ABSTRACT

SAS is widely used in business for computer performance tuning, market research, product planning, operations research and MIS reporting as well as for standard statistical applications. Three examples are presented. The second example uses the new ARRAY and DO-END capabilities of SAS 79.

EXAMPLE 1: USING BOX PLOTS FOR CHANNEL TUNING

Using schematic or box plots is an excellent way to view large batches of univariate or bivariate data (with side-by-side box plots) in an exploratory manner. An example is shown which illustrates its value in a channel tuning application. Figure 1 illustrates what happens when we plot a week's worth of bivariate 5-second data into a stored SAS data set.

10,000 observations will be equally unilluminating. If however we first group CHANNEL 3 BUSY into 10% percentage classes 0-10%,...90%-100% and then do schematic plots of CPU BUSY for each 10% group, Figure 2, a very coherent plot indicative of a possible bottleneck in CPU BUSY whenever CHANNEL 3 BUSY is greater than 70% emerges. The simple SAS program which groups the data and produces the side-by-side box plots with PROC SPLIT is as follows:

```
DATA; SET SASSPACE.S410 (KEEP=C9 CII);
   CII=10*INT(CII/10); *GROUP CII-CH3BUSY;
   *INTO 10% CLASSES;
PROC SORT; BY CII;
PROC SPLIT; CLASSES CII; VAR C9;
TITLE SPLIT OF CPU BUSY VS CHANNEL 3 BUSY;
```

Figure 1: An Unilluminating Plot of 10,073 Points

William R. Gjertsen, SAS Institute Inc.
Figure 2: Informative Side-by-Side Schematic Plots of the Same Data

EXAMPLE 2: PRODUCING U. S. MAP REPORTS

The following two examples generate reports in the context of a user-created pseudo SAS macro library. The steps in allocating space, storing the macros and calling them are given below:

Step 1: Setting up the Space for a SAS Macro Library
// EXEC PGM=LEFEB14
//SASMACRO DD UNIT=SYSDA,SPACE=(TRK,(1,1)),
//VOL=SER=DATA05,DSN=XXX.YYY.ZZZ,DISP=(,CATLG)

Step 2: Storing the Macro Definitions
// EXEC SAS
//SASMACRO DD BSN=XXX.YYY.ZZZ,DISP=OLD
//SYSPRINT DD *

DATA;
FILE SASMACRO;
INPUT; PUT _INFILE_;
CARDS4;

SAS MACRO DEFINITIONS

; ; ;

46
To Use the Macros

EXEC SAS, OPTIONS='NOSOURCE'
SYSIN DD DSN=XXX.YYY.ZZZ, DISP=SHR
DD *

SAS JOB INVOKING THE STORED MACROS

To produce a U. S. map filled with the number of SAS installations we first create a series of macros and place them in a macro library as outlined above. To put the final report, Figure 3, the final SAS job is:

EXEC SAS, OPTIONS='NOSOURCE'
SUGI DD DSN=
SYSIN DD DSN=
DD *
REDUCE; PUT_US_

PUT_US_ is really a composite macro using calls to other building-block macros. These macros as well as REDUCE and PUT_US_ are given in detail in Appendix 1. A brief description of them follows:

REDUCE ...does a sort of the input data set by STATE and then does a match accumulation by STATE so that state totals (T1-T51) are totalled efficiently in a horizontal SAS array ready for formatting into the map. (This uses the ARRAY and DO...END features of SAS 79)

FILLUP ...fills up each state with its abbreviation and its state total

USTITL ...provides title lines as a header for the map

CENTRAL WEST MIDWEST NORTHEAST SOUTHEAST

MAGEN ...pieces together the different sections into one complete map of the U. S.

PUT_US_ ...brings together macros FILLUP->MAGEN to produce the final report

We first note that this map report can be easily generalized to display any measure of interest (i.e., percentages of total or rankings) by state. For percentage we may want to put the state abbreviation followed by percent in a 3.1 format. To make the appropriate changes first, define a new macro FT as:

MACRO FT 3.5 %

Then generalize macro FILLUP by replacing the 2. format for totals to FT. For instance the first line of FILLUP becomes:

PUT #3 29 'AK' 41 T1 FT #8 09 'WA' 41 T48 FT

The other minor problem is that 3.1 may be too large of a format. For example, Connecticut's percentage could spill into Rhode Island. Therefore, further adjustments will need to be made to accomodate enlarged formats. Connecticut's percentage could be put out to the right along with the other small eastern states.

