Chapter 1 - Introduction

This document describes how to install the Platform Suite for SAS, version 10.1, on UNIX/Linux hosts for use with SAS products and solutions. The Platform Suite for SAS can be an individual addition to several SAS products and solutions to provide enterprise-level scheduling capabilities on a single server environment. The Platform Suite for SAS is also included as part of the SAS Grid Manager product to enable:

- distributed enterprise scheduling
- workload balancing
- parallelized workload balancing

The Platform Suite for SAS includes the following components:

- **Process Manager** – the interface used by the SAS scheduling framework to control the submission of scheduled jobs to LSF (Load Sharing Facility) which manages any dependencies between the jobs. The Flow Manager and Calendar Editor clients are included with Process Manager and may be optionally installed. These clients are not required by SAS; however, they do provide additional functionality.
  - **Flow Manager** - provides a visual representation of flows that have been created for a Process Manager Server. These include flows that were created and scheduled in SAS Management Console’s Schedule Manager, as well as reports that have been scheduled through SAS Web Report Studio. Platform Flow Manager provides information about each flow’s status and associated dependencies. You can view or update the status of jobs within a flow, and you can run or rerun a single job regardless of whether the job failed or completed successfully.
  - **Calendar Editor** - a scheduling client for a Process Manager Server. This client enables you to create new calendar entries for time dependencies for jobs that are scheduled to run on the server. You can use it to create custom versions of the calendars that are used to create time dependencies for jobs.

- **LSF** – dispatches all jobs submitted to it, either by Process Manager or directly by SAS, and returns the status of each job. LSF also manages any resource requirements and performs load balancing across machines in a grid environment.

- **Grid Management Services** – provides the run-time information about jobs, hosts and queues for display in the SAS Grid Manager Plug-in for SAS Management Console.

**Platform RTM for SAS**

Platform RTM (Report, Track & Monitor) for SAS is a web-based tool that provides IT administrators a way to graphically view the status of devices and services within their SAS grid environment as well as manage the policies and configuration of their grid. It is a visual tool to quickly track and diagnose issues before they affect service levels. Platform RTM for SAS includes drill-down capabilities to view details of hosts, jobs, queues, and user activities while instant alerts on job performance and grid efficiency allow administrators to optimize usage and workloads. It includes customizable graphs to visually analyze resource usage, workload trends, and job behavior. It also includes GUI interfaces to allow administrators to update the policies and rules in the grid configuration. Administrators can also set up high availability for any of the
services that are critical to the operation of the grid as well as the applications executing in the grid. Platform RTM for SAS helps system administrators improve decision-making, reduce costs and increase service levels for SAS grid deployments.

You can download Platform RTM for SAS from the SAS Demos and Downloads site at http://support.sas.com/downloads/package.htm?pid=669. System requirements and installation instructions for Platform RTM for SAS are provided on the download page and are therefore not covered in this document.

Architecture

SAS® Scheduling Architecture

Job scheduling on a single machine requires that you install Platform Process Manager 10.1. During the Process Manager install, you are to install Platform LSF 10.1. See “Chapter 2 - Installing Process Manager and LSF” for the instructions on installing on a single server.
Several types of machines make up a SAS grid environment. These machines have been defined to clarify the software components that must be installed on each one as well as the SAS metadata that must be configured. The SAS Metadata Server is shown on a separate machine in this sample architecture. It is common to dedicate a machine to running the SAS Metadata Server, but you may choose to run the metadata server on the grid control server. The three machine types specific to a grid installation are defined as follows:

- **grid client** - a grid client submits work to the grid but is not part of the grid resources available to execute work. Examples of a grid client include:
  - a SAS Data Integration Studio client (Platform LSF not installed on this client machine)
  - a SAS Enterprise Miner client (Platform LSF not installed on this client machine)
  - a SAS Management Console client using the Schedule Manager plug-in or any other applications scheduling SAS workflows (Platform LSF not installed on this client machine)
  - a SAS Foundation install (minimum Base SAS, SAS/CONNECT, and Platform LSF) used to run a program that submits work—both whole programs or programs separated into parallel segments which are programs separated into parallel segments to the grid.
  
  Installation of the Platform LSF component is required in this case in order for SAS/CONNECT to submit the work to the grid.
  - Platform RTM for SAS (requires Platform LSF)

- **grid control server** - any machine in the grid can be designated as the grid control server. More software is installed on the grid control server and more SAS metadata configuration
takes place on this machine. You are to start the installation of the Platform Suite for SAS on this machine. In a SAS Data Integration Studio and SAS Enterprise Miner scenario the grid control server runs a workspace server that executes programs that utilize SAS/CONNECT to distribute work to the grid nodes. The grid control server can be configured as a grid resource capable of receiving work to execute or not, depending on the needs of your environment.

- **grid node** - a grid node is a grid computing resource capable of receiving the work that is being distributed. Each grid node must be running a minimum of Base SAS, SAS/CONNECT and Platform LSF.

Installation of Platform Suite for SAS is performed first on the grid control server and is followed by installation on all of the grid node machines. Installation of Platform LSF on the grid control server can be installed as a part of the Process Manager installation or it can be installed by itself. This document only shows LSF being installed as part of the Process Manager installation.

Machines that do processing for the grid as well as machines that submit jobs to run on the grid must have Platform LSF installed. Grid clients such as SAS Data Integration Studio or SAS Enterprise Miner do not submit jobs directly but rather work with a SAS workspace server or a stored process server that does the job submission. Since those grid clients do not submit jobs, they do not need Platform LSF installed, but the machine where the workspace server or stored process server would need it installed. If you are writing your own grid-enabled SAS program in SAS Foundation and want to run the program, that grid client workstation must have Platform LSF installed since it processes the actual submission of jobs to the grid.

This document is designed to assist you with installing Platform Suite for SAS to create a computer cluster and enable the cluster to work with the SAS Business Intelligence Platform. Please refer to the *Grid Computing in SAS document*, located at [http://support.sas.com/documentation/onlinedoc/gridmgr/index.html](http://support.sas.com/documentation/onlinedoc/gridmgr/index.html).

SAS Grid Manager Control Server requires Platform Process Manager 10.1 and Platform Grid Management Service 8.01. Platform LSF 10.1 is to be installed during the Platform Process Manager 10.1 installation. See “Chapter 2 - Installing Process Manager and LSF” for the instructions on installing Process Manager and LSF. See “Chapter 3 - Installing Grid Management Service (GMS)” for instructions on installing Grid Management Services. SAS Grid Manager Node and SAS Grid Manager Client require only Platform LSF 10.1. See “Chapter 4 - Installing LSF on Grid Nodes, SAS Foundation Grid Clients” for the instructions on installing LSF.

