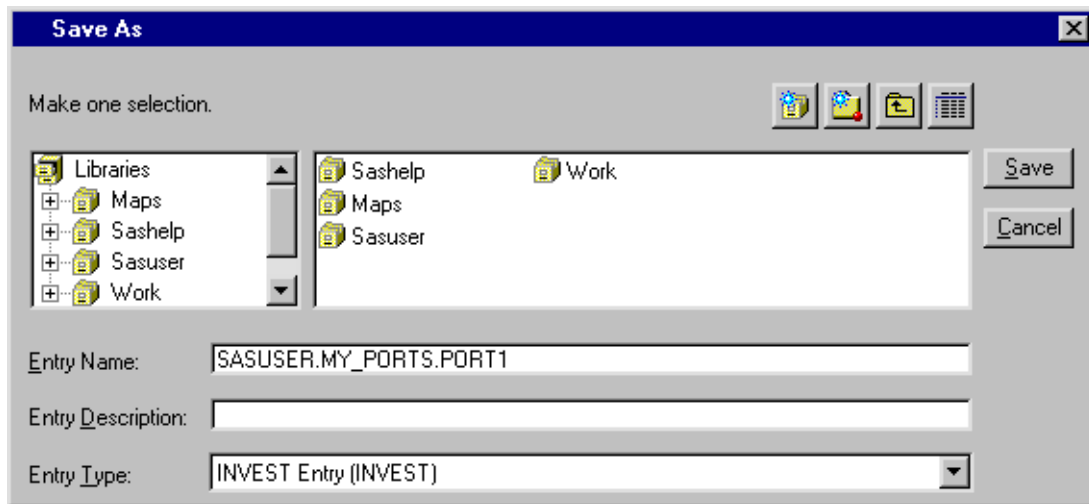

Click **Open** to load the portfolio. The portfolio should look like Figure 52.4.

Figure 52.4 The Opened Portfolio

Saving a Portfolio to a Different Name

From the Investment Analysis dialog box, select **File** → **Save Portfolio As**.

This opens the standard SAS Save As dialog box. You can enter the name of a SAS portfolio into the **Entry Name** box. For example, enter SASUSER.MY_PORTS.PORT1, as in Figure 52.5.

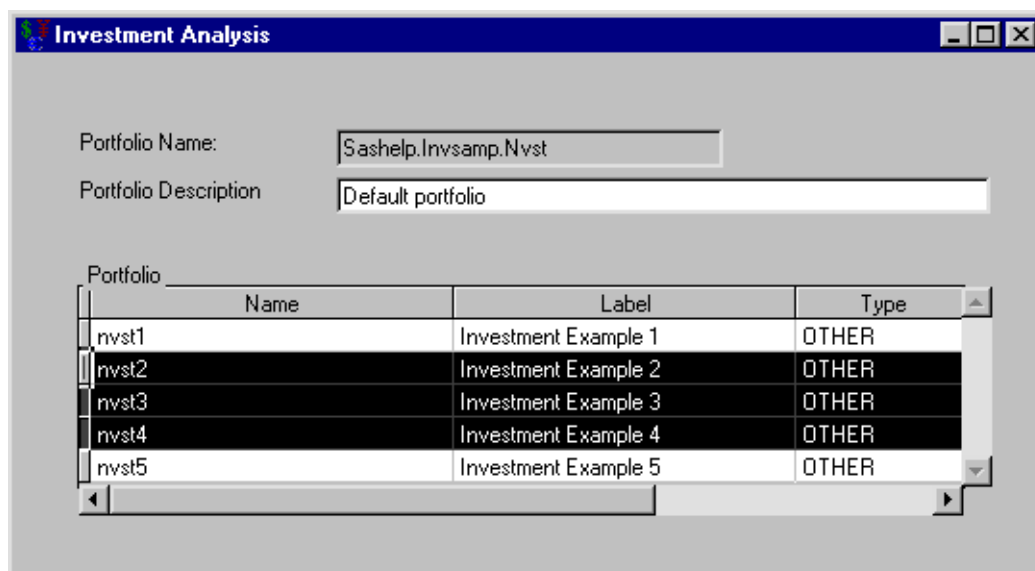

Figure 52.5 Saving a Portfolio to a Different Name

Click **Save** to save the portfolio.

Selecting Investments within a Portfolio

To select a single investment in an opened portfolio, click the investment in the Portfolio area within the Investment Analysis dialog box.

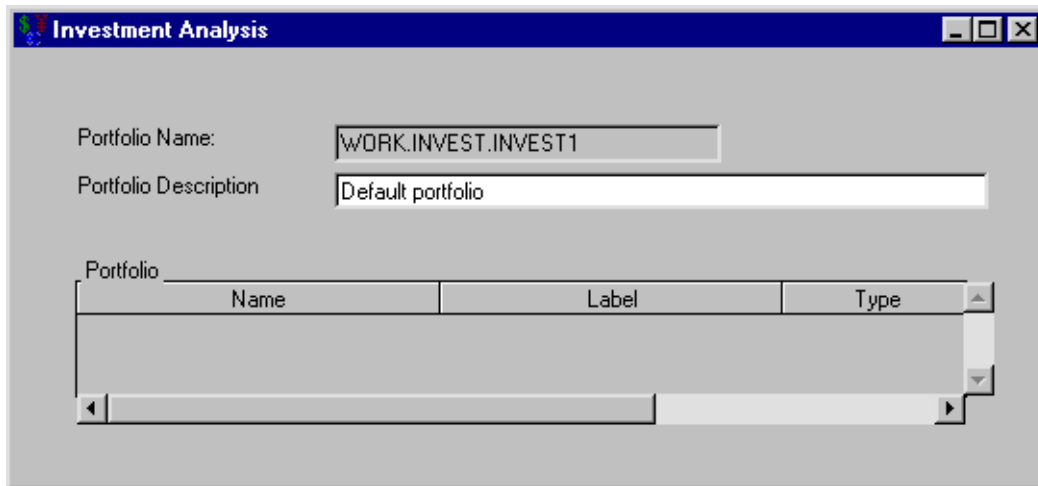

To select a list of adjacent investments, do the following: click the first investment, hold down SHIFT, and click the final investment. After the list of investments is selected, you can release the SHIFT key. The selected investments will appear highlighted as in Figure 52.6.

Figure 52.6 Selecting Investments within a Portfolio

Dialog and Utility Guide

Investment Analysis

Figure 52.7 Investment Analysis Dialog Box

Investment Portfolio Name holds the name of the portfolio. The name is of the form `library.catalog_entry.portfolio`. The default portfolio name is `work.invest.invest1`, as in [Figure 52.7](#).

Portfolio Description provides a more descriptive explanation of the portfolio's contents. You can edit this description any time this dialog box is active.

The **Portfolio** area contains the list of investments comprising the particular portfolio. Each investment in the **Portfolio** area displays the following attributes:

Name is the name of the investment. It must be a valid SAS name. It is used to distinguish investments when performing analyses and computations.

Label is a place where you can provide a more descriptive explanation of the investment.

Type is the type of investment, which is fixed when you create the investment. It is one of the following: LOAN, SAVINGS, DEPRECIATION, BOND, or OTHER.

Additional tools to aid in the management of your portfolio are available by selecting from the [menu bar](#) or by [right-clicking](#) within the **Portfolio** area.

Menu Bar Options

Figure 52.8 The Menu Bar

The menu bar (shown in [Figure 52.8](#)) provides many tools to aid in the management of portfolios and the investments that comprise them. The following menu items provide functionality particular to Investment Analysis:

File opens and saves portfolios.

Investment creates new investments within the portfolio.

Compute performs constant dollar, after tax, and currency conversion computations on generic cashflows.

Analyze analyzes investments to aid in decision-making.

Tools sets default values of inflation and income tax rates.

Right-Clicking within the Portfolio Area

Figure 52.9 Right-Clicking

After selecting an investment, right-clicking in the **Portfolio** area pops up a menu (see [Figure 52.9](#)) that offers the following options:

Edit opens the selected investment within the portfolio.

Duplicate creates a duplicate of the selected investment within the portfolio.

Delete removes the selected investment from the portfolio.

If you wish to perform one of these actions on a collection of investments, you must select a collection of investments (as described in the section “[Selecting Investments within a Portfolio](#)” on page 3143) before right-clicking.

The Investment Menu

Because there are many types of investments, a tool that manages and analyzes collections of investments must be robust and flexible. Providing specifications for four specific investment types and one generic type, Investment Analysis can model almost any real-world investment.

Figure 53.1 Investment Menu

The **Investment** menu, shown in [Figure 53.1](#), offers the following items:

New → **Loan** opens the [Loan](#) dialog box. Loans are useful for acquiring capital to pursue various interests. Available terms include rate adjustments for variable rate loans, initialization costs, prepayments, and balloon payments.

New → **Savings** opens the [Savings](#) dialog box. Savings are necessary when planning for the future, whether for business or personal purposes. Account summary calculations available per deposit include starting balance, deposits, interest earned, and ending balance.

New → **Depreciation** opens the [Depreciation](#) dialog box. Depreciations are relevant in tax calculation. The available depreciation methods are Straight Line, Sum-of-years Digits, Depreciation Table, and Declining Balance. Depreciation Tables are necessary when depreciation calculations must conform to set yearly percentages. Declining Balance with conversion to Straight Line is also provided.

New → **Bond** opens the [Bond](#) dialog box. Bonds have widely varying terms depending on the issuer. Because bond issuers frequently auction their bonds, the ability to price a bond between the issue date and maturity date is desirable. Fixed-coupon bonds may be analyzed for the following: price versus yield-to-maturity, duration, and convexity. These are available at different times in the bond's life.

New → **Generic Cashflow** opens the [Generic Cashflow](#) dialog box. Generic cashflows are the most flexible investments. Only a sequence of date-amount pairs is necessary for specification. You can enter date-amount pairs and load values from SAS data sets to specify any type of investment. You can generate uniform, arithmetic, and geometric cashflows with ease. SAS's forecasting ability is available to forecast future cashflows as well. The new graphical display aids in visualization of the cashflow and enables the user to change the frequency of the cashflow view to aggregate and disaggregate the view.

Edit opens the specification dialog box for an investment selected within the portfolio.

Duplicate creates a duplicate of an investment selected within the portfolio.

Delete removes an investment selected from the portfolio.

If you want to edit, duplicate, or delete a collection of investments, you must select a collection of investments as described in the section "[Selecting Investments within a Portfolio](#)" on page 3143 before performing the menu-option.

Tasks

Loan Tasks

Suppose you want to buy a home that costs \$100,000. You can make a down payment of \$20,000. Hence, you need a loan of \$80,000. You are able to acquire a 30-year loan at 7% interest starting January 1, 2000. Let's use Investment Analysis to specify and analyze this loan.

In the Investment Analysis dialog box, select **Investment** → **New** → **Loan** from the menu bar to open the Loan dialog box.

Specifying Loan Terms to Create an Amortization Schedule

You must specify the loan before generating the amortization table. To specify the loan, follow these steps:

1. Enter MORTGAGE for the **Name**.
2. Enter 80000 for the **Loan Amount**.
3. Enter 7 for the **Initial Rate**.
4. Enter 360 for the **Number of Payments**.
5. Enter 01JAN2000 for the **Start Date**.

After you have specified the loan, click **Create Amortization Schedule** to generate the amortization schedule displayed in [Figure 53.2](#).

Figure 53.2 Creating an Amortization Schedule

The 'Loan' dialog box is shown with the following fields and values:

- Name: MORTGAGE
- Loan Specification:
 - Loan Amount: 80000
 - Initial Rate: 7.00
 - Periodic Payment: (empty)
 - Start Date: 01JAN2000
 - Number of Payments: 360
 - Payment Interval: MONTH
 - Compounding Interval: MONTH
- Buttons on the right: Initialization..., Prepayments..., Balloon Payments..., Rate Adjustments..., Rounding Off...
- Buttons at the bottom: Save Data As..., OK, Cancel, Help
- Amortization Schedule table:

Date	Beginning Principal Amount	Periodic Payment Amount	Interest Payment	Principal Rep
JAN2000	80000.00	0.00	0.00	0.00
FEB2000	80000.00	532.24	466.67	65.57
MAR2000	79934.43	532.24	466.28	65.96
APR2000	79868.47	532.24	465.90	66.34

Storing Other Loan Terms

Let's include information concerning the purchase price and downpayment. These terms are not necessary to specify the loan, but it may be advantageous to store such information with the loan.

Consider the loan described in the section “[Loan Tasks](#)” on page 3149. In the Loan dialog box ([Figure 53.2](#)) click **Initialization** to open the Loan Initialization Options dialog box, where you can specify the down payment, initialization costs, and discount points. To specify the down payment, enter 100000 for the **Purchase Price**, as shown in [Figure 53.3](#).

Figure 53.3 Including the Purchase Price

Loan Initialization Options

Price, Loan Amount and Downpayment

Purchase Price:	<input type="text" value="100000"/>		
Loan Amount:	<input type="text" value="80000"/>	% of Price:	<input type="text" value="80.00"/>
Downpayment:	<input type="text" value="20000"/>	% of Price:	<input type="text" value="20.00"/>

Initialization Costs and Discount Points

Loan Amount:	<input type="text" value="80000"/>		
Initialization Costs:	<input type="text"/>	% of Amount:	<input type="text" value="0.00"/>
Discount Points:	<input type="text"/>	% of Amount:	<input type="text" value="0.00"/>

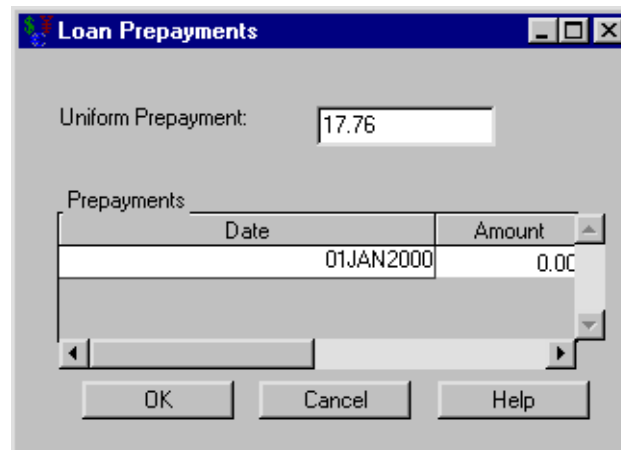

OK Cancel Help

Click **OK** to return to the Loan dialog box.

Adding Prepayments

Now let's observe the effect of prepayments on the loan. Consider the loan described in the section “[Loan Tasks](#)” on page 3149. You must pay a minimum of \$532.24 each month to keep up with payments. However, let's say you dislike entering this amount in your checkbook. You would rather pay \$550.00 to keep the arithmetic simpler. This would constitute a uniform prepayment of \$17.76 each month.

In the Loan dialog box, click **Prepayments**, which opens the Loan Prepayments dialog box shown in [Figure 53.4](#).

Figure 53.4 Specifying the Loan Prepayments

The screenshot shows a dialog box titled "Loan Prepayments". It contains a text box labeled "Uniform Prepayment:" with the value "17.76". Below this is a table titled "Prepayments" with two columns: "Date" and "Amount". The table has one row with the date "01JAN2000" and the amount "0.00". At the bottom of the dialog are three buttons: "OK", "Cancel", and "Help".

Date	Amount
01JAN2000	0.00

You can specify an arbitrary sequence of prepayments in the **Prepayments** area. If you want a uniform prepayment, clear the **Prepayments** area and enter the uniform payment amount in the **Uniform Prepayment** text box. That amount will be added to each payment until the loan is paid off.

To specify this uniform prepayment, follow these steps:

1. Enter 17.76 for the **Uniform Prepayment**.
2. Click **OK** to return to the Loan dialog box.
3. Click **Create Amortization Schedule**, and the amortization schedule is updated, as displayed in [Figure 53.5](#).

Figure 53.5 The Amortization Schedule with Loan Prepayments

The screenshot shows the 'Loan' dialog box with the following fields and buttons:

- Name:** MORTGAGE
- Loan Specification:**
 - Loan Amount:** 80000
 - Initial Rate:** 7.00
 - Periodic Payment:** (empty)
 - Start Date:** 01JAN2000
 - Number of Payments:** 360
 - Payment Interval:** MONTH
 - Compounding Interval:** MONTH
- Buttons:** Initialization..., Prepayments..., Balloon Payments..., Rate Adjustments..., Rounding Off...
- Amortization Schedule:**
 - Create Amortization Schedule** button
 - Table:**

Date	Beginning Principal Amount	Periodic Payment Amount	Interest Payment	Principal Rep
JAN2000	80000.00	0.00	0.00	0.00
FEB2000	80000.00	550.00	466.67	83.33
MAR2000	79916.67	550.00	466.18	83.82
APR2000	79832.85	550.00	465.69	84.31
- Bottom Buttons:** Save Data As..., OK, Cancel, Help

The last payment is on January 2030 without prepayments and February 2027 with prepayment; you would pay the loan off almost three years earlier with the \$17.76 prepayments.

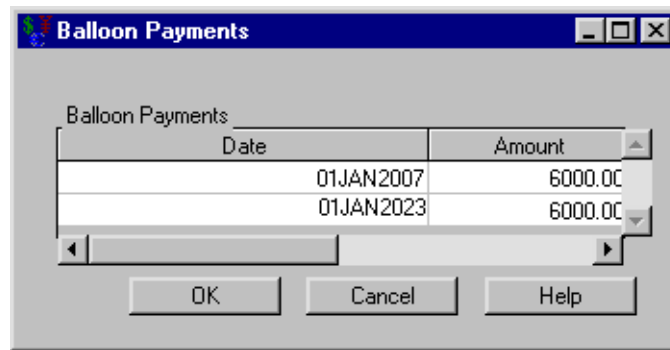

To continue this example you must remove the prepayments from the loan specification, following these steps:

1. Reopen the Loan Prepayments dialog box from the Loan dialog box by clicking **Prepayments**.
2. Enter 0 for **Uniform Prepayment**.
3. Click **OK** to return to the Loan dialog box.

Adding Balloon Payments

Consider the loan described in the section “[Loan Tasks](#)” on page 3149. Suppose you cannot afford the payments of \$532.24 each month. To lessen your monthly payment, you could pay balloon payments of \$6,000 at the end of 2007 and 2023. You wonder how this would affect your monthly payment. (Note that Investment Analysis does not allow both balloon payments and rate adjustments to be specified for a loan.)

In the Loan dialog box, click **Balloon Payments**, which opens the Balloon Payments dialog box shown in [Figure 53.6](#).

Figure 53.6 Defining Loan Balloon Payments

You can specify an arbitrary sequence of balloon payments by adding date-amount pairs to the **Balloon Payments** area.

