What's New in DataFlux Data Management Server 2.3 and 2.4

Introduction

The following enhancements were delivered in the 2.4 release:

- Enhance the performance of Monitor jobs.
- Enhance access control by IP address.
- Browse available services and Web Services Definition Language (WSDL) files.
- Specify credentials when running jobs from a command line.
- Persist and purge the histories of job run instances.

The following enhancements were delivered in releases 2.3 and 2.3.1:

- overlay installation
- compatibility
- job-specific WSDL files
- browse available services and WSDL files
- support for DataFlux Federation Server data source names (DSNs)
- additional ODBC drivers

To learn more about these enhancements, refer to the *DataFlux Data Management Server Administrator's Guide*.

Enhance the Performance of Monitor jobs

Bulk loading is now used to enhance performance for Monitor jobs that include row-logging events. You can change the number of rows in each bulk load using the app.cfg configuration option MONITOR/BULK_ROW_SIZE. You can also specify that the Monitor is to store temporary jobs on disk using the app.cfg configuration option MONITOR/DUMP_JOB_DIR. To learn more, see "Configure Bulk Loading in Monitor Jobs."

Enhance Access Control by IP address

Administrators can now allow or deny, by IP address, the capability of bypassing all security checks on the DataFlux Data Management Server. See the new dmserver.cfg configuration option DMSERVER/IPACC/NOSECURITY.

Browse Available Services and WSDL Files

You can now use a web browser to display the services and WSDL files that are available on DataFlux Data Management Servers. See "Browse Available Services and WSDLs."

Specify Credentials When Running Jobs from a Command Line

When you use a command line to run jobs, you can now specify a user name and password for authentication by a DataFlux Authentication Server. See "Run Jobs from a Command Line."

Persist and Purge the Histories of Job Run Instances

You can now store the histories of job run instances so that they persist between restarts of the Data Management Server. See the new configuration option `DMSERVER/JOBS_KEEP_HISTORY`. Also, you can now specify when the server is to automatically remove the history items that are created when you run a job. See the new configuration option `DMSERVER/JOBS_HISTORY_MAXAGE`.

Overlay Installation

You can now install DataFlux Data Management Server so that it replaces a previous version, as opposed to installing side-by-side.

Compatibility

DataFlux Data Management Server now must share the same release as DataFlux Data Management Studio.

Job-Specific WSDL Files

You can now create WSDL files for individual real-time services that exist on a DataFlux Data Management Server. A SOAP client built from a job-specific WSDL file can directly execute a service on the server, passing in parameters and receiving outputs. New configuration options have been added to control job-specific WSDL functionality. See "Apply SOAP Commands and WSDL Options."

Access DataFlux Federation Server DSNs

You can now define localized data source names (DSNs) that reference DataFlux Federation Server DSNs. Localized DSNs enable your DataFlux Data Management Server jobs to access federated tables that are populated by the DataFlux Federation Server from enterprise database management systems. See "Create a Localized DSN Connection."

Additional ODBC Drivers

You can now run data jobs and process jobs that interact with Sybase IQ and Salesforce.com, as you would with any other ODBC-based data source. See "Create a Custom Data Connection."
