ABSTRACT
Making a data delivery to a client is a complicated endeavor. There are many aspects that must be carefully considered and planned for: de-identification, public use versus restricted access, documentation, ancillary files such as programs, formats, and so on, and methods of data transfer, among others. This paper provides a blueprint for planning and executing your data delivery.

INTRODUCTION
Congratulations! You’re expected to make a data delivery. This paper and poster will walk you through the questions you should ask, the resources you should check, the resources you should create, and the SAS® tools that will help you along the way. In essence, we’ll travel back to the future to find out exactly what you need to be doing from the very start of your project, so you don’t run “out of time”.

QUESTIONS YOU SHOULD ASK ABOUT THE PROJECT AND ITS DATA
- Is there any information regarding data processing in the proposal / contract / grant application / Statement of Work (SOW) – or the request for proposal (RFP)?
- Is there a data usage agreement (DUA) / Data Security Plan (DSP) / Data Management Plan (DMP) / Analysis Plan (AP) in place for the project that would give you information as to the source of the incoming data, the security level of the incoming data, where the data is housed, the timing of the incoming data (waves, years, quarters, months, etc.), and/or any analytic activities planned for incoming data?
- Is there any information on the source of the data? i.e. is the data coming from a survey, web or otherwise? Claims data bases? Collected from public use files on the web? Are you creating the data? If so, how?
- Is there any documentation for the incoming data (we assume you will use SAS tools to document any data you create!)? Any usage notes that might be relevant?
- Are there any relevant company / government / prime contractor regulations that apply to the use of incoming and/or created data, i.e. HIPAA, FISMA, FDA, etc.?
- Is your incoming / created data subject to IRB regulations?
- Is there a data manager / data lead for the project (is it you?)
- Who else is working on the project? Anyone else with data processing and analysis responsibilities?

TIP: Keep electronic documents relating to data processing on the project in an easily accessible folder where data processing occurs.

QUESTIONS YOU SHOULD ASK ABOUT THE DATA DELIVERY
- Is there any information regarding the data delivery in the proposal / contract / grant application – or the RFP?
- Is there PHI/PII in the data delivery? How is it being protected?
• Will you be creating restricted access files (RAF) and/or public use files (PUF)?
• In what format will the data be delivered? SAS, Stata, delimited, MS Excel, MS Access, XML, relational data bases?
• What versions of software are required to be used?
• What platform will the data be coming from, processed on by your company, and be used on by the recipient?
• How is the data expected to be delivered? SFTP? Encrypted drives (if so, what encryption software)? Another transfer method?
• Will code / programs be delivered to the client? If so, in which language(s)?
• Will associated files (format libraries, macro libraries) be delivered to the client? If so, in what form?
• Will documentation be delivered to the client? If so, in what format?
• What naming conventions should be used for files in the data delivery?

TIP: Keep any emails / memos / specs regarding the data delivery in an easily accessible folder where data processing occurs.

PLAN FOR THE END OF YOUR PROJECT

Think about your project’s close-out (and data delivery) BEFORE you think about its start-up. Looking at the products that you need to deliver first will enable you to build a data management structure to help ensure success.

• What are the desired outcomes of your project? Will there be a data delivery or a series of data deliveries? If there isn’t written verification of that, you need to research all available materials (see page 1 and Getting Started) and record and store the information that you find.
• At the conclusion of your project, will your data need to be destroyed? Delivered? Kept? If kept, for how long, in what form, and where? Will back-ups including your data need to be destroyed? In what time frame?
• Think about the cycle of deliverables. Will your project deliver data on a daily / weekly / monthly / quarterly / yearly basis? Or will it be a one-time delivery? Will there be interim and final deliveries? What are the exact dates or date ranges associated with each data delivery?
• Does your company or client have any official close-out practices or documents that need to be completed?
• Does your company or client have any quality assurance practices for deliverables that need to be planned for?

Who, What, Where, How, When are all important items to know at the outset. Answering these questions will help you get started, inform your data management plan, and help ensure success with your data deliverable.