To specify these balloon payments, follow these steps:

1. Right-click within the **Balloon Payment** area (which pops up a menu) and release on **New**.
2. Set the pair's **Date** to 01JAN2007.
3. Set **Amount** to 6000.
4. Right-click within the **Balloon Payment** area (which pops up a menu) and release on **New**.
5. Set the new pair's **Date** to 01JAN2023.
6. Set its **Amount** to 6000.

Click **OK** to return to the Loan dialog box. Click **Create Amortization Schedule**, and the amortization schedule is updated. Your monthly payment is now \$500.30, a difference of approximately \$32 each month.

To continue this example you must remove the balloon payments from the loan specification, following these steps:

1. Reopen the Balloon Payments dialog box.
2. Right-click within the **Balloon Payment** area (which pops up a menu) and release on **Clear**.
3. Click **OK** to return to the Loan dialog box.

Handling Rate Adjustments

Consider the loan described in the section “[Loan Tasks](#)” on page 3149. Another option for lowering your payments is to get a variable rate loan. You can acquire a three-year adjustable rate mortgage (ARM) at 6% with a periodic cap of 1% with a maximum of 9%. (Note that Investment Analysis does not allow both rate adjustments and balloon payments to be specified for a loan.)

In the Loan dialog box, click **Rate Adjustments** to open the Rate Adjustment Terms dialog box shown in [Figure 53.7](#).

Figure 53.7 Setting the Rate Adjustments

Rate Adjustment Terms:

Life Cap: 3.00

Periodic Cap: 1.00

Adjustment Frequency: 36 months

Rate Adjustment Assumption:

☒ Worst Case

☐ Best Case

☐ Fixed Case

☐ Estimated Case

Estimated Rates

Date	Rate
------	------

OK Cancel Help

To specify these loan adjustment terms, follow these steps:

1. Enter 3 for the **Life Cap**. The **Life Cap** is the maximum deviation from the Initial Rate.
2. Enter 1 for the **Periodic Cap**.
3. Enter 36 for the **Adjustment Frequency**.
4. Confirm that **Worst Case** is selected from the Rate Adjustment Assumption options.
5. Click **OK** to return to the Loan dialog box.
6. Enter 6 for the **Initial Rate**.
7. Click **Create Amortization Schedule**, and the amortization schedule is updated.

Your monthly payment drops to \$479.64 each month. However, if the worst-case scenario plays out, the payments will increase to \$636.84 in nine years. [Figure 53.8](#) displays amortization table information for the final few months under this scenario.

Figure 53.8 The Amortization Schedule with Rate Adjustments

The screenshot shows a 'Loan' dialog box with the following fields and buttons:

- Name:** untitled_loan
- Loan Specification:**
 - Loan Amount:** 80000
 - Initial Rate:** 6.00
 - Periodic Payment:** (empty)
 - Start Date:** 01JAN2000
 - Number of Payments:** 360
 - Payment Interval:** MONTH
 - Compounding Interval:** MONTH
- Buttons:** Initialization..., Prepayments..., Balloon Payments..., Rate Adjustments..., Rounding Off...
- Amortization Schedule:**
 - Create Amortization Schedule** button
 - Table:**

Date	Beginning Principal Amount	Periodic Payment Amount	Interest Payment	Principal Repay
AUG2029	3722.76	636.84	27.92	608.92
SEP2029	3113.84	636.84	23.35	613.49
OCT2029	2500.35	636.84	18.75	618.09
NOV2029	1882.26	636.84	14.12	622.72
DEC2029	1259.54	636.84	9.45	627.39
JAN2030	632.15	636.89	4.74	632.15
- Bottom Buttons:** Save Data As..., OK, Cancel, Help

Click **OK** to return to the Investment Analysis dialog box.

Specifying Savings Terms to Create an Account Summary

Suppose you put \$500 each month into an account that earns 6% interest for 20 years. What is the balance of the account after those 20 years?

In the Investment Analysis dialog box, select **Investment** → **New** → **Savings** from the menu bar to open the Savings dialog box.

To specify the savings, follow these steps:

1. Enter RETIREMENT for the **Name**.
2. Enter 500 for the **Periodic Deposit**.
3. Enter 240 for the **Number of Deposits**.
4. Enter 6 for the **Initial Rate**.

You must specify the savings before generating the account summary. After you have specified the savings, click **Create Account Summary** to compute the ending date and balance and to generate the account summary displayed in Figure 53.9.

Figure 53.9 Creating an Account Summary

The screenshot shows a 'Savings' dialog box with the following fields and values:

- Name: RETIREMENT
- Savings Specification:
 - Periodic Deposit: 500
 - Start Date: 01JAN2000

- Buttons: Save Data As..., OK, Cancel, Help

Click **OK** to return to the Investment Analysis dialog box.

Depreciation Tasks

Commercial assets are considered to lose value as time passes. For tax purposes, you want to quantify this loss. This investment structure helps calculate appropriate values.

Suppose you spend \$50,000 for a commercial fishing boat that is considered to have a ten-year useful life. How would you depreciate it?

In the Investment Analysis dialog box, select **Investment** → **New** → **Depreciation** from the menu bar to open the Depreciation dialog box.

Specifying Depreciation Terms to Create a Depreciation Table

To specify the depreciation, follow these steps:

1. Enter FISHING_BOAT for the **Name**.

2. Enter 50000 for the **Cost**.
3. Enter 2000 for the **Year of Purchase**.
4. Enter 10 for the **Useful Life**.
5. Enter 0 for the **Salvage Value**.

You must specify the depreciation before generating the depreciation schedule. After you have specified the depreciation, click **Create Depreciation Schedule** to generate a depreciation schedule like the one displayed in Figure 53.10.

Figure 53.10 Creating a Depreciation Schedule

Depreciation

Name:

Depreciable Asset Specification

Cost:

Year of Purchase:

Useful Life:

Salvage Value:

Depreciation Method

☐ Straight Line (SL)
☐ Sum-of-years-digits
☐ Depreciation Table....
☒ Declining Balance (DB)

DB Factor: ☒ 2 ☐ 1.5 ☐ 1

Conversion to SL: ☒ Yes ☐ No

Depreciation Schedule

Year	StartBookValue	Depreciation	EndBookValue
2000	50000.00	10000.00	40000.00
2001	40000.00	8000.00	32000.00
2002	32000.00	6400.00	25600.00
2003	25600.00	5120.00	20480.00
2004	20480.00	4096.00	16384.00

The default depreciation method is Declining Balance (with Conversion to Straight Line). Try the following methods to see how they each affect the schedule:

- Straight Line
- Sum-of-years Digits
- Declining Balance (without conversion to Straight Line)

It might be useful to compare the value of the boat at 5 years for each method.

A description of these methods is available in the section “[Depreciation Methods](#)” on page 3223.

Using the Depreciation Table

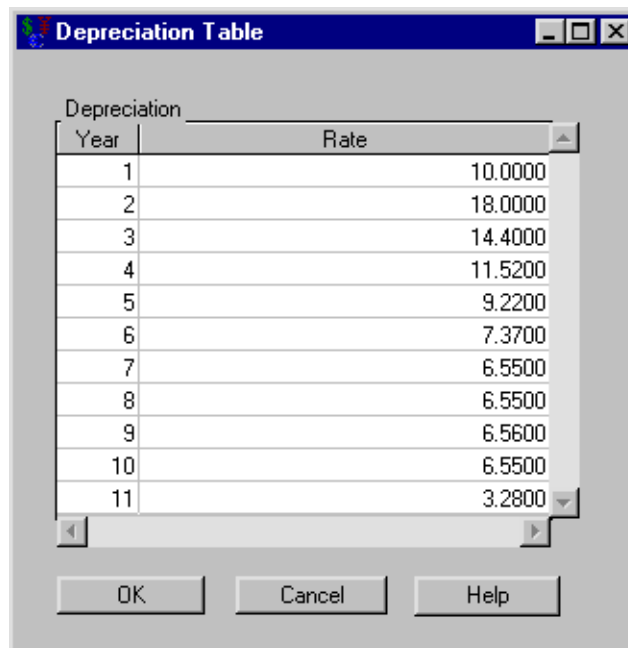

Sometimes you want to force the depreciation rates to be certain percentages each year. This option is particularly useful for calculating modified accelerated cost recovery system (MACRS) depreciations. The United States' Tax Reform Act of 1986 set depreciation rates for an asset based on an assumed lifetime for that asset. Since these lists of rates are important to many people, Investment Analysis provides SAS data sets for situations with yearly rates (using the “half-year convention”). Find them at `SASHELP.MACRS*` where * refers to the class of the property. For example, use `SASHELP.MACRS15` for a fifteen-year property. (When using the MACRS with the Tax Reform Act tables, you must set the **Salvage Value** to zero.)

Suppose you want to compute the depreciation schedule for the commercial fishing boat described in the section “[Depreciation Tasks](#)” on page 3157. The boat is a ten-year property according to the Tax Reform Act of 1986.

To employ the MACRS depreciation from the Depreciation dialog box, follow these steps:

1. Select the **Depreciation Table** option within the **Depreciation Method** area and click **OK**. This opens the Depreciation Table dialog box.
2. Right-click within the **Depreciation** area (which pops up a menu) and select **Load**.
3. Enter `SASHELP.MACRS10` for the **Dataset Name**. The dialog box should look like [Figure 53.11](#).

Figure 53.11 MACRS Percentages for a Ten-Year Property

Year	Rate
1	10.0000
2	18.0000
3	14.4000
4	11.5200
5	9.2200
6	7.3700
7	6.5500
8	6.5500
9	6.5600
10	6.5500
11	3.2800

Click **OK** to return to the Depreciation dialog box. Click **Create Depreciation Schedule** and the depreciation schedule fills (see [Figure 53.12](#)).

Note there are eleven entries in this depreciation schedule. This is because of the half-year convention that enables you to deduct one half of a year the first year which leaves a half year to deduct after the useful life

is over.

Figure 53.12 Depreciation Table with MACRS10

The screenshot shows a 'Depreciation' dialog box with the following fields and options:

- Name:** FISHING_BOAT
- Depreciable Asset Specification:**
 - Cost:** 50000
 - Year of Purchase:** 2000
 - Useful Life:** 10
 - Salvage Value:** 0
- Depreciation Method:**
 - ☐ Straight Line (SL)
 - ☐ Sum-of-years-digits
 - ☒ Depreciation Table....
 - ☐ Declining Balance (DB)
- DB Factor:** ☒ 2 ☐ 1.5 ☐ 1
- Conversion to SL:** ☒ Yes ☐ No
- Create Depreciation Schedule** (button)
- Depreciation Schedule Table:**

Year	StartBookValue	Depreciation	EndBookValue
2000	50000.00	5000.00	45000.00
2001	45000.00	9000.00	36000.00
2002	36000.00	7200.00	28800.00
2003	28800.00	5760.00	23040.00
2004	23040.00	4608.00	18432.00
- Buttons:** Save Data As..., OK, Cancel, Help

Click **OK** to return to the Investment Analysis dialog box.

Bond Tasks

Suppose someone offers to sell you a 20-year utility bond that was issued six years ago. It has a \$1,000 face value and pays semi-year coupons at 2%. You can purchase it for \$780. Would you be satisfied with this bond if you expect an 8% minimum attractive rate of return (MARR)?

In the Investment Analysis dialog box, select **Investment** → **New** → **Bond** from the menu bar to open the Bond dialog box.

Specifying Bond Terms

To specify the bond, follow these steps:

1. Enter UTILITY_BOND for the **Name**.
2. Enter 1000 for the **Face Value**.

3. Enter 2 for the **Coupon Rate**. The **Coupon Payment** updates to 20.
4. Select SEMIYEAR for **Coupon Interval**.
5. Enter 28 for the **Number of Coupons**. Because 14 years remain before the bond matures, the bond still has 28 semiyear coupons to pay. The **Maturity Date** updates.

Computing the Price from Yield

Enter 8 for **Yield** within the **Valuation** area. You see the bond's value would be \$666.72 as in [Figure 53.13](#).

Figure 53.13 Bond Value

The screenshot shows a 'Bond' dialog box with the following fields and values:

- Name:** UTILITY_BOND
- Bond Specification:**
 - Face Value:** 1000
 - Coupon Interval:** SEMIYEAR (dropdown menu)
 - Coupon Payment:** 20
 - Number of Coupons:** 28
 - Coupon Rate:** 2.00
 - Maturity Date:** 01JAN2014
- Valuation:**
 - Value:** 666.73873564
 - Yield:** 8.00

Buttons at the bottom include 'Analyze...', 'OK', 'Cancel', and 'Help'.

Computing the Yield from Price

Now enter 780 for **Value** within the **Valuation** area. You see the yield is only 6.5%, as in [Figure 53.14](#). This is not acceptable if you desire an 8% MARR.

Performing Bond Analysis

To perform bond-pricing analysis, follow these steps:

1. Click **Analyze** to open the Bond Analysis dialog box.
2. Enter 8.0 as the **Yield to Maturity**.
3. Enter 4.0 as the **+/-**.
4. Enter 0.5 as the **Increment by**.
5. Enter 780 as the **Reference Price**.
6. Click **Create Bond Valuation Summary**.

The **Bond Valuation Summary** area fills and shows you the different values for various yields as in [Figure 53.15](#).

Graphics... Save Data As... Return Help

Creating a Price versus Yield-to-Maturity Graph

Click **Graphics** to open the Bond Price dialog box. This contains the price versus yield-to-maturity graph shown in Figure 53.16.

Figure 53.16 Bond Price Graph

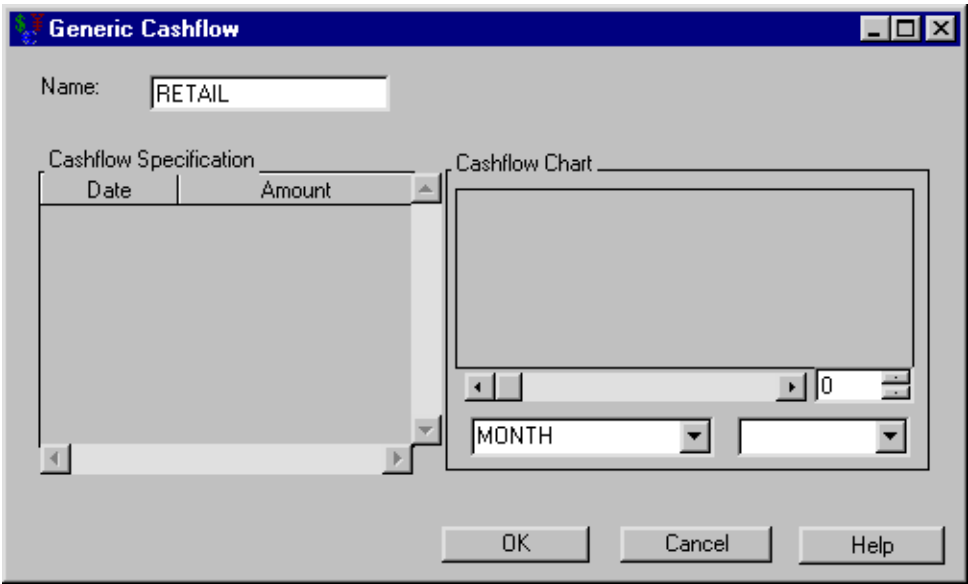

Click **Return** to return to the Bond Analysis dialog box. In the Bond Analysis dialog box, click **OK** to return to the Bond dialog box. In the Bond dialog box, click **OK** to return to the Investment Analysis dialog box.

Generic Cashflow Tasks

To specify a generic cashflow, you merely define any sequence of date-amount pairs. The flexibility of generic cashflows enables the user to represent economic alternatives or investments that do not fit into loan, savings, depreciation, or bond specifications.

In the Investment Analysis dialog box, select **Investment** → **New** → **Generic Cashflow** from the menu bar to open the **Generic Cashflow** dialog box. Enter RETAIL for the **Name** as in Figure 53.17.

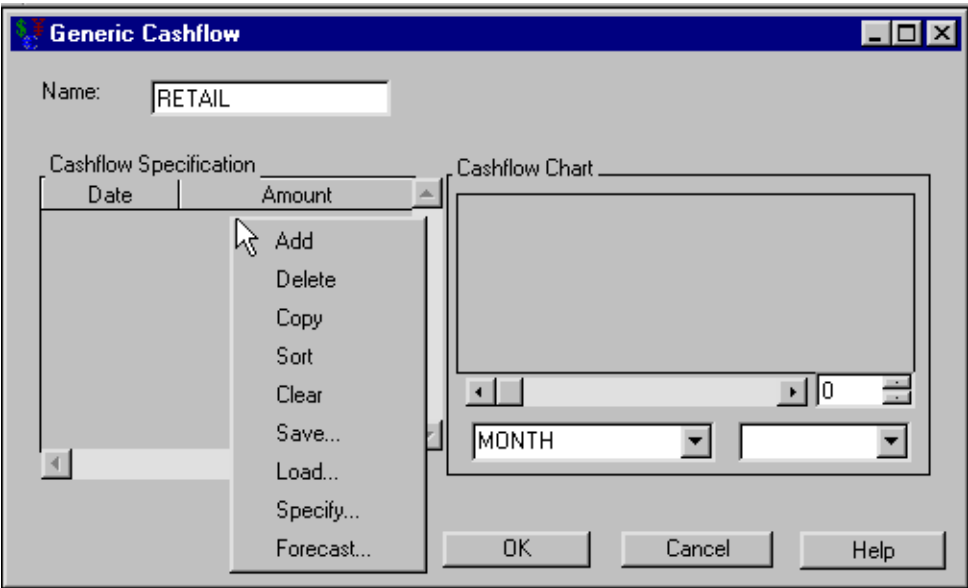

Figure 53.17 Introducing the Generic Cashflow

Right-Clicking within the Cashflow Specification Area

Right-clicking within Generic Cashflow’s **Cashflow Specification** area reveals the pop-up menu displayed in Figure 53.18. The menu provides many useful tools to assist you in creating these date-amount pairs.

Figure 53.18 Right-Clicking within the Cashflow Specification Area

The following sections describe how to use most of these right-click options. The **Specify** and **Forecast** menu items are described in the sections “[Including a Generated Cashflow](#)” on page 3167 and “[Including a Forecasted Cashflow](#)” on page 3169.

Adding a New Date-Amount Pair

To add a new date-amount pair manually, follow these steps:

1. Right-click in the **Cashflow Specification** area as shown in [Figure 53.18](#), and release on **Add**.
2. Enter 01JAN01 for the date.
3. Enter 100 for the amount.

Copying a Date-Amount Pair

To copy a selected date-amount pair, follow these steps:

1. Select the pair you just created.
2. Right-click in the **Cashflow Specification** area as shown in [Figure 53.18](#), but this time release on **Copy**.

Sorting All of the Date-Amount Pairs

Change the second date to 01JAN00. Now the dates are unsorted. Right-click in the **Cashflow Specification** area as shown in [Figure 53.18](#), and release on **Sort**.

