

# Orthogonal Array Lists

## Warren F. Kuhfeld - SAS

This report provides a list of virtually all known strength-two orthogonal arrays up through 143 runs<sup>1</sup> (rows or factor combinations) and a list of additional orthogonal arrays up through 1,000 runs. At the end of these lists is a reference list of books and papers on orthogonal array construction. The reference list mostly covers newer and larger arrays. Many of the older arrays were created based on secondary sources such as *Orthogonal Fractional Factorial Designs* by Dey (1985); *Orthogonal Arrays* by Hedayat, Sloane, and Stufken (1999); and *A Library of Orthogonal Arrays*, by Sloane (2005). Their reference lists are not duplicated here. The work so far could not have happened without the work of many people over the span of over 110 years (the earliest reference in this list is an 1893 paper by the French mathematician Jacques Hadamard). This resource cannot continue to grow without your help. Thanks to Don Anderson, StatDesign; Warwick de Launey, Center for Communications Research; Nam-Ky Nguyen, Gendex; Shanqi Pang, Henan Normal University; Neil Sloane, AT&T Shannon Lab; Chung-yi Suen, Cleveland State University; Randy Tobias, SAS Institute Inc.; Ian Wakeling, Qi Statistics; J. C. Wang, Western Michigan University; and Yingshan Zhang, Henan Normal University, who have all kindly helped with some of the arrays in this catalog.

While the orthogonal array lists are virtually complete for the smaller arrays, new arrays are being discovered all the time. The goal is to create the most complete strength-two orthogonal array source ever assembled and to provide computerized tools that completely automate their construction.

The first listing presents strength-two orthogonal arrays up through 143 runs. The columns include the number of runs, the array, and the lineage or rules for making the array. The listing is sorted by the number of runs. Within runs, it is sorted by the number of two-level factors, then the number of three-level factors, and so on, all in descending order. Hence within runs, the arrays with the most two-level factors are listed first. The second column after the number of runs contains a running count of the number of arrays that can be made for this number of runs. The first array is  $2^3$ , which has 3 two-level factors in 4 runs. Further down the list you see  $2^1 3^7$ , which has 1 two-level factor and 7 three-level factors in 18 runs. The base is the number of levels and the exponent is the number of factors. Hence,  $2^1 3^7$  means a  $2 \times 3 \times 3 \times 3 \times 3 \times 3 \times 3$  design. All of these arrays are strength-two main-effects designs, which means that all level pairs occur equally often within every pair of columns.

The lineage of an array shows how it can be made from other arrays. Some arrays have no lineage.

These arrays are called *parent* arrays. They are constructed in many different ways—some with simple algebra, some with very complicated algebra, and others through computerized searches. The remaining arrays are constructed from the parents. For example, the array  $2^7$  has a lineage of  $2^4 4^1$ ,  $4^1 \rightarrow 2^3$ , which means it can be made from  $2^4 4^1$  by replacing  $4^1$  with copies of the array  $2^3$  in 4 runs. The first part of the lineage gives the parent array, which will always have the same number of runs as the array of interest. Subsequent parts of the lineage show how to replace one or more factors in the parent with copies of smaller arrays that appear before this array in the listing. The replacement array appears after the arrow (for example, the  $2^3$  in  $4^1 \rightarrow 2^3$ ). The factor that

---

<sup>1</sup>There are a few missing designs in 108 runs. I would welcome help in making them.

needs to be replaced appears before the arrow, and it also gives the number of runs in the replacement array. The exponent on this factor will always be 1. Some replacements, particularly for four-level factors, might occur more than once. The lineage provides information on what to do. The number of times it needs to happen is not explicitly stated in this listing, but it is obvious from the context. Consider, for example, the array  $2^{15}$  whose lineage consists of  $4^5, 4^1 \rightarrow 2^3$ .  $4^1$  must be replaced by  $2^3$  a total of 5 times. The lineage does not consist of something like  $4^5, 4^5 \rightarrow 2^{15}$  because that would hide the critical information that it is the array  $2^3$  that is needed to make the larger array. The array  $4^5$  becomes  $2^3 4^4$  after the first replacement. This array has too many four-level factors and not enough two-level factors, so  $2^3 4^4$  becomes  $2^6 4^3$ , which becomes  $2^9 4^2$ , which becomes  $2^{12} 4^1$ , which finally, after the last replacement, becomes  $2^{15}$ , the desired result.