### Installation Directories

**Caution:** Do not install Process Manager and LSF to the same directory.

Installing Platform Suite for SAS produces the following directory structure:

- **JS_TOP** is the local directory in which the Process Manager Server and Client files are installed, (for example, `/usr/share/pm`).
- **LSF_TOP** is the shared directory in which LSF files are installed (for example, `/usr/share/lsf`). Generally, **LSF_TOP** is mounted from a file server and all files associated with LSF (state files, binaries for the different architectures, configuration files) are stored in this file share. **LSF_TOP** must be a shared directory between all the machines in the grid. For increased high availability this file server could be a machine that is not part of the grid.
The GMS (Grid Management Service) files are installed in the LSF directory structure under their own directory, gms (for example, /usr/share/lsf/gms).

Machine-dependent files are installed under LSF_TOP/10.1/platform_name. These directories and the files underneath represent the machine-dependent files. Machine-dependent files are specific to a particular host type and are the LSF command binaries, server daemons, libraries, and utilities.

Machine-independent files are independent of the host type and are shared by all host types (main pages, configuration files, include files, examples, etc.)

**Pre-Installation Requirements**

1. Read the Platform Web Services deployment documentation if you plan on using SAS Environmental Manager. See the document at http://support.sas.com/documentation/cdl/en/gridref/69583/HTML/default/p1ad54icxt53fxn1wltw5tcbplq.htm

2. Ensure that the SAS install user account exists. If not, create it. The user account sas will be used throughout this document as an example where a specific user account name is necessary for clarity. It is recommended that the same operating system account be used to deploy both SAS and Platform LSF. Separate accounts can be used but doing so means that a patch will be required in order to run Platform Web Services. See the Platform Web Services deployment documentation for details.

3. Contact your system administrator to create a network share that all computers on your cluster can access. This can be an NFS mount, a directory on a SAN, an SMBFS/CIFS mount, or any other method of creating a directory that is shared among all the machines in the grid. All machines in the grid must be able to access this share at boot time, so have your system administrator set that up based on the type of share. All machines in the grid must also have root access, since any machine may become the grid master. All grid users must be able to read the share at runtime. This is referred to as LSF_TOP, the LSF top-level installation directory. This installation concludes that LSF_TOP is mounted on each machine as /usr/share/lsf. Make sure root has read/write access to this subdirectory.

4. Create a directory on the grid control server that contains the Process Manager files. This is referred to as JS_TOP, the Process Manager top-level installation directory. This installation concludes that JS_TOP is /usr/share/pm.

5. Make a list of the names of all the computers that participate in the cluster.

6. Choose a name for the cluster.

7. Locate the SAS9*_*.txt and LSF*_*_.txt file located in the sid_files directory in your SAS Software Depot. The LSF*_*_.txt file is to license all components of Platform Suite for SAS in a scheduling capabilities on a single server environment. The SAS9*_*.txt is to license all the components of Platform Suite for SAS as part of the SAS Grid Manager.

8. Determine the types of all computers in the grid using `uname -a` so that the correct tar files can be copied for the install. This allows you to determine the subdirectory in your SAS Software Depot that contains the software for all the UNIX operating system types and CPU architectures in the grid. The files are in the third_party directory of the SAS Software Depot. The install requires a pm10*.tar of the same operating system and CPU architecture as the single machine or grid control server. The pm10* files are in Platform_Process_Manager/10_1 directory
under the sub-directory named for the host you are installing on. The install requires a
`gms8.0.1_install.tar.Z` and the `gms8.0.1_* .tar.Z` for the OS/CPU type as the grid
control server. The `gms8.0.1_*` files are in `Platform_Grid_Management_Service/8_01E`
directory under the sub-directory named for the host you are installing on. The install requires
the `lsf10.1_lsfinstall.tar.Z` and `lsf10.1*.tar.Z` files for all other grid nodes OS/CPU
types. The `lsf10.1*` files are in `Platform_LSF/10_1` directory under the sub-directory named for
the host you are installing on. As an example, if the grid control server is a Solaris 10 SPARC
system, but the grid contains Linux 2.6 machines with x86, and Linux 2.6 x86-64 machines, the
following tar files are needed:

- `Platform_Process_Manager/10_1/64-
  bit_Enabled_Solaris/pml0.1_sas_sparc-sol10-64.tar` (which contains
  `lsf10.1_sparc-sol10-64.tar.Z`)
- `Platform_Grid_Management_Service/8_01E/64-
  bit_Enabled_Solaris/gms8.0.1_install.tar.Z`
- `Platform_Grid_Management_Service/8_01E/64-
  bit_Enabled_Solaris/gms8.0.1_sparc-sol10-64.tar.Z`
- `Platform_LSF/10_1/Linux/lsf10.1_lsfinstall.tar.Z`
- `Platform_LSF/10_1/Linux/lsf10.1_linux2.6-glibc2.3-x86.tar.Z`
- `Platform_LSF/10_1/Linux_for_x64/lsf10.1_linux2.6-glibc2.3-
  x86_64.tar.Z`

9. If your operating system performs user authentication against an LDAP/PAM server, you are
required to make some configuration changes to allow GMS and PM to use the PAM interface.
The instructions for making those configuration changes are located in the appendix.

10. LSF uses RSH/RLOGIN by default to execute certain commands on machines in the grid. If you
would prefer to use SSH, please refer to the “Encrypt transmission of LSF commands for remote
execution and login” section of the Platform LSF Security document for a list of required changes.

11. On Linux, Platform PM requires the `libstdc++.so.5` library. If this is not found on your system,
install `libstdc++` or the compat-libstdc++ RPM containing the `libstdc++.so.5` `libstdc++` library that is
appropriate for your system. Contact Redhat, `www.redhat.com` for assistance in obtaining this
library information if necessary.
Chapter 2 - Installing Process Manager and LSF

Caution: Do not install Process Manager and LSF to the same directory.

1. Log on to the machine as the Primary LSF administrator.
2. Create a Process Manager install directory (such as /local/pm_install) to hold the installation files.
3. Copy the pm10.1_sas_*_.tar file from the appropriate location (see step 6 from the pre-installation requirements section) to the install directory. The pm10.1 files contain both LSF and PM media. If this is part of a grid installation and there are machines in the grid that are a different operating system or CPU architecture than the grid control server, then copy the appropriate lsf10.1_*_tar.Z files for those operating systems/CPUs.

However, there are two files for each UNIX-based OS/CPU as shown below:

pm10.1_sas_lnx26-x64.tar – as a first step, get the installer tar file for your platform host for 32-bit Linux. Next, untar the installer so the remainder of the processing can take place.

pm10.1_sas_pinstaller.tar.Z – is the client installer and installs Process Manager clients similar to a flow manager setup.

4. Change the working directory to the Process Manager install directory.

   Extract the pm10.1_sas_*_.tar file. For example, under Linux you can use the command tar xvf pm10.1_sas_linux2.6-glibc2.3-x86.tar. This is designed to create a pm10.1_sas_pinstall subdirectory in the Process Manager install directory.