Deleting a Date-Amount Pair

To delete a selected date-amount pair, follow these steps:

1. Select a date-amount pair.
2. Right-click in the **Cashflow Specification** area as shown in [Figure 53.18](#), and release on **Delete**.

Clearing All of the Date-Amount Pairs

To clear all date-amount pairs, right-click in the **Cashflow Specification** area as shown in [Figure 53.18](#), and release on **Clear**.

Loading Date-Amount Pairs from a Data Set

To load date-amount pairs from a SAS data set into the **Cashflow Specification** area, follow these steps:

1. Right-click in the **Cashflow Specification** area, and release on **Load**. This opens the Load Dataset dialog box.
2. Enter SASHELP.RETAIL for **Dataset Name**.
3. Click **OK** to return to the Generic Cashflow dialog box.

If there is a **Date** variable in the SAS data set, Investment Analysis loads it into the list. If there is no date-time-formatted variable, it loads the first available date or date-time-formatted variable. Investment Analysis then searches the SAS data set for an **Amount** variable to use. If none exists, it takes the first numeric variable that is not used by the **Date** variable.

Saving Date-Amount Pairs to a Data Set

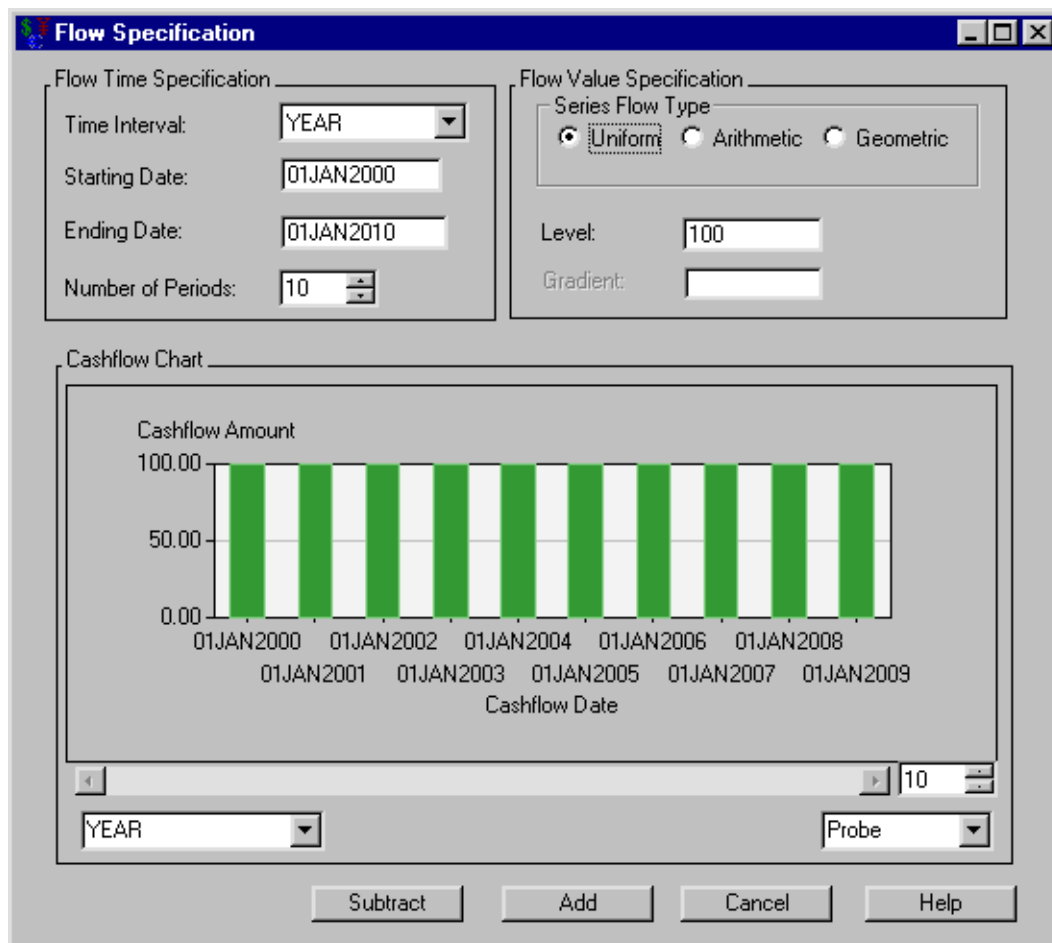

To save date-amount pairs from the **Cashflow Specification** area to a SAS data set, follow these steps:

1. Right-click in the **Cashflow Specification** area and release on **Save**. This opens the Save Dataset dialog box.
2. Enter the name of the SAS data set for **Dataset Name**.
3. Click **OK** to return to the Generic Cashflow dialog box.

Including a Generated Cashflow

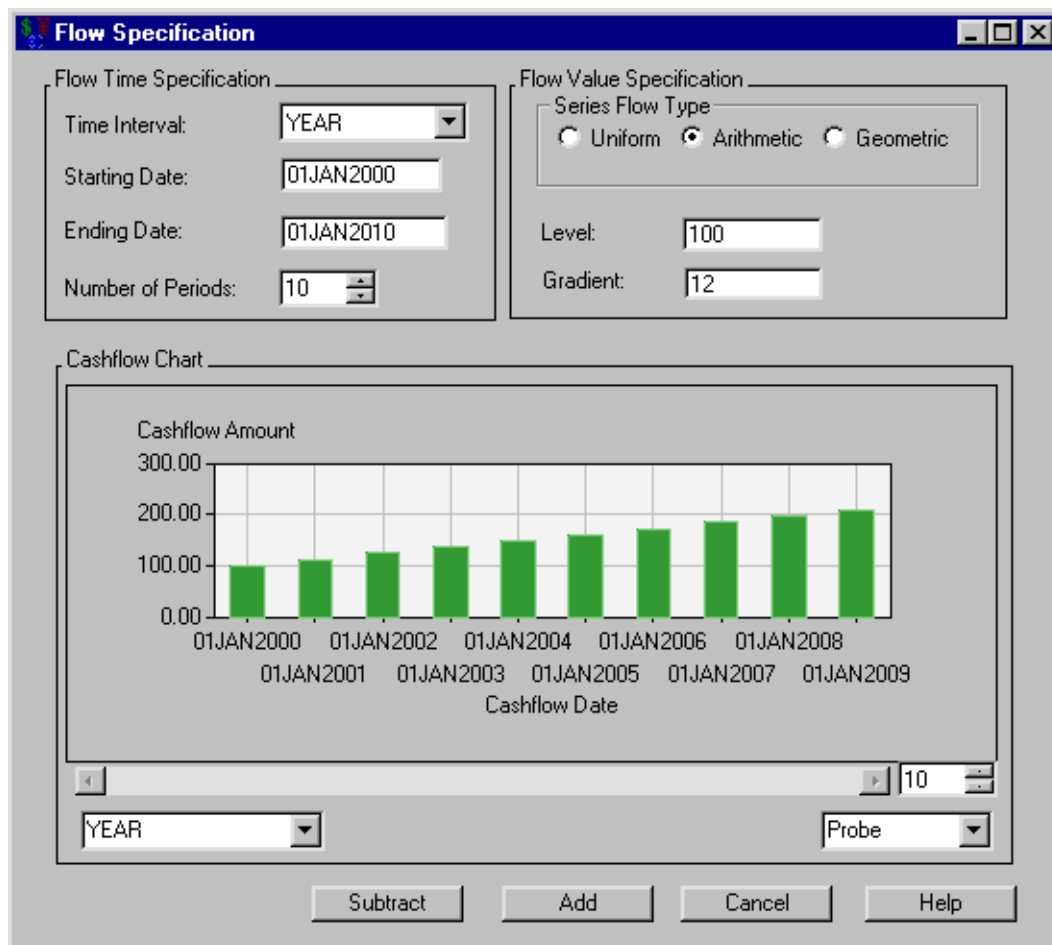

To generate date-amount pairs for the **Cashflow Specification** area, follow these steps:

1. Right-click in the **Cashflow Specification** area and release on **Specify**. This opens the Flow Specification dialog box.
2. Select YEAR for the **Time Interval**.
3. Enter today's date for the **Starting Date**.
4. Enter 10 for the **Number of Periods**. The **Ending Date** updates.
5. Enter 100 for the level. You can visualize the specification in the Cashflow Chart area (see [Figure 53.19](#)).
6. Click **Add** to add the specified cashflow to the list in the Generic Cashflow dialog box. Clicking **Add** also returns you to the Generic Cashflow dialog box.

Figure 53.19 Uniform Cashflow Specification

Clicking **Subtract** subtracts the current cashflow from the Generic Cashflow dialog box, and it returns you to the Generic Cashflow dialog box.

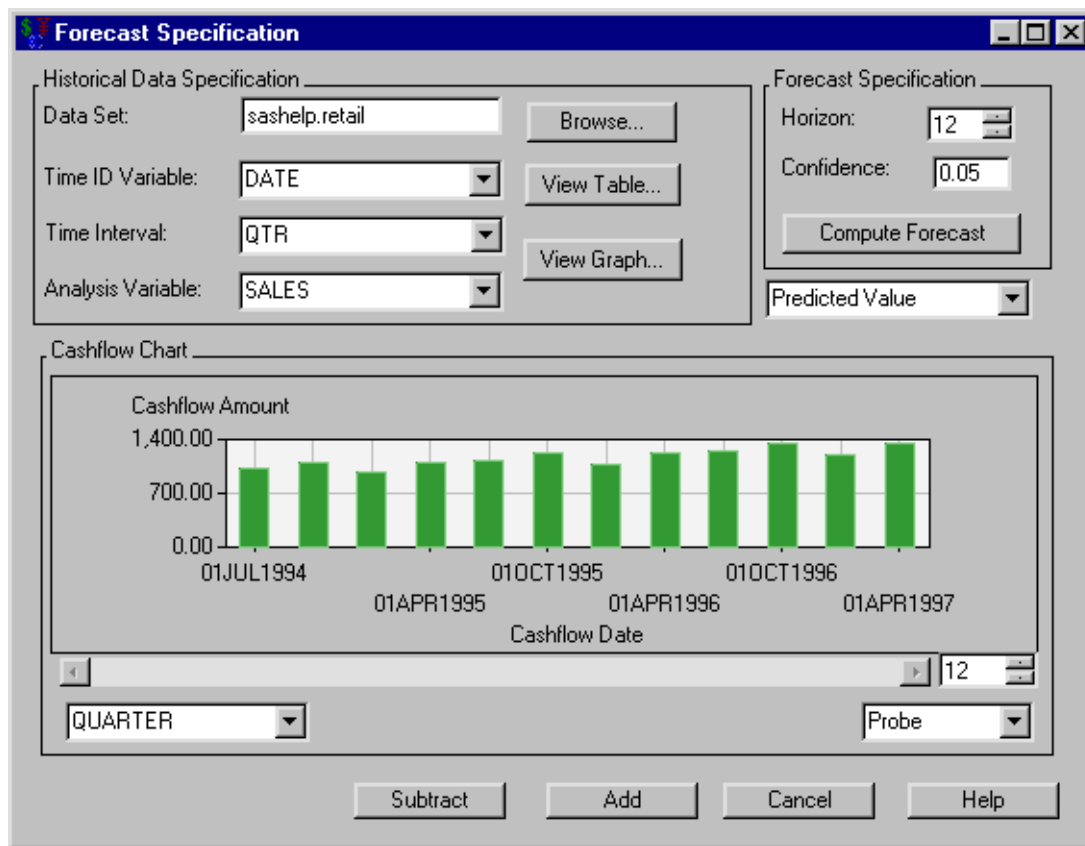

You can generate arithmetic and geometric specifications by clicking them within the **Series Flow Type** area. However, you must enter a value for the **Gradient**. In both cases the **Level** value is the value of the list at the **Starting Date**. With an arithmetic flow type, entries increment by the value **Gradient** for each **Time Interval**. With a geometric flow type, entries increase by the factor **Gradient** for each **Time Interval**. [Figure 53.20](#) displays an arithmetic cashflow with a **Level** of 100 and a **Gradient** of 12.

Figure 53.20 Arithmetic Cashflow Specification

Including a Forecasted Cashflow

To generate date-amount pairs for the **Cashflow Specification** area, follow these steps:

1. Right-click in the **Cashflow Specification** area and release on **Forecast** to open the **Forecast Specification** dialog box.
2. Enter sashelp.retail as the **Data Set**.
3. Select SALES for the **Analysis Variable**.
4. Click **Compute Forecast** to generate the forecast. You can visualize the forecast in the Cashflow Chart area (see [Figure 53.21](#)).
5. Click **Add** to add the forecast to the list in the Generic Cashflow dialog box. Clicking **Add** also returns you to the Generic Cashflow dialog box.

Figure 53.21 Cashflow Forecast

Clicking **Subtract** subtracts the current forecast from the Generic Cashflow dialog box, and it returns you to the Generic Cashflow dialog box.

To review the values from the SAS data set you forecast, click **View Table** or **View Graph**.

You can adjust the following values for the SAS data set you forecast: **Time ID Variable**, **Time Interval**, and **Analysis Variable**.

You can adjust the following values for the forecast: the **Horizon**, the **Confidence**, and choice of predicted value, lower confidence limit, and upper confidence limit.

Using the Cashflow Chart

Three dialog boxes contain the Cashflow Chart to aide in your visualization of cashflows: Generic Cashflow, Flow Specification, and Forecast Specification. Within this chart, you possess the following tools:

You can click on a bar in the plot and view its **Cashflow Date** and **Cashflow Amount**.

You can change the aggregation period of the view with the box in the lower-left corner of the Cashflow Chart. You can take the quarterly sales figures from the previous example, select **YEAR** as the value for this box, and view the annual sales figures. You can change the number in the box to the right of the horizontal scroll bar to alter the number of entries you want to view. The number in that box must be no

greater than the number of entries in the cashflow list. Lessening this number has the effect of zooming in upon a portion of the cashflow. When the number is less than the number of entries in the cashflow list, you can use the scroll bar at the bottom of the chart to scroll through the chart.

Dialog Box Guide

Loan

Selecting **Investment** → **New** → **Loan** from the Investment Analysis dialog box's menu bar opens the Loan dialog box displayed in Figure 53.22.

Figure 53.22 Loan Dialog Box

The following items are displayed:

Name holds the name you assign to the loan. You can set the name here or within the **Portfolio** area of the **Investment Analysis** dialog box. This must be a valid SAS name.

The **Loan Specification** area gives access to the values that define the loan.

Loan Amount holds the borrowed amount.

Periodic Payment holds the value of the periodic payments.

Number of Payments holds the number of payments in loan terms.

Payment Interval holds the frequency of the Periodic Payment.

Compounding Interval holds the compounding frequency.

Initial Rate holds the interest rate (a nominal percentage between 0 and 120) you pay on the loan.

Start Date holds the SAS date when the loan is initialized. The first payment is due one Payment Interval after this time.

Initialization opens the [Loan Initialization Options](#) dialog box where you can define initialization costs and down-payments relevant to the loan.

Prepayments opens the [Loan Prepayments](#) dialog box where you can specify the SAS dates and amounts of any prepayments.

Balloon Payments opens the [Balloon Payments](#) dialog box where you can specify the SAS dates and amounts of any balloon payments.

Rate Adjustments opens the [Rate Adjustment Terms](#) dialog box where you can specify terms for a variable-rate loan.

Rounding Off opens the [Rounding Off](#) dialog box where you can select the number of decimal places for calculations.

Create Amortization Schedule becomes available when you adequately define the loan within the **Loan Specification** area. Clicking it generates the amortization schedule.

Amortization Schedule fills when you click **Create Amortization Schedule**. The schedule contains a row for the loan's start-date and each payment-date with information about the following:

Date is a SAS date, either the loan's start-date or a payment-date.

Beginning Principal Amount is the balance at that date.

Periodic Payment Amount is the expected payment at that date.

Interest Payment is zero for the loan's start-date; otherwise it holds the interest since the previous date.

Principal Repayment is the amount of the payment that went toward the principal.

Ending Principal is the balance at the end of the payment interval.

Print becomes available when you generate the amortization schedule. Clicking it sends the contents of the amortization schedule to the SAS session print device.

Save Data As becomes available when you generate the amortization schedule. Clicking it opens the [Save Output Dataset](#) dialog box where you can save the amortization table (or portions thereof) as a SAS Dataset.

OK returns you to the [Investment Analysis](#) dialog box. If this is a new loan specification, clicking **OK** appends the current loan specification to the portfolio. If this is an existing loan specification, clicking **OK** returns the altered loan specification to the portfolio.

Cancel returns you to the [Investment Analysis](#) dialog box. If this is a new loan specification, clicking **Cancel** discards the current loan specification. If this is an existing loan specification, clicking **Cancel** discards the current changes.

Loan Initialization Options

Clicking **Initialization** in the Loan dialog box opens the Loan Initialization Options dialog box displayed in Figure 53.23.

Figure 53.23 Loan Initialization Options Dialog Box

The dialog box is titled "Loan Initialization Options". It is divided into two main sections. The first section, "Price, Loan Amount and Downpayment", contains three input fields: "Purchase Price:", "Loan Amount:", and "Downpayment:". To the right of each input field is a "% of Price" spinner. The "Purchase Price" spinner is set to 100.0, the "Loan Amount" spinner is set to 100.0, and the "Downpayment" spinner is set to 0.00. The second section, "Initialization Costs and Discount Points", contains three input fields: "Loan Amount:", "Initialization Costs:", and "Discount Points:". To the right of each input field is a "% of Amount" spinner. The "Loan Amount" spinner is set to 0.00, the "Initialization Costs" spinner is set to 0.00, and the "Discount Points" spinner is set to 0.00. At the bottom of the dialog are three buttons: "OK", "Cancel", and "Help".

The following items are displayed:

The **Price, Loan Amount and Downpayment** area contains the following information:

Purchase Price holds the actual price of the asset. This value equals the loan amount plus the downpayment.

Loan Amount holds the loan amount.

% of Price (to the right of **Loan Amount**) updates when you enter the **Purchase Price** and either the **Loan Amount** or **Downpayment**. This holds the percentage of the **Purchase Price** that comprises the **Loan Amount**. Setting the percentage manually causes the **Loan Amount** and **Downpayment** to update.

Downpayment holds any downpayment paid for the asset.

% of Price (to the right of **Downpayment**) updates when you enter the **Purchase Price** and either the **Loan Amount** or **Downpayment**. This holds the percentage of the **Purchase Price** that comprises the **Downpayment**. Setting the percentage manually causes the **Loan Amount** and **Downpayment** to update.

Initialization Costs and Discount Points area

Loan Amount holds a copy of the **Loan Amount** above.

Initialization Costs holds the value of any initialization costs.

% of Amount (to the right of **Initialization Costs**) updates when you enter the **Purchase Price** and either the **Initialization Costs** or **Discount Points**. This holds the percentage of the **Loan Amount** that comprises the **Initialization Costs**. Setting the percentage manually causes the **Initialization Costs** to update.