Replacing a four-level factor by 3 two-level factors consists of replacing: a 0 in the four-level factor by the first row of the  $2^3$  array, a 1 in the four-level factor by the second row of  $2^3$ , and so on. More generally, to replace a  $p$ -level factor by an array in  $p$  runs, replace level  $i = 0, \dots, p - 1$  with row  $i + 1$  of the array in  $p$  runs. The following example illustrates:

$2^4 4^1, n = 8$	and	$2^3, n = 4$	makes	$2^7, n = 8$	where	$4^1 \rightarrow 2^3$
0000 0		000		0000 000		0 $\rightarrow$ 000
0011 2		011		0011 101		1 $\rightarrow$ 011
0101 1		101		0101 011		2 $\rightarrow$ 101
0110 3		110		0110 110		3 $\rightarrow$ 110
1001 3				1001 110		
1010 1				1010 011		
1100 2				1100 101		
1111 0				1111 000		

In practice, you never have to actually do any of this because the SAS macro %MktEx does it all for you. See the Web book *Marketing Research Methods in SAS* for more information on the %MktEx macro, which automates orthogonal array and nonorthogonal factorial design creation. In particular, see the chapters “Experimental Design and Choice Modeling Macros” and “Discrete Choice” for documentation and numerous examples of its use. The book and macros are free on the Web at [http://support.sas.com/techsup/tnote/tnote\\_stat.html#market](http://support.sas.com/techsup/tnote/tnote_stat.html#market).

The following examples show how easy it is to run %MktEx to get orthogonal arrays:

```
%mktex(2 ** 15, n=16)
%mktex(2 3 ** 7, n=18)
%mktex(2 ** 18 4 4 8, n=32)
```

However, %MktEx has many more options because it has many other capabilities, including facilities for making highly restricted designs. While the examples in *Marketing Research Methods in SAS* have a marketing research orientation, researchers in many other areas use %MktEx to make designs for a variety of purposes.

When orthogonal arrays are not available, the %MktEx macro automatically constructs a  $D$ -efficient nonorthogonal design. For  $3^{15} 2^5$  in 36 runs, %MktEx usually makes a design that is mostly orthogonal but with a few correlated factors. For  $2^{31}$  in 33 runs (which is an unusual request, since there is an orthogonal array in 32 runs), %MktEx makes a design that is nonorthogonal but with all factors slightly and equally correlated.

```
%mktex(3 ** 15 2 ** 5, n=36)
```

```
%mktex(2 ** 31, n=33)
```

%MktEx can also make designs with interactions and complicated restrictions.

While this listing shows virtually all known orthogonal arrays up to 143 runs, it does not contain all known lineages for each orthogonal array, nor does it indicate that many orthogonal arrays, including many parent arrays, can be made in multiple ways. For example, the array  $2^7$  in 8 runs can alternatively be constructed as a Hadamard array based on the fact that  $8-1 = 7$  is prime or based on the fact that  $8 = 2^3$ . The page [http://support.sas.com/techsup/technote/ts723\\_Designs.txt](http://support.sas.com/techsup/technote/ts723_Designs.txt) provides one orthogonal array for every parent in this listing (except for the full-factorial designs, which require no special expertise to generate). Also see Neil Sloane's orthogonal array page, <http://neilsloane.com/oadir/>. Sloane's page provides many strength two-orthogonal arrays including some arrays that are alternatives to the ones shown here. His page also contains arrays of strength greater than 2, assorted Hadamard matrices constructed in alternative ways, and many other useful designs not covered here. There is also a link to the official Web page for the 1999 book *Orthogonal Arrays* by Hedayat, Sloane, and Stufken.