5. Change to the pm10.1_sas_pinstall subdirectory.

6. Copy the license file obtained from SAS (for example, ‘LSF‘ in the sid_files directory in your SAS Software Depot) into the current directory and rename it license.dat.

7. Edit the install.config file and change the following sections:

For more information see, “Chapter 1: Managing Your Cluster,” “Add a host of a new type using lsfinstall” section, in the Administering IBM Spectrum LSF document found in the docs directory of your SAS Software Depot containing Platform LSF.

Note: In a majority of SAS installation and configuration environments, JS_‘name descriptions’ and LSF ‘name descriptions’ as shown below are required.

<table>
<thead>
<tr>
<th>Required Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JS_TOP</td>
<td>Directory to install Process Manager. This does not need to be a network share but recommended. For example: JS_TOP=/usr/share/pm</td>
</tr>
<tr>
<td>JS_HOST</td>
<td>Host that is assigned to be the Process Manager host. Specify the</td>
</tr>
<tr>
<td>Required Section</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>machine’s fully qualified domain name (FQDN). For a grid installation this is in place to be the grid control server.</td>
</tr>
<tr>
<td>JS_ADMIN</td>
<td>Space-delimited example of a user ID that serves as an LSF administrator.</td>
</tr>
</tbody>
</table>
| JS_ADMINS        | Space-delimited list of user IDs that will serve as LSF administrators. It is recommended that the SAS install account be used as the Primary LSF administrator, which is the first name in the list. Examples:  
JS_ADMINS=sas  
JS_ADMINS="sas_admin2_admin3" |
| LSF_INSTALL      | Flag indicating whether to install LSF. This must be “true”. |
| LSF_TOP          | Network share containing the LSF installation mentioned in the pre-installation requirements. For example:  
LSF_TOP=/usr/share/lsf |
| LSF_CLUSTER_NAME | Name of cluster. For example:  
LSF_CLUSTER_NAME=sas_cluster |
| LSF_MASTER_LIST  | List of servers that are going to participate as master candidates. The first server in the list is considered the default LSF master machine. The master list should be in the order of how the user prefers the cluster master succession should be listed. For example, HOSTA, HOSTB, and HOSTC means that HOSTA is the default master. When HOSTA expires, HOSTB will be the master and so on. The LSF master machine is the grid control server for a grid installation and the machine containing Process Manager. |
| LSF_ADD_SERVERS  | List of servers that are going to participate in the cluster that are not required to be included as master candidates. |
| LSF_ADD_CLIENTS  | List of hosts that only submit jobs to the grid. |

8. Optional sections can be specified as shown below:

<table>
<thead>
<tr>
<th>Optional Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JS_PORT</td>
<td>Process Manager port number. Use default of 1966 unless it is in use by another program.</td>
</tr>
<tr>
<td>JS_TARDIR</td>
<td>Path of directory to Process Manager distribution files. If not used, the tar files are expected to be in the current directory running jsinstall.</td>
</tr>
<tr>
<td>JS_LICENSE</td>
<td>Full path to Process Manager/LSF license file. If not used, the license.dat file is expected to be in the current directory running jsinstall.</td>
</tr>
</tbody>
</table>
| JS_MAILHOST      | The name of the mail server host if you want to receive email notices from LSF. For example:  
JS_MAILHOST=[SMTP|Exchange:]hostname |
LSF_TARDIR | Path of directory to architecture specific tar files. If not used, the tar files are expected to be in the current directory running jsinstall.

The resulting file contains content similar to this example:

```
# --------------------------
JS_TOP=/usr/share/pm
# --------------------------
# REQUIRED. You must uncomment this keyword and specify a value.
# --------------------------
JS_HOST=myhost
# --------------------------
# REQUIRED. You must uncomment this keyword and specify a value.
# --------------------------
JS_PORT=
# --------------------------
# OPTIONAL. The default port number is 1966.
# --------------------------
JSADMINS=sas
# --------------------------
# REQUIRED. You must uncomment this keyword and specify a value.
# --------------------------
LSF_INSTALL=true
# --------------------------
# REQUIRED. You must uncomment this keyword and specify a value.
# --------------------------
LSF_TOP="/usr/share/lsf"
# --------------------------
# REQUIRED. You must uncomment this keyword and specify a value.
# --------------------------
LSF_CLUSTER_NAME="sas_cluster"
# --------------------------
# REQUIRED. You must uncomment this keyword and specify a value.
# --------------------------
LSF_MASTER_LIST="myhost"
```

9. **Change to the root user and execute the command .*/jsinstall -f install.config.** Doing so installs LSF first, and then, Process Manager. A directory is created for each component and an `Install.log` file is created in each directory. All the events of the installation are logged here.

```
$ ./jsinstall -f install.config
Starting jsinstall...
Verifying the working directory...
Reading configuration file...
Updating JS and LSF config files.
This may take a few minutes...
```
10. Read and agree to the LSF End User License Agreement.

International Program License Agreement

Part 1 - General Terms

BY DOWNLOADING, INSTALLING, COPYING, ACCESSING, CLICKING ON AN "ACCEPT" BUTTON, OR OTHERWISE USING THE PROGRAM, LICENSEE AGREES TO THE TERMS OF THIS AGREEMENT. IF YOU ARE ACCEPTING THESE TERMS ON BEHALF OF LICENSEE, YOU REPRESENT AND WARRANT THAT YOU HAVE FULL AUTHORITY TO BIND LICENSEE TO THESE TERMS. IF YOU DO NOT AGREE TO THESE TERMS,

* DO NOT DOWNLOAD, INSTALL, COPY, ACCESS, CLICK ON AN "ACCEPT" BUTTON, OR USE THE PROGRAM; AND

* PROMPTLY RETURN THE UNUSED MEDIA, DOCUMENTATION, AND

Press Enter to continue viewing the license agreement, or enter "1" to accept the agreement, "2" to decline it, "3" to print it, "4" to read non-IBM terms, or "99" to go back to the previous screen.

jsinstall completed successfully. Done.
17. Change into the LSF_TOP/10.1/install subdirectory (for example, 
/usr/share/lsf/10.1/install). Run the following command to set up the proper 
initialization files for future reboots:

`./hostsetup --top="/usr/share/lsf" --boot="y" --profile="y"  
--start="y"`

**Note:** There are two dashes “--” in the options. See “Chapter 5 – LSF Quick Reference” for more 
information on the `hostsetup` command.

```
$ # ./hostsetup --top="/usr/share/lsf" --boot="y" --profile="y" --start="y"
Logging installation sequence in /usr/share/lsf/10.1/log/install.log
------------------------------------------------------------
LSF HOST SETUP UTILITY
------------------------------------------------------------
This script sets up local host (LSF server, client or slave) environment.

Setting up LSF server host "myhost" ...
Checking LSF installation for host "myhost" ... Done
Installing LSF RC scripts on host "myhost" ... Done
LSF service ports are defined in /usr/share/lsf/conf/lsf.conf.
Checking LSF service ports definition on host "myhost" ... Done
... Setting up LSF server host "myhost" is done
... LSF host setup is done.
```