Discount Points holds the value of any discount points.

% of Amount (to the right of **Discount Points**) updates when you enter the **Purchase Price** and either the **Initialization Costs** or **Discount Points**. This holds the percentage of the **Loan Amount** that comprises the **Discount Points**. Setting the percentage manually causes the **Discount Points** to update.

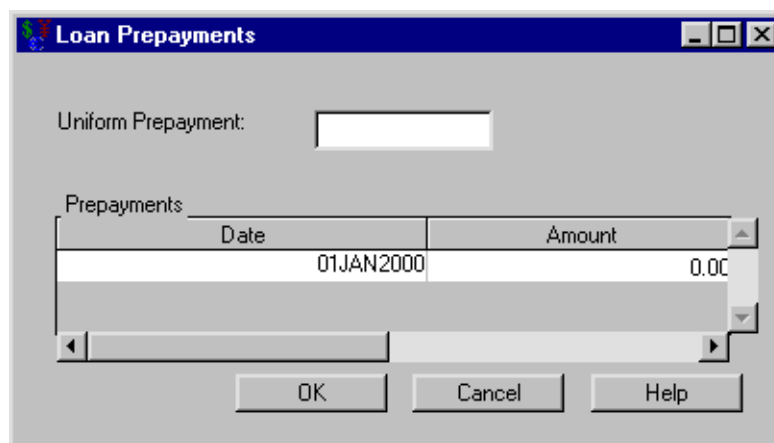

OK returns you to the **Loan** dialog box, saving the information that is entered.

Cancel returns you to the **Loan** dialog box, discarding any changes made since you opened the dialog box.

Loan Prepayments

Clicking **Prepayments** in the **Loan** dialog box opens the **Loan Prepayments** dialog box displayed in [Figure 53.24](#).

Figure 53.24 Loan Prepayments Dialog Box

The following items are displayed:

Uniform Prepayment holds the value of a regular prepayment concurrent to the usual periodic payment.

Prepayments holds a list of date-amount pairs to accommodate any prepayments. **Right-clicking** within the **Prepayments** area reveals many helpful tools for managing date-amount pairs.

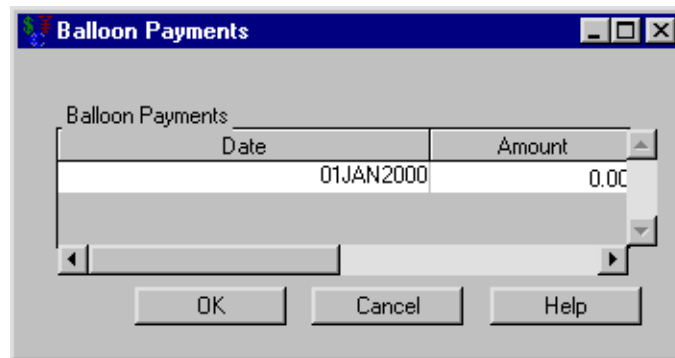

OK returns you to the **Loan** dialog box, storing the information entered on the prepayments.

Cancel returns you to the [Loan](#) dialog box, discarding any prepayments entered since you opened the dialog box.

Balloon Payments

Clicking **Balloon Payments** in the Loan dialog box opens the Balloon Payments dialog box displayed in Figure 53.25.

Figure 53.25 Balloon Payments Dialog Box

The following items are displayed:

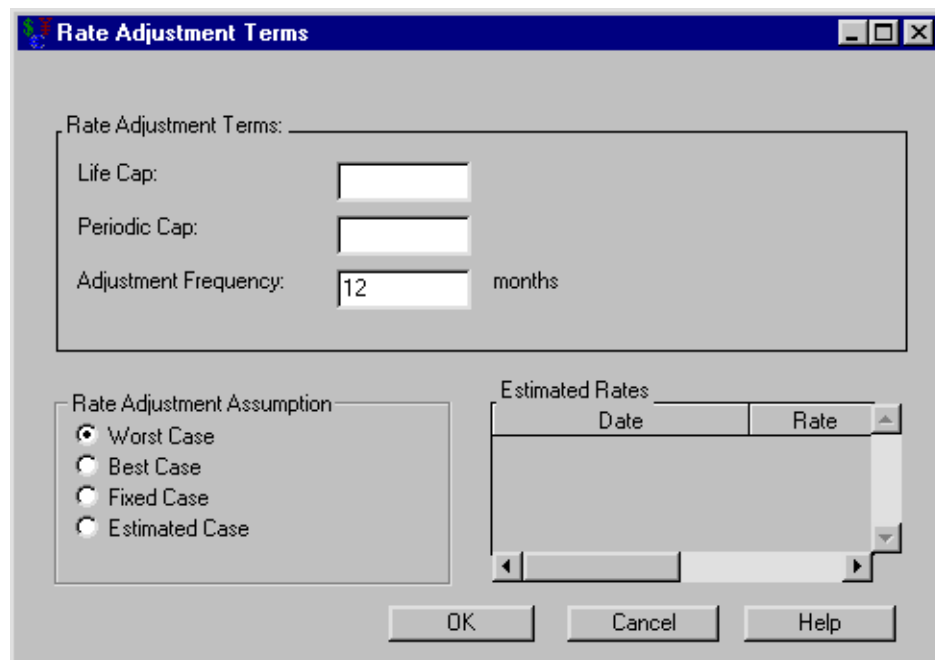

Balloon Payments holds a list of date-amount pairs to accommodate any balloon payments. **Right-clicking** within the **Balloon Payments** area reveals many helpful tools for managing date-amount pairs.

OK returns you to the [Loan](#) dialog box, storing the information entered on the balloon payments.

Cancel returns you to the [Loan](#) dialog box, discarding any balloon payments entered since you opened the dialog box.

Rate Adjustment Terms

Clicking **Rate Adjustments** in the Loan dialog box opens the Rate Adjustment Terms dialog box displayed in Figure 53.26.

Figure 53.26 Rate Adjustment Terms Dialog Box

The dialog box is titled "Rate Adjustment Terms". It contains two main sections. The first section, "Rate Adjustment Terms:", has three input fields: "Life Cap:" (empty), "Periodic Cap:" (empty), and "Adjustment Frequency:" (12) followed by the text "months". The second section, "Rate Adjustment Assumption", has four radio buttons: "Worst Case" (selected), "Best Case", "Fixed Case", and "Estimated Case". To the right of this section is a table titled "Estimated Rates" with two columns: "Date" and "Rate". The table is currently empty. At the bottom of the dialog are three buttons: "OK", "Cancel", and "Help".

The following items are displayed:

The **Rate Adjustment Terms** area

Life Cap holds the maximum deviation from the **Initial Rate** allowed over the life of the loan.

Periodic Cap holds the maximum adjustment allowed per adjustment.

Adjustment Frequency holds how often (in months) the lender can adjust the interest rate.

The **Rate Adjustment Assumption** determines the scenario the adjustments will take.

Worst Case uses information from the **Rate Adjustment Terms** area to forecast a worst-case scenario.

Best Case uses information from the **Rate Adjustment Terms** area to forecast a best-case scenario.

Fixed Case specifies a fixed-rate loan.

Estimated Case uses information from the **Rate Adjustment Terms** and **Estimated Rate** area to forecast a best-case scenario.

Estimated Rates holds a list of date-rate pairs, where each date is a SAS date and the rate is a nominal percentage between 0 and 120. The **Estimated Case** assumption uses these rates for its calculations. [Right-clicking](#) within the **Estimated Rates** area reveals many helpful tools for managing date-rate pairs.

OK returns you to the [Loan](#) dialog box, taking rate adjustment information into account.

Cancel returns you to the [Loan](#) dialog box, discarding any rate adjustment information provided since opening the dialog box.

Rounding Off

Clicking **Rounding Off** in the Loan dialog box opens the Rounding Off dialog box displayed in Figure 53.27.

Figure 53.27 Rounding Off Dialog Box

The following items are displayed:

Decimal Places fixes the number of decimal places your results will display.

OK returns you to the [Loan](#) dialog box. Numeric values will then be represented with the number of decimals specified in **Decimal Places**.

Cancel returns you to the [Loan](#) dialog box. Numeric values will be represented with the number of decimals specified prior to opening this dialog box.

Savings

Selecting **Investment** → **New** → **Savings** from the Investment Analysis dialog box's menu bar opens the Savings dialog box displayed in Figure 53.28.

Figure 53.28 Savings Dialog Box

The Savings Dialog Box is shown with the following fields and controls:

- Name:** untitled_saving
- Savings Specification:**
 - Periodic Deposit: []
 - Start Date: 01JAN2000
 - Number of Deposits: []
 - Deposit Interval: MONTH (dropdown)
 - Initial Rate: []
 - Compounding Interval: MONTH (dropdown)
- Ending Date:** [] **Balance:** [] **Create Account Summary** (button)
- Account Summary** (list box)
- Buttons:** Save Data As..., OK, Cancel, Help

The following items are displayed:

Name holds the name you assign to the savings. You can set the name here or within the **Portfolio** area of the **Investment Analysis** dialog box. This must be a valid SAS name.

The **Savings Specification** area

Periodic Deposit holds the value of your regular deposits.

Number of Deposits holds the number of deposits into the account.

Initial Rate holds the interest rate (a nominal percentage between 0 and 120) the savings account earns.

Start Date holds the SAS date when deposits begin.

Deposit Interval holds the frequency of your **Periodic Deposit**.

Compounding Interval holds how often the interest compounds.

Create Account Summary becomes available when you adequately define the savings within the **Savings Specification** area. Clicking it generates the account summary.

Account Summary fills when you click **Create Account Summary**. The schedule contains a row for each deposit-date with information about the following:

Date is the SAS date of a deposit.

Starting Balance is the balance at that date.

Deposits is the deposit at that date.

Interest Earned is the interest earned since the previous date.

Ending Balance is the balance after the payment.

Print becomes available when you generate an account summary. Clicking it sends the contents of the account summary to the SAS session print device.

Save Data As becomes available when you generate an account summary. Clicking it opens the [Save Output Dataset](#) dialog box where you can save the account summary (or portions thereof) as a SAS Dataset.

OK returns you to the [Investment Analysis](#) dialog box. If this is a new savings, clicking **OK** appends the current savings specification to the portfolio. If this is an existing savings specification, clicking **OK** returns the altered savings to the portfolio.

Cancel returns you to the [Investment Analysis](#) dialog box. If this is a new savings, clicking **Cancel** discards the current savings specification. If this is an existing savings, clicking **Cancel** discards the current changes.

Depreciation

Selecting **Investment** → **New** → **Depreciation** from the Investment Analysis dialog box's menu bar opens the Depreciation dialog box displayed in [Figure 53.29](#).

Figure 53.29 Depreciation Dialog Box

The following items are displayed:

Name holds the name you assign to the depreciation. You can set the name here or within the **Portfolio** area of the [Investment Analysis](#) dialog box. This must be a valid SAS name.

Depreciable Asset Specification

Cost holds the asset's original cost.

Year of Purchase holds the asset's year of purchase.

Useful Life holds the asset's useful life (in years).

Salvage Value holds the asset's value at the end of its **Useful Life**.

The **Depreciation Method** area holds the depreciation methods available:

- Straight Line
- Sum-of-years Digits
- [Depreciation Table](#)
- Declining Balance
 - DB Factor: choice of 2, 1.5, or 1
 - Conversion to SL: choice of Yes or No

Create Depreciation Schedule becomes available when you adequately define the depreciation within the **Depreciation Asset Specification** area. Clicking the **Create Depreciation Schedule** button then fills the **Depreciation Schedule** area.

Depreciation Schedule fills when you click **Create Depreciation Schedule**. The schedule contains a row for each year. Each row holds:

Year is a year.

Start Book Value is the starting book value for that year.

Depreciation is the depreciation value for that year.

End Book Value is the ending book value for that year.

Print becomes available when you generate the depreciation schedule. Clicking it sends the contents of the depreciation schedule to the SAS session print device.

Save Data As becomes available when you generate the depreciation schedule. Clicking it opens the [Save Output Dataset](#) dialog box where you can save the depreciation table (or portions thereof) as a SAS Dataset.

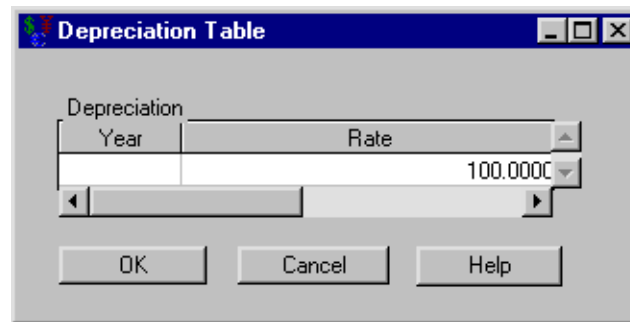

OK returns you to the [Investment Analysis](#) dialog box. If this is a new depreciation specification, clicking **OK** appends the current depreciation specification to the portfolio. If this is an existing depreciation specification, clicking **OK** returns the altered depreciation specification to the portfolio.

Cancel returns you to the [Investment Analysis](#) dialog box. If this is a new depreciation specification, clicking **Cancel** discards the current depreciation specification. If this is an existing depreciation specification, clicking **Cancel** discards the current changes.

Depreciation Table

Clicking **Depreciation Table** from **Depreciation Method** area of the Depreciation dialog box opens the Depreciation Table dialog box displayed in [Figure 53.30](#).

Figure 53.30 Depreciation Table Dialog Box

The following items are displayed:

The **Depreciation** area holds a list of year-rate pairs where the rate is an annual depreciation rate (a percentage between 0% and 100%). [Right-clicking](#) within the **Depreciation** area reveals many helpful tools for managing year-rate pairs.

OK returns you to the [Depreciation](#) dialog box with the current list of depreciation rates from the **Depreciation** area.

Cancel returns you to the [Depreciation](#) dialog box, discarding any editions to the **Depreciation** area since you opened the dialog box.

Bond

Selecting **Investment** → **New** → **Bond** from the Investment Analysis dialog box's menu bar opens the Bond dialog box displayed in [Figure 53.31](#).

Figure 53.31 Bond

The following items are displayed:

Name holds the name you assign to the bond. You can set the name here or within the **Portfolio** area of the [Investment Analysis](#) dialog box. This must be a valid SAS name.

Bond Specification

Face Value holds the bond's value at maturity.

Coupon Payment holds the amount of money you receive periodically as the bond matures.

Coupon Rate holds the rate (a nominal percentage between 0% and 120%) of the **Face Value** that defines the **Coupon Payment**.

Coupon Interval holds how often the bond pays its coupons.

Number of Coupons holds the number of coupons before maturity.

Maturity Date holds the SAS date when you can redeem the bond for its **Face Value**.

The **Valuation** area becomes available when you adequately define the bond within the **Bond Specification** area. Entering either the **Value** or the **Yield** causes the calculation of the other. If you respecify the bond after performing a calculation here, you must reenter the **Value** or **Yield** value to update the calculation.

Value holds the bond's value if expecting the specified **Yield**.

Yield holds the bond's yield if the bond is valued at the amount of **Value**.

You must specify the bond before analyzing it. After you have specified the bond, clicking **Analyze** opens the [Bond Analysis](#) dialog box where you can compare various values and yields.

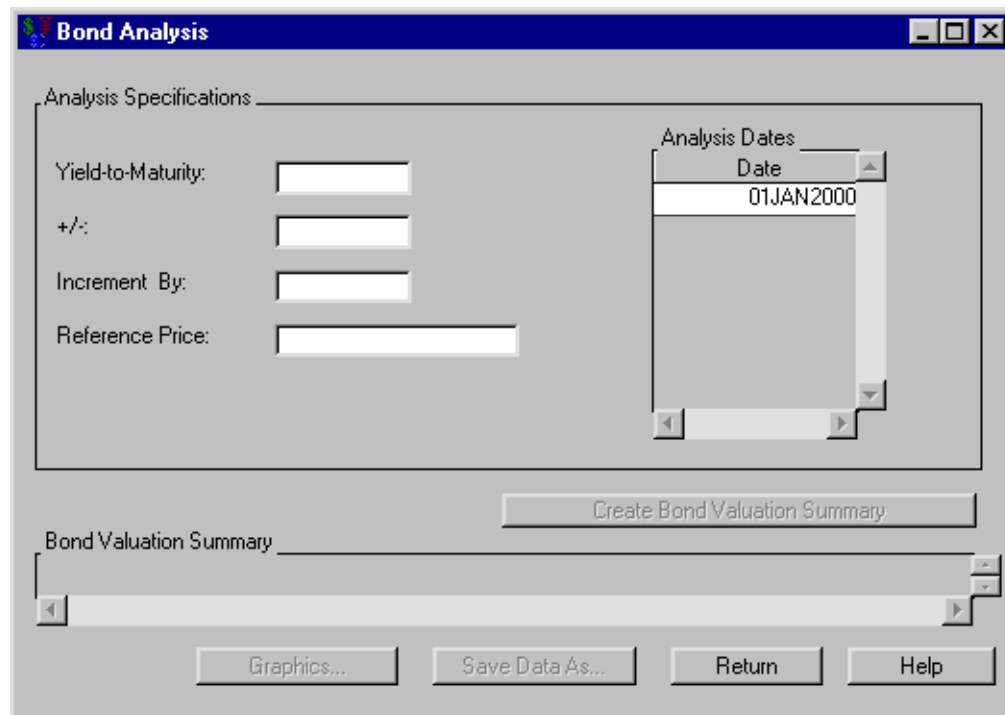

OK returns you to the **Investment Analysis** dialog box. If this is a new bond specification, clicking **OK** appends the current bond specification to the portfolio. If this is an existing bond specification, clicking **OK** returns the altered bond specification to the portfolio.

Cancel returns you to the **Investment Analysis** dialog box. If this is a new bond specification, clicking **Cancel** discards the current bond specification. If this is an existing bond specification, clicking **Cancel** discards the current changes.

Bond Analysis

Clicking **Analyze** from the Bond dialog box opens the Bond Analysis dialog box displayed in [Figure 53.32](#).

Figure 53.32 Bond Analysis

The following items are displayed:

Analysis Specifications

Yield-to-maturity holds the percentage yield upon which to center the analysis.

+/- holds the maximum deviation percentage to consider from the **Yield-to-maturity**.

Increment by holds the percentage increment by which the analysis is calculated.

Reference Price holds the reference price.

Analysis Dates holds a list of SAS dates for which you perform the bond analysis.

You must specify the analysis before valuing the bond for the various yields. After you adequately specify the analysis, click **Create Bond Valuation Summary** to generate the bond valuation summary.

Bond Valuation Summary fills when you click **Create Bond Valuation Summary**. The schedule contains a row for each rate with information concerning the following:

Date is the SAS date when the **Value** gives the particular **Yield**.