Also, the modular approach gives us the flexibility to picture just one section of the country (by changing MAGEN) together with the option of perhaps listing detail records next to the picture by adding a few PUT statements.

EXAMPLE 3: PRODUCING CALENDAR REPORTS

Another popular type of report with various business applications is a calendar report. The following set of macros and the subsequent job which calls them illustrates how to produce a calendar for January, 1979 for some fictitious sales data (Figure 4). The macros stored on the macro library are given in detail in Appendix 2 and described in general below:

F1,F2,B1, ...building block macros which when
B2,F,6S put together form FIVELN and SIXLN

FIVELN ...puts the outline of a five row (week) calendar

SIXLN ...puts the outline of a six row (week) calendar

JANFILL, FEBFILL, MARFILL ...macros which fill up the cells with the appropriate day number for each month

DECFLF

CAL ...fills up the calendar with items desired to be displayed. The SAS code in this macro takes as input a vertically structured file (i.e., one obs. per day) and restructures it into a row by row report using PUT statements. For calendar reports each row corresponds to 7 cells. This SAS code was first suggested by A. J. Barr at the 1976 SUGI meetings.

The SAS job:

DATA A; INPUT DAY SALES CALLS LEADS;
CARDS;
DATA B (KEEP=SALES TCALLS TLEADS);
SET A RNI;EOF;
TSALES+SALES; TCALLS+CALLS; TLEADS+LEADS;
IF EOF THEN OUTPUT;
DATA JANSALES; MERGE A B;
MAGRÖ, INDATA JANSALES %
MACRO LABELS
@0 'DAY'
@2 'SALES'
@2 'CALLS'
@2 'NEWLEADS'

MACRO CODES
#0 'MONTHLY TOTALS'
#0 'TOT.SALES'
#0 'TOT.CALLS'
#0 'TOT.NEW LEADS'

47
DATA _NULL_; SET INDATA; RETAIN C 1;
CAL;
H: PUT FIVELN LABELS JANFILL;
PUT 60 661 TSALES 3.
   / 660 TCALLS 4.
   / 660 TLEADS 4.;
RETURN;
   
For another application, to produce user-specified calendar reports that summarize monthly computer usage activity we might redefine macros CAL and LABELS and proceed as follows.

DATA A (DROP DATE M Y);
SET USUAGE.DAILY (KEEP=DATE JOBS ACTIVEHR IDLEC HR CPUHR IPLS);
M=MONTH(DATE);
Y=YEAR(DATE);
IF M=2 & YEAR=1979;
DATA B (KEEP=TJOBS TACTIVE TIDLE TRCPUHR TIPLS);
SET A END=EOF;
TJOBS+JOBS; TACTIVE+ACTIVEHR; TIPLS+IPLS;
TIDLE+IDLEHR; TCPUHR+CPUHR;
IF EOF THEN OUTPUT;
DATA C; MERGE A B;
PJOBS=JOBS/TJOBS:
MACRO INDATA C %
MACRO LABELS
#4 @2 'JOBS' @ 'TOT.JOBS'
#5 @2 'CTJOBS'
#6 @2 'ACTIVEHR' @ 'TOT.ACTIVE'
#7 @2 'IDLEHR' @ 'TOT.IDLE'
#8 @2 'CPUHR' @ 'TOT.CPUHR'
#9 @2 'IPLS' @ 'TOT.IPLS'
MACRO CAL
FILE PRINT N=Ps HEADER=H NOTITLES;
J=MOD (C,7); I=INT (C/7);
L1=7*I+15; CJ=5+9*J;
PUT #LI @ CJ JOBS 4.
   / @ CJ PJOBS 4.1
   / @ CJ ACTIVE HR 4.1
   / @ CJ IDLEHR 4.1
   / @ CJ CPUHR 4.1
   / @ IPLS 4. ;
C=C+1; RETURN;
%
DATA _NULL_; SET INDATA:
RETAIN C 4;
   * FEB 1, 1979 IS A THURS;
   * SO CELL COUNTER C=4 INITIALLY;
CAL;
H: PUT FIVELN LABELS FEBFILL;
PUT 60 658 TJOBS 6.
   / 658 TACTIVE 6.1
   / 658 TIDLE 6.1
   / 658 TCPUHR 6.1
   / 658 TIPLS 6. ;

We note that there are at most only 14 possible monthly calendars for each month (i.e., Jan 1 can fall on one of seven days and each year can be a leap year or a non-leap year). Thus to generalize the calendar reports to report on any month for any year we could use the month and year in question to link to the appropriate JANFILL, FEBFILL, ... DECFILL macro.