**Note:** Host setup does not require the profile be sourced.

18. Type `ps –ef | grep <LSF_TOP>` and make sure all daemons are running. Note that `mbatchd` 
and `mschd` only run on the master machine, therefore, they may not show up.

```
$ . profile.lsf
$ lsadmin limstartup
Starting up LIM on <myhost> ...... done
$ lsadmin resstartup
Starting up RES on <myhost> ...... done
$ badmin hstartup
Starting up slave batch daemon on <myhost> ...... done

$
Installation Instructions for Platform Suite for SAS for UNIX

19. Start up the Process Manager Server. This can be done easily by rebooting the computer or doing the following as root:
   a. Set up the Process Manager environment by sourcing the profile.js file. This can be done by executing the following command: `..<JS_TOP>/conf/profile.js`. Please note the period ‘.’ which is the command to ‘source’ the file.
      Note: Since all Process Manager commands require the environment set up by sourcing the profile.js file, it is best practice to source the profile.js file in the default profile for the shell.
   b. Start the jfd daemons with the command `jadmin start`.
   c. To start the jfd daemon at boot time, run the command `bootsetup` located in `JS_TOP/10.1/install`.
   d. Type `ps –ef | grep jfd` and make sure the daemon is running.

```
$ jadmin start
Starting up jfd ...
$ cd .../10.1/install
$ bootsetup
Logging installation sequence in /usr/share/pm/10.1/install/Install.log
Copying /etc/init.d/jstartup, /etc/init.d/rc5.d/S96jstartup and /etc/init.d/rc4.d/K05jstartup
Installing Process Manager RC scripts on host "disuse" ... Done
... Process Manager boot setup is done.
$ ps -ef | grep jfd
sas  16417     1  0 15:03 ?        00:00:00 /usr/share/pm/10.1/linux2.6-glibc2.3-x86_64/etc/jfd
root 16566   944  0 15:04 pts/0    00:00:00 grep jfd
$```

Testing the Installation

Once the system has rebooted, you can follow these steps to make sure LSF on the grid control server or scheduling server is operating properly.

1. Log onto the machine as an LSF administrator or user.
2. Make sure the LSF daemons are running by executing the command `ps –ef | grep <LSF_TOP>`. This lists multiple daemons such as `lim, pim, res, sbatchd, mbatchd` and `mbschd`.
3. Run the command `lsid`. This displays the cluster name and the grid control server (LSF master machine) name. If you cannot find the lsid command, you may have to source the profile first by opening a command prompt and executing the following command:
       `..<LSF_TOP>/conf/profile.lsf`
      Please note the period ‘.’ which is the command to ‘source’ the file.
      Note: The hostsetup command automatically produces the sourced profile.lsf for each user, but if it does not, you need to source it yourself.
4. Run the command `lshosts`. This displays static information about the grid control server (LSF master machine).
5. Run the command `lsload`. This displays dynamic information about the grid control server (LSF master machine).
6. Run the command `bsub sleep 29`. This submits a job to the grid control server since it is the only machine so far in the cluster.

7. Run the command `bjobs`. This displays the job information. As you repeat this command, you can see the job go from PEND, to RUN, to being removed from the queue. The following is sample output assuming the grid control server (LSF master machine) is `grid3.testgrid.com`.

8. Set up the Process Manager environment by sourcing the `profile.js` file. This can be done by executing the following command: `. <JS_TOP>/conf/profile.js`. Please note the period `.` which is the command to ‘source’ the file.

   **Note:** Since all Process Manager commands require the environment set up by sourcing the `profile.js` file, it is best practice to source the `profile.js` file in the default profile for the shell.

9. Run the command `jid`. When prompted for username and password, provide the Primary LSF administrator credentials. This displays static information about the Process Manager Server.

10. Run the command `flowmanager`. This executes a client application to verify client communication to the Process Manager Server.

   **Note:** If you are installing Platform Suite for SAS for single machine scheduling, the task is complete at this stage and you can stop here. If you are installing Platform Suite for SAS for use with SAS Grid Manager, continue with the next chapter.
Chapter 3 - Installing Grid Management Service (GMS)

Grid Management Service is a daemon that is used by the Grid Manager Plug-in for the SAS Management Console to display grid information. After installing this service, you can use the SAS Management Console to view grid information.

1. Log onto the grid control server as the Primary LSF administrator.
2. Create a Grid Management Service install directory to hold the install files.
3. Copy the gms8.0.1_install.tar.Z file from the appropriate location (see step 6 from the pre-installation requirements section) to the install directory along with the gms8.0.1_<platform>_tar.Z specific to the operating system and architecture of the grid control server.
4. Change the working directory to the Grid Management Service install directory.
5. Untar the gms8.0.1_install.tar.Z file. For example, under Linux you can use the command gunzip -d gms8.0.1_install.tar.Z followed by tar xvf gms8.0.1_install.tar. This created a gms8.0.1_install subdirectory in the Grid Management Service install directory.
6. Change into the gms8.0.1_install subdirectory.
7. Edit the install.config file and change the following sections:

<table>
<thead>
<tr>
<th>Required Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSF_TOP</td>
<td>Network share containing the LSF installation mentioned in the pre-installation requirements. For example: LSF_TOP=/usr/share/lsf.</td>
</tr>
<tr>
<td>LSF_TARDIR</td>
<td>Path of directory to architecture specific tar files. If not used, the tar files are expected to be in the parent directory of the current working directory. For example: LSF_TARDIR=/usr/share/lsf/10.1/install</td>
</tr>
<tr>
<td>GABD_PORT</td>
<td>Port GMS recommended to use for incoming connections. If not specified, it is 1976. Note: This configuration variable is not commented on in the install.config file and needs to be added if the default is not wanted.</td>
</tr>
<tr>
<td>BOOT</td>
<td>Setting BOOT=&quot;Y&quot; installs a script that starts the service to start at boot time. Default is not to start at boot time.</td>
</tr>
</tbody>
</table>
8. Change to the root user and execute the following command: `./gmsinstall -f install.config`. This installs the Grid Management Service.

```
$ ./gmsinstall -f install.config

Logging installation sequence in /install/gms_install/gms8.0.1_install/Install.log
pre-installation check ...
uncompress is /usr/bin/uncompress

Please wait, extracting /install/gms_install/gms8.0.1_linux2.6-glibc2.3-x86_64.tar.Z
may take up to 5 minutes ...

Creating /usr/share/lsf/gms ...
Creating /usr/share/lsf/gms/log ...
... Done extracting /install/gms_install/gms8.0.1_linux2.6-glibc2.3-x86_64.tar.Z.
Install Platform Grid Management Service 8.0.1
Creating /usr/share/lsf/gms/8.0.1/misc ...

Modifying owner, access mode, setuid flag of files ...
... Done modifying owner, access mode, setuid flag of files ...

Creating script for starting daemon: /usr/share/lsf/gms/bin/gaadmin
Installation of Platform Grid Management Service 8.0.1 completed
```

9. Start the service by either rebooting the machine, running the script created in the `<GMS_TOP>/bin` directory, or using a service management tool available on your platform. In the example above, the following command would start the service (assuming you are logged on as 'root'):

```
/usr/share/lsf/gms/bin/gaadmin start
```

**Testing the Installation**

Once SAS has been installed and configured, the SAS Grid Manager Plug-in in the SAS Management Console can be used to test that the Grid Management Service is working properly.
Chapter 4 - Installing and Configuring LSF on Grid Nodes, SAS Foundation Grid Clients or UNIX

When the install.config file was filled out, you listed machines that are to be part of the grid. Some of these machines process jobs, some may submit jobs and some may do both. Grid nodes process jobs for the grid and can optionally submit jobs to the grid. SAS Foundation Grid Clients only submit jobs to the grid without processing grid jobs.