Yield is the percent yield that corresponds to the **Value** at the given **Date**.

Value is the value of the bond at **Date** for the given **Yield**.

Percent Change is the percent change if the **Reference Price** is specified.

Duration is the duration.

Convexity is the convexity.

Graphics opens the [Bond Price](#) graph that represents the price versus yield-to-maturity.

Print becomes available when you generate the **Bond Valuation Summary**. Clicking it sends the contents of the summary to the SAS session print device.

Save Data As becomes available when you fill the **Bond Valuation Summary** area. Clicking it opens the [Save Output Dataset](#) dialog box where you can save the valuation summary (or portions thereof) as a SAS Dataset.

Return takes you back to the [Bond](#) dialog box.

Bond Price

Clicking **Graphics** from the Bond dialog box opens the Bond Price dialog box displayed in Figure 53.33.

Figure 53.33 Bond Price Graph

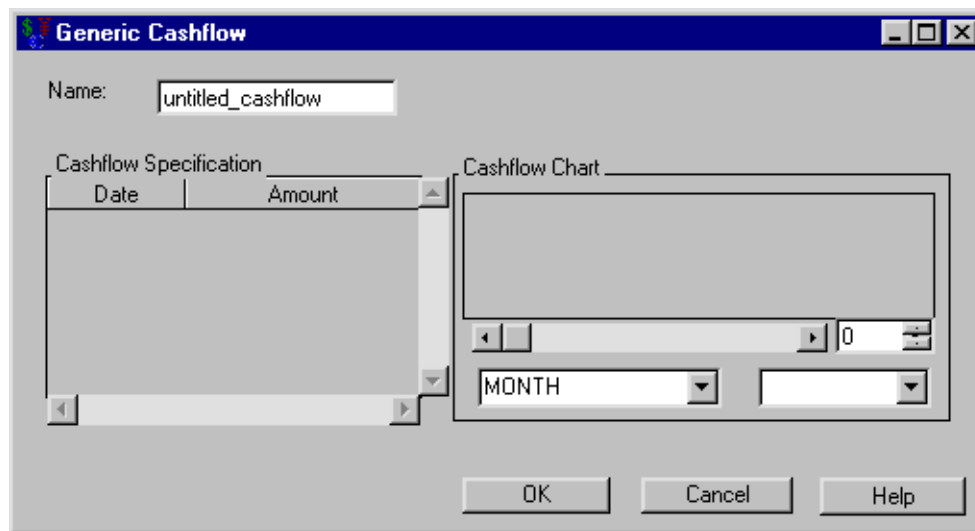

It possesses the following item:

Return takes you back to the [Bond Analysis](#) dialog box.

Generic Cashflow

Selecting **Investment** → **New** → **Generic Cashflow** from the Investment Analysis dialog box's menu bar opens the Generic Cashflow dialog box displayed in Figure 53.34.

Figure 53.34 Generic Cashflow

The following items are displayed:

Name holds the name you assign to the generic cashflow. You can set the name here or within the **Portfolio** area of the [Investment Analysis](#) dialog box. This must be a valid SAS name.

Cashflow Specification holds date-amount pairs that correspond to deposits and withdrawals (or benefits and costs) for the cashflow. Each date is a SAS date. [Right-clicking](#) within the **Cashflow Specification** area reveals many helpful tools for managing date-amount pairs.

The **Cashflow Chart** fills with a graph representing the cashflow when the **Cashflow Specification** area is nonempty. The box to the right of the scroll bar controls the number of entries with which to fill the graph. If the number in this box is less than the total number of entries, you can use the scroll bar to view different segments of the cashflow. The left box below the scroll bar holds the frequency for drilling purposes.

OK returns you to the [Investment Analysis](#) dialog box. If this is a new generic cashflow specification, clicking **OK** appends the current cashflow specification to the portfolio. If this is an existing cashflow specification, clicking **OK** returns the altered cashflow specification to the portfolio.

Cancel returns you to the [Investment Analysis](#) dialog box. If this is a new cashflow specification, clicking **Cancel** discards the current cashflow specification. If this is an existing cashflow specification, clicking **Cancel** discards the current changes.

Right-Clicking within Generic Cashflow's Cashflow Specification Area

Right-click within the **Cashflow Specification** area of the Generic Cashflow dialog box pops up the menu displayed in [Figure 53.35](#).

Figure 53.35 Right-Clicking

Add creates a blank pair.

Delete removes the currently highlighted pair.

Copy duplicates the currently selected pair.

Sort arranges the entered pairs in chronological order.

Clear empties the area of all pairs.

Save opens the [Save Dataset](#) dialog box where you can save the entered pairs as a SAS Dataset for later use.

Load opens the [Load Dataset](#) dialog box where you select a SAS Dataset to populate the area.

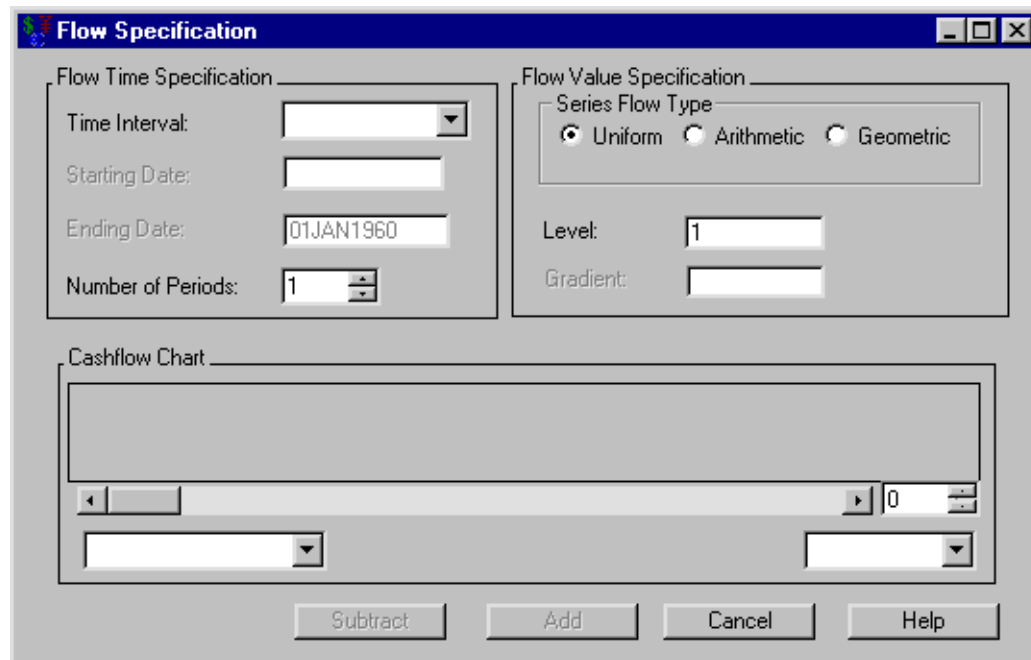

Specify opens the [Flow Specification](#) dialog box where you can generate date-rate pairs to include in your cashflow.

Forecast opens the [Forecast Specification](#) dialog box where you can generate the forecast of a SAS data set to include in your cashflow.

If you want to perform one of these actions on a collection of pairs, you must select a collection of pairs before right-clicking. To select an adjacent list of pairs, do the following: click the first pair, hold down the SHIFT key, and click the final pair. After the list of pairs is selected, you can release the SHIFT key.

Flow Specification

Figure 53.36 Flow Specification

The dialog box is titled "Flow Specification". It is divided into two main sections: "Flow Time Specification" and "Flow Value Specification".

Flow Time Specification:

- Time Interval:** A dropdown menu.
- Starting Date:** A text input field.
- Ending Date:** A text input field containing "01JAN1960".
- Number of Periods:** A spin box with the value "1".

Flow Value Specification:

- Series Flow Type:** A group box containing three radio buttons: "Uniform" (selected), "Arithmetic", and "Geometric".
- Level:** A text input field containing "1".
- Gradient:** A text input field.

Cashflow Chart:

A large empty rectangular area for a chart. Below it is a horizontal scrollbar with a value of "0". At the bottom of the chart area are two dropdown menus.

Buttons: "Subtract", "Add", "Cancel", and "Help" are located at the bottom of the dialog.

The following items are displayed:

Flow Time Specification

Time Interval holds the uniform frequency of the entries.

You can set the **Starting Date** when you set the **Time Interval**. It holds the SAS date the entries will start.

You can set the **Ending Date** when you set the **Time Interval**. It holds the SAS date the entries will end.

Number of Periods holds the number of entries.

Flow Value Specification

Series Flow Type describes the movement the entries can assume:

- **Uniform** assumes all entries are equal.
- **Arithmetic** assumes the entries begin at **Level** and increase by the value of **Gradient** per entry.
- **Geometric** assumes the entries begin at **Level** and increase by a factor of **Gradient** per entry.

Level holds the starting amount for all flow types.

You can set the **Gradient** when you select either **Arithmetic** or **Geometric** series flow type. It holds the arithmetic and geometric gradients, respectively, for the **Arithmetic** and **Geometric** flow types.

When the cashflow entries are adequately defined, the **Cashflow Chart** fills with a graph displaying the dates and values of the entries. The box to the right of the scroll bar controls the number of entries with which to fill the graph. If the number in this box is less than the total number of entries, you can use the scroll bar to view different segments of the cashflow. The left box below the scroll bar holds the frequency.

Subtract becomes available when the collection of entries is adequately specified. Clicking **Subtract** then returns you to the [Generic Cashflow](#) dialog box and subtracts the entries from the current cashflow.

Add becomes available when the collection of entries is adequately specified. Clicking **Add** then returns you to the [Generic Cashflow](#) dialog box and adds the entries to the current cashflow.

Cancel returns you to [Generic Cashflow](#) dialog box without changing the cashflow.

Forecast Specification

Figure 53.37 Forecast Specification

Forecast Specification

Historical Data Specification

Data Set:

Time ID Variable:

Time Interval:

Analysis Variable:

Forecast Specification

Horizon:

Confidence:

Predicted Value:

Cashflow Chart

The following items are displayed:

Historical Data Specification

Data Set holds the name of the SAS data set to forecast.

Browse opens the standard SAS **Open** dialog box to help select a SAS data set to forecast.

Time ID Variable holds the time ID variable to forecast over.

Time Interval fixes the time interval for the **Time ID Variable**.

Analysis Variable holds the data variable upon which to forecast.

View Table opens a table that displays the contents of the specified SAS data set.

View Graph opens the Time Series Viewer that graphically displays the contents of the specified SAS data set.

Forecast Specification

Horizon holds the number of periods into the future you want to forecast.

Confidence holds the confidence limit for applicable forecasts.

Compute Forecast fills the **Cashflow Chart** with the forecast.

The box below **Forecast Specification** holds the type of forecast you want to generate:

- Predicted Value
- Lower Confidence Limit
- Upper Confidence Limit

The **Cashflow Chart** fills when you click **Compute Forecast**. The box to the right of the scroll bar controls the number of entries with which to fill the graph. If the number in this box is less than the total number of entries, you can use the scroll bar to view different segments of the cashflow. The left box below the scroll bar holds the frequency.

Subtract becomes available when the collection of entries is adequately specified. Clicking **Subtract** then returns you to the [Generic Cashflow](#) dialog box subtracting the forecast from the current cashflow.

Add becomes available when the collection of entries is adequately specified. Clicking **Add** then returns you to the [Generic Cashflow](#) adding the forecast to the current cashflow.

Cancel returns to [Generic Cashflow](#) dialog box without changing the cashflow.

Computations

Contents	
The Compute Menu	3191
Tasks	3192
Taxing a Cashflow	3192
Converting Currency	3194
Deflating Cashflows	3196
Dialog Box Guide	3198
After Tax Cashflow Calculation	3198
Currency Conversion	3199
Constant Dollar Calculation	3201

The Compute Menu

Figure 54.1 shows the **Compute** menu.

Figure 54.1 The Compute Menu

The **Compute** menu offers the following options that apply to generic cashflows.

After Tax Cashflow opens the **After Tax Cashflow Calculation** dialog box. Computing an after tax cashflow is useful when taxes affect investment alternatives differently. Comparing after tax cashflows provides a more accurate determination of the cashflows’ profitabilities. You can set default values for income tax rates by selecting **Tools** → **Define Rate** → **Income Tax Rate** from the Investment Analysis dialog box. This opens the **Income Tax Specification** dialog box where you can enter the tax rates.

Currency Conversion opens the **Currency Conversion** dialog box. Currency conversion is necessary when investments are in different currencies. For data concerning currency conversion rates, see <http://dsbb.imf.org/>, the International Monetary Fund’s Dissemination Standards Bulletin Board.

Constant Dollars opens the **Constant Dollar Calculation** dialog box. A constant dollar (inflation adjusted monetary value) calculation takes cashflow and inflation information and discounts the cashflow to a level where the buying power of the monetary unit is constant over time. Groups quantify inflation (in the form of price indices and inflation rates) for countries and industries by averaging the growth of prices for various products and sectors of the economy. For data concerning price indices, see the United States Department of Labor at <http://www.dol.gov/> and the International Monetary Fund's Dissemination Standards Bulletin Board at <http://dsbb.imf.org/>. You can set default values for inflation rates by clicking **Tools** → **Define Rate** → **Inflation** from the Investment Analysis dialog box. This opens the **Inflation Specification** dialog box where you can enter the inflation rates.

Tasks

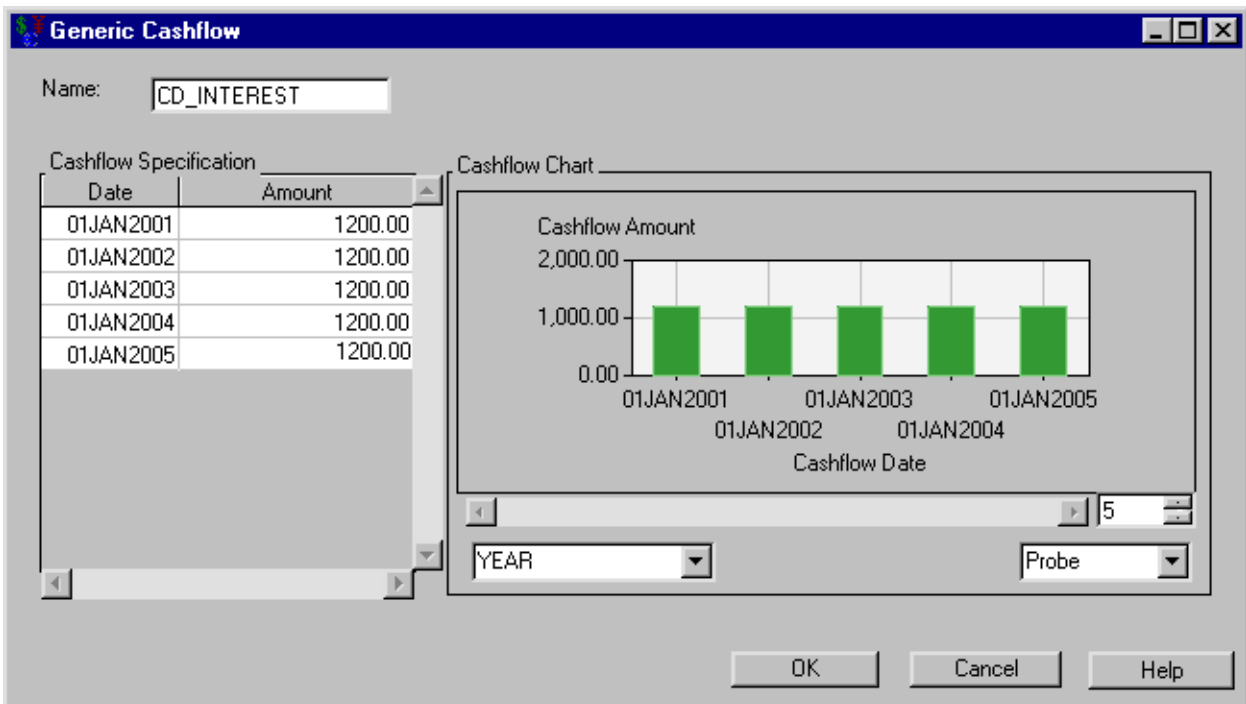

The next few sections show how to perform computations for the following situation. Suppose you buy a \$10,000 certificate of deposit that pays 12% interest a year for five years. Your earnings are taxed at a rate of 30% federally and 7% locally. Also, you want to transfer all the money to an account in England. British pounds convert to American dollars at an exchange rate of \$1.00 to £0.60. The inflation rate in England is 3%. The instructions in this example assume familiarity with the following:

- The right-clicking options of the **Cashflow Specification** area in the Generic Cashflow dialog box (described in the section “**Right-Clicking within Generic Cashflow’s Cashflow Specification Area**” on page 3186.)
- The **Save Data As** button located in many dialog boxes (described in the section “**Saving Output to SAS Data Sets**” on page 3219.)

Taxing a Cashflow

Consider the example described in the section “**The Compute Menu**” on page 3191. To create the earnings, follow these steps:

1. Select **Investment** → **New** → **Generic Cashflow** to create a generic cashflow.
2. Enter CD_INTEREST for the **Name**.
3. Enter 1200 for each of the five years starting one year from today as displayed in **Figure 54.2**.
4. Click **OK** to return to the Investment Analysis dialog box.

Figure 54.2 Computing the Interest on the CD

To compute the tax on the earnings, follow these steps:

1. Select CD_INTEREST from the **Portfolio** area.
2. Select **Compute** → **After Tax Cashflow** from the pull-down menu.
3. Enter 30 for **Federal Tax**.
4. Enter 7 for **Local Tax**. Note that **Combined Tax** updates.
5. Click **Create After Tax Cashflow**. The **After Tax Cashflow** area fills, as displayed in [Figure 54.3](#).