# Orthogonal Array Parents

This next listing shows virtually all known parent orthogonal arrays up through 143 runs, a reasonably comprehensive set of parent orthogonal arrays for 144 through 513 runs, and some additional parent orthogonal arrays up through 1,000 runs. While this listing is virtually complete for the smaller arrays, new arrays are being discovered all the time. If you know of any arrays that are not in this catalog, please email [Warren.Kuhfeld@sas.com](mailto:Warren.Kuhfeld@sas.com).

The number of parents up through 143 runs is fairly reasonable; currently there are 874. Beyond that, the number of parents grows at a very rapid rate. At some point, it becomes impossible to make the catalog complete. 143 runs was chosen as the stopping point for completeness and 144 runs as the stopping point for defining child arrays. This means that this catalog has at most 144-level factors. Arrays, for example, in 288 and 432 runs are made by replacing the 144-level factor in  $2^{144}144^1$  and  $3^{144}144^1$  with all of the arrays in 144 runs, and replacing (72, 36, 48, 24, 18, 12, 9, 8, 6, and 4)-level factors by arrays in that many runs, providing a rich mix of levels. Hence, *many* large and varied arrays can be made from this catalog even if it is not complete beyond 143 runs. Beyond 288 runs, 145-level and larger factors are not available, so in their place, arrays are listed that are manufactured from the most important arrays in  $n > 144$  runs. Such arrays are not true parents—they just provide a convenient mechanism to get a large catalog of arrays up through 513 runs without the computational burden of enabling (145 through 256)-level factors. These designs are usually of the form  $2^{3n/4}(n/4)^1$  in  $n$  runs where the real parent would be  $2^{n/2}(n/2)^1$ . Examples include:  $2^{264}88^1$  in 352 runs (the real parent is  $2^{176}176^1$ ) and  $2^{300}100^1$  in 400 runs (the real parent is  $2^{200}200^1$ ). Note that most arrays in this listing, even those with more than 288 runs, are true parents. Just a few are not.

This listing shows the number of parents, the total number of arrays in  $n$  runs, and a list of the parents. The 874 parents in this catalog can generate a total of 130,147 orthogonal arrays.<sup>2</sup> All of the arrays in this catalog can be generated with the SAS %MktEx macro. The %MktOrth macro maintains this catalog and can be used to list and process it. For example, all of the tables in this report were automatically generated using the %MktOrth macro and a SAS program to write a L<sup>A</sup>T<sub>E</sub>X file complete with the tabular markups. When the catalog grows, it only takes a few minutes to regenerate this entire report. The %MktRuns macro enables you to specify a design and see all of the orthogonal arrays that fit your specification along with suggestions for sizes for smaller nonorthogonal designs. See the Web book *Marketing Research Methods in SAS* for more information. In particular, see the chapters “Experimental Design and Choice Modeling Macros” and “Discrete Choice” for documentation and numerous examples of their uses. The book and macros are on the Web at [http://support.sas.com/techsup/tnote/tnote\\_stat.html#market](http://support.sas.com/techsup/tnote/tnote_stat.html#market).

The page [http://support.sas.com/techsup/technote/ts723\\_Designs.txt](http://support.sas.com/techsup/technote/ts723_Designs.txt) provides one orthogonal array for every parent in this listing up through 143 runs (except for the full-factorial designs, which require no special expertise to generate).

---

<sup>2</sup>The %MktEx macro can additionally generate a number of orthogonal designs that are not explicitly in the %MktOrth catalog, including full-factorial designs with more than 143 runs, large fractional factorial designs where the number of runs is the power of a prime number, and larger designs with two-level factors based on large Hadamard matrices.