1. Verify that the host information is already in the LSF cluster file LSF_CONFDIR/lsf.cluster.cluster_name. If it is not, then edit the Host section of the cluster file to add the host. For more information see, “Chapter 1: Managing Your Cluster,” “Adding a host” section, in the Administering IBM Spectrum LSF document found in the docs directory of your SAS Software Depot containing Platform LSF.

2. Log onto each newly added machine as root.

3. Make sure access to the shared directory where LSF was installed is available. Also, make sure the share is available for the boot initialization process and all grid users can read the share.

4. Add the Primary LSF administrator user if this was not done before the installation process started.

5. Change into the <LSF_TOP>/10.1/install share directory (in our example, it is /usr/share/lsf/10.1/install).

6. Run the following command to set up the proper initialization files for future reboots:

   ./hostsetup --top="/usr/share/lsf" --boot="y" --profile="y" --start="y"

   Note: There are two dashes “--” in the options. See “Chapter 5 – LSF Quick Reference” for more information on the hostsetup command.

7. Run the following two commands on the grid control node to make the new node known:

   lsadmin reconfig
   badmin reconfig

Testing the Installation

Once the system has rebooted, you can follow these steps to make sure LSF on the cluster is operating properly.

1. Log onto the grid control server as an LSF administrator or user.

2. Run the command lshosts. This displays static information about the grid control server and all grid node machines.

3. Run the command lsload. This displays dynamic information about the grid control server and all grid node machines.

4. Run the command bsub sleep 1000. This submits a job to the cluster. Repeat this command once for each node in the cluster.
5. Run the command `bjobs`. This displays the job information. As you repeat this command, you see the job go from PEND, to RUN, to being removed from the queue.

The following is sample output of a homogeneous cluster where the grid control server (LSF master machine) is `myhost` running Linux and the grid nodes are `node1.sas.com`, `node2`, `node3`, and `node4`, all running Linux.

$$
\text{\$ . /usr/share/lsf/conf/profile.lsf} \\
\text{\$ lshosts} \\
\text{\$ lshosts} \\
\text{\$ lsload} \\
\text{\$ lshosts} \\
\text{\$ bhosts}
$$

### Adding Nodes or SAS Foundation Clients to the Grid

A grid can have machines added to it any time in the future. If a new machine needs to be added to the grid after an initial install, the procedures are similar to adding grid nodes to a new LSF cluster.

To add a node to an existing LSF cluster, do the following:

1. **Edit the `lsf.cluster.<cluster_name>` file** (`lsf.cluster.sas_cluster` in our case) and add the new machine names in the host section. This section looks like the example below:

```
Begin Host
HOSTNAME                model type server r1m  mem  swp  RESOURCES 
#Keywords
myhost                   !    LINUX86  1   -   -   -   (linux) 
nodem1.sas.com          !    LINUX86  1   -   -   -   (linux) 
node2                    !    LINUX86  1   -   -   -   (linux) 
node3                    !    LINUX86  1   -   -   -   (linux) 
node4                    !    LINUX86  1   -   -   -   (linux) 
End   Host
```

For example, to add `node5` to the previous cluster, the resulting Host section would look like the example below:

```
Begin Host
HOSTNAME                model type server r1m  mem  swp  RESOURCES 
#Keywords
myhost                   !    LINUX86  1   -   -   -   (linux) 
nodem1.sas.com          !    LINUX86  1   -   -   -   (linux) 
node2                    !    LINUX86  1   -   -   -   (linux) 
node3                    !    LINUX86  1   -   -   -   (linux) 
node4                    !    LINUX86  1   -   -   -   (linux) 
node5                    !    LINUX86  1   -   -   -   (linux) 
End   Host
```
2. Follow the steps at the beginning of this chapter.

Converting a Grid Node Machine to a Grid Client

If you are running SAS Foundation to submit jobs to the grid but the machine will not participate as a grid node, and you installed Platform LSF on a machine as an “LSF Server” host type, prevent jobs from running on the machine by making it, in effect, an “LSF Client” machine. Change the state of a machine to ‘closed’ by following these steps:

1. Log on as the LSF Administrator.
2. Run the command `badmin hclose <host_name>`.

When you run the `bhosts` command, the host displays a status of ‘closed’.

Adding a New Machine Type to the Grid

Before adding a new machine type to an existing grid, verify that the host type does not already exist in your cluster by logging onto any host in the cluster and listing the contents of the `LSF_TOP/<version>` directory. If the host type currently exists, a subdirectory with the name of the host type is to display, and it’s recommended that you edit the `LSF_CONFDIR/lsf.cluster.<clustername>` file to add the hostname in the HOST section. Then go to step 5 below. If the host type does not already exist, complete all the steps below.

1. Get the LSF distribution tar file for the host type you want to add.
2. Log on as root to any host that can access the LSF install directory.
3. Change to the LSF install directory.
4. Edit `install.config`:
   a. For `LSF_TARDIR`, specify the path to the tar file. For example:
   
   `LSF_TARDIR="/usr/share/lsf_distrib/10.1"
   
   b. For `LSF_ADD_SERVERS`, list the new host names enclosed in quotes and separated by spaces. For example:
   
   `LSF_ADDSERVERS="hosta hostb"
   
   c. Run `./lsfinstall -f install.config`

   This automatically creates the host information in `lsf.cluster.cluster_name`.
5. Run `lsadmin reconfig` to reconfigure LIM.
6. Run `badmin reconfig` to reconfigure mbatchd.
7. Run `hostsetup` to set up the new host and configure the daemons to start automatically at boot. For example, from an install directory such as `/usr/share/lsf/10.1/install:`
Installation Instructions for Platform Suite for SAS for UNIX

./hostsetup --top="/usr/share/lsf" --boot="y" --profile="y" --start="y"

Note: There are two dashes “--” in the options. See “Chapter 5 – LSF Quick Reference” for more information on the hostsetup command.