Figure 54.3 Computing the Interest After Taxes

After Tax Cashflow Calculation

Name:

Federal Tax:

Local Tax:

Combined Tax:

After Tax Cashflow

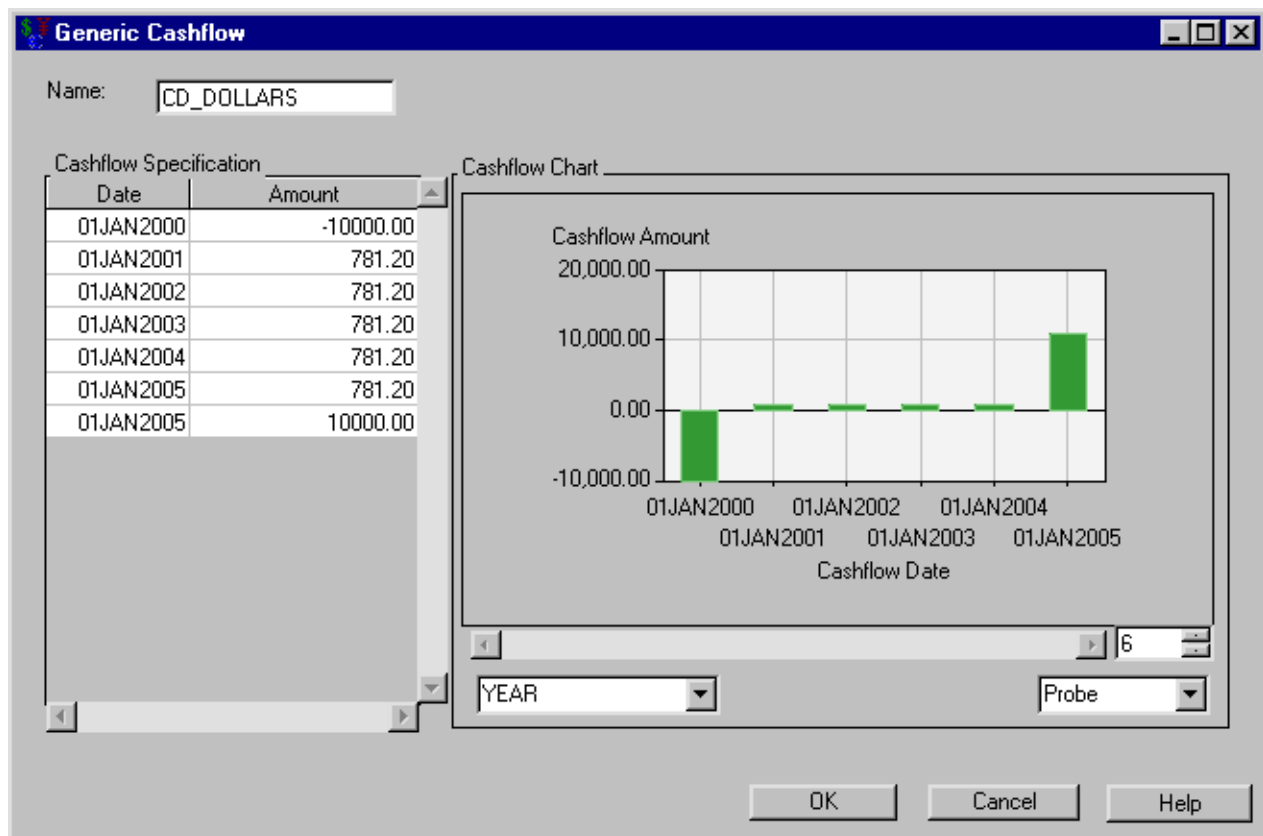

Date	Amount
01JAN2001	781.20
01JAN2002	781.20
01JAN2003	781.20
01JAN2004	781.20
01JAN2005	781.20

Save the taxed earnings to a SAS data set named `WORK.CD_AFTERTAX`. Click **Return** to return to the Investment Analysis dialog box.

Converting Currency

Consider the example described in the section “[The Compute Menu](#)” on page 3191. To create the cashflow to convert, follow these steps:

1. Select **Investment** → **New** → **Generic Cashflow** to open a new generic cashflow.
2. Enter `CD_DOLLARS` for the **Name**.
3. Load `WORK.CD_AFTERTAX` into its **Cashflow Specification**.
4. Add $-10,000$ for today and $+10,000$ for five years from today to the cashflow as displayed in [Figure 54.4](#).
5. Sort the transactions by date to aid your reading.
6. Click **OK** to return to the Investment Analysis dialog box.

Figure 54.4 The CD in Dollars

To convert from British pounds to American dollars, follow these steps:

1. Select CD_DOLLARS from the portfolio.
2. Select **Compute** → **Currency Conversion** from the pull-down menu. This opens the Currency Conversion dialog box.
3. Select USD for the **From Currency**.
4. Select GBP for the **To Currency**.
5. Enter 0.60 for the **Exchange Rate**.
6. Click **Apply Currency Conversion** to fill the **Currency Conversion** area as displayed in [Figure 54.5](#).

Figure 54.5 Converting the CD to Pounds

Name:

From Currency:

To Currency:

Exchange Rate:

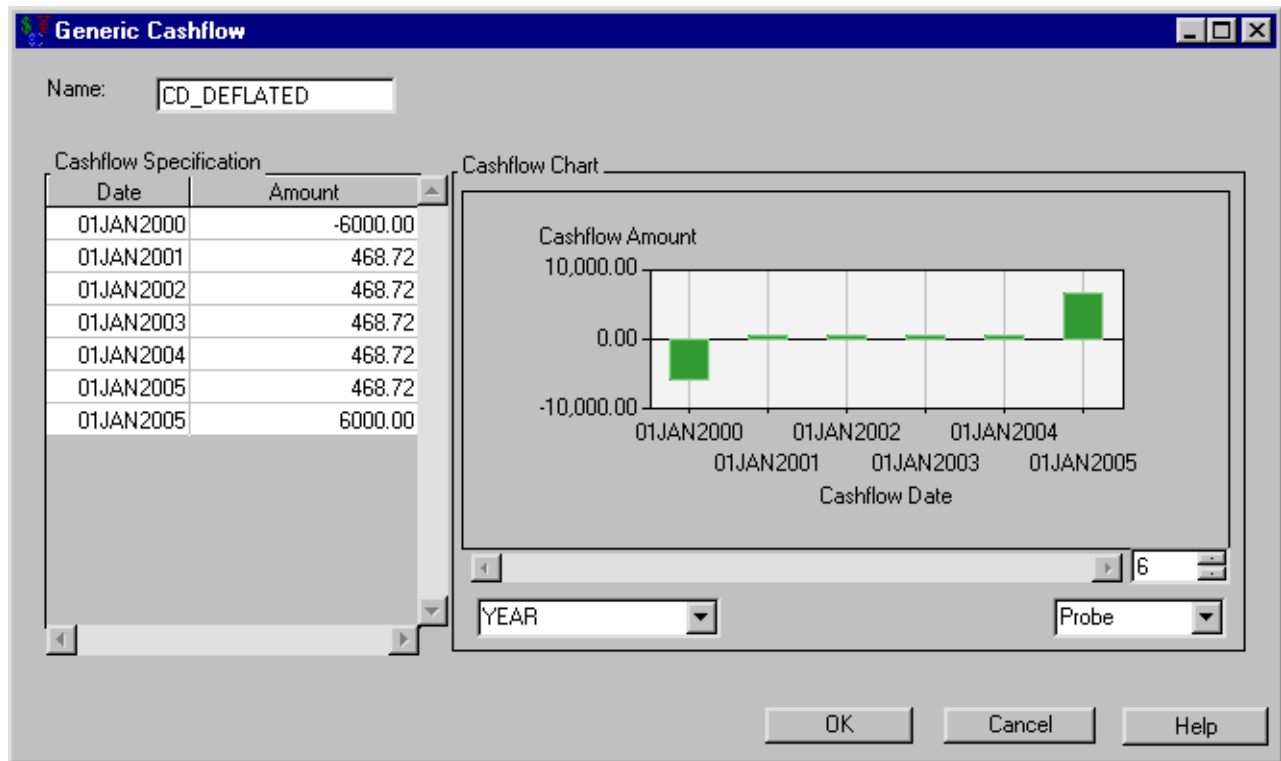

Date	CD_DOLLARS	GBP
01JAN2000	-10000.00	-6000.00
01JAN2001	781.20	468.72
01JAN2002	781.20	468.72
01JAN2003	781.20	468.72
01JAN2004	781.20	468.72
01JAN2005	781.20	468.72
01JAN2005	10000.00	6000.00

Save the converted values to a SAS data set named WORK.CD_POUNDS. Click **Return** to return to the Investment Analysis dialog box.

Deflating Cashflows

Consider the example described in the section “[The Compute Menu](#)” on page 3191. To create the cashflow to deflate, follow these steps:

1. Select **Investment** → **New** → **Generic Cashflow** to open a new generic cashflow.
2. Enter CD_DEFLATED for **Name**.
3. Load WORK.CD_POUNDS into its **Cashflow Specification** (see [Figure 54.6](#)).
4. Click **OK** to return to the Investment Analysis dialog box.

Figure 54.6 The CD before Deflation

To deflate the values, follow these steps:

1. Select CD_DEFLATED from the portfolio.
2. Select **Compute** → **Constant Dollars** from the menu. This opens the Constant Dollar Calculation dialog box.
3. Clear the **Variable Inflation List** area.
4. Enter 3 for the **Constant Inflation Rate**.
5. Click **Create Constant Dollar Equivalent** to generate a constant dollar equivalent summary (see [Figure 54.7](#)).

Figure 54.7 CD Values after Deflation

Constant Dollar Calculation

Name:

Constant Inflation Rate:

Variable Inflation List

Date	Rate

Dates

Date
01JAN2000

Constant Dollar Equivalent Summary

Date	JAN2000
01JAN2000	-6000.00
01JAN2001	455.07
01JAN2002	441.81
01JAN2003	428.95
01JAN2004	416.45
01JAN2005	404.32
01JAN2005	5175.65

You can save the deflated cashflow to a SAS data set for use in an internal rate of return analysis or breakeven analysis.

Click **Return** to return to the Investment Analysis dialog box.

Dialog Box Guide

After Tax Cashflow Calculation

Having selected a generic cashflow from the Investment Analysis dialog box, to perform an after tax calculation, select **Compute** → **After Tax** from the Investment Analysis dialog box's menu bar. This opens the After Tax Cashflow Calculation dialog box displayed in [Figure 54.8](#).

Figure 54.8 After Tax Cashflow Calculation Dialog Box

The following items are displayed:

Name holds the name of the investment for which you are computing the after-tax cashflow.

Federal Tax holds the federal tax rate (a percentage between 0% and 100%).

Local Tax holds the local tax rate (a percentage between 0% and 100%).

Combined Tax holds the effective tax rate from federal and local income taxes.

Create After Tax Cashflow becomes available when **Combined Tax** is not empty. Clicking **Create After Tax Cashflow** then fills the **After Tax Cashflow** area.

After Tax Cashflow fills when you click **Create After Tax Cashflow**. It holds a list of date-amount pairs where the amount is the amount retained after taxes for that date.

Print becomes available when you fill the after-tax cashflow. Clicking it sends the contents of the after tax cashflow to the SAS session print device.

Save Data As becomes available when you fill the after tax cashflow. Clicking it opens the [Save Output Dataset](#) dialog box where you can save the resulting cashflow (or portions thereof) as a SAS Dataset.

Return returns you to the [Investment Analysis](#) dialog box.

Currency Conversion

Having selected a generic cashflow from the Investment Analysis dialog box, to perform a currency conversion, select **Compute** → **Currency Conversion** from the Investment Analysis dialog box's menu bar. This opens the Currency Conversion dialog box displayed in [Figure 54.9](#).

Figure 54.9 Currency Conversion Dialog Box

The screenshot shows a standard Windows-style dialog box titled "Currency Conversion". It features several input fields and buttons. The "Name" field contains the text "untitled_cashflo". The "From Currency" and "To Currency" fields are dropdown menus currently set to "USD" and "GBP" respectively. The "Exchange Rate" field is empty. To the right of these fields is a button labeled "Apply Currency Conversion". Below this is a large, empty rectangular area labeled "Currency Conversion" at the top left, which appears to be a table or list area with a horizontal scrollbar. At the bottom of the dialog are three buttons: "Save Data As...", "Return", and "Help".

The following items are displayed:

Name holds the name of the investment to which you are applying the currency conversion.

From Currency holds the name of the currency the cashflow currently represents.

To Currency holds the name of the currency to which you wish to convert.

Exchange Rate holds the rate of exchange between the **From Currency** and the **To Currency**.

Apply Currency Conversion becomes available when you fill **Exchange Rate**. Clicking **Apply Currency Conversion** fills the **Currency Conversion** area.

Currency Conversion fills when you click **Apply Currency Conversion**. The schedule contains a row for each cashflow item with the following information:

- **Date** is a SAS date within the cashflow.
- The **From Currency** value is the amount in the original currency at that date.
- The **To Currency** value is the amount in the new currency at that date.

Print becomes available when you fill the **Currency Conversion** area. Clicking it sends the contents of the conversion table to the SAS session print device.

Save Data As becomes available when you fill the **Currency Conversion** area. Clicking it opens the [Save Output Dataset](#) dialog box where you can save the conversion table (or portions thereof) as a SAS Dataset.

Return returns you to the [Investment Analysis](#) dialog box.

Constant Dollar Calculation

Having selected a generic cashflow from the Investment Analysis dialog box, to perform a constant dollar calculation, select **Compute** → **Constant Dollars** from the Investment Analysis dialog box's menu bar. This opens the Constant Dollar Calculation dialog box displayed in Figure 54.10.

Figure 54.10 Constant Dollar Calculation Dialog Box

The dialog box is titled "Constant Dollar Calculation". It contains the following elements:

- Name:** A text field containing "untitled_cashflow".
- Constant Inflation Rate:** An empty text field.
- Variable Inflation List:** A table with two columns: "Date" and "Rate". It contains one row with "01JAN2000" and "0.0000".
- Dates:** A list box containing "01JAN2000".
- Create Constant Dollar Equivalent:** A button located below the Variable Inflation List and Dates sections.
- Constant Dollar Equivalent Summary:** An empty list box at the bottom of the main area.
- Buttons:** "Save Data As...", "Return", and "Help" are located at the bottom of the dialog.

The following items are displayed:

Name holds the name of the investment for which you are computing the constant dollars value.

Constant Inflation Rate holds the constant inflation rate (a percentage between 0% and 120%). This value is used if the **Variable Inflation List** area is empty.

Variable Inflation List holds date-rate pairs that describe how inflation varies over time. Each date is a SAS date, and the rate is a percentage between 0% and 120%. Each date refers to when that inflation rate begins. Right-clicking within the **Variable Inflation** area reveals many helpful tools for managing date-rate pairs. If you assume a fixed inflation rate, just insert that rate in **Constant Rate**.

Dates holds the SAS date(s) at which you wish to compute the constant dollar equivalent. Right-clicking within the **Dates** area reveals many helpful tools for managing date lists.

Create Constant Dollar Equivalent becomes available when you enter inflation rate information. Clicking it fills the constant dollar equivalent summary with the computed constant dollar values.

Constant Dollar Equivalent Summary fills with a summary when you click **Create Constant Dollar Equivalent**. The first column lists the dates of the generic cashflow. The second column contains the constant dollar equivalent of the original generic cashflow item of that date.

Print becomes available when you fill the constant dollar equivalent summary. Clicking it sends the contents of the summary to the SAS session print device.

Save Data As becomes available when you fill the constant dollar equivalent summary. Clicking it opens the [Save Output Dataset](#) dialog box where you can save the summary (or portions thereof) as a SAS Dataset.

Return returns you to the [Investment Analysis](#) dialog box.

Breakeven Analysis	3216
Breakeven Graph	3217

The Analyze Menu

Figure 55.1 shows the **Analyze** menu.

Figure 55.1 Analyze Menu

The **Analyze** menu offers the following options for use on applicable investments.

Time Value opens the [Time Value Analysis](#) dialog box. Time value analysis involves moving money through time across a defined minimum attractive rate of return (MARR) so that you can compare value at a consistent date. The MARR can be constant or variable over time.

Periodic Equivalent opens the [Uniform Periodic Equivalent](#) dialog box. Uniform periodic equivalent analysis determines the payment needed to convert a cashflow to uniform amounts over time, given a periodicity, a number of periods, and a MARR. This option helps when making comparisons where one alternative is uniform (such as renting) and another is not (such as buying).

Internal Rate of Return opens the [Internal Rate of Return](#) dialog box. The internal rate of return of a cashflow is the interest rate that makes the time value equal to 0. This calculation assumes uniform periodicity of the cashflow. It is particularly applicable where the choice of MARR would be difficult.

Benefit-Cost Ratio opens the [Benefit-Cost Ratio Analysis](#) dialog box. The benefit-cost ratio divides the time value of the benefits by the time value of the costs. For example, governments often use this analysis when deciding whether to commit to a public works project.

Breakeven Analysis opens the [Breakeven Analysis](#) dialog box. Breakeven analysis computes time values at various MARRs to compare, which can be advantageous when it is difficult to determine a MARR. This analysis can help you determine how the cashflow's profitability varies with your choice of MARR. A graph displaying the relationships between time value and MARR is also available.

Tasks

Performing Time Value Analysis

Suppose a rock quarry needs equipment to use the next five years. It has two alternatives:

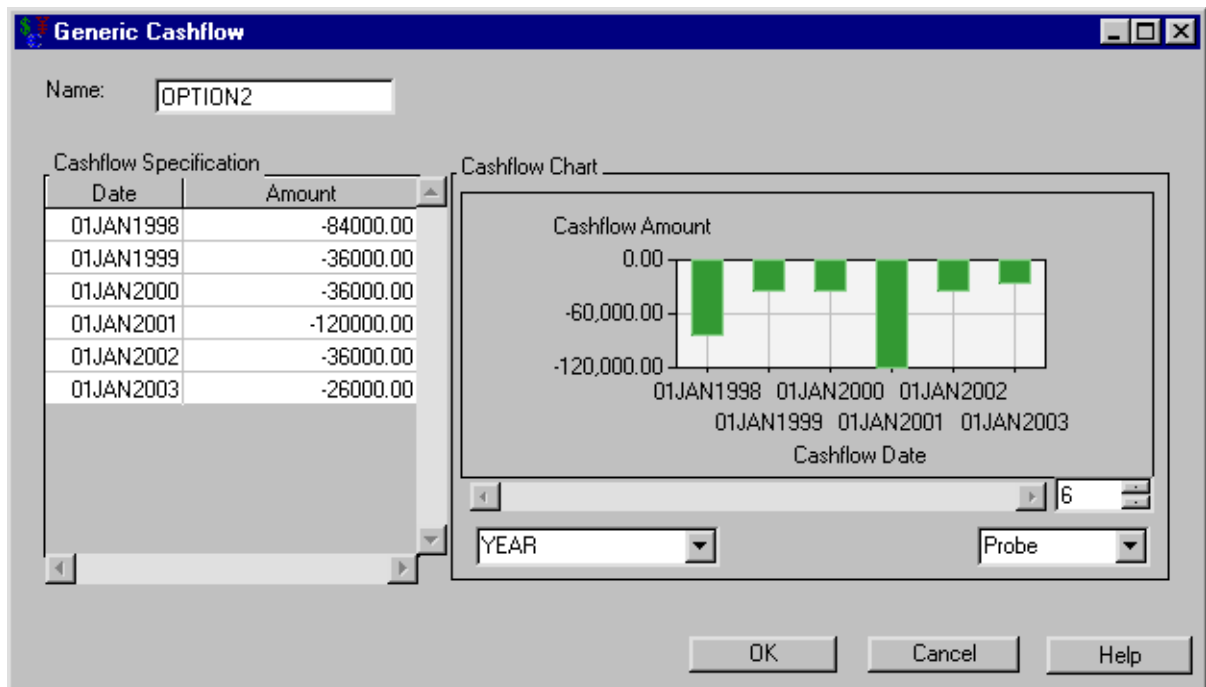

- a box loader and conveyer system that has a one-time cost of \$264,000
- a two-shovel loader, which costs \$84,000 but has a yearly operating cost of \$36,000. This loader has a service life of three years, which necessitates the purchase of a new loader for the final two years of the rock quarry project. Assume the second loader also costs \$84,000 and its salvage value after its two-year service is \$10,000. A SAS data set that describes this is available at `SASHELP.ROCKPIT`

You expect a 13% MARR. Which is the better alternative?

