

Developing Web Applications with htmSQL
Jason Thomas, SAS Institute Inc.

htmSQL™ is a data service component of SAS/IntrNet™ software. It serves as an easy to use yet powerful tool that allows the web and application developer to dynamically access data from the web.

In this hands-on tutorial, the participant will walk through developing a real web application that will dynamically access data on a SAS/SHARE server. Actual code will be included, as well as definitions of the necessary directives used to create a web application.

This tutorial should serve both the beginner and expert web developer. Basic html and SQL knowledge is helpful, but not required.

For more information on SAS/IntrNet software, please refer to <http://www.sas.com/software/components/intrnet.html>. For more information on htmSQL, please refer to <http://www.sas.com/rnd/web/htmSQL/index.html>.