8. Start LSF on the new host:
   ladmin limstartup
   ladmin resstartup
   badmin hstartup

Setting up UNIX as a LSF Client Installation for Non-Access to a Shared Directory

Use this configuration setup if your machine does not have access to a shared directory.

Use slave.config to install a slave host. Note that slave.config is located in the same directory as install.config after you untar the installer package.

Note: Seeing the term, “UNAVAILABLE” display during installation is “normal” for a LSF client configuration that is not running LSF daemons.

1. In slave.config, you need to specify the following params. Even though some params are not needed for client, you need to provide them for the installer to work.

   LSF_TOP -- this should be on a local directory but not the same one as noted for the master host.
   LSF_LICENSE – identifies a path to the license where the entitlement and inventory tag files are stored.
   LSF_ADMINS -- specify the existing admins of the main cluster.
   LSF_ADD_CLIENTS -- specify the host you are installing on (that is the slave and client host).
   LSF_SERVER_HOSTS -- specify the master and master candidate hosts of the main cluster (in the same order as in the main cluster).
   LSF_LIM_PORT -- specify the LIM port of the main cluster.

   This setup allows you to run "sudo ./lsfinstall -s -f slave.config" to install it.

2. Add a line to the lsf .cluster.xxx file of the main cluster. Be sure to indicate the host is type client. For example,

   HOSTNAME model type server RESOURCES #Keywords
   ...
   ib16b06           ! ! 0 ()

   Then run ladmin reconfig. (badmin reconfig is probably not needed, but was run in this test).

3. On the client host, you can try lsd, and bsub to submit a job. On bsub, you need to specify -R "type==any" as LSF won’t detect the host type of a client machine.

   The client host does not refer to to LSF_TOP of the main cluster. The example below shows how lsf.conf looks on the client machine after these steps (from LSF10.1):
4. When running the boot (hostsetup) command for LSF with LSF 10.1, you may receive a message about a missing “LSF Entitlement” in the dialog.

There are two solutions to correct this issue.
1. Ignore the problem and let it display an error. Therefore, you do not need an LSF entitlement.
2. Workaround solution: Is there a bug in the hostsetup command? If so, set the following two environment variables before running the hostsetup script.

   IS_SAS_BUILD=Y
   LSF_LICENSE=<path to the license.dat>

Example:
   a. [root@xxxx install]# export IS_SAS_BUILD=Y
   b. [root@xxxx install]# export LSF_LICENSE=/opt/sasinside/LSF_Share/license.dat
   c. [root@xxxx install]# ./hostsetup --top="/opt/sasinside/LSF_Share/lsf" --boot="y" --profile="y" --start="y"

Logging installation sequence in /opt/sasinside/LSF_Share/lsf/log/Install.log

**Startup and Boot Setup for LSF and PM**

**LSF Boot Setup with Startup**
Change into the LSF_TOP/9*/install subdirectory. For example:

[root@localhost]# cd /common/share/lsf/10/install

Run the following command initialization files for future reboots after sourcing the LSF profile. This will add the LSF daemons to the server startup and startup the required LSF daemons. Note the two dashes before each parameter.
[root@localhost] # ./hostsetup --top="/common/share/lsf" --boot="y" --start="y"

PM (jfd) Boot Setup
Set up the Process Manager environment by sourcing the profile.js file if it was not already run. Then, run the PM/jfd “bootsetup” script.

[root@localhost] # . <JS_TOP>/conf/profile.js
[root@localhost] # . <JS_TOP>/10*/install/bootsetup

Example:
[root@localhost] # . /common/share/pm/conf/profile.js
[root@localhost] # /common/share/pm/10*/install/bootsetup

Reminder: (bootsetup with no arguments) will install PM/jfd startup at boot time.
### Chapter 5 - LSF Quick Reference

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lsid</td>
<td>Displays version number, cluster name, and the grid control server (LSF master host) name. Useful to see if the grid daemons are running and if running in SAS mode.</td>

### admin

Administrative tool for LSF’s batch processing facility available to LSF administrators. Useful subcommands include the following:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reconfig</td>
<td>Reconfigures the batch facility without restarting sbatchd or mbatchd to read any changes in the configuration files.</td>
</tr>
<tr>
<td>hstartup</td>
<td>Starts sbatchd on the local host</td>
</tr>
<tr>
<td>hrestart</td>
<td>Restarts sbatchd on the local host</td>
</tr>
<tr>
<td>mbdrestart</td>
<td>Restarts mbatchd. Needs to be done when new hosts are added to the grid (cluster).</td>
</tr>
<tr>
<td>helose <code>&lt;host&gt;</code></td>
<td>Closes a host preventing it from running jobs.</td>
</tr>
<tr>
<td>hopen <code>&lt;host&gt;</code></td>
<td>Opens a host to allow it to run jobs.</td>
</tr>
</tbody>
</table>

### bsub

Submit a job to the grid. Useful parameters include the following:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-I</code></td>
<td>Interactive. Remote output displayed locally.</td>
</tr>
<tr>
<td><code>-m</code></td>
<td>Submit to a specific host.</td>
</tr>
<tr>
<td><code>-R &quot;res_req&quot;</code></td>
<td>Submit with specified resource.</td>
</tr>
</tbody>
</table>

### hostsetup

Sets up a host to use the LSF cluster and configures LSF daemons to start automatically.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--top</code></td>
<td>Top-level installation directory that contains the cluster the local host belongs to. <code>&lt;path&gt;</code> must be accessible to local host where hostsetup is running</td>
</tr>
<tr>
<td><code>--boot</code></td>
<td>Configure system scripts to automatically start and stop LSF at system startup and shutdown. The local host where hostsetup is running must be an LSF server in the cluster.</td>
</tr>
<tr>
<td><code>--profile</code></td>
<td>Add cshrc.lsf and profile.lsf to system-wide environment and startup programs.</td>
</tr>
<tr>
<td><code>--start</code></td>
<td>Start LSF on the local host after hostsetup. The local host where hostsetup is running must be an LSF server in the cluster.</td>
</tr>
<tr>
<td><code>--quiet</code></td>
<td>Do not display detailed messages.</td>
</tr>
</tbody>
</table>

The LSF commands shown in this section include examples of typical output. The output you see differs according to your local configuration.

The commands are described briefly so that you can easily use them as a “confirmation check” for your LSF installation. See the LSF Reference for complete usage and command options. You can use these commands on any LSF host. If you get proper output from these commands, your cluster is ready to use. If your output from the commands discussed in this section has errors, see the LSF Reference for help.
**Check Cluster Configuration (lsadmin)**

`lsadmin ckconfig -v`

The `lsadmin` command controls the operation of an LSF cluster and LSF configuration files. The `-v` flag displays detailed information about the LSF configuration:

```
$ lsadmin ckconfig -v
```

Checking configuration files ...