To create the cashflows, follow these steps:

1. Create a cashflow with the single amount –264,000. Date the amount 01JAN1998 to be consistent with the SAS data set you load.
2. Load SASHELP.ROCKPIT into a second cashflow, as displayed in [Figure 55.2](#).

Figure 55.2 The contents of SASHELP.ROCKPIT

To compute the time values of these investments, follow these steps:

1. Select both cashflows.
2. Select **Analyze** → **Time Value**. This opens the Time Value Analysis dialog box.
3. Enter the date 01JAN1998 into the **Dates** area.
4. Enter 13 for the **Constant MARR**.
5. Click **Create Time Value Summary**.

Figure 55.3 Performing the Time Value Analysis

Time Value Analysis

Analysis Specifications

Dates

Date
01JAN1998

Constant MARR: 13.00

MARR List

Date	MARR
------	------

Create Time Value Summary

Time Value Summary

Date	OPTION1	OPTION2
01JAN1998	-264000.00	-263408.94

Save Data As... Return Help

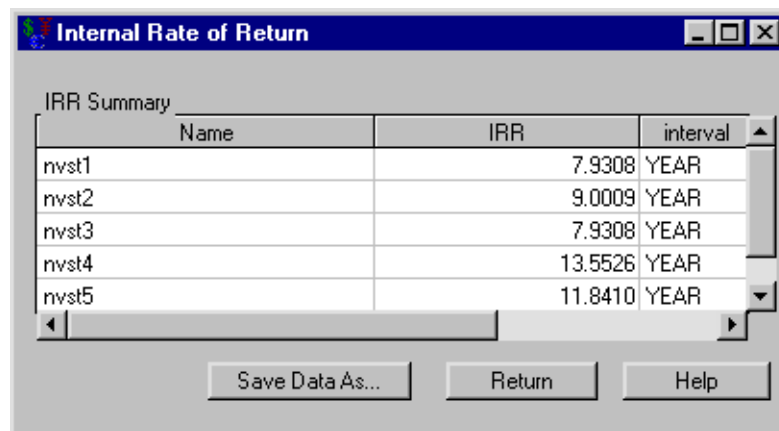

As shown in Figure 55.3, option 1 has a time value of $-\$264,000.00$ naturally on 01JAN1998. However, option 2 has a time value of $-\$263,408.94$, which is slightly less expensive.

Computing an Internal Rate of Return

You are choosing between five investments. A portfolio containing these investments is available at SASHELP.INVSAMP.NVST. Which investments are acceptable if you expect a MARR of 9%?

Open the portfolio SASHELP.INVSAMP.NVST and compare the investments. Note that Internal Rate of Return computations assume regular periodicity of the cashflow. To compute the internal rates of return, follow these steps:

1. Select all five investments.
2. Select **Analyze** → **Internal Rate of Return**.

Figure 55.4 Computing an Internal Rate of Return

The screenshot shows a software window titled "Internal Rate of Return". Inside, there is a section labeled "IRR Summary" containing a table with three columns: "Name", "IRR", and "interval". The table lists five investments: nvst1, nvst2, nvst3, nvst4, and nvst5. Below the table are three buttons: "Save Data As...", "Return", and "Help".

Name	IRR	interval
nvst1	7.9308	YEAR
nvst2	9.0009	YEAR
nvst3	7.9308	YEAR
nvst4	13.5526	YEAR
nvst5	11.8410	YEAR

The results displayed in Figure 55.4 indicate that the internal rates of return for investments 2, 4, and 5 are greater than 9%. Hence, each of these is acceptable.

Performing a Benefit-Cost Ratio Analysis

Suppose a municipality has excess funds to invest. It is choosing between the same investments described in the previous example. Government agencies often compute benefit-cost ratios to decide which investment to pursue. Which is best in this case?

Open the portfolio SASHELP.INVSAMP.NVST and compare the investments.

To compute the benefit-cost ratios, follow these steps:

1. Select all five investments.
2. Select **Analyze** → **Benefit-Cost Ratio**.
3. Enter 01JAN1996 for the **Date**.
4. Enter 9 for **Constant MARR**.
5. Click **Create Benefit-Cost Ratio Summary** to fill the **Benefit-Cost Ratio Summary** area.

The results displayed in Figure 55.5 indicate that investments 2, 4, and 5 have ratios greater than 1. Therefore, each is profitable with a MARR of 9%.

Figure 55.5 Performing a Benefit-Cost Ratio Analysis

Buttons: Save Data As..., Return, Help

Computing a Uniform Periodic Equivalent

Suppose you need a warehouse for ten years. You have two options:

- pay rent for ten years at \$23,000 per year
- build a two-stage facility that you will maintain and which you intend to sell at the end of those ten years

Data sets describing these scenarios are available in the portfolio SASHELP.INVSAMP.BUYRENT. Which option is more financially sound if you desire a 12% MARR?

Open the portfolio SASHELP.INVSAMP.BUYRENT and compare the options.

To perform the periodic equivalent, follow these steps:

1. Load the portfolio SASHELP.INVSAMP.BUYRENT.
2. Select both cashflows.
3. Select **Analyze** → **Periodic Equivalent**.
This opens the Uniform Periodic Equivalent dialog box.
4. Enter 01JAN1996 for the **Start Date**.
5. Enter 10 for the **Number of Periods**.

6. Select YEAR for the **Interval**.
7. Enter 12 for the **Constant MARR**.
8. Click **Create Time Value Summary**.

Figure 55.6 Computing a Uniform Periodic Equivalent

Uniform Periodic Equivalent

Analysis Specifications

Start Date: 01JAN1996 Interval: YEAR

Number of Periods: 10 Constant MARR: 12.00

Create Periodic Equivalent Summary

Periodic Equivalent Summary

Name	Amount
buy	-21868.44
rent	-20535.71

Save Data As... Return Help

Figure 55.6 indicates that renting costs about \$1,300 less each year. Hence, renting is more financially sound. Notice the periodic equivalent for renting is not \$23,000. This is because the \$23,000 per year does not account for the MARR.

Performing a Breakeven Analysis

In the previous example you computed the uniform periodic equivalent for a rent-buy scenario. Now let's perform a breakeven analysis to see how the MARR affects the time values.

To perform the breakeven analysis, follow these steps:

1. Select both options.
2. Select **Analyze** → **Breakeven Analysis**.
3. Enter 01JAN1996 for the **Date**.
4. Enter 12.0 for **Value**.
5. Enter 4.0 for (+/-).

6. Enter 0.5 for **Increment by**.
7. Click **Create Breakeven Analysis Summary** to fill the **Breakeven Analysis Summary** area as displayed in Figure 55.7.

Figure 55.7 Performing a Breakeven Analysis

The screenshot shows the 'Breakeven Analysis' dialog box. The 'Analysis Specifications' section contains the following fields:

- Analysis: TIME VALUE (dropdown)
- Variable: MARR (dropdown)
- Date: 01JAN1996 (text box)
- Value: 12.00 (text box)
- +/-: 4.00 (text box)
- Increment by: 0.50 (text box)

Below these fields is a button labeled 'Create Breakeven Analysis Summary'. Below the button is a section titled 'Breakeven Analysis Summary' containing a table with the following data:

Date	buy	rent	MARR
01JAN1996	-138119.27	-111164.23	16.0000
01JAN1996	-138200.93	-113265.33	15.5000
01JAN1996	-138270.89	-115431.68	15.0000
01JAN1996	-138328.24	-117665.87	14.5000
01JAN1996	-138371.98	-119970.66	14.0000

At the bottom of the dialog box are four buttons: 'Graphics...', 'Save Data As...', 'Return', and 'Help'.

Click **Graphics** to view a plot displaying the relationship between time value and MARR.

Figure 55.8 Viewing a Breakeven Graph

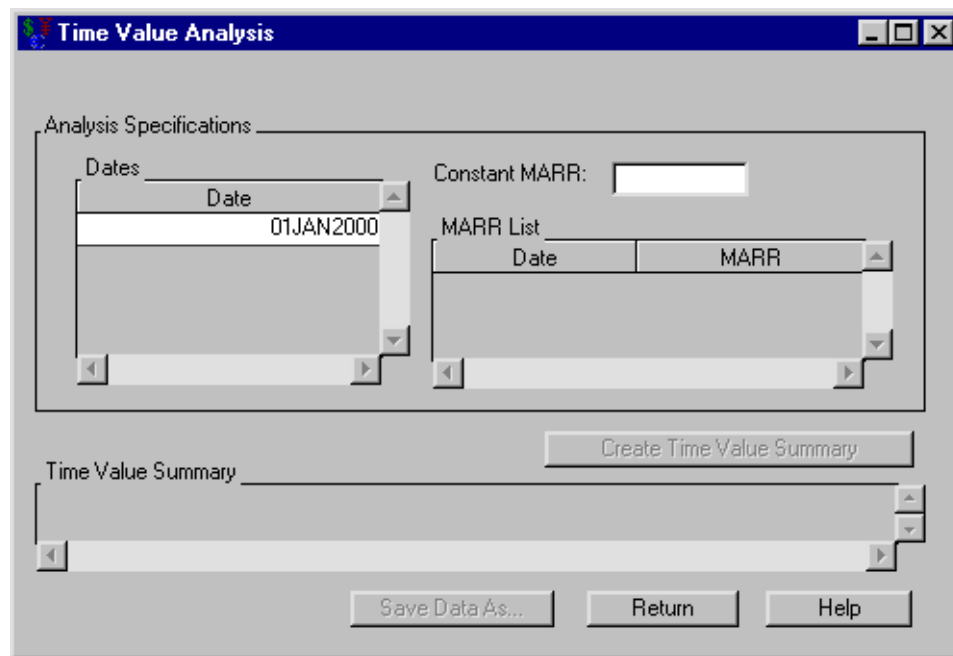

As shown in [Figure 55.8](#), renting is better if you want a MARR of 12%. However, if your MARR should drop to 10.5%, buying would be better.

With a single investment, knowing where the graph has a time value of 0 tells the MARR when a venture switches from being profitable to being a loss. With multiple investments, knowing where the graphs for the various investments cross each other tells at what MARR a particular investment becomes more profitable than another.

Dialog Box Guide

Time Value Analysis

Having selected a generic cashflow from the Investment Analysis dialog box, to perform an time value analysis, select **Analyze** → **Time Value** from the Investment Analysis dialog box's menu bar. This opens the Time Value Analysis dialog box displayed in [Figure 55.9](#).

Figure 55.9 Time Value Analysis Dialog Box

The following items are displayed:

Analysis Specifications

Dates holds the list of dates as of which to perform the time value analysis. [Right-clicking](#) within the **Dates** area reveals many helpful tools for managing date lists.

Constant MARR holds the desired MARR for the time value analysis. This value is used if the **MARR List** area is empty.

MARR List holds date-rate pairs that express your desired MARR as it changes over time. Each date refers to when that expected MARR begins. [Right-clicking](#) within the **MARR List** area reveals many helpful tools for managing date-rate pairs.

Create Time Value Summary becomes available when you adequately specify the analysis within the **Analysis Specifications** area. Clicking **Create Time Value Summary** then fills the **Time Value Summary** area.

Time Value Summary fills when you click **Create Time Value Summary**. The table contains a row for each date in the **Dates** area. The remainder of each row holds the time values at that date, one value for each investment selected.

Print becomes available when you fill the time value summary. Clicking it sends the contents of the summary to the SAS session print device.

Save Data As becomes available when you fill the time value summary. Clicking it opens the [Save Output Dataset](#) dialog box where you can save the summary (or portions thereof) as a SAS Dataset.

Return takes you back to the [Investment Analysis](#) dialog box.

Uniform Periodic Equivalent

Having selected a generic cashflow from the Investment Analysis dialog box, to perform a uniform periodic equivalent, select **Analyze** → **Periodic Equivalent** from the Investment Analysis dialog box's menu bar. This opens the Uniform Periodic Equivalent dialog box displayed in [Figure 55.10](#).

Figure 55.10 Uniform Periodic Equivalent Dialog Box

The following items are displayed:

Analysis Specifications

Start Date holds the date the uniform periodic equivalents begin.

Number of Periods holds the number of uniform periodic equivalents.

Interval holds how often the uniform periodic equivalents occur.

Constant MARR holds the Minimum Attractive Rate of Return.

Create Periodic Equivalent Summary becomes available when you adequately fill the **Analysis Specification** area. Clicking **Create Periodic Equivalent Summary** then fills the periodic equivalent summary.

Periodic Equivalent Summary fills with two columns when you click **Create Periodic Equivalent Summary**. The first column lists the investments selected. The second column lists the computed periodic equivalent amount.

Print becomes available when you fill the periodic equivalent summary. Clicking it sends the contents of the summary to the SAS session print device.

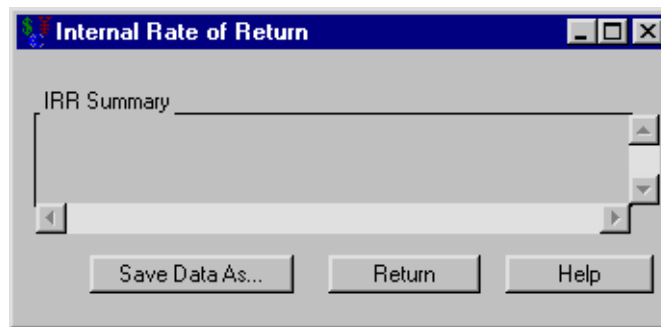

Save Data As becomes available when you generate the periodic equivalent summary. Clicking it opens the [Save Output Dataset](#) dialog box where you can save the summary (or portions thereof) as a SAS Dataset.

Return takes you back to the [Investment Analysis](#) dialog box.

Internal Rate of Return

Having selected a generic cashflow from the Investment Analysis dialog box, to perform an internal rate of return calculation, select **Analyze** → **Internal Rate of Return** from the Investment Analysis dialog box's menu bar. This opens the Internal Rate of Return dialog box displayed in Figure 55.11.

Figure 55.11 Internal Rate of Return Dialog Box

The following items are displayed:

IRR Summary contains a row for each deposit. Each row holds:

Name holds the name of the investment.

IRR holds the internal rate of return for that investment.

interval holds the interest rate interval for that **IRR**.

Print becomes available when you fill the IRR summary. Clicking it sends the contents of the summary to the SAS session print device.

Save Data As opens the [Save Output Dataset](#) dialog box where you can save the IRR summary (or portions thereof) as a SAS data set.

Return takes you back to the [Investment Analysis](#) dialog box.

Benefit-Cost Ratio Analysis

Having selected a generic cashflow from the Investment Analysis dialog box, to compute a benefit-cost ratio, select **Analyze** → **Benefit-Cost Ratio** from the Investment Analysis dialog box's menu bar. This opens the Benefit-Cost Ratio Analysis dialog box displayed in Figure 55.12.

Figure 55.12 Benefit-Cost Ratio Analysis Dialog Box

The dialog box is titled "Benefit-Cost Ratio Analysis". It contains the following elements:

- Analysis Specifications:**
 - Dates:** A list box containing "01JAN2000".
 - Constant MARR:** An empty text input field.
 - MARR List:** A table with two columns: "Date" and "MARR".
- Benefit-Cost Ratio Summary:** A large, empty table area.
- Buttons:**
 - "Create Benefit-Cost Ratio Summary" (located between the two main sections).
 - "Save Data As..." (bottom left).
 - "Return" (bottom center).
 - "Help" (bottom right).

The following items are displayed:

Analysis Specifications

Dates holds the dates as of which to compute the Benefit-Cost ratios.

Constant MARR holds the desired MARR. This value is used if the **MARR List** area is empty.

MARR List holds date-rate pairs that express your desired MARR as it changes over time. Each date refers to when that expected MARR begins. [Right-clicking](#) within the **MARR List** area reveals many helpful tools for managing date-rate pairs.

Create Benefit-Cost Ratio Summary becomes available when you adequately specify the analysis. Clicking **Create Benefit-Cost Ratio Summary** fills the benefit-cost ratio summary.

Benefit-Cost Ratio Summary fills when you click **Exchange the Rates**. The area contains a row for each date in the **Dates** area. The remainder of each row holds the benefit-cost ratios at that date, one value for each investment selected.

Print becomes available when you fill the benefit-cost ratio summary. Clicking it sends the contents of the summary to the SAS session print device.

Save Data As becomes available when you generate the benefit-cost ratio summary. Clicking it opens the [Save Output Dataset](#) dialog box where you can save the summary (or portions thereof) as a SAS Dataset.

Return takes you back to the [Investment Analysis](#) dialog box.

Breakeven Analysis

Having selected a generic cashflow from the Investment Analysis dialog box, to perform a breakeven analysis, select **Analyze** → **Breakeven Analysis** from the Investment Analysis dialog box's menu bar. This opens the Breakeven Analysis dialog box displayed in Figure 55.13.

Figure 55.13 Breakeven Analysis Dialog Box

The screenshot shows the 'Breakeven Analysis' dialog box. The 'Analysis Specifications' section includes the following fields:

- Analysis:** A dropdown menu currently showing 'TIME VALUE'.
- Variable:** A dropdown menu currently showing 'MARR'.
- Date:** A text box containing '01JAN2000'.
- Value:** An empty text box.
- +/-:** An empty text box.
- Increment by:** An empty text box.

Below the specifications is a button labeled 'Create Breakeven Analysis Summary'. At the bottom of the dialog is a section titled 'Breakeven Analysis Summary' which contains a scrollable area for the results. Below this section are four buttons: 'Graphics...', 'Save Data As...', 'Return', and 'Help'.

The following items are displayed:

Analysis Specification

Analysis holds the analysis type. Only Time Value is currently available.

Date holds the date for which you perform this analysis.

Variable holds the variable upon which the breakeven analysis will vary. Only MARR is currently available.

Value holds the desired rate upon which to center the analysis.

+/- holds the maximum deviation from the **Value** to consider.

Increment by holds the increment by which the analysis is calculated.

Create Breakeven Analysis Summary becomes available when you adequately specify the analysis. Clicking **Create Breakeven Analysis Summary** then fills the **Breakeven Analysis Summary** area.

Breakeven Analysis Summary fills when you click **Create Breakeven Analysis Summary**. The schedule contains a row for each MARR and date.