It is also important to consider HOW you will deliver your data. Your client may have specific requirements in terms of:

• Encryption (no, yes, if yes, what program / level)
• Transfer method (SFTP? External drive?)
GETTING STARTED

If there is not a data manager assigned to your project, and there is not an existing data management plan, that is the first place to start. Every project involving data processing and/or data deliveries, large or small, will benefit from a comprehensive data management plan. The DMP should cover guidelines and standards for:

- Storage practices and folder structures. There may be multiple platforms and multiple time periods (as well as multiple users) on your project.
- File and program naming conventions (see Data Storage Considerations)
- Documentation procedures
- Communication within the project team
- Input / Output cataloging
- Processing logging
- Peer review / quality assurance
- The DMP should also include references to:
  - Data security plan (DSP) if relevant
  - Data usage agreement(s) (DUAs) if relevant
- And incorporate:
  - Analysis Plan (AP)
  - Schedule of deliverables
  - Delivery method
  - Plan for project close-out, including data retention and destruction

If a DSP is relevant but not written, the data manager should ensure one is provided as a companion to the data management plan. In addition, the data manager should ensure that DUAs are properly executed and updated in a timely manner.

DATA STORAGE CONSIDERATIONS

It is vital to store files in an organized way. Keep all programs, logs and output, source data and final data used to create deliverables in separate folders. Data folders containing PHI/PII should be clearly labeled as such. Have a clearly-defined plan for naming datasets, programs and variables. Create a deliverable folder to hold final data sets, documentation, and programs (if applicable).

DOCUMENTATION

Document processes with a process log: at a minimum, include process / program name, user, date and any relevant notes. Inputs and outputs with number of observations are also helpful. Maintain a catalog of incoming and outgoing data files: at a minimum, include filename, user, to/from locations, and transfer method. Use SAS® to create data dictionaries for original and analytic files, write auxiliary files such as format assignment code, make entries into a process log, and put documentation within program code.
USE SAS® TO SELF-DOCUMENT

Use system macros and functions to document your logs, lists, output and SAS output:
SYSFUNC(GETOPTION(SYSIN)) returns the path and name of the program; &SASDATE returns the date
the program began; &SYSTIME returns the time the program began and &SYSUSERID returns the user ID
of the programmer who submitted the job. These are available to all SAS users, and can be used in
titles, footnotes, label statements, description statements, created variables and even a stored macro to
populate program headers (see Paper 8300-2016, Glass and Hadden).

Build a process log using SAS, using the %WINDOW and %DISPLAY commands to solicit input from users.
If the routine is included in programs, information from each run of each program will be collected
including the information described above and more. (see Paper 8300-2016, Glass and Hadden). The
program outputs information into an Excel workbook which is read in and exported iteratively so that
any additional information entered into the workbook is retained.

If you receive data sets that do not have data set or variable labels, etc., use PROC DATASETS commands
to modify the data set. This is far more efficient than saving a new copy of the data set (or [gasp]
overwriting your data set).

Similarly, if you have unlabeled macros, graphics catalogs or format catalogs, you can use PROC
CATALOG to “describe” them after the fact. (You can use the DES option when creating macro and
graphics catalogs, but must use PROC CATALOG to modify format catalog descriptions.)

If you need to deliver formats specific to a project or a portion of a project, save your formats with a two
level catalog name. For example:

PROC FORMAT LIBRARY = LIBRARY.Compendium2011Res;
   VALUE YESNODK 1 = "Yes" 2 = "No" 8 = "Don't Know";
RUN;

Using two level catalog names makes it far easier to identify the piece of a project a format is applicable
to.

USE SAS® TO MANAGE DIRECTORIES

Create a text directory listing of a project directory starting from the top level from a command prompt
or through the X command in SAS including subdirectories (i.e. dir *.* /s > dirlist.txt). Then use the
resulting text file as input to a SAS program (readdirlist.sas, available from the author) which uses SAS
functions to parse each line in the directory listing, converting the information into useful variables, and
exports the information into an Excel spreadsheet. This spreadsheet (or the originating SAS data set)
can be used to locate duplicate file names, large files, etc.
USE SAS® TO PRODUCE WRITE CODE AND PRODUCE CODEBOOKS

Using all the tips described in this paper (and more), you are ready to document your deliverables. It is possible to produce customized codebooks for SAS data sets with very little user intervention.

- Use PROC DATASETS, PROC CONTENTS, or dictionary tables, etc. to produce a documentation spreadsheet
- Review the spreadsheet and perhaps modify a missing label or format assignment. In addition, you may wish to categorize your variables beyond numeric and character.
- Import the modified spreadsheet, and use the information to write code to be included to generate a codebook with output varying by variable type; write code to generate a label statement; and write code to generate a format assignment statement, among other normally onerous tasks.
CONCLUSION
Preparation for a data delivery is a complicated endeavor. By going back to the future, and with the help of SAS tools, you can plan for a successful transfer of data.

Full code for SAS tips described on this page available from the author upon request.