Oct 26 10:24:52 2016 9687 6 1.2.10 Checking Done.
```

No errors found.

The messages shown are typical of normal output from `lsadmin ckconfig -v`. Other messages may indicate problems with your LSF configuration. See the LSF Reference for help with some common configuration errors.
**Find Out Cluster Status (lsid and lsload)**

**lsid**
Informs you if your LSF environment is set up properly. Cluster status lsid displays the current LSF version number, cluster name, and host name of the current grid control server (LSF master host) for your cluster. The grid control server (LSF master) name displayed by `lsid` may vary, but it is usually the first host configured in the Hosts section of `LSF_CONFDIR/lsf.cluster.cluster_name`.

**lsload**
Displays the current load levels of the cluster. The output contains one line for each host in the cluster. The status is correct for all hosts in your cluster. For example:

```
lsload
HOST_NAME status r15s r1m r15m ut pg ls it tmp swp mem
hosta      ok  0.0  0.0  0.0  6%  0.2  2 1365  97M  65M  29M
hostb      ok  0.0  0.0  0.0  9%  0.0  4  1130M 319M  12M
hostc      ok  2.5  2.2  1.9 64% 56.7  50  929M 931M 4000M
hostd      ok  0.2  0.2  0.2  1%  0.0  0 367  93M  86M  50M
hoete      busy *6.0  2.2  1.9 64% 56.7  50  929M 931M 4000M
hostf      unavail
```

A **busy** status is shown for hosts with any load index beyond its configured thresholds. An asterisk (*) marks load indices that are beyond their thresholds, causing the host status to be **busy**. A minus sign (-) in front of the value **ok** means that RES is not running on that host.

If you see the message

```
Cannot open lsf.conf file
```

the LSF_ENVDIR environment variable is probably not set correctly. Use `cshrc.lsf` or `profile.lsf` to set up your environment.

If you see the message

```
LIM is down
```

or

```
LIM is not responding
```

after starting or reconfiguring LSF, wait a few seconds and try `lsload` again to give the LIMs time to initialize. Notice that `lsload` also shows if LSF is licensed for the host. If you see the message

```
Host does not have a software license
```
you must install a valid LSF license or make sure that the license server is running properly.

There are also a couple of other useful commands:

- The `lshosts` command displays configuration information for LSF hosts and their
  static resource information.
- The `lsinfo` command displays cluster configuration information about resources, host
types, and host models.

**Check LSF Batch Configuration (badmin)**

```bash
badmin ckconfig -v
```

The `badmin` command controls and monitors the operation of the LSF Batch system. Use the
`badmin ckconfig` command to check the LSF Batch configuration files. The `-v` flag displays
detailed information about the configuration:

```
badmin ckconfig -v
Checking configuration files ...
---------------------------------------------------------
No errors found.
```

The messages shown above are the normal output from `badmin ckconfig -v`. Other messages
may indicate problems with the Platform LSF Batch configuration. See the *LSF Reference* for help
with some common configuration errors.

**Find Out LSF Batch System Status (bhosts and bqueues)**

```bash
bhosts
```

The `bhosts` command tells you if LSF Batch is running properly. Notice that `bhosts` displays
the status and other details about the grid nodes (LSF Batch server hosts) in the cluster:

- maximum number of job slots allowed by a single user
- total number of jobs in the system, jobs running, jobs suspended by users, and jobs
  suspended by the system
- total number of reserved job slots

The status is designed to be `ok` for all grid nodes (hosts) in your cluster. For example:

```
bhosts
```

<table>
<thead>
<tr>
<th>HOST_NAME</th>
<th>STATUS</th>
<th>JL/U</th>
<th>MAX</th>
<th>NJOBS</th>
<th>RUN</th>
<th>SSUSP</th>
<th>USUSP</th>
<th>RSV</th>
</tr>
</thead>
<tbody>
<tr>
<td>hosta</td>
<td>ok</td>
<td>-</td>
<td>-</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>hostb</td>
<td>ok</td>
<td>-</td>
<td>-</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>hostc</td>
<td>ok</td>
<td>-</td>
<td>-</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>hostd</td>
<td>ok</td>
<td>-</td>
<td>-</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

If you see the message

```
lsbatch daemons not responding
```

after starting or reconfiguring LSF, wait a few seconds and try `bhosts` again to give the SBDs
time to initialize.
bqueues

LSF Batch queues organize jobs with different priorities and different scheduling policies. The bqueues command displays available queues and their configuration parameters. For a queue to accept and dispatch jobs, the status is to be Open:Active.

bqueues

<table>
<thead>
<tr>
<th>QUEUE_NAME</th>
<th>PRIO</th>
<th>STATUS</th>
<th>MAX</th>
<th>JU/L</th>
<th>JU/P</th>
<th>JU/H</th>

<td>-</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

The queue information displayed by bqueues is configured in lsb.queues. Eight queues are defined by default in lsb.queues. Modify this file to add, delete, or change queues.

bqueues -l

To see more detailed queue information, use bqueues -l:

```
bqueues -l normal
```

---

bqueues -l shows the following kinds of information about the queue:

- What kinds of jobs are meant to run on the queue?
- Resource usage limits.
- Nodes (hosts) and users that are able to use the queue.
- Scheduling threshold values:
  - loadSched is the threshold for LSF to dispatch a job automatically.
  - loadStop is the threshold for LSF to suspend a job automatically.

There are a couple of other useful commands:

- The bparams command displays information about the LSF Batch configuration parameters.
- The bhist command displays historical information about jobs.
Verifying the Network Setup

Overview
The first step in troubleshooting problems with a SAS grid is to verify that all computers in the grid can communicate with one another through the ports that are used by the grid middleware.

Host Addresses
Check the /etc/hosts file on each grid node to ensure that the machine name is not mapped to the 127.0.0.1 address. This mapping causes the signon connection to the grid node to fail or to hang. This happens because the SAS session being invoked on the grid node cannot determine the correct IP address of the machine on which it is running. A correct IP address must be returned to the client session in order to complete the connection. For example, delete the name "myserver" if the following line is present in the /etc/hosts file:

```
127.0.0.1 myserver localhost.localdomain localhost
```

Host Connectivity
You must verify that the network has been set up properly and that each machine knows the network address of all the other machines in the grid. Follow these steps to test the network setup:

1. Run the hostname command on every machine in the grid (including grid nodes, grid control servers, and SAS Foundation grid clients).
2. Run the ping command on all grid node machines and the grid control machine against every other machine in the grid (including grid client machines). When you ping a grid client machine, use the host name without the domain suffix.
3. Run the ping command on each grid client machine against every other machine in the grid (including itself). When a grid client machine pings itself using the value from the hostname command, verify that the returned IP address is the same IP address that is returned when the grid nodes ping the client. However, this might not occur on machines with multiple network adapters.

If the network tests indicate a problem, you must either correct the DNS server or add entries to each machine's hosts file. Contact your network administrator for the best way to fix the problem.

Platform LSF assumes that each host in the grid has a single name, that it can resolve the IP address from the name, and that it can resolve the official name from the IP address. If any of these conditions are not met, LSF needs its own hosts file, which is located in its configuration directory (LSF_ENVDIR/conf/hosts).

Host Ports
You must verify that the ports that SAS and LSF use for communication are accessible from other machines. The ports might not be accessible if a firewall is running on one or more machines. If firewalls are running, you must open ports to verify that communication works between the LSF daemons and the instances of SAS. Issue the telnet <host><port> command to determine whether a port is open on a specific host.
The default ports used in a grid are:

- LSF: 6878, 6881, 6882, 7869, 7870, 7871, and 7872
- Grid Monitoring Service: 1976
- Platform Process Manager: 1966

If you need to change any port numbers, modify these files:

- LSF ports: LSF_ENVDIR/conf/lsf.conf and EGO_CONFDIR/ego.conf
- Grid Monitoring Service port: gms/conf/ga.conf
- Platform Process Manager port: pm/conf/js.conf

If you change the Grid Monitoring Service port, you must also change the metadata for the Grid Monitoring Server. If you change the Platform process Manager port you must also change the metadata for the Job Scheduler Server.

Ports might be used by other programs. To check for ports that are in use, stop the LSF daemons and issue the command `netstat -an |<search-tool><port>`, where `search-tool` is `grep` (UNIX) or `findstr` (Windows). Check the output of the command for the LSF ports. If a port is in use, reassign the port or stop the program that is using the port.

SAS assigns random ports for connections, but you can restrict the range of ports SAS uses by using the `-tcpportfirst <first-port>` and `-tcpportlast <last-port>` options. You can specify these options in the SAS configuration file or on the SAS command line. For remote sessions, you must specify these options either in the grid command script (`sasgrid.cmd` on Windows or `sasgrid` on UNIX) or in the Command field in the logical grid server definition in metadata. For example, adding the following parameters to the SAS command line in the grid script restricts the ports that the remote session uses to between 5000 and 5005:

```bash
-tcpportfirst 5000 -tcpportlast 5005
```

For More Information

See the LSF Administrator’s Guide for more information about seeing the status of your cluster.

See the LSF Reference for detailed information about the commands described in this section.

See Administering Process Manager for detailed information about Process Manager configuration and maintenance.

These documents are also available at:

Appendix – LDAP/PAM Authentication

Configure LDAP/PAM Authentication for Process Manager Server

On UNIX systems, Process Manager supports LDAP/PAM authentication through PAM (pluggable authentication modules). PAM is a third-party tool that can be configured to use the pam_ldap module from the libpam-ldap package to log into the LDAP/PAM server for password checking.

To enable LDAP/PAM authentication for Process Manager, perform the following steps:

1. Set JS_LOGIN_REQUIRED=true in js.conf.

2. Modify the PAM configuration on your system to add a service name eauth_userpass for the module type authorization.

   For example, on Linux, create a new file eauth_userpass under the /etc/pam.d directory, and then add the following entry to the file:
   
   ```
   auth required /lib/security/$ISA/pam_ldap.so
   ```

   On Solaris, modify /etc/pam.conf to add the following entries:
   
   ```
   eauth_userpass auth requisite /usr/lib/security/64/pam_authtok_get.so.1
   eauth_userpass auth required /usr/lib/security/64/pam_dhkeys.so.1
   eauth_userpass auth required /usr/lib/security/64/pam_unix_cred.so.1
   eauth_userpass auth binding /usr/lib/security/64/pam_passwd_auth.so.1
   server_policy
   eauth_userpass auth required /usr/lib/security/64/pam_ldap.so.1
   ```

   On AIX, modify /etc/pam.conf to add the following entry:
   
   ```
   eauth_userpass auth required /usr/lib/security/64/pam_aix
   ```

   Note that the absolute path for the pam_ldap module may be different on your system. Ensure that you specify the 64-bit pam_ldap module on 64-bit operating systems.

3. Restart Process Manager server jfd.

Configure LDAP/PAM Authentication for GMS

On UNIX systems, GMS supports LDAP/PAM authentication through pluggable authentication modules (PAM). PAM is a third-party tool that can be configured to use the pam_ldap module from the libpam-ldap package to log into the LDAP/PAM server for password checking.

To enable LDAP/PAM authentication for GMS, perform the following steps:

1. Set GA_PAM_ENABLE=Y in ga.conf.

2. Modify the PAM configuration on your system. You have two options for this step:

   Option 1: Modify the existing PAM module: passwd

   For example, on Linux, make sure /etc/pam.d/passwd has the following entry:
   
   ```
   auth required pam_stack.so service=system-auth
   ```
Then modify `/etc/pam.d/system-auth` to add the following:

```
auth sufficient /lib/security/$ISA/pam_ldap.so use_first_pass
```

On Solaris, modify `/etc/pam.conf` to add the following:

```
passwd auth requisite /usr/lib/security/64/pam_authtok_get.so.1
passwd auth required /usr/lib/security/64/pam_dhkeys.so.1
passwd auth required /usr/lib/security/64/pam_unix_cred.so.1
passwd auth binding /usr/lib/security/64/pam_passwd_auth.so.1
server_policy
passwd auth required /usr/lib/security/64/pam_ldap.so.1
```

On Solaris, modify `/etc/pam.conf` to add the following:

```
server_policy
```

On AIX, modify `/etc/pam.conf` to add the following:

```
auth required /usr/lib/security/64/pam_aix
```

Option 2: Configure a new PAM module specified by `GA_PAM_SERVICE` in `ga.conf`

For example, in `ga.conf`, set the following:

```
GA_PAM_ENABLE=Y
GA_PAM_SERVICE=ga_auth
```

On Linux, create a new file `ga_auth` under `/etc/pam.d` directory, and add the following entry to the file:

```
auth required /lib/security/$ISA/pam_ldap.so
```

On Solaris, modify `/etc/pam.conf` to add the following entries:

```
ga_auth auth requisite /usr/lib/security/64/pam_authtok_get.so.1
.ga_auth auth required /usr/lib/security/64/pam_dhkeys.so.1
.ga_auth auth required /usr/lib/security/64/pam_unix_cred.so.1
.ga_auth auth binding /usr/lib/security/64/pam_passwd_auth.so.1
server_policy
.ga_auth auth required /usr/lib/security/64/pam_ldap.so.1
```

On AIX, modify `/etc/pam.conf` to add the following entry:

```
ga_auth auth required /usr/lib/security/64/pam_aix
```

Note that the absolute path for the `pam_ldap` module may be different on your system. Make sure you specify the 64-bit `pam_ldap` module on 64-bit operating systems.

Option 1 is recommended. Use option 2 if your site does not allow changing of the `passwd` module.

3. Restart GMS daemon gabd.
SAS is the leader in business analytics software and services, and the largest independent vendor in the business intelligence market. Through innovative solutions, SAS helps customers at more than 70,000 sites improve performance and deliver value by making better decisions faster. Since 1976 SAS has been giving customers around the world THE POWER TO KNOW®.