Graphics becomes available when you fill the **Breakeven Analysis Summary** area. Clicking it opens the [Breakeven Graph](#) graph representing the time value versus MARR.

Print becomes available when you fill the breakeven analysis summary. Clicking it sends the contents of the summary to the SAS session print device.

Save Data As becomes available when you generate the breakeven analysis summary. Clicking it opens the **Save Output Dataset** dialog box where you can save the summary (or portions thereof) as a SAS Dataset.

Return takes you back to the **Investment Analysis** dialog box.

Breakeven Graph

Suppose you perform a breakeven analysis in the Breakeven Analysis dialog box. Once you create the breakeven analysis summary, you can click the **Graphics** button to open the Breakeven Graph dialog box displayed in Figure 55.14.

Figure 55.14 Breakeven Graph Dialog Box

The following item is displayed:

Return takes you back to the **Breakeven Analysis** dialog box.

Investments and Data Sets

Investment Analysis provides tools to assist you in moving data between SAS data sets and lists you can use within Investment Analysis.

Saving Output to SAS Data Sets

Many investment specifications have a button that reads **Save Data As**. Clicking that button opens the Save Output Dataset dialog box (see [Figure 56.1](#)). This dialog box enables you to save all or part of the area generated by the specification.

Figure 56.1 Saving to a Dataset

The following items are displayed:

Dataset Name holds the SAS data set name to which you want to save.

Browse opens the standard SAS **Open** dialog box, which enables you to select an existing SAS data set to overwrite.

Dataset Label holds the SAS data set's label.

Dataset Variables organizes variables. The variables listed in the **Selected** area will be included in the SAS data set.

- You can select variables one at a time, by clicking the single right-arrow after each selection to move it to the **Selected** area.
- If the desired SAS data set has many variables you want to save, it may be simpler to follow these steps:
 1. Click the double right-arrow to select all available variables.
 2. Remove any unwanted variable by selecting it from the **Selected** area and clicking the single left-arrow.
- The double left-arrow removes all selected variables from the proposed SAS data set.
- The up and down arrows below the **Available** and **Selected** boxes enable you to scroll up and down the list of variables in their respective boxes.

Save Dataset attempts to save the SAS data set. If the SAS data set name exists, you are asked if you want to replace the existing SAS data set, append to the existing SAS data set, or cancel the current save attempt. You then return to this dialog box ready to create another SAS data set to save.

Return takes you back to the specification dialog box.

Loading a SAS Data Set into a List

Right-click in the area that you want to load the list and release on **Load**. This opens the Load Dataset dialog box (see Figure 56.2).

Figure 56.2 Load Dataset Dialog Box

The following items are displayed:

Dataset Name holds the name of the SAS data set that you want to load.

Browse opens the standard SAS **Open** dialog box, which aids in finding a SAS data set to load. If there is a **Date** variable in the SAS data set, Investment Analysis loads it into the list. If there is no **Date** variable, it loads the first available time-formatted variable. If an amount or rate variable is needed, Investment Analysis searches the SAS data set for a **Amount** or **Rate** variable to use. Otherwise it takes the first numeric variable that is not used by the **Date** variable.

Dataset Label holds a SAS data set label.

OK attempts to load the SAS data set specified in **Dataset Name**. If the specified SAS data set exists, clicking **OK** returns you to the calling dialog box with the selected SAS data set filling the list. If the specified SAS data set does not exist and you click **OK**, you receive an error message and no SAS data set is loaded.

Cancel returns you to the calling dialog box without loading a SAS data set.

Saving Data from a List to a SAS Data Set

Right-click in the area you want to hold the list, and release on **Save**. This opens the Save Dataset dialog box.

Figure 56.3 Save Dataset Dialog Box

The following items are displayed:

Dataset Name holds the SAS data set name to which you want to save.

Browse opens the standard SAS **Save As** dialog box, which enables you to find an existing SAS data set to overwrite.

Dataset Label holds a user-defined description to be saved as the label of the SAS data set.

OK saves the current data to the SAS data set specified in **Dataset Name**. If the specified SAS data set does not already exist, clicking **OK** saves the SAS data set and returns you to the calling dialog box. If the specified SAS data set does already exist, clicking **OK** warns you and enables you to replace the old SAS data set with the new SAS data set or cancel the save attempt.

Cancel aborts the save process. Clicking **Cancel** returns you to the calling dialog box without attempting to save.

Right Mouse Button Options

A pop-up menu often appears when you right-click within table editors. The menus offer tools to aid in the management of the table's entries. Most table editors provide the following options.

Figure 56.4 Right-Clicking Options

Add creates a blank row.

Delete removes any currently selected row.

Copy duplicates the currently selected row.

Sort arranges the rows in chronological order according to the date variable.

Clear empties the table of all rows.

Save opens the [Save Dataset](#) dialog box where you can save the all rows to a SAS Dataset for later use.

Load opens the [Load Dataset](#) dialog box where you select a SAS Dataset to fill the rows.

If you want to perform one of these actions on a collection of rows, you must select a collection of rows before right-clicking. To select an adjacent list of rows, do the following: click the first pair, hold down SHIFT, and click the final pair. After the list of rows is selected, you may release the SHIFT key.

Depreciation Methods

Suppose an asset's price is \$20,000 and it has a salvage value of \$5,000 in five years. The following sections describe various methods to quantify the depreciation.

Straight Line (SL)

This method assumes a constant depreciation value per year.

Assuming that the price of a depreciating asset is P and its salvage value after N years is S , the annual depreciation is:

$$\frac{P - S}{N}$$

For our example, the annual depreciation would be

$$\frac{\$20,000 - \$5,000}{5} = \$3,000$$

Sum-of-Years Digits

An asset often loses more of its value early in its lifetime. A method that exhibits this dynamic is desirable.

Assume an asset depreciates from price P to salvage value S in N years. First compute the sum-of-years as $T = 1 + 2 + \cdots + N$. The depreciation for the years after the asset's purchase is:

Table 56.1 Sum-of-Years General Example

Year Number	Annual Depreciation
first	$\frac{N}{T}(P - S)$
second	$\frac{N-1}{T}(P - S)$
third	$\frac{N-2}{T}(P - S)$
\vdots	\vdots
final	$\frac{1}{T}(P - S)$

For the i th year of the asset's use, the annual depreciation is:

$$\frac{N + 1 - i}{T}(P - S)$$

For our example, $N = 5$ and the sum of years is $T = 1 + 2 + 3 + 4 + 5 = 15$. The depreciation during the first year is

$$(\$20,000 - \$5,000)\frac{5}{15} = \$5,000$$

Table 56.2 describes how Declining Balance would depreciate the asset.

Table 56.2 Sum-of-Years Example

Year	Depreciation	Year-End Value
1	$(\$20,000 - \$5,000)\frac{5}{15} = \$5,000$	\$15,000.00
2	$(\$20,000 - \$5,000)\frac{4}{15} = \$4,000$	\$11,000.00
3	$(\$20,000 - \$5,000)\frac{3}{15} = \$3,000$	\$8,000.00
4	$(\$20,000 - \$5,000)\frac{2}{15} = \$2,000$	\$6,000.00
5	$(\$20,000 - \$5,000)\frac{1}{15} = \$1,000$	\$5,000.00

As expected, the value after N years is S .

$$\begin{aligned}
 S &= P - (5 \text{ years' depreciation}) \\
 &= P - \left(\frac{5}{15}(P - S) + \frac{4}{15}(P - S) + \frac{3}{15}(P - S) + \frac{2}{15}(P - S) + \frac{1}{15}(P - S) \right) \\
 &= P - (P - S)
 \end{aligned}$$

Declining Balance (DB)

Recall that the straight line method assumes a constant depreciation value. Conversely, the declining balance method assumes a constant depreciation rate per year. And like the sum-of-years method, more depreciation tends to occur earlier in the asset's life.

Assume the price of a depreciating asset is P and its salvage value after N years is S . You could assume the asset depreciates by a factor of $\frac{1}{N}$ (or a rate of $\frac{100}{N}\%$). This method is known as single declining balance. The annual depreciation is:

$$\frac{1}{N}(\text{previous year's value})$$

So for our example, the depreciation during the first year is $\frac{\$20,000}{5} = \$4,000$. Table 56.3 describes how declining balance would depreciate the asset.

Table 56.3 Declining Balance Example

Year	Depreciation	Year-End Value
1	$\frac{\$20,000.00}{5} = \$4,000.00$	\$16,000.00
2	$\frac{\$16,000.00}{5} = \$3,200.00$	\$12,800.00
3	$\frac{\$12,800.00}{5} = \$2,560.00$	\$10,240.00
4	$\frac{\$10,240.00}{5} = \$2,048.00$	\$8,192.00
5	$\frac{\$12,800.00}{5} = \$1,638.40$	\$6,553.60

DB Factor

You could also accelerate the depreciation by increasing the factor (and hence the rate) at which depreciation occurs. Other commonly accepted depreciation rates are $\frac{200}{N}\%$ (called double declining balance as the depreciation factor becomes $\frac{2}{N}$) and $\frac{150}{N}\%$. Investment Analysis enables you to choose between these three types for declining balance: 2 (with $\frac{200}{N}\%$ depreciation), 1.5 (with $\frac{150}{N}\%$), and 1 (with $\frac{100}{N}\%$).

Declining Balance and the Salvage Value

The declining balance method assumes that depreciation is faster earlier in an asset's life; this is what you wanted. But notice the final value is greater than the salvage value. Even if the salvage value were greater than \$6,553.60, the final year-end value would not change. The salvage value never enters the calculation, so there is no way for the salvage value to force the depreciation to assume its value. Newnan and Lavelle (1998) describe two ways to adapt the declining balance method to assume the salvage value at the final time. One way is as follows:

Suppose you call the depreciated value after i years $V(i)$. This sets $V(0) = P$ and $V(N) = S$.

- If $V(N) > S$ according to the usual calculation for $V(N)$, redefine $V(N)$ to equal S .

- If $V(i) < S$ according to the usual calculation for $V(i)$ for some i (and hence for all subsequent $V(i)$ values), you can redefine all such $V(i)$ to equal S .

This alteration to declining balance forces the depreciated value of the asset after N years to be S and keeps $V(i)$ no less than S .

Conversion to SL

The second (and preferred) way to force declining balance to assume the salvage value is by conversion to straight line. If $V(N) > S$, the first way redefines $V(N)$ to equal S ; you can think of this as converting to the straight line method for the last timestep.

If the $V(N)$ value supplied by DB is appreciably larger than S , then the depreciation in the final year would be unrealistically large. An alternate way is to compute the DB and SL step at each timestep and take whichever step gives a larger depreciation (unless DB drops below the salvage value).

After SL assumes a larger depreciation, it continues to be larger over the life of the asset. SL forces the value at the final time to equal the salvage value. As an algorithm, this looks like the following statements:

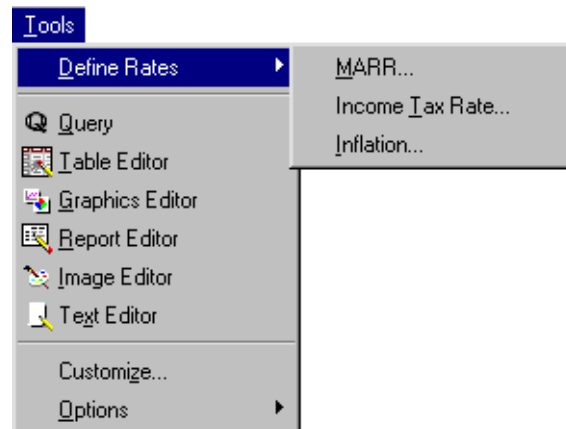

```
V(0) = P;
for i=1 to N
    if DB step > SL step from (i,V(i))
        take a DB step to make V(i);
    else
        break;
for j = i to N
    take a SL step to make V(j);
```

The MACRS, which is discussed in the section that describes the [Depreciation Table](#) window, is actually a variation on the declining balance method with conversion to the straight line method.

Rate Information

The Tools Menu

Figure 56.5 shows the **Tools** menu.

Figure 56.5 The Tools Menu

The **Tools** → **Define Rates** menu offers the following options.

MARR opens the **Minimum Attractive Rate of Return (MARR)** dialog box.

Income Tax Rate opens the **Income Tax Specification** dialog box.

Inflation opens the **Inflation Specification** dialog box.

Dialog Box Guide

Minimum Attractive Rate of Return (MARR)

Selecting **Tools** → **Define Rates** → **MARR** from the Investment Analysis dialog box menu bar opens the MARR dialog box that is displayed in Figure 56.6.

Figure 56.6 MARR Dialog Box

The dialog box is titled "Minimum Attractive Rate of Return (MARR)". It contains the following elements:

- Name:** A text input field.
- Constant MARR:** A numeric input field.
- MARR List:** A table editor with two columns: "Date" and "MARR". The table is currently empty.
- Buttons:** "OK", "Cancel", and "Help" buttons at the bottom.

Name holds the name that you assign to the MARR specification. This must be a valid SAS name.

Constant MARR holds the numeric value that you choose to be the constant MARR. This value is used if the **MARR List** table editor is empty.

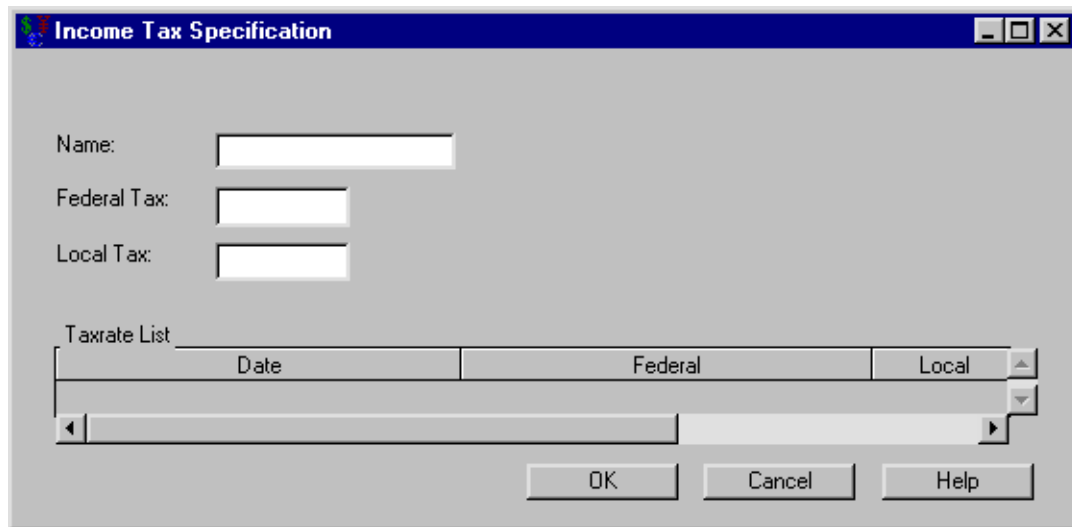

MARR List holds date-MARR pairs where the date refers to when the particular MARR value begins. Each date is a SAS date.

OK returns you to the [Investment Analysis](#) dialog box. Clicking it causes the preceding MARR specification to be assumed when you do not specify MARR rates in a dialog box that needs MARR rates.

Cancel returns you to the [Investment Analysis](#) dialog box, discarding any work that was done in the MARR dialog box.

Income Tax Specification

Selecting **Tools** → **Define Rates** → **Income Tax Rate** from the Investment Analysis dialog box menu bar opens the Income Tax Specification dialog box displayed in [Figure 56.7](#).

Figure 56.7 Income Tax Specification Dialog Box

The dialog box is titled "Income Tax Specification". It contains three input fields: "Name:", "Federal Tax:", and "Local Tax:". Below these is a "Taxrate List" table with columns for "Date", "Federal", and "Local". The table is currently empty. At the bottom are three buttons: "OK", "Cancel", and "Help".

Date	Federal	Local

Name holds the name you assign to the Income Tax specification. This must be a valid SAS name.

Federal Tax holds the numeric value that you want to be the constant Federal Tax.

Local Tax holds the numeric value that you want to be the constant Local Tax.

Taxrate List holds date-Income Tax triples where the date refers to when the particular Income Tax value begins. Each date is a SAS date, and the value is a percentage between 0% and 100%.

OK returns you to the [Investment Analysis](#) dialog box. Clicking it causes the preceding income tax specification to be the default income tax rates when using the [After Tax Cashflow Calculation](#) dialog box.

Cancel returns you to the [Investment Analysis](#) dialog box, discarding any changes that were made since this dialog box was opened.

Inflation Specification

Selecting **Tools** → **Define Rates** → **Inflation** from the Investment Analysis dialog box menu bar opens the Inflation Specification dialog box displayed in [Figure 56.8](#).

Figure 56.8 Inflation Specification Dialog Box

The dialog box is titled "Inflation Specification". It contains the following elements:

- Name:** A text input field.
- Constant Rate:** A numeric input field.
- Inflation Rate List:** A table editor with two columns: "Date" and "Rate". The table is currently empty.
- Buttons:** "OK", "Cancel", and "Help" buttons at the bottom.

Name holds the name that you assign to the Inflation specification. This must be a valid SAS name.

Constant Rate holds the numeric value that you want to be the constant inflation rate. This value is used if the **Inflation Rate List** table editor is empty.

Inflation Rate List holds date-rate pairs where the date refers to when the particular inflation rate begins. Each date is a SAS date and the rate is a percentage between 0% and 120%.

OK returns you to the [Investment Analysis](#) dialog box. Clicking it causes the preceding inflation specification to be assumed when you use the [Constant Dollar Calculation](#) dialog box and do not specify inflation rates.

Cancel returns you to the [Investment Analysis](#) dialog box, discarding any changes that were made since this dialog box was opened.

Your Turn

We welcome your feedback.

- If you have comments about this book, please send them to **`yourturn@sas.com`**. Include the full title and page numbers (if applicable).
- If you have comments about the software, please send them to **`suggest@sas.com`**.

SAS® Publishing Delivers!

Whether you are new to the work force or an experienced professional, you need to distinguish yourself in this rapidly changing and competitive job market. SAS® Publishing provides you with a wide range of resources to help you set yourself apart. Visit us online at support.sas.com/bookstore.

SAS® Press

Need to learn the basics? Struggling with a programming problem? You'll find the expert answers that you need in example-rich books from SAS Press. Written by experienced SAS professionals from around the world, SAS Press books deliver real-world insights on a broad range of topics for all skill levels.

support.sas.com/saspress

SAS® Documentation

To successfully implement applications using SAS software, companies in every industry and on every continent all turn to the one source for accurate, timely, and reliable information: SAS documentation. We currently produce the following types of reference documentation to improve your work experience:

- Online help that is built into the software.
- Tutorials that are integrated into the product.
- Reference documentation delivered in HTML and PDF – **free** on the Web.
- Hard-copy books.
